About the Product

Matrix provides different platforms to run the SARVAM Application.

- The ETERNITY GENX platform - This is the common hardware platform for SARVAM UCS SME and SARVAM UMG Application.
- The ETERNITY LENX/MENX platform - This is the hardware platform for SARVAM UCS ENT Application.
- The ETERNITY PENX platform - This is the hardware platform for SARVAM UCS SMB Application.

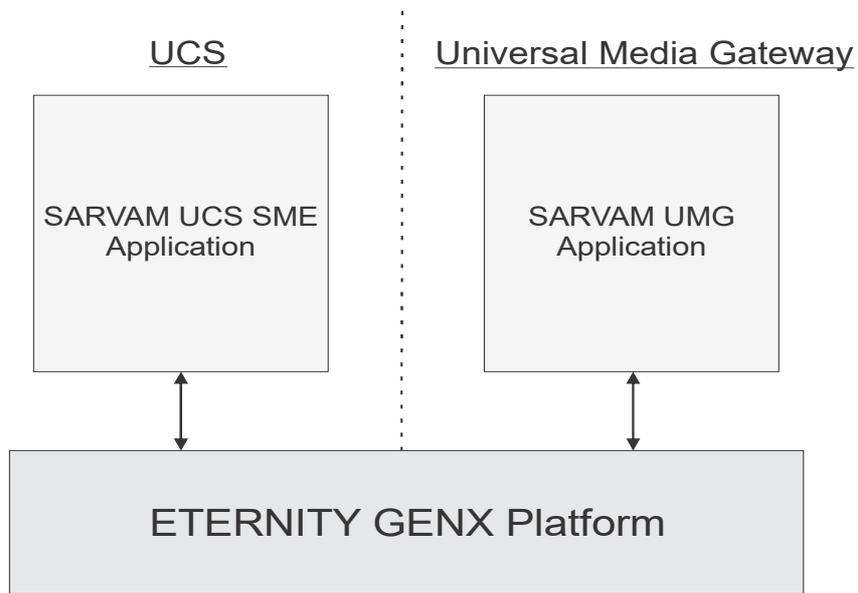

ETERNITY GENX Platform

The ETERNITY GENX is the common hardware platform for SARVAM UCS and SARVAM UMG Application.

You can use the ETERNITY GENX as the Unified Communication Server or the Universal Media Gateway depending upon the Application License you purchase.

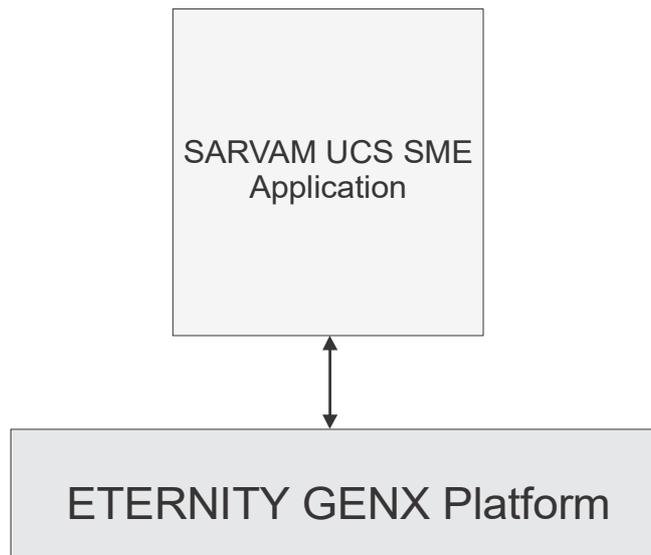

To run the ETERNITY GENX as the Unified Communication Server, you need to purchase the **SARVAM UCS SME** Application¹ license and to run it as the Universal Media Gateway, you need to purchase the **SARVAM UMG SME** Application license.

1. Refer ["Pre-activated Licenses"](#).

ETERNITY GENX as the Universal Media Gateway acts as an IP-based system providing value added voice services. The system enables you to route calls from the Source port to the Destination port using Destination Number determination and Destination Port determination methods. It also offers a robust SIP Stack which gives a thorough interoperability and usability with various SIP trunk providers and IP-PBX. The system provides high performance and high reliability in a compact, modular design.

ETERNITY GENX as the Unified Communication Server acts as a fully hosted and managed Unified Communication Server. It delivers the convergence of voice, data, wired communications for small and medium sized businesses. It also offers UC features, Voice over IP Integration, Voice Mail, Computer Telephony Integration and Switching functions. The system provides reliable, efficient and unrestricted simultaneous communication (incoming and outgoing) by all users.

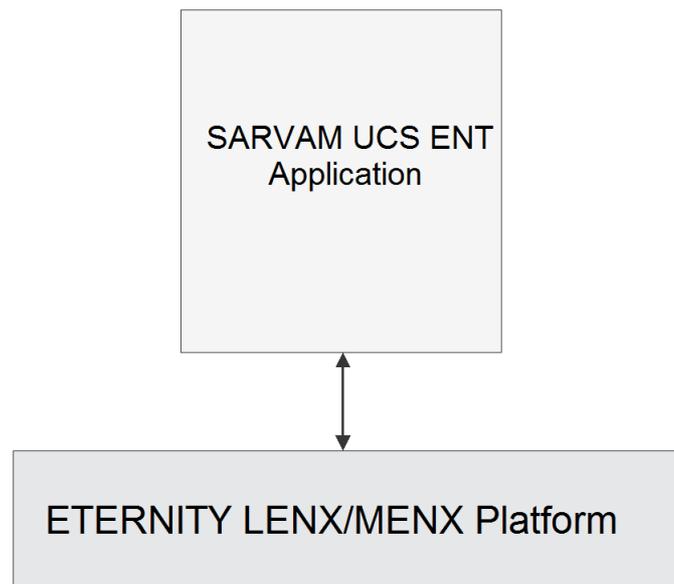

ETERNITY LENX/MENX Platform

The ETERNITY LENX/MENX is the hardware platform for SARVAM UCS ENT Application.

To run the ETERNITY LENX/MENX as the Unified Communication Server, you need to purchase the **SARVAM UCS ENT Application²** license.

ETERNITY LENX/MENX as the Unified Communication Server acts as a fully hosted and managed Unified Communication Server. It delivers the convergence of voice, data, wired communications for small and medium sized businesses. It also offers UC features, Voice over IP Integration, Voice Mail, Computer Telephony Integration and Switching functions. The system provides reliable, efficient and unrestricted simultaneous communication (incoming and outgoing) by all users.

ETERNITY PENX Platform

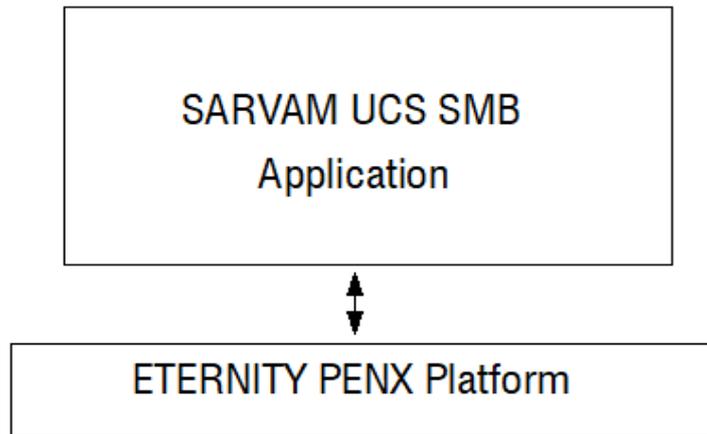

The ETERNITY PENX is the hardware platform for SARVAM UCS SMB Application.

To run the ETERNITY PENX as the Unified Communication Server, you need to purchase the **SARVAM UCS SMB Application³** license.

ETERNITY PENX as the Unified Communication Server acts as a fully hosted and managed Unified Communication Server. It delivers the convergence of voice, data, wired communications for small and medium sized businesses. It also offers UC features, Voice over IP Integration, Voice Mail, Computer Telephony Integration and Switching functions.

The system provides reliable, efficient and unrestricted simultaneous communication (incoming and outgoing) by all users.

2. Refer ["Pre-activated Licenses"](#).
3. Refer ["Pre-activated Licenses"](#).

The manual henceforth will describe in detail — the application, installation, configuration and features of SARVAM UCS.

Welcome

Thank you for choosing our product SARVAM UCS! We hope you will make optimum use of this intelligent, fully hosted and managed Unified Communication Server. Please read this document carefully to get acquainted with the product before installing and operating it.

About this System Manual

This System Manual provides information and instructions for installing, configuring and using the SARVAM UCS.

You may also refer to the SARVAM UCS *Quick Start* for quick installation. To view or download the Quick Start, scan the QR Code printed on the Product Label/Packaging Label. Similarly, the instructions and guidelines for setting up and operating SARVAM UCS in hotels and health care establishments is documented in *SARVAM UCS Hospitality System Manual*.

You may download the documents from <https://www.matrixtelesol.com/product-manuals.html>

For instructions on using the features of the SARVAM UCS by the clients, refer to the respective User Guides. The documentation can be found at the link shared above.

For product registration and warranty related details, please visit <https://www.matrixcomsec.com/product-registration-form.html>

This is a common documentation for all the platforms and the SARVAM UCS Application. This document is written with reference to the ETERNITY GENX platform and SARVAM UCS SME Application.

The configuration commands are written with respect to ETERNITY MENX.

Intended Audience

This System Manual is aimed at:

- **System Engineers**, who will install, maintain and support the system. System Engineers are persons who customize the system configuration to meet the requirements of the organization/users. It is assumed that they are experienced in installing the Unified Communication Server, are familiar with telecom wiring technology, how it works, and the various technical terms and functions associated with it. The SE must have undergone training in configuring the SARVAM UCS.

No one, other than the System Engineer is permitted to make any alterations to the configuration of the SARVAM UCS.

- **System Administrators**, who are the people administering the system. Generally an operator/receptionist in an organization, or the staff manning the reception or front desk area of the establishment are selected as System Administrators.

It is assumed that the System Administrators have some previous experience in administering the system and its Terminals and Consoles. The System Administrators are not expected to install and program the Unified Communication Server, but only the routine jobs and features that are specific to them like generating SMDR reports, Setting report filters, configuring the features, Setting Alarms, reminders, etc.

- **Users**, people/organizations who will use the resources of the SARVAM UCS. They may be executives, include personnel of small and medium businesses, large enterprises, front desk and service staff of Hotels/Motels, hospitals, and other commercial and public organizations/institutions.

Organization of this Document

This system manual is broadly divided into the following:

- **Know Your SARVAM UCS** - introduces the system features and benefits, describes the application scenarios, hardware overview and the interfaces supported.
- **Installing the ETERNITY LENX** - gives step-by-step instructions for preparing for and installing the ETERNITY LENX Platform in general, like setting up the main distribution frames for the wiring, the safety measures for protecting the system and persons handling the installation and maintenance. It also provides step-by-step instructions for installation, inserting the cards, connecting the cables and powering the system.
- **Installing the ETERNITY MENX** - gives step-by-step instructions for preparing for and installing the ETERNITY MENX Platform in general, like setting up the main distribution frames for the wiring, the safety measures for protecting the system and persons handling the installation and maintenance. It also provides step-by-step instructions for installation, inserting the cards, connecting the cables and powering the system.
- **Installing the ETERNITY GENX** - gives step-by-step instructions for preparing for and installing the ETERNITY GENX Platform in general, like setting up the main distribution frames for the wiring, the safety measures for protecting the system and persons handling the installation and maintenance. It also provides step-by-step instructions for installation, inserting the cards, connecting the cables and powering the system.
- **Installing the ETERNITY PENX** - gives step-by-step instructions for preparing for and installing the ETERNITY PENX Platform in general, like setting up the main distribution frames for the wiring, the safety measures for protecting the system and persons handling the installation and maintenance. It also provides step-by-step instructions for installation, inserting the cards, connecting the cables and powering the system.
- **Configuring ETERNITY GENX** - describes the basic configuration to select the application you wish to run on the ETERNITY GENX platform.
- **Configuring SARVAM UCS** - contains description of the different tools and options available to configure SARVAM UCS. It provides detailed description of how to configure the various extension and trunk port

types - SIP Extensions, VoIP-SIP, T1E1PRI, E1FO, CO, Radio, Data, Mobile, BRI, E&M, SLT, DKP, ISDN Terminal and Magneto, Virtual Extensions - supported by SARVAM UCS.

- **Features and Facilities** - describes in detail, each feature and facility offered by the SARVAM UCS. This includes a description of the feature/facility, how it works, and how to program the feature/facility.

The feature description is arranged alphabetically by Feature Name to make it easy for you to locate the description you want to look up.

- **System Maintenance** - provides instructions for back-up, generating reports and debugging.

How to Read this System Manual

This document is organized in a manner to help you get familiar with the ETERNITY GENX Platform and SARVAM UCS SME Application, learn how to install the platform, load application on platform, connect it to the various networks and interfaces, start the system and use the features.

This System Manual is presented in a manner that will help you find the information you need easily and quickly.

You may use the table of contents and the Index to navigate through this document to the relevant topic or information you want to look up.

All the commands given in the System Manual can be performed from DKP. However, these commands may or may not work from the IP Phones.

Cross-references are provided in blue font with hyperlinks. You can look up the source by clicking the links.

Instructions

The instructions in this document are written in a numbered, step-by-step format, as follows. Each step, its outcome and indication/notification, wherever they occur, have been described.

Access Codes

Access codes are strings of digits dialed by an extension to

- Call another extension, Department Group,
- Grab a trunk line
- Use a Feature, like Call Block, Call Forward.

The Access Codes provided in the instructions throughout this document, are default access codes. It is possible to change the Access Codes according to user requirement and preferences. Verify with the Installer/System Engineer, if the default Access Codes have been changed, and use the codes programmed by the System Engineer. For more information, read the topic "[Access Codes](#)" in this document.

Notices

The following symbols have been used for notices to draw your attention to important items.

Important: *to indicate something that requires your special attention or to remind you of something you might need to do when you are using the system.*

Caution: to indicate an action or condition that is likely to result in malfunction or damage to the system or your property.

Warning: to indicate a hazard or an action that will cause damage to the system and or cause bodily harm to the user.

Tip: to indicate a helpful hint giving you an alternative way to operate the system or carry out a procedure, or use a feature more efficiently.

Terminology used in this System Manual

The technical terms and Acronyms used in this Manual are standard terms, commonly used in the telecommunications and data communications industry. Considering the broad group of intended users of this manual, wherever possible, use of jargon has been avoided.

Acronyms have been defined in the text and a list of the same is appended.

Some of the terms specific to this Manual that you will encounter are defined below:

The words '**UCS**', '**SARVAM UCS**' and '**System**' are used interchangeably and synonymously to mean Unified Communication Server.

- **IP Phone:** a phone that uses Voice over IP (VoIP) Technologies for placing and transmitting telephone calls over an IP network, such as the Internet.
- **SIP Extensions:** any SIP-enabled device — a Matrix UC Client (Matrix VARTA WIN200, Matrix VARTA ADR100, Matrix VARTA AMP100), an IP-phone, an Extended IP-phone, a Soft phone or an Analog Phone Adapter — registered with the system, from which you can make/receive calls to any extension or external number.
- **SIP Trunking:** VoIP or streaming media service based on Session Initiation Protocol (SIP) by which Internet Telephony Initiation Protocols (ITSPs) deliver telephonic services and Unified communications to the customers equipped with SIP-based System.
- **Port:** the physical interfaces on the cards for trunk lines and extension lines.
- **Extension:** it is the port of the system to which a telephone instrument (DKP/SLT/ISDN/SIP) is connected.
- **Mobile Extension:** a mobile/landline phone used as a remote extension of SARVAM UCS. You can access all the features of an extension of SARVAM UCS from the mobile/landline phone.
- **RUIM Card:** Removable User Identity Module is a card that supports the CDMA services just like the SIM card that supports GSM services. In this manual, consider SIM as RUIM, if CDMA Mobile Card is installed in your system.
- **Station:** same as extension.
- **Service Provider:** the providers of telecom network lines/Internet - POTS, PSTN, CDMA, GSM, ISDN PRI, ISDN BRI, and Internet Telephony Service Providers (ITSP).
- **CO trunks:** two-wire trunks, that is, analog trunk lines from the POTS network.

- **System Administrator Commands/SA Commands:** number strings dialed from the System Administrator access/mode to operate features or set/cancel features for other extensions.
- **System Commands/SE Commands:** number strings dialed from the System Engineer access/mode to program the system features/functions.
- **CO Network:** the public telephone exchange.
- **CO Lines:** the lines subscribed from the CO Network. These may be Two-wire Trunk Lines, ISDN BRI, ISDN PRI, etc.
- **Digital Key Phone (DKP):** refers to EON, the proprietary digital key phone of Matrix that can be connected with the system. The term 'Digital Key Phone' refers to all models of EON.
- **Single Line Telephone (SLT):** any standard two-wire telephone attached as extensions of the system.
- **Called party/Callee:** the person to whom the call is made.
- **Calling party/Caller:** the person who makes a call.
- **Enterprise Application/Features:** pertaining to the general and special telephone and call management features required by business establishments, public and private organizations.
- **Internal numbers:** same as extension numbers.
- **External Numbers:** numbers of parties/individuals outside the UCS network. The unique number string given to subscribers of PSTN, PLMN, ITSP, etc.
- **Internal Calls:** calls made from and received by one extension to another extension of the SARVAM UCS.
- **External Calls:** calls made by users of SARVAM UCS to subscribers of PSTN, PLMN, ITSPs, etc.
- **Hospitality Application/ Features:** pertaining to the special telephone and guest/patient management features required by accommodation establishments like hotels and hospitals.

Using this Manual, we hope, you will be able to set up, operate and make optimum use of this feature packed Unified Communication Server. If you encounter any technical problems, please contact your Dealer/reseller or the Matrix Customer Care.

Introduction

When ETERNITY GENX platform is used with SARVAM UCS application, it acts as a fully hosted and managed Unified Communication Server. It delivers the convergence of voice, data, wired and wireless communications for small and medium sized businesses.

SARVAM UCS offers UC features, Voice over IP Integration, wireless communications, voice mail, computer telephony integration and switching functions.

This Unified Communication Server creates a collaborative environment by:

- Integrating UC Features like unified messaging, video conferencing etc.
- Addition of more features and functions
- Simplifying management
- Providing services and support
- Centralizing troubleshooting to help solve problems quickly
- Securing IP communications for the mobile workforce

Features and Benefits

Features - UC Features like video calling, instant messaging, IM to SMS, Email to SMS etc, Caller ID, Call Forwarding, Pushkit support, Conference calling and voice messaging.

SIP Trunking - SIP Trunking to Internet Telephony Service Providers. SARVAM UCS allows users to make or receive SIP Trunk calls.

Trunk Interfaces - A variety of network trunk interfaces including CO/Two-wired trunk, ISDN BRI, ISDN T1E1PRI, E&M, Mobile and SIP Trunks.

Extensions - Provides support for a range of extensions — Digital Extensions, Analog Extensions, Radio Extensions, Virtual Extensions and SIP Extensions using Voice over IP technology to provide sophisticated voice performance for new and growing businesses.

UC Clients - Provides support for Matrix UC Clients — VARTA WIN200 Desktop UC Client, VARTA ADR100 and VARTA AMP100 Mobile UC Clients.

Telephones - A variety of telephones including analog, digital, IP hard and soft phones (wired and wireless) to provide an appropriate desktop or device telephone for every need.

Advanced Call Routing - Various options for routing incoming and outgoing calls on trunks are provided.

Q-Sig Networking - With Q-Sig, you can network SARVAM UCS with another UCS or any other ISDN QSIG supported system to expand the system resources. This provides the feature transparency between the systems to function as a single unit.

Universal Connectivity

SARVAM UCS supports UC communication which includes Instant Messaging, Call Management, Smart Directory and Video Calling using a variety of *IP phones such as the Standard SIP Phones and Matrix UC Clients — VARTA WIN200 Desktop UC Client, VARTA ADR100 and VARTA AMP100 Mobile UC Clients.*

SARVAM UCS offers Universal Connectivity, working with all major telecom interfaces: VoIP, POTS, ISDN BRI and PRI (T1/E1), GSM/3G/CDMA, E&M, Radio and Magneto. So, you have access to multiple telecom networks on a single platform. The system's intelligent Least Cost Routing logic diverts your calls through the appropriate network, ensuring least possible call cost.

SARVAM UCS also supports Video Conferencing over IP using any standard SIP Video Conferencing device. Video Conferencing and data connectivity is also supported over ISDN interface.

Flexibility and Scalability

SARVAM UCS is designed to support both pure IP and Hybrid IP solution. Non-IP interfaces can be added by inserting non-IP homogeneous and Mix Port Slave Cards in Universal Slots. The Hybrid Cards offer all possible communication interface options to match your communication requirement.

The system is also designed to provide very high level of flexibility and scalability to meet your future communication needs. The flexible licensing allows you to start with desired number of SIP Users, VoIP Channels and VARTA UC Users. If required, you may increase the number of users or channels supported by purchasing the respective licenses.

The Universal Slot platform and the modular design of the Cards allow you to start with the minimum required configuration and expand the system capacity later, by adding more Cards to the Universal Slots. So, you can invest progressively in scaling up the system as the communication needs of your organization grow.

Cost Saving and Productivity Enhancing Features

Key features like Multi-party Conference, Auto Attendant, Remote programming, SMDR Buffer with a large capacity, that normally warrant additional investment in most other brands, are built into the system.

Intelligent features like Auto Attendant, CLI/DDI based Routing and Dial by Name ensure efficient call management and prompt response to callers.

Least Cost Routing and Call Budgeting help reduce communication cost and enhance productivity.

The system can route a VoIP call to GSM, CO or T1E1PRI port. In the same way, a call on a T1E1PRI port can be routed to VoIP, GSM or CO ports. Further, you can select Fixed or Least Cost Routing to route outgoing calls. SARVAM UCS can handle calls on all ports simultaneously, allowing full traffic on all ports.

SARVAM UCS can work as an adjunct to your existing telephony infrastructure, as a Gateway, saving you the cost of equipment replacement, wiring and installation, while giving you Universal Connectivity and a host of intelligent features.

Redundancy⁴

To reduce down time and provide uninterrupted communication, the ETERNITY LENX/MENX supports redundancy option for the two cards that are critical to its functioning: The Power Supply Card and the CPU Card. There are two cards of each on the platform. When the active card fails, the standby card takes over.

Hot Swap⁵

With the Hot Swap feature you can remove a card and insert it back without switching off the system. So, you can replace a faulty card with a functional one without affecting the functioning of the system. The ETERNITY LENX/MENX supports Hot Swap.

UC Features

- Set/View Presence
- Presence based call controlling (make call/reject call)
- Video Calling
- IM using VARTA WIN200, VARTA ADR100 and VARTA AMP100
- IM using third party SIP Phones/soft clients
- IM to SMS and vice versa using SMS Server
- SMS campaigning using SMS Server and SMS Gateway(in collaboration with third party SMPP application)
- Smart Handover from extension to mobile
- Smart directory access using VARTA WIN200, VARTA ADR100 and VARTA AMP100 for easy and quick access to the extensions and other contacts
- Mobile and Remote workers support
- Outlook integration using CTI Interface
- Auto-attendant with configurable call-flow

Other Key Features

- Account Codes
- Auto Black List IP Address for Web access, VoIP access, etc.
- Call Accounting Software interfaces supported
- Call Billing
- CAS Interface
- Class of Service
- CLI Based Routing
- Closed User Group
- Conference upto 21 party
- Emergency Call Detection and Reporting
- Firmware and Configuration zip file upload using browser
- Hospitality features with Front Desk Web Interface (for Hotels and Hospitals)
- Hot Desking
- Internal SMDR Report buffer
- Least Cost Routing
- Logical Partitioning for restricting toll bypass
- PMS Interface
- Priority
- Q-Sig
- Remote(ISDN) Programming

4. ETERNITY GENX and PENX do not support Redundancy.

5. ETERNITY GENX and PENX do not support Hot Swap.

- SNMP interface for error/event notification and status check
- Syslog (for easy maintenance)
- System Activity Log
- System Fault Log
- Toll Control
- Trusted IP Address to avoid unauthorized access
- Universal Slots
- Voice Applications
- Voice Mail
- Web-based Programming (HTTP/HTTPS)
- White List IP Address

Applications of SARVAM UCS

The Matrix SARVAM UCS can be deployed in small to large enterprises and institutions: manufacturing units, corporate offices, banking and financial institutions, software firms, shopping malls, hospitals, hotels-motels, in power line carrier communication of electric utilities, call centers, in institutions and, power line carrier communication (PLCC) networks.

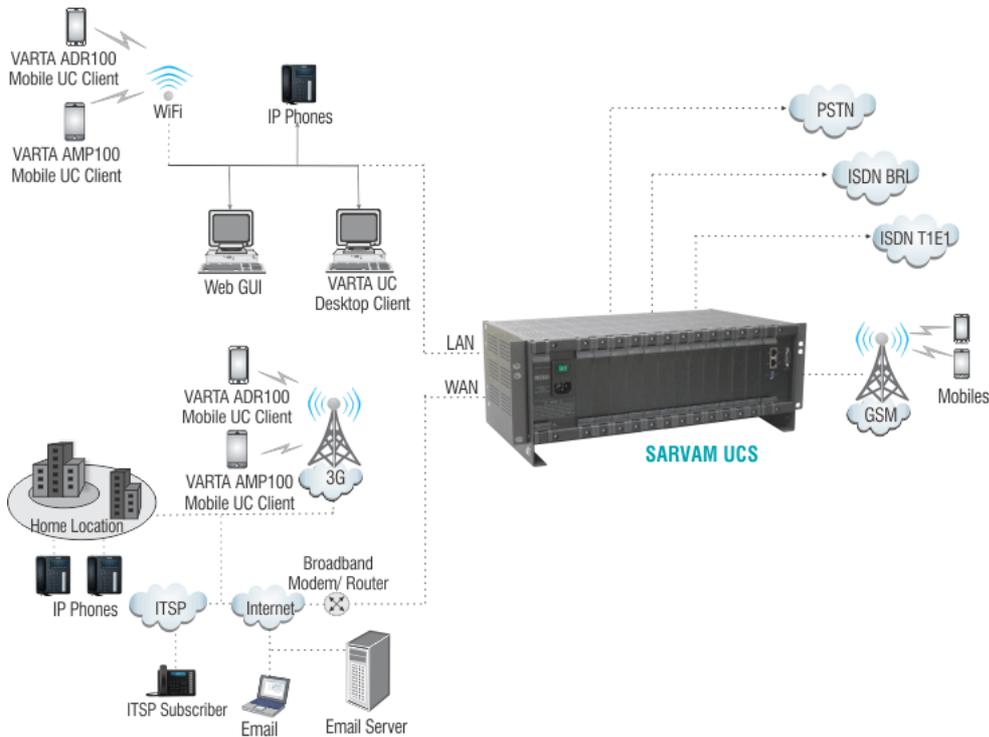

Illustrated in the following are various scenarios where the SARVAM UCS finds application.

Enterprise Application

UC Applications

If connecting to the Public IP Network,

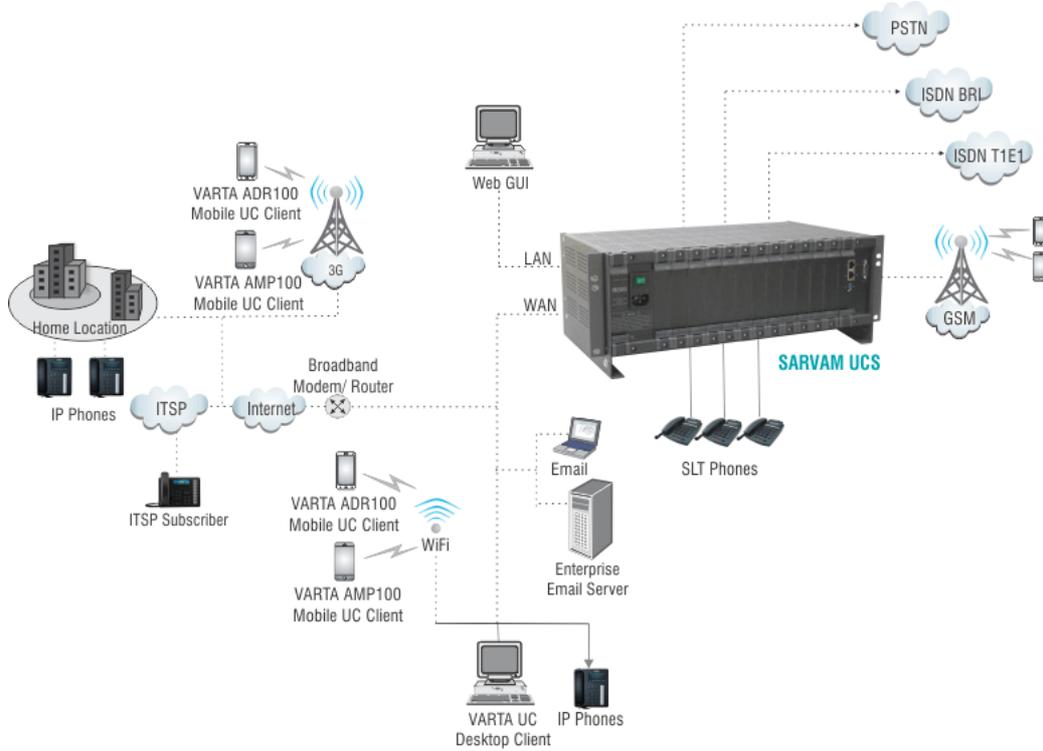

Plug one end of the RJ45 Ethernet cable into the WAN Port of the system and the other end into the Broadband Router/Modem.

Connecting SARVAM UCS to the Public IP Network

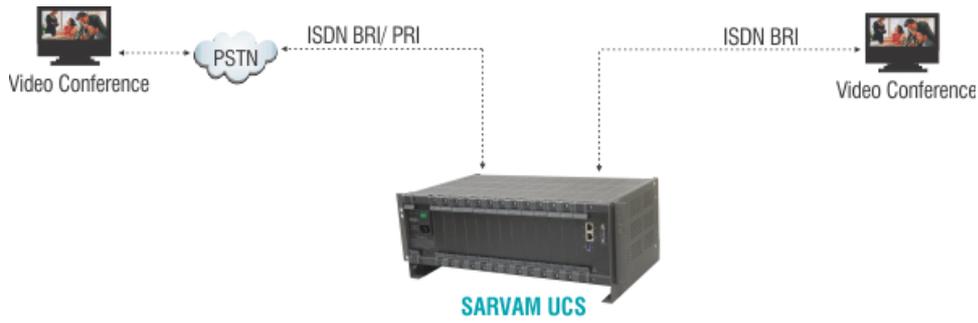

If connecting to a Private Network (Behind a NAT Router),

Plug one end of the RJ45 Ethernet cable into the WAN Port of the system and the other end into the LAN Switch/ Hub.

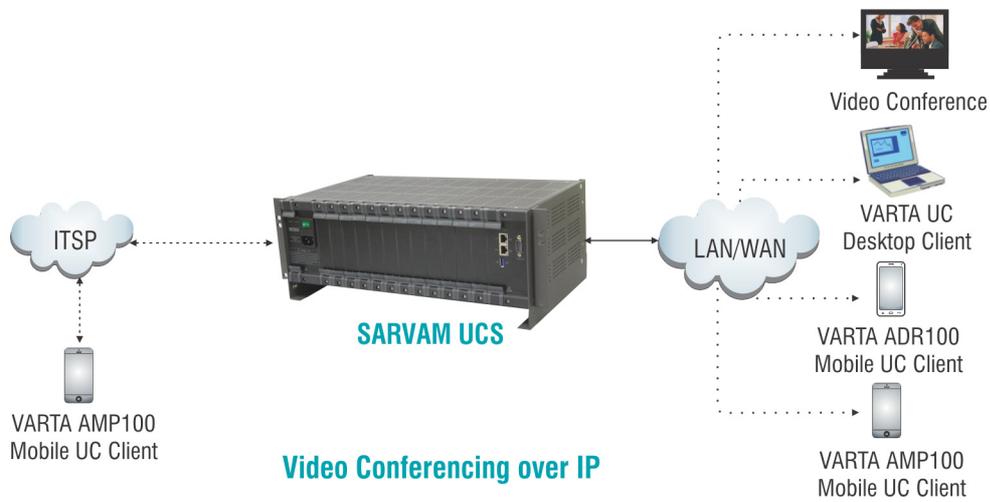

Connecting SARVAM UCS to the Private IP Network

Video Conferencing

Video Conferencing over ISDN BRI/PRI

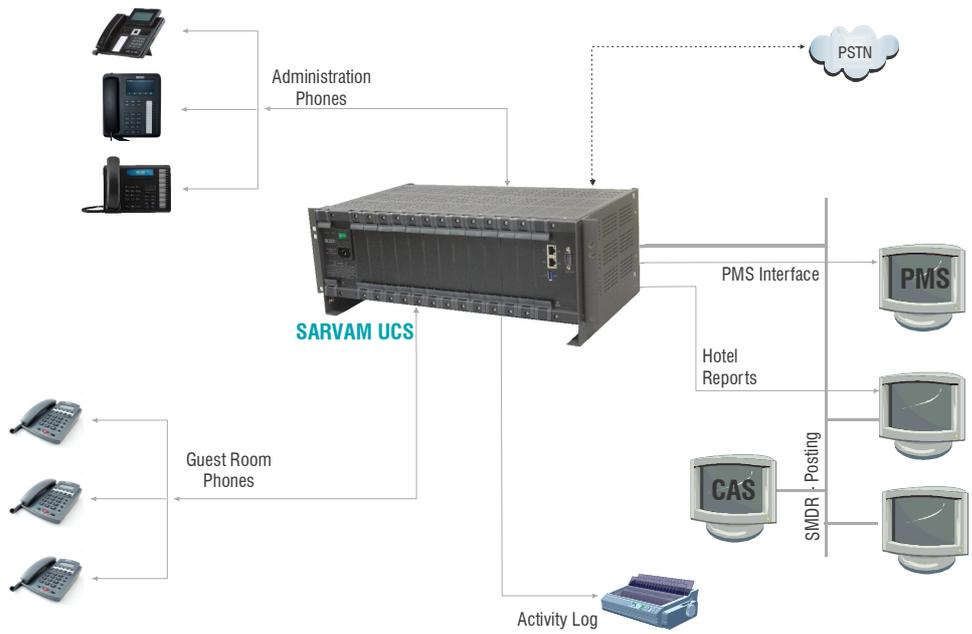

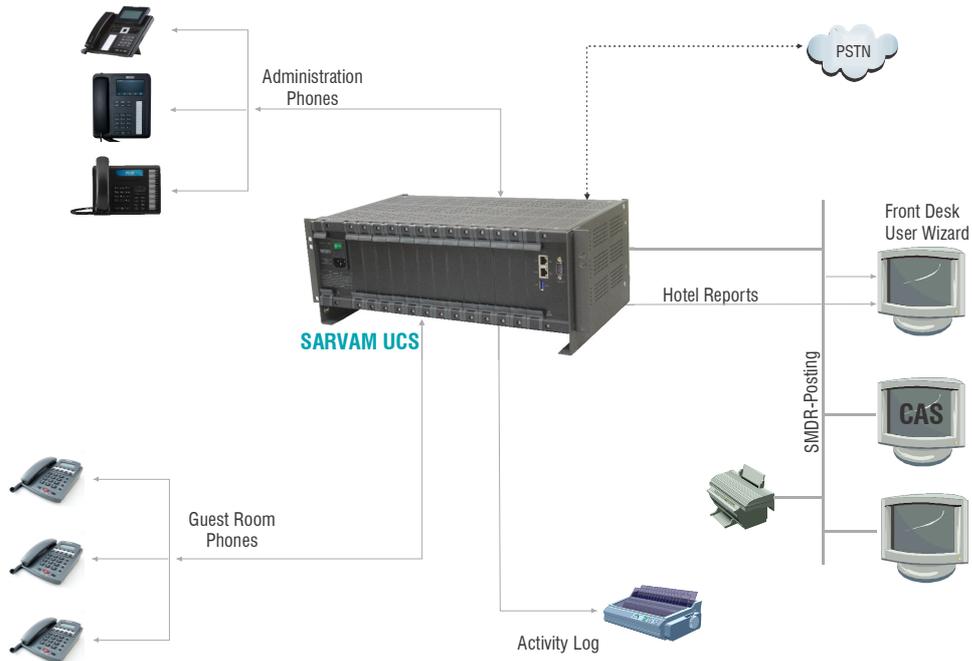

Video Conferencing over IP

Mobility

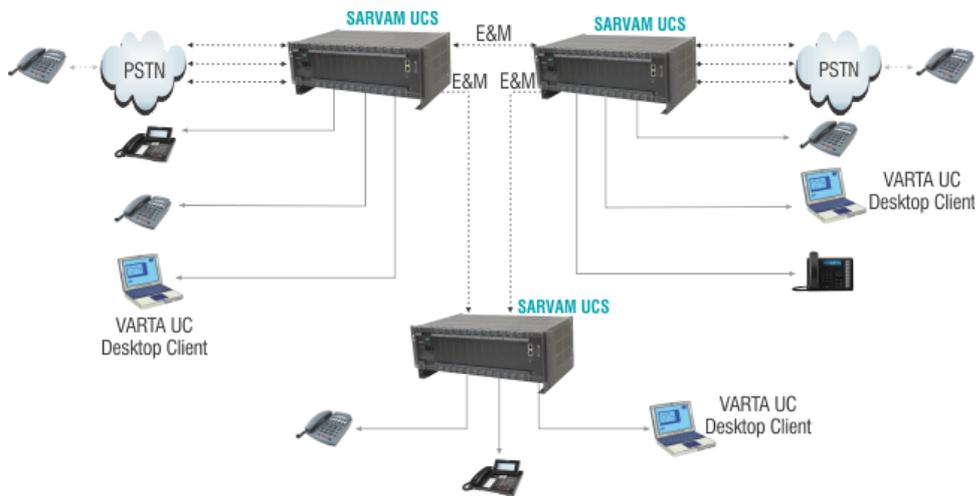

SARVAM UCS - MOBILITY

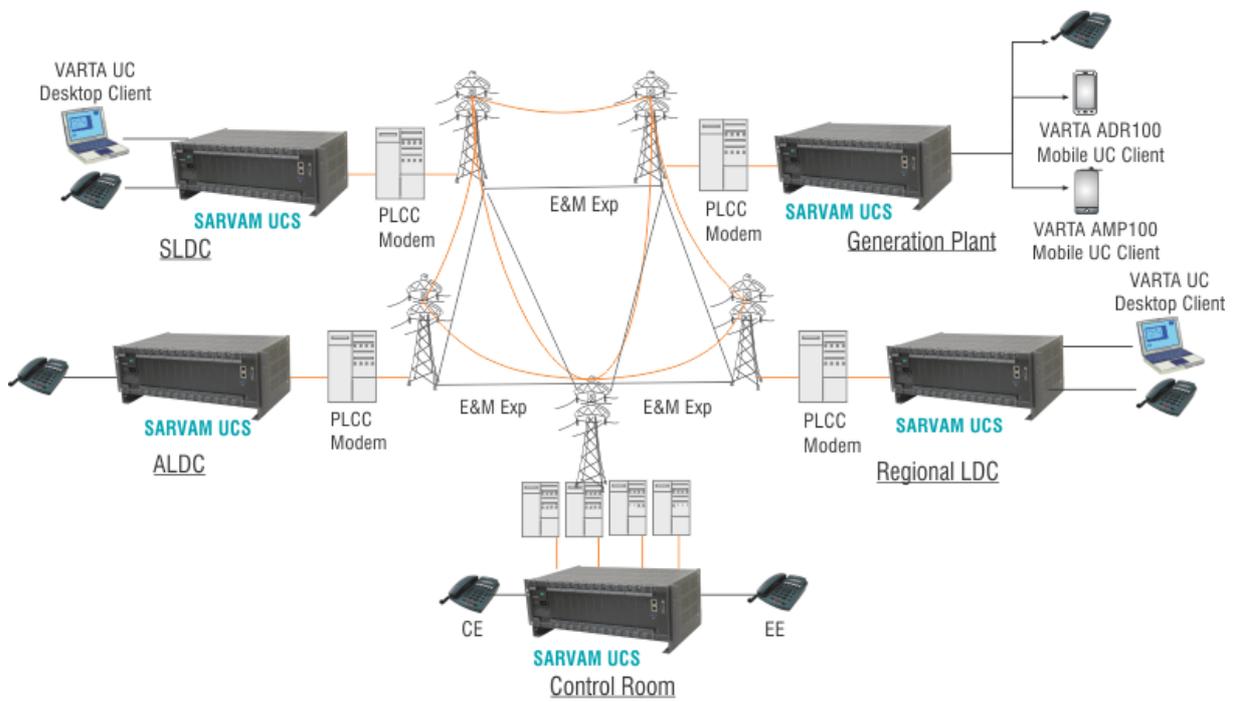

Hotel Application

Closed User Group Application

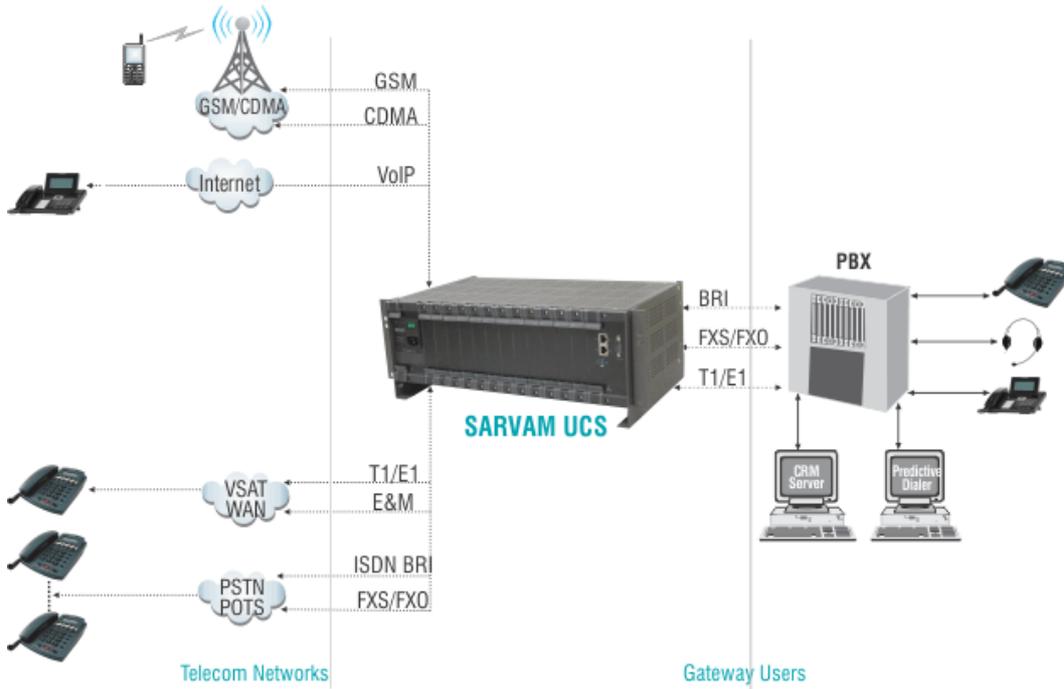

Power Line Carrier Communication Application

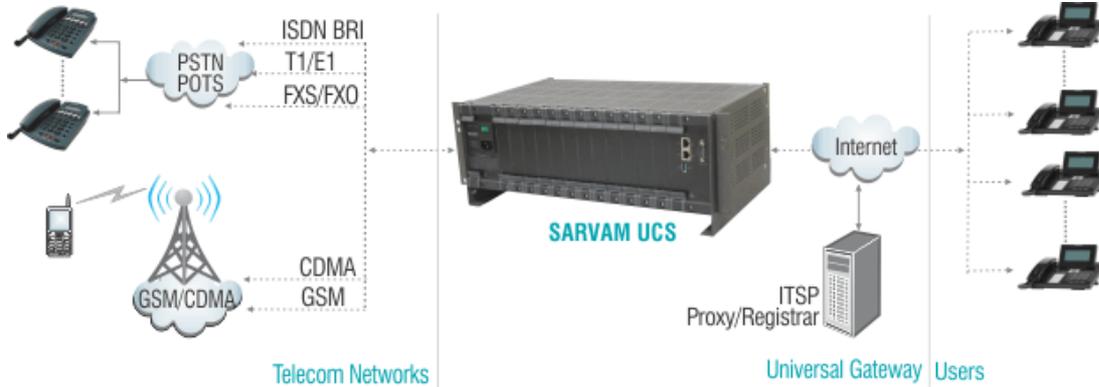

CE: Chief Engineer
 EE: Executive Engineer
 LDC: Load Despatch Centre

— E&M - Express Lines

Universal Gateway Application

SARVAM UCS - Universal Gateway for Call Centres

SARVAM UCS- Universal Gateway for ITSP

Hardware Overview

ETERNITY LENX

The Enclosure

The enclosure of ETERNITY LENX consists of fixed and universal slots. The fixed slots are occupied by specific cards - Power Supply Cards and CPU Cards - and cannot be changed, whereas in the universal slots, you can install any of the various card.

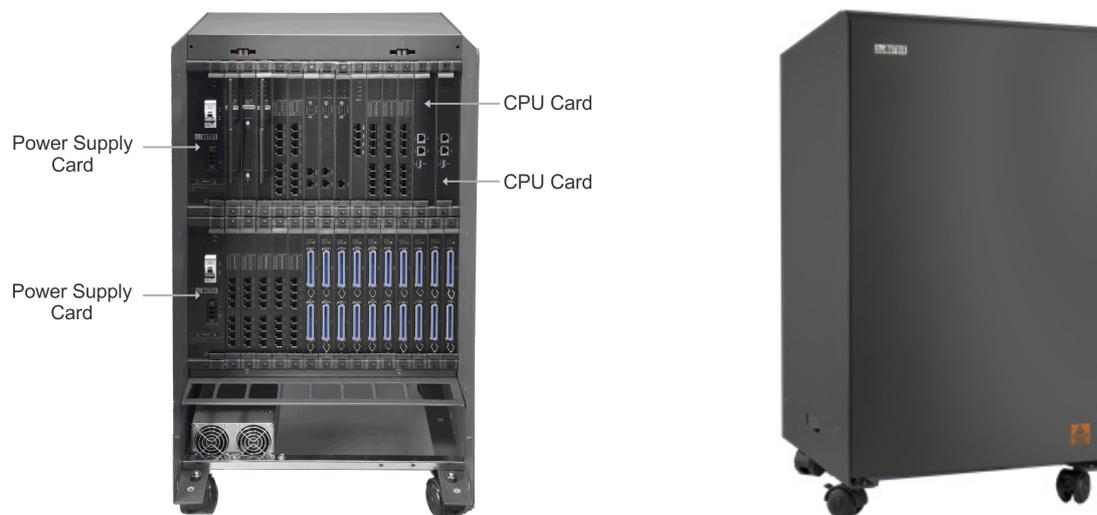

The slot connectors are located on the motherboard on the backplane of the enclosure. Each slot has guide rails for inserting the cards.

ETERNITY LENX has two racks and a total of 27 Universal slots. The first rack has a total of 15 slots. The first slot from the left is a fixed slot and the last two slots to the right are fixed slots and the remaining 12 are universal slots.

The second rack has a total of 16 slots. The first slot from the left is a fixed slot and the remaining 15 are universal slots.

ETERNITY LENX can be wall mounted, rack mounted or placed on a table. You can also affix wheels to the system; to move it like a trolley. After you have inserted the required cards, you must affix the front top cover.

Illustrated below are design of the enclosure and the position of the slots in ETERNITY LENX.

The Cards

ETERNITY LENX houses the following Cards:

1. CPU Card
2. Power Supply Card - PS48V
3. SLT Card
4. CO Card
5. CO+SLT Card
6. DKP Card
7. E&M Card
8. BRI Card

9. T1E1PRI Card
10. GSM/3G Card
11. Magneto Card
12. Radio Card
13. Data Card

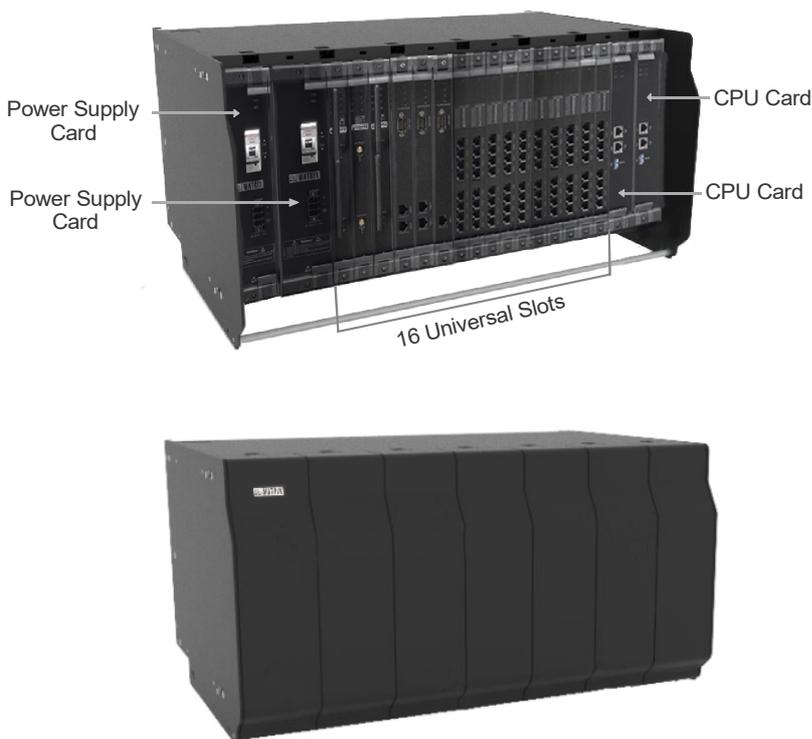

ETERNITY MENX

The Enclosure

The enclosure of ETERNITY MENX has fixed and universal slots. The fixed slots are occupied by specific Cards - Power Card and the CPU Card - and cannot be changed, whereas in the universal slots you can install various Slave Cards. ETERNITY MENX has 16 universal slots.

Inside the enclosure of ETERNITY MENX are slot connectors located on the motherboard on the backplane of the enclosure. Each slot has guide rails for inserting the Cards.

Illustrated below are the design of the enclosure and the slots positioning in ETERNITY MENX.

The Cards

ETERNITY MENX houses the following Cards:

1. CPU Card
2. Power Supply Card - PS48V/ PS UNI
3. SLT Card
4. CO Card
5. CO+SLT Card

6. DKP Card
7. E&M Card
8. BRI Card
9. T1E1PRI Card
10. GSM/3G/CDMA Card
11. Magneto Card
12. Radio Card
13. Data Card

ETERNITY GENX

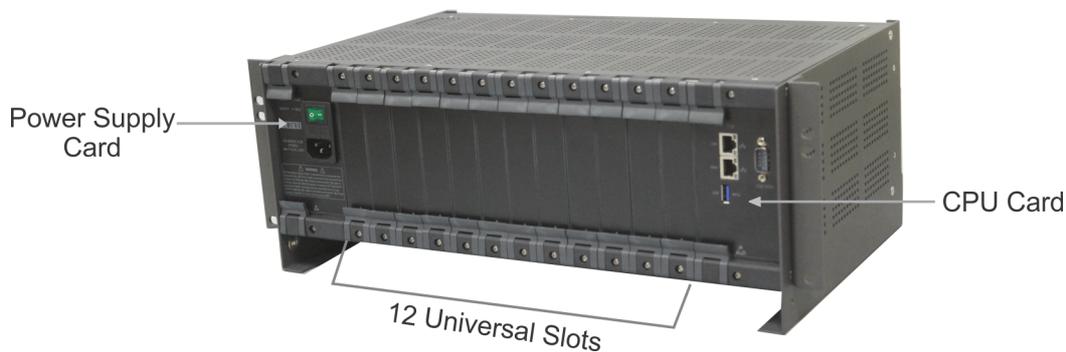

The Enclosure

The enclosure of ETERNITY GENX has fixed and universal slots. The fixed slots are occupied by specific Cards - Power Card and the CPU Card - and cannot be changed, whereas in the universal slots you can install various Slave Cards. ETERNITY GENX has 12 universal slots.

Inside the enclosure of ETERNITY GENX are slot connectors located on the motherboard on the backplane of the enclosure. Each slot has guide rails for inserting the Cards.

Illustrated below are the design of the enclosure and the slots positioning in ETERNITY GENX.

ETERNITY GENX

The first slot from the left is reserved for the Power Supply Card and the first slot from the right is reserved for the CPU Card.

The Cards

The ETERNITY GENX houses the following types of cards:

1. Power Supply Card - AC Input Card or DC Input Card
2. CPU Card
3. SLT Card
4. CO Card
5. DKP Card
6. CO+SLT(Combo) Card
7. DKP+SLT(Combo) Card
8. CO+DKP+SLT(Combo) Card
9. Intercom Line Card

10. E&M Card
11. E1FOPRI Single Card
12. BRI Card
13. T1E1PRI Single Card
14. Magneto Card
15. Radio Interface Card
16. GSM/3G/CDMA Card

For an at-a-glance view of the Cards available with ETERNITY GENX Platform when used with SARVAM UCS Application, refer "[Technical Specifications - SARVAM UCS](#)".

ETERNITY PENX

The Enclosure

The ETERNITY PENX has a different design. The enclosure of ETERNITY PENX consists of a top plate, which functions as the cover and can be removed.

The Power Supply unit and the CPU are in-built, and fixed on the bottom plane of the ETERNITY PENX.

The CPU card is fixed on the bottom plate of the enclosure, with the 2-row connectors for the card slots facing up. Illustrated in the following are the design of the enclosures and the position of the slots in each model of ETERNITY PENX.

ETERNITY PENX

The Power Supply unit and the CPU are in-built, and fixed on the bottom plane of the ETERNITY PENX.

Universal slots are located on the CPU. The connectors of the slots are located on the CPU.

Cards are mounted on the CPU, and secured on the three studs labeled as H1, H2, H3 on the CPU, with the screws are provided for this purpose.

The Cards

The ETERNITY PENX houses the following Cards:

1. CPU Card
2. SLT Card
3. DKP Card
4. CO Card
5. DKP+ SLT Card
6. CO + SLT Card

7. DKP + CO Card
8. DKP + CO + SLT Card
9. T1E1PRI Card
10. GSM4 Card

The Interfaces

The SARVAM UCS supports the following interfaces for connecting with different telecom networks, digital key phones, standard telephones and other external devices.

The VoIP Interface

The Voice-over-IP (VoIP) Interface connects SARVAM UCS with the internet or the private IP network. It enables the SARVAM UCS to handle incoming and outgoing calls over the IP network. It offers great flexibility and mobility to users for making or receiving calls across the world.

The VoIP Interface supports UC Clients, SIP Extensions and SIP Trunks.

With SIP Trunks users can make IP calls using the SIP Server of the Internet Telephony Service Providers (ITSPs).

Make sure the NX DBM VOCODER64 module is installed and the channel licenses — SARVAM VOCODER CHNL4 or SARVAM VOCODER CHNL16 — purchased as per your requirement.

The in-skin Registrar Server allows any SIP enabled device like a UC/SIP Soft Client or an IP-Phone to be registered with it and function as the 'SIP Extension' of SARVAM UCS. The SIP Extension users can make and receive calls to any extension user of the SARVAM UCS as well as any external numbers over VoIP, PSTN, GSM and other trunks. With SIP Extensions, organizations can communicate and stay connected at the lowest cost without any geographical restrictions.

The VoIP Interface supports adaptive jitter buffer for reducing delay and improving speech quality.

The key features of the VoIP Interface are:

- Up to 99⁶ SIP Trunks - for Proxy as well as Peer-to-Peer (non-Proxy) calls.
- Up to 999⁷ SIP Extensions.
- Upto 550⁸ simultaneous IP-to-IP calls (with Direct RTP/ RTP Relay).
- 64 simultaneous IP-to-IP call legs / IP-to-TDM calls (with Transcoding) for one NX DBM VOCODER64 module installed.
- 128 simultaneous IP-to-IP call legs/ IP-to-TDM calls (with Transcoding) for two NX DBM VOCODER64 modules installed.
- Selectable Network Assignment (Connection Type) - Static IP, DHCP, PPPoE.
- Selectable DNS - Automatic and Static.
- Dynamic DNS for SIP devices in public network.
- STUN.

6. *ETERNITY LENX/MENX also supports 99 SIP Trunks and ETERNITY PENX supports 50 SIP Trunks.*

7. *ETERNITY LENX/MENX supports 2000 SIP Extensions and ETERNITY PENX supports 100 SIP Extensions.*

8. *This is the total capacity supported by SARVAM UCS system. ETERNITY PENX supports 64 simultaneous IP-to-IP calls.*

- TCP and UDP NAT Keep Alive.
- VLAN
- Symmetric RTP Selection.
- MAC Address Cloning option.
- Fax over IP - T.38 (UDPTL), T.38 (RTP) and Pass Through.
- Send CLI Option for outgoing calls
- Selectable DTMF - RTP (RFC 2833), SIP Info, InBand
- Flash Detection using SIP INFO and RFC2833.
- Broad Voice Codec Selection: G.723, G.729 AB, GSM FR, iLBC - 30 ms, iLBC - 20 ms, G. 711 μ -Law, and G. 711 A-Law.
- Quality of Service - SIP DiffServe/ToS, RTP DiffServe/ToS
- VoIP Silence Detection and Disconnection.
- Voice Mail Subscription on SIP Extensions.
- Busy Lamp Field Subscription on SIP Extensions and SIP Trunks.
- Upto 10 Call Appearances on SIP Extensions.
- Registration of SIP Extensions from 3 different locations and Shared Call Appearance.
- Sharing the same SIP Extension number among a maximum of 3 different SIP devices using Share Call Appearance functionality.
- Programmable Loop Current

SIP Trunks

The ETERNITY GENX⁹ platform when used with SARVAM UCS application supports a maximum of 99 SIP Trunks, allowing you to subscribe to as many as 99 different Internet Telephony Service Providers (ITSP) or peer-to-peer connectivity with multiple end SIP devices.

Make sure the NX DBM VOCODER64 module is installed.

SIP Extensions

ETERNITY GENX platform when used with SARVAM UCS application supports 999¹⁰ SIP Extensions which can be registered with the in-skin SIP B2BUA of CPU Card.

9. ETERNITY LENX/MENX also supports 99 SIP Trunks and ETERNITY PENX supports 50 SIP Trunks.

10. ETERNITY LENX/MENX supports 2000 SIP Extensions and ETERNITY PENX supports 100 SIP Extensions.

Any SIP-enabled device like an IP-phone, a Softphone, analog phone adapter, can be registered with the CPU Card and function as the 'SIP Extension' of the ETERNITY GENX platform when used with SARVAM UCS application.

The SIP Extensions function in the same way as other extensions of the SARVAM UCS. SIP Extension users can make and receive calls from and to other extensions of System and external numbers over PSTN, GSM, VoIP and E&M lines¹¹. You can also connect the Standard and Extended IP Phones offered by Matrix as SIP Extensions.

Make sure the NX DBM VOCODER64 module is installed and the channel licenses — SARVAM VOCODER CHNL4 or SARVAM VOCODER CHNL16 — purchased as per your requirement.

A SIP Extension can be registered with SARVAM UCS from three different locations. This helps organizations overcome geographical distances and reduce call costs.

Five SIP Extensions are free, for additional extensions you require an IP Subscriber license. To know more about Licensing requirements and how to acquire and activate a license key, see the topic [“License Management”](#).

You can connect ETERNITY GENX platform when used with SARVAM UCS application to the IP network, which may be Public Internet or a LAN.

The ISDN PRI Interface

The ISDN PRI Interface enables SARVAM UCS to be connected to digital networks over T1¹² and E1¹³ carrier lines.

On T1 carrier lines, the Interface supports the following signaling types:

- PRI
- Robbed Bit Signaling (RBS)
- Q-Signaling (QSIG)
- E&M

On E1 carrier lines, SARVAM UCS supports the following signaling types:

- PRI
- Channel Associated Signaling (CAS)
- Q-Signaling (QSIG)
- E&M

The ISDN T1E1PRI Interface supports the following features:

- Terminal (TE) mode and Network (NT) Mode
- Voice Calling
- Video conferencing and data connectivity

11. Only if there are no restrictions on calls from VoIP to other Public Networks in your country. If the telecom regulations of your country prohibit call traffic between the public telephony networks and IP networks, you must configure Logical Partition in your system. To know more, see [“Logical Partition”](#).

12. T1 PRI (T-Carrier) offers 23 Bearer Channels and one Signaling Channel (23B+D). It is used in North America and Korea.

13. E1 PRI (E-Carrier) offers 30 Bearer Channels and two Signaling Channels (30B+D). It is used in all countries, except North America, Japan and Korea.

ISDN BRI¹⁴

The ISDN BRI Interface enables SARVAM UCS to be connected to ISDN BRI Lines and connect ISDN BRI compatible devices with the SARVAM UCS.

The ISDN BRI Interface has the following features:

- Signaling types - 2B+D Signaling
- Terminal (TE) mode
- Video conferencing and data connectivity

Depending on the requirement, each BRI Port can be configured in the TE/NT mode.

It is possible to feed power from the SARVAM UCS to the terminal equipment connected to the ETERNITY (on its BRI port configured as NT).

The Mobile Interface

The Mobile Interface enables the SARVAM UCS to be connected to 2G/3G/4G/CDMA¹⁵ network operators worldwide. For example, the Frequency Band supported by the GSM networks varies across countries. In some countries, the network operators may use 850MHz while network operators in some countries may use 1900MHz, in some countries network operators may use both frequency bands.

SARVAM USC's Mobile Interface supports full Quad-Band Operation (GSM850, 900, 1800, 1900MHz) for world-wide use, for Global, Inter and Intra country roaming.

The Mobile Interface supports the following features:

- CDMA, GSM 2G, GSM 3G, GSM 4G network support.
- Selectable GSM Frequency Bands - 900, 1800, 1900, 850 + 1900, 900+1800 MHz.
- Selectable CDMA Frequency Bands - 800MHz CDMA cellular; 1900MHz PCS.
- Programmable Network Selection for GSM - Manual and Automatic. For CDMA, only Automatic is applicable.
- Programmable Network Operator Codes in order of priority (from 1 to 9) in case of Manual Network Selection.
- Programmable Speech Tx Gain
- Programmable Speech Rx Gain
- Selectable Incoming Call Modes - Allow, Ignore, Reject.
- SIM Card protection with a Personal Identification Number (PIN)¹⁶.
- Single Rooftop (RT) antenna for 'High Gain'

If CDMA module is installed in your system, following features and facilities will not be applicable.

- Band Selection
- CLIR
- BCCH Selection
- Emergency Number

14. ETERNITY PENX does not support ISDN BRI Interface.

15. ETERNITY PENX does not support CDMA.

16. Not applicable for CDMA Mobile Card.

- Network Selection
- Preferred Network Mode
- RCOOC (Route Call to Original Caller)
- SIM PIN
- SIM Card Balance and Recharging
- SIM Recharge
- SMSC
- SMS Parameters
- SMS on No Reply
- SMS Server
- SMS Gateway

If CDMA module is installed in your system, DTMF Detection might not work properly.

The SARVAM UCS Mobile Interface does not offer GPRS features, Fax and Data services, and network supported services, except CLIR and USSD.

The CO Interface

The CO Interface enables the SARVAM UCS to be connected to the POTS Network. The POTS Networks across the world support various standards and differ in features. For example, some networks support Caller ID Presentation using DTMF signaling, while some support Caller ID Presentation using FSK signaling; some networks offer 600 Ohms Impedance, while others offer complex impedance.

SARVAM UCS's versatile architecture allows it to be connected to such networks differing in their characteristics. The CO Interface supports following features:

- Programmable AC Impedance - 600Ω, 900Ω and various complex impedances
- Answer Supervision/Polarity Reversal
- Selectable Disconnect Supervision - Polarity Reversal, Open Loop Disconnect
- Selectable Caller ID Presentation - DTMF, FSK
- Programmable Dialing method - Pulse/Tone (with programmable Pulse Ratio/DTMF On-Off period)
- Programmable Speech Tx Gain
- Programmable Speech Rx Gain
- Programmable Disconnect Tone Sensing
- Programmable Flash Timer

The Radio Port Interface¹⁷

The Radio Interface Card offers connectivity to the Radio transceiver devices/Combat-Net Radio devices. The Radio Interface Card (RIC) adds the two-way Radio functionality in SARVAM UCS, wherein the speech can be transmitted as well as received by the radio device.

Radio Transceiver or CNR radio devices interfaced with the Radio port can be operated on High Frequency (HF), Very High Frequency (VHF) or Ultra High Frequency (UHF).

Using the Radio Interface, the user can:

- Set the frequencies for receiving and sending audio messages.

¹⁷. *ETERNITY PENX does not support Radio Interface.*

- Playback the audio received over the air through the Speaker.
- Send the audio message over the air through the Microphone.
- Activate radio transmission over air using Push-to-Talk (PTT) button.

The Radio Transceivers remains in receiving (Rx) mode, so that the audio messages broadcasted over the air can be heard.

The E&M Interface¹⁸

The E&M Interface of the SARVAM UCS supports analog trunking to connect various communication equipment telephone switches, Routers, Leased Lines, etc.

Often, E&M connectivity is used to expand the system capacity (by connecting a second system with the main system) or to connect two or more remotely located Systems, forming a network of Systems.

The E&M Interface can be used for the following applications:

- Power Line Carrier Communication (PLCC) Networks, where several EPAXs are connected with each other through E&M tie lines. Refer [“PLCC-An Introduction”](#) to know more.
- Closed User Groups, where several System are connected with each other through E&M tie lines¹⁹.
- System expansion, where two System are connected with each other with E&M tie lines.
- Connecting remote Systems/Satellite equipment over E&M tie lines

Also, refer the topics [“E&M Connectivity”](#) and [“E&M Feature Template”](#) to know more.

The E&M Interface can be programmed to provide Trunk Interface, a Subscriber (Station) Interface or both, as a Tie Line with the dual personality of a Trunk and a Subscriber.

The E&M Interface of the SARVAM UCS has the following features:

- Programmable Orientation Type - trunk, station, tie-line.
- Selectable E&M Interface Types - IV and V.
- Selectable Speech Interface (Audio Interface)²⁰ - Two-wire and four-wire.
- Selectable E&M Trunk Seizure Type²¹ - Immediate, Immediate + Wink, Seizure Pulse, Seizure Pulse + Wink, Express, and Compander Control Signal.
- Selectable Address Signaling - Pulse dial (Pulse 10PPS, Pulse 20PPS) and Tone Dial (DTMF).

The Magneto Interface²²

Magneto Telephones²³ can be connected to the Magneto Interface of SARVAM UCS. Magneto telephones are widely used by the defense establishments as field phones in front lines, and by other establishments such as

18. ETERNITY PENX does not support E&M Interface.

19. The Systems in a Closed User Group can be connected over ISDN T1/E1 Lines as well. Refer the topic [“Closed User Group \(CUG\)”](#) to know more.

20. The number of wires used to transmit audio signals.

21. This is the line protocol that defines how the equipment seizes the E&M trunk. Also, referred to as Start Dial Supervision Signaling Protocol.

22. ETERNITY PENX does not support Magneto Interface.

railroad companies (signaling emergencies, crossings, etc.), electric utilities, pipeline companies, who need to have their networks at places that are too remote to be serviced by public telephone networks.

SARVAM UCS can land calls from magneto field telephones on the extensions (SLT, DKP, ISDN Terminal) of the SARVAM UCS and place calls from the extensions of the SARVAM UCS on magneto telephones.

To know more about how the Magneto Card works, refer the topic [“Configuring Magneto Interface”](#).

The Digital Key Phone Interface

The Digital Key Phone Interface of SARVAM UCS is for the purpose of connecting the proprietary Digital Key Phones of Matrix Comsec of the *EON* series, the proprietary Direct Station Selection (DSS) Consoles and the PC-based phone, *EONSOFT*, with SARVAM UCS.

The Digital Key Phone Interface has the following features:

- Programmable Call Capacity - up to 10 Call Appearances/Call Loops on a single DKP.
- Selectable Headset and Speaker (Hands-free) modes.
- Selectable Auto Answer mode.
- Programmable Headset Speech Tx and Rx Gains.
- Programmable Hands-free (Speaker) Speech Tx and Rx Gains.
- Programmable Key Click Volume levels.
- Programmable Key Maps for Operator, Executive, Hotel Attendant and Guests.
- 4-Level Adjustable Back light and Contrast Controls
- Selectable Ring Types.
- Ringer Volume Control.
- Programmable Ringer Modes - Ring Immediately, Ring if Idle, Ring after Delay, Ring Off.
- Ring On Speakerphone and Ring on Headset options.
- Language Support - English, French, German, Portuguese, Spanish.

The Single Line Telephone Interface

The Single Line Telephone (SLT) Interface allows any standard, two-wire, analog single line telephone instrument - rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification - to be connected to the SARVAM UCS as extension phone.

The SLT Interface has the following features:

- Selectable Caller ID Presentation - DTMF, FSK
- Programmable CLIP Digit Pad Count (0-9).
- Programmable Ring Type - Trapezoidal, Sinusoidal, Low Trapezoidal, Low Sinusoidal.
- Programmable AC Impedance - 600Ω , 900Ω , $350\Omega + (100\Omega \parallel 0.21\mu\text{F})$, $220\Omega + (820\Omega \parallel 120\text{nF})$, $270\Omega + (750\Omega \parallel 150\text{nF})$
- Selectable Answer Signaling.
- Selectable Disconnect Signaling - Polarity Reversal, Open Loop Disconnect.
- Programmable Speech Rx Gain.
- Programmable Speech Tx Gain.
- Programmable Flash Timer.
- Programmable Loop Current.

23. A magneto telephone is a local battery telephone set, in which signaling current is provided by a magneto hand generator. The hand generator, commonly referred to as 'crank', is located on the right hand side of the telephone set and is turned to produce energy to ring other phones or to signal the CO. The magneto, also called the generator, is used to convert the mechanical motion via the crank to produce sufficient energy to ring other phones or to signal the CO.

- Fax machine connectivity.

Voice Mail System (VMS)

The SARVAM UCS application supports a full-fledged, in-skin Voice Mail System module to provide mailbox facility to all its extensions users. The Voice Mail System also forms the basis of other features like Conversation Recording and Call Taping.

Each Mailbox has the capacity of storing 15,000 voice messages. The maximum size of each Mailbox is 60,000 minutes. By default, the size of each Mailbox is set to 5 minutes. The maximum Message Length for each Mailbox is 9,999 seconds. By default, the Maximum Message Length for each Mailbox is set to 15 seconds.

The VMS Module in the SARVAM UCS is an optional module. It must be purchased separately. The VMS in ETERNITY GENX/MENX/LENX/PENX is delivered as a module. The default factory fitted 8GB Pen Drive on the CPU Card contains the VMS configuration files, voice messages for prompts and greetings. The Pen Drive is also the storage device for mailbox messages.

If required, you may use a Pen Drive of upto 64GB by replacing the factory fitted pendrive with a new one. The key Voice Mail and Auto Attendant features supported by SARVAM UCS's Voice Mail System are:

- Programmable Mailbox Size.
- Programmable Message Length.
- Welcome Greetings according to the time of the day.
- Different voice greetings for different time zones.
- Special greetings for holidays.
- Five call transfer types: none, blind, wait for ring, wait for answer, and screened.
- Dial by extension.
- Dial by name.
- Personalized greetings for each mailbox.
- Individual mailbox size.
- Call forward to voice mail.
- Message forwarding.
- Distribution lists.
- Broadcast message.
- Message Wait Notification.
- Redirecting messages.
- Message Wait Notification via Email and Call.

SARVAM UCS's Voice Mail System also forms the basis of other features like:

- Conversation Recording
- Call Taping
- Voice-guided Wake-up Calls and Reminders
- Message Wait Notification
- Call Transfer to Mailbox
- Call Forward to Voice Mail
- Department Calls - Mailbox for Department Groups

The Data Port Interface²⁴

The Data Card supports four Ethernet 10/100mbps interfaces. Ethernet data coming to ports can be mapped to 2Mb streams. It can map data to 60 channels of E1 interface. The remaining channels of E1 can be used for voice applications. The Data Card has a 4-port Ethernet switch on board, which can aggregate multiple data streams to PCM streams of the system.

Computer

You can connect a standalone computer with the SARVAM UCS over the RS232 serial Communication Port/s²⁵ of the system.

You can also connect SARVAM UCS to a standalone computer or to a LAN Switch over the LAN/WAN Port of the SARVAM UCS.

PC connectivity is required to:

- access the web-based configuration interface JEEVES.
- set up and run software applications such as Property Management Software (PMS), Call Accounting Software (CAS) in the Hotel Application from Web JEEVES interface.
- to run the Front Desk User Wizard of the Hotel Application.
- capture and download Station Message Detail Records (SMDR): SMDR reports, SMDR Online and SMDR Posting.
- capture and download System Activity Log and System Fault Log, and Hotel Motel Activity Log in the Hotel Application.

24. *ETERNITY PENX does not support Data Port Interface.*

25. *ETERNITY GENX supports two Communication Ports — COM and USB to COM. ETERNITY MENX/LENX/PENX supports only one communication port —USB to COM. For details, see [“Communication Ports”](#).*

Before you begin the installation of the system, make sure that the required telecom wiring has been done.

The number of extensions you require and their location will determine the type of cabling you require on your premises.

We recommend that you plan the wiring and the installation of the system according to your current and expected future requirements.

Before you begin to install and set up the hardware of the system, make sure you have the following items:

- A Main Distribution Frame (MDF)
- A suitable location to install the Main Distribution Frame and the system.
- Cables for trunk lines and extensions.
- The Cards supported.
- One or more Single Line Telephone or Digital Key Phones for testing.
- Power supply.
- One or more active Two-wire trunk lines for test calls.
- A modem for the ISDN T1E1PRI line.
- An NT1 termination device for the ISDN BRI line.
- Appropriate cables and connectors to set up and test the Ethernet interface of the system and the LAN connection.
- A standalone PC or a PC connected in a LAN that can PING the system's IP Address.
- A SIM card to test mobile network connectivity.
- A SIP Account to test VoIP connectivity.

Well begun is half done; plan your hardware installation well.

The Main Distribution Frame (MDF)

The MDF connects outside telephone lines coming from the local exchange, on one side and the internal (System) lines on the other.

In simple form, the MDF is a special metallic frame designed and constructed with columns of receptacles to firmly hold the termination modules for the trunk and extension cables.

The cables or trunk lines to/from the Public Telephone Exchange terminate on the line side and cross connections (jumpers) run to the opposite (System) side of the MDF. From those terminals, a multi-core cable runs from a second set of terminals into the System.

A multi-core cable runs from the System into the MDF. From the distribution frame, the smaller cables run into each individual extension telephone outlet or socket (RJ11 or RJ45).

In a multi-storied building or on a widely spread out premises, it is common to have more than one distribution frame, called the Intermediate Distribution Frame (IDF) on each floor, to provide the connection between the MDF and the individual telephone wiring. IDFs function as wiring points to gather and distribute wiring. IDFs are used when a large number of extensions are to be connected and the wire runs extend over hundreds of feet; hence the distance is too great to economically terminate every extension individually to the MDF.

- Select a suitable MDF (and IDF, if required) with the standard lead-in cable termination KRONE modules.
- Ensure that the MDF complies with the local building telecom wiring Guidelines, Rules and Regulations.
- Select an appropriate site to install the MDF.

Location of the MDF

- The MDF is normally installed inside the building in a location and position which is free from the ingress of dust and moisture, and which is not subject to damp or humid conditions.
- This also applies to MDF installed outside the building. It must be protected from exposure to weather conditions, dust, dampness and humidity
- Do not install the MDF in any of the following locations:
 - In washing or toilet facilities, boiler/plant/machine rooms or any area subject to corrosive fumes and fluids;
 - In fire escape stairways;
 - Within a cupboard containing a fire hose reel;
 - Within any refrigeration room or sauna heater room;
 - Near any water feature or water body like fountains, sprinklers, a bath, shower or other fixed water container, a swimming pool, paddling pool, spa pool or tub; or any area where hosing down operations are carried out.
 - In a high voltage electrical switch room or near a heavy voltage transformer.
- The MDF should be robust and securely attached to a permanent building element such as a wall, floor or column. Do not mount the MDF on movable elements such as hinged panels or wheeled trolleys.
- Provide adequate lighting in the place where the MDF is located.
- Provide adequate space around the MDF where any person is required to pass to enable safe and convenient access to the MDF and ready escape from the vicinity under emergency conditions.
- Any room containing the MDF must not require the use of a tool, key, card, number pad or the like to exit the room. Ensure a quick hurdle-free exit from such a room.
- The MDF or the enclosure in which it is located should have the provision for securing with a key, lock or tool. External MDF should be adequately secured against vandalism and access by children or unauthorized persons.
- The MDF enclosure should be designed so as to prevent access to live parts by unqualified persons and should be free of exposed sharp edges.
- The MDF enclosure should be protected from insects and rodents.

Selecting the Installation Site for the system

The system maybe be mounted on a table or wall. Refer to the mechanical dimensions of the model you have, when selecting the site for installation, and deciding whether to mount the system on a table top, or on the wall, or on a rack.

Select an appropriate site to install the system taking into consideration the following recommendations and precautions:

- The site of installation should be well-ventilated, moisture and dust free, and not exposed to direct sunlight, heat, excessive cold or humidity.
- The site should be equidistant from all the extensions to simplify cabling network and reduce cabling costs.
- The system should be installed at a height of at least 3.5 feet from the ground. Installation at this height makes preventive or corrective maintenance tasks easy.
- The system should be installed away from any source of electromagnetic noise such as any radio equipment, heavy transformers, faulty electric chokes of tube-lights, any device having faulty coil, etc.

Read "[Protecting the System and Yourself](#)".

Selecting Cables

- Select standard good quality telephone cables with 0.5 mm conductor diameter for the internal as well as over-head cabling.
- Use twisted pair wires to reduce interference.
- Use separate cable conduits for electrical and telephone cables.
- The length of the cables must not be too long. They must have minimum number of joints. This will help you detect cable faults easily.
- Maintain cable records so that cables and cross-connections on the MDF can be correctly identified and connected. The records should be in a clear, legible and updatable format.

Selecting Extension Telephones

Select appropriate telephone instruments to be connected as extension phones. You may connect:

- any of the models of the proprietary Digital Key Phone (DKP) of the EON series.
- Any standard telephone instrument like rotary phone, Pulse/tone switchable push-button phone, Feature phone or Cordless phone. So, you can also use your existing telephone instruments.

You can connect DKPs with DSS of the EON series for Operator/Receptionist/ Front Desk/Senior management extensions.

Providing Power Supply Source

- ETERNITY LENX operates on 48VDC (+20% to -15%).
- The ETERNITY GENX/ MENX/PENX work with input voltages ranging between 100-240VAC or 48VDC (250W for GENX and 500W for MENX).
- Arrange for a separate power point and switch, close to the system.
- Power supply for the system must be separate from other heavy electrical loads like Air-conditioners, heaters, welding machines, electrical motors, etc.

Terminating Trunk and Extension Cables on the MDF

- Terminate the CO Trunk Line cables from the CO (public telephone exchange) and E&M cables into the 'Trunk Lines' side of the MDF using the punch tool for Krone modules.
- Terminate all the extension cables (connected to the wall sockets/outlets) into the 'Station Lines' side of the MDF using the punch tool for Krone modules.
- Label the trunk and extension line cables for easy identification and keep a record of the trunk and extension lines in an updatable format.

Where multiple wiring cabinets/distribution frames are used, label each frame and reference its number on the corresponding outlet.

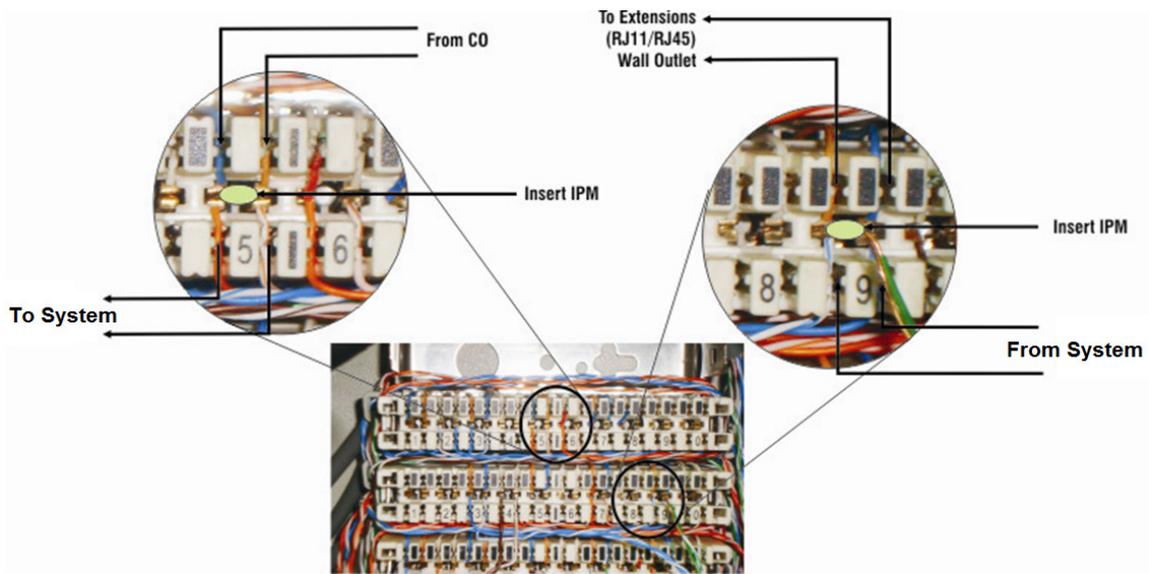

- Install Primary Protection modules with Gas Discharge Tubes (GDT) and fuses on entry points for all trunk lines. This is to protect the system from heavy voltages from trunk lines and overhead stations.

The product warranty does not cover damages resulting from lack of primary protection on trunk lines.

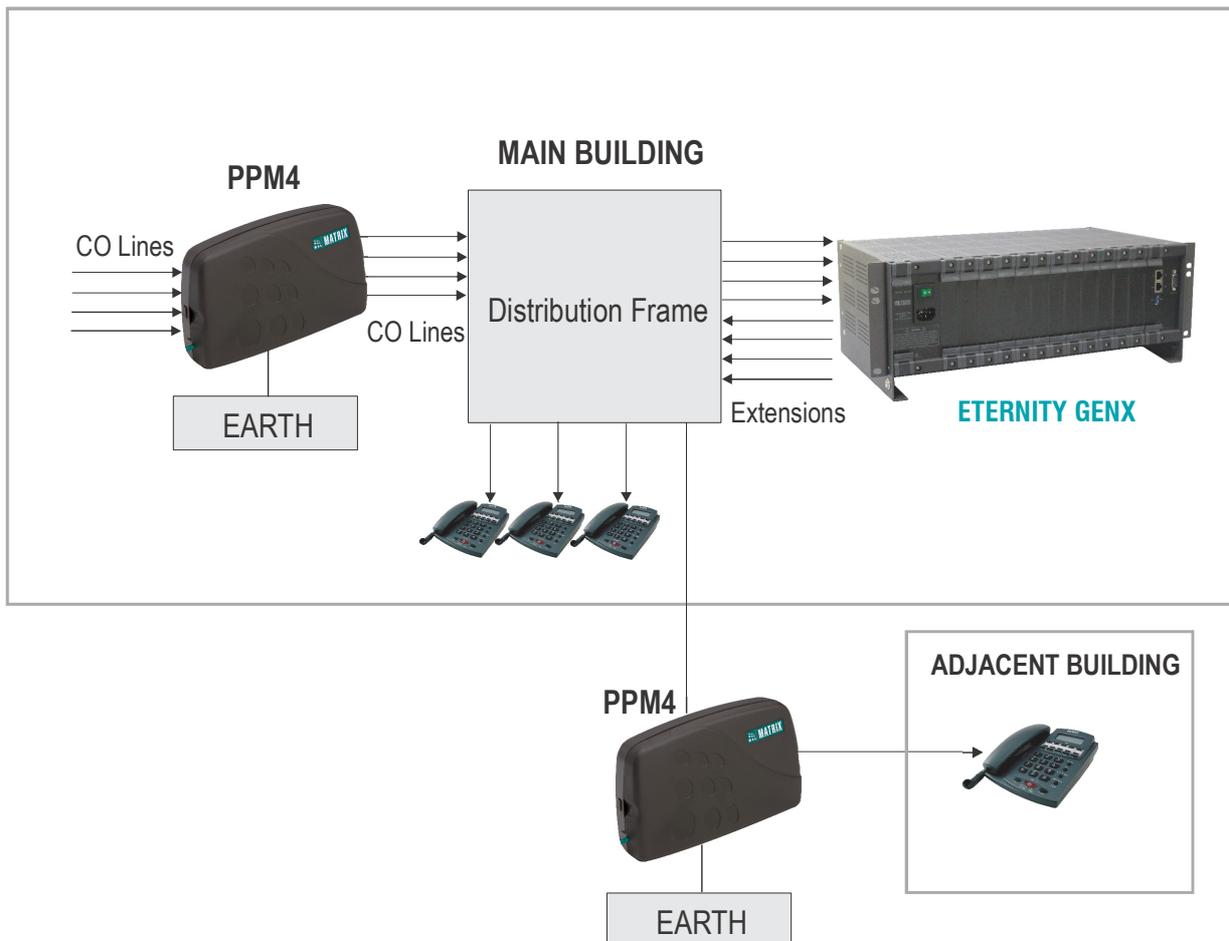

- It is recommended that you also install Primary Protection modules with GDT and fuses on all Extension lines, particularly off-premise extensions, and E&M ports.

For this, you are recommended to use the Primary Protection Module (PPM4) supplied by Matrix.

- A typical connection between a System and the MDF is illustrated in the figure below.

You are recommended to use the “[Primary Protection Module - PPM4](#)” supplied by Matrix.

Connecting Primary Protection Modules to Trunk and Overhead/Off-Premises Lines

It is necessary to protect the system from heavy voltages entering the system from the Trunk Lines and overhead stations.

The protection can be in the form of surge suppressor devices like Gas Discharge Tubes (GDT), MOVs, Fuses, etc.

Input Protection Modules (IPM)

Install IPM on the Krone Modules of the MDF. Input protection modules are for analog input channels to protect against over-voltages that may be applied between any two input connectors or between an input connector and the ground.

Primary Protection Module - PPM4

Matrix provides Primary Protection Modules (PPM) consisting of four PPM circuits. The PPM4 contains Gas Discharge Tubes and Fuses.

The Gas Discharge Tube is an over voltage protection device. It has three terminals. It is connected parallel to the CO Line or the overhead station cable. The third terminal is connected to a telecom earth. When the voltage between any of the two terminals exceeds the permissible limit (general 150V), the gas in the device begins to conduct and the terminals with the earth terminal. Heavy voltage passes to the earth instead of entering the system, thereby protecting the system.

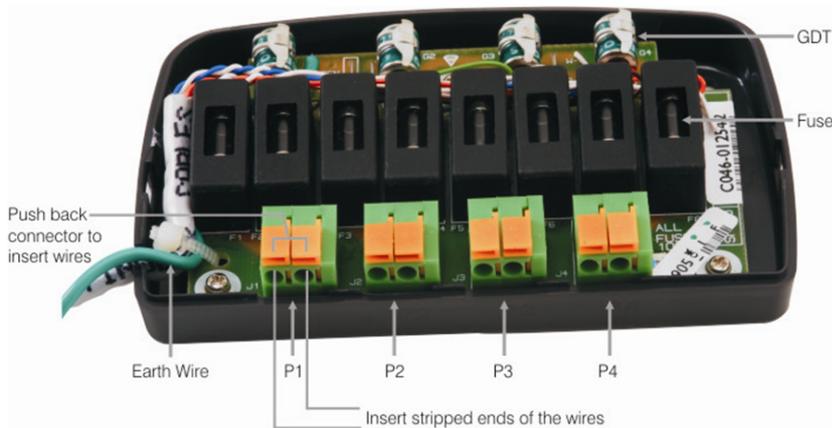

The Fuses in the PPM4 are an over current protection device. Whenever the current builds up beyond the permissible limit, (generally 100mA), the fuse opens to protect the circuit ahead.

PPM4 must be properly earthed to work well. It is recommended that PPM4 be connected to a separate telecom earth (ground).

Telecom earth is a dedicated earth (ground) only for the System. A dedicated earth greatly reduces the risk of back voltage.

Installing PPM4

Refer the block diagram above for the location of the PPM4.

1. Unpack the PPM and check the package contents.
2. Select an appropriate location for the PPM4. Refer the block diagram above when deciding where to place the PPM4. Also, take into consideration the length of the cables of the PPM4
3. Use the Mounting Template supplied with the PPM4 to drill holes on the wall to fix the PPM in the selected location. Fix the screws supplied with the PPM4 into the drilled holes, with their heads protruding from the wall.
4. You may mount the PPM4 first and connect the cables OR you may connect the cables first and then mount the PPM4.
5. To connect cables, press the snap fits on both sides of the PPM4 to release the cover. Remove the cover.
6. Connect the Earth wire (green wire) to the Telecom Earth.
7. Now connect the CO Trunk wires from the CO side into the PPM4 port connectors marked as P1, P2, P3 and P4.
8. To do so, strip off about half a centimeter of the insulation of the wire ends of the first pair of CO Trunk you want to connect to the PPM4.
9. Push back the (orange-color) levers of the connector of port P1, using a blunt pin or a small flat screw driver or your thumbnail.
10. Insert the stripped ends of the two wires into the two (green-color) openings of the connector, with one wire in each opening.
11. Release pressure on the levers. Both wires will be held in place by spring clamp action.

To remove the wires,

- push back the levers.
- pull out the wires gently.
- release pressure on the levers.

12. Now, repeat the above steps to connect the other CO Trunk wires from the CO side into the connectors of the ports P2, P3, and P4.
13. Now, terminate the wire pairs emerging from the PPM4 multi-pair cable into the 'Trunk Lines' side of the MDF using the punch tool for Krone Modules.

Refer the following table for connection details of the wires:

PPM4 Port	Color
P1	Blue and White
P2	Orange and White
P3	Green and White
P4	Brown and White

14. Replace the cover of the PPM4 by pressing back the snap fits on both sides.
15. Mount the PPM, if not done already.

Protecting the System and Yourself

The System is an electronic device. When you handle any electrical or electronic equipment, you are in a situation that could cause you bodily harm, besides damage to the product. When handling any electronic equipment, you must be aware of the safety hazards involved in electrical circuitry and the standard practices for accident prevention.

When using any telephone equipment, take every safety precaution to reduce the risk of fire, electric shock and injury to persons. Read and understand the precautions, dos and don'ts of handling this product listed below.

These instructions are by no means exhaustive. So, take all the necessary precautions for handling electronic and electrical appliances. Your safety and that of the others lies in your hands.

Location

- Do not place this product in any of the following locations:
 - Near a water source like a wash bowl, kitchen sink, laundry tub, near a swimming pool, or in a wet basement.
 - In places where dust, oil, corrosive fumes may come in contact with the system.
 - Any area where it is exposed to direct sunlight, heat, excessive cold or humidity.
 - On movable or unstable surfaces, which may cause the product to fall and get damaged.
 - Any area where shocks or vibration are frequent or strong.
 - Near High-Frequency generating devices such as Electric Welder, Sewing Machine or and Microwave Oven.
- Do not leave cables exposed on the ground where they may be trampled upon, or get damaged by entangling with feet or pressure from other heavy objects.

Power Supply

- This product should be operated with proper supply voltage. If you are not sure about supply voltage, contact authorized dealer.
- The System does not work in isolation from the environment. Power is fed to the system for functioning of the system. It has several interfaces like trunk lines and extensions, PC interface, etc. So there are chances of heavy voltages entering the system through these interfaces. Also, static charges could find their way through the system components.

Protect the system from heavy voltages from the mains

- The System is designed to work with input voltages ranging between 100-240VAC. The Power Card of System have a 'switch mode' design to support such a wide range of operating voltage.

Protect the system from heavy voltages on the trunk lines and the overhead stations

- The System may be damaged by heavy voltages entering the system from trunk lines or from overhead stations. These heavy voltages may enter the trunk lines and from overhead stations due to:
 - Heavy voltage line falling on the CO line or on the overhead stations cable. A dangerous surge can occur if a telephone line comes in contact with a power line.
 - Lightning/Thunderbolts.
- To protect System from these voltages, use Primary Protection/Surge Protectors on the trunk and long distance extension lines to protect the system from lightning and electrical surges.
- Install any standard Input Protection (punch down protection) on the Krone Modules of the MDF or the “Primary Protection Module - PPM4” supplied by Matrix at entry points for all CO trunks lines and all overhead stations. The product Warranty does not cover damages resulting from heavy voltage on CO lines and overhead stations!
- It is recommended that you install the PPM on the MDF, as MDF cables from the CO are terminated on the System MDF.

Protect the system from Lightning

- To protect System from extremely high voltage currents associated with lightning strikes, install a lightning protector on an outside (CO) line.

Protect the system from static charges

- Every person carries some static charge in his/her body depending upon body composition and the environment around them. Most of the times, this charge finds its way to the earth when the person touches any object which is grounded, or when the person is barefoot.
- Generally, persons installing or handling electronic and electrical equipment take precaution to wear appropriate footwear to get protection from electric shocks. Doing so, the static charge accumulates in his/her body and does not find its way to the ground. But when such a person touches any of the electronic cards, the static charge finds its way through the electronic components thereby causing damage to the cards.
- So, the person installing or servicing the system must provide a path to the static charges, by wearing an antistatic belt, which is properly earthed.

Protect the system from heavy voltage on the communication cable

- The Communication Port (COM Port) is provided on the System for connecting a PC.
- If an electrical wire carrying heavy voltage accidentally shorts with this cable, heavy voltages can damage the communication port.
- It is recommended that the communication cable (connecting System and the PC) be run through the conduit carrying telephone cables or through a separate conduit.

Telecom Earth (Ground)

- The Earth (Ground) is the most important safety procedure to prevent electrical shocks and fires. It protects from lightning strikes, electrical transients, static discharges, electromagnetic interference and electrical hazards.
- Ensure that a proper electrical earth and a telecom earth are in place for the safety of people and the system. Telecom earth is a dedicated earth for the System/any other telecom equipment.
- Provide a separate Telecom Earth (Ground) to the system installation. Providing a separate earth to the telecom equipment eliminates the possibility of any back-voltage on the earth.
- Refer ["How to Make the Telecom Earth"](#) for instructions on making the perfect earth (ground).

Shock and Fire Hazard

- Always wear a properly earthed, electrostatic discharge preventive wrist strap/belt while handling the system and its cards to prevent damage to the system and harm to yourself.
- Do not open the system in power On condition.
- Slots and openings in the cabinet and the back or bottom are provided for ventilation, to protect the system from overheating. These openings must not be blocked or covered.
- Never insert or push objects of any kind into this product through the cabinet slots as they may touch dangerous voltage points or short out parts which may result in fire or electric shock.
- Do not allow anything to rest on the power cord. Do not locate this product where the cord will be trampled upon or get entangled.
- This product is equipped with a plug having a third (ground) pin, which fits only into a grounding-type outlet. This is a safety feature. So, if the existing outlet is not a three-pin and or if you are unable to insert the plug into the outlet, have the outlet replaced by the electrician.
- Do not overload wall outlets and extension cords as this can result in the risk of fire or electric shock.
- Do not disassemble this product. Opening or removing covers may expose you to dangerous voltages or other risks. Incorrect reassembly may cause electric shock when the appliance is used. Take the product to a qualified technician when service or repair work is required.
- Avoid using a telephone (other than a cordless type) during a storm, to prevent electric shock from lightning.
- Do not use the telephone to report a gas leak in the vicinity of the leak so as to prevent the risk of fire.

External Devices

- When you connect external devices like headset, sensors, paging devices, telephone instruments, cables, connectors, etc., ensure that they are of standard make and good quality, so that the functioning of the system is not affected.
- Matrix does not guarantee the performance of external devices that are not supplied by it.

Cleaning and maintenance

- Unplug this product from the wall outlet before cleaning.
- Do not use liquid cleaners or aerosol cleaners. Never spill liquid of any kind on the product.
- Use a dry cloth for cleaning.

Service and Repair

- Unplug this product from the wall outlet and refer servicing to a qualified service person under the following conditions:
 - When the power supply cord or plug is damaged or frayed.
 - If liquid has been spilled into the product.
 - If the product has been exposed to rain or water.
 - If the product has been dropped or the cabinet has been damaged.
 - If the product exhibits a distinct change in performance.

Battery

System contains a 3VDC/15mAh Manganese Lithium Coin Battery (ML 1220 - Rechargeable) of diameter 12.5mm and height 2.0mm. The Battery is located on the CPU Card. The Battery should be replaced only by authorized dealers of Matrix. End Users must not attempt to replace it.

Caution: *There is risk of explosion if the Battery is replaced in an incorrect manner. Please dispose-off used Batteries.*

Disposal

- This product must be disposed according to the national laws and regulations prevailing in the country where it is installed.

Warning for RF Safety

The product complies with RF exposure guidelines as per standard FCC 47 CFR part 2. However, please observe the following precautions.

- Make sure that the RF Antenna is installed at least 20 cm away from other electronic and radio transmission devices.
- Make sure that the RF Antenna is installed at a place at 20 cm away from people's vicinity.
- Do not place magnetic storage media near the product.
- People carrying medical implants like cardiac pacemakers are advised to maintain appropriate distance from the system. They are also advised to avoid being in the vicinity of the product for a long time.

- *The Matrix ETERNITY LENX is to be installed by persons trained and experienced in telecom wiring.*
- *The person installing the ETERNITY LENX must be familiar with trunks, physical wiring of the MDF on both the exchange (System) side and the line side (CO).*
- *When installing any equipment, make sure that you take all the necessary precautions for handling electronic and electrical appliances. Follow proper procedures for static electricity, while handling the system and its cards to prevent damage to the system and harm to yourself.*
- *Use a grounding mat and wear an anti-static strap/belt. Read the do's and don'ts listed in [“Protecting the System and Yourself”](#).*
- *If you have complied with the requirements and instructions described in [“Before You Start”](#), you may now begin the installation of your ETERNITY LENX.*

Firmware Version V1R2 and earlier

ETERNITY LENX can be wall mounted, rack mounted or placed on a table. You can also affix wheels to the system; to move it like a trolley.

ETERNITY LENX has two racks and a total of 27 Universal slots. The first rack has a total of 15 slots. The first slot from the left is a fixed slot and the last two slots to the right are fixed slots and the remaining 12 are universal slots.

The second rack has a total of 16 slots. The first slot from the left is a fixed slot and the remaining 15 are universal slots.

The Matrix ETERNITY LENX is shipped factory fitted with the Power Supply Card, the CPU Card in their respective fixed slots (refer the section [“Know Your SARVAM UCS”](#)). VoIP and VMS are in-skin to the CPU Card. Hence, separate VMS and VoIP Cards are not required.

The Slave Cards - BRI, T1E1PRI, GSM, DKP, CO, SLT, E&M, Radio, Data, Magneto, E1FO - are shipped separately as per the order placed by individual customers. These Cards are installed in any of the Universal slots.

ETERNITY LENX supports ETERNITY LE PS48VDC card, ETERNITY MENX-LENX CPU card, ETERNITY LE SLT48 card, ETERNITY LE ILC48 card and all other cards of ETERNITY ME (except ETERNITY ME Power Supply card.)

If you upgrade the system firmware to V1R3 and later, the Expansion Slots license will be applicable for the universal slots. No universal slots will be functional by default. You must purchase the SARVAM EXP4 ENT license to activate the universal slots as required.

For details, see [“Expansion Slots”](#) under [“License Management”](#).

Firmware Version V1R3 and Later

ETERNITY LENX can be wall mounted, rack mounted or placed on a table. You can also affix wheels to the system; to move it like a trolley.

ETERNITY LENX has two racks and a total of 27 Universal slots. The first rack has a total of 15 slots. The first slot from the left is a fixed slot and the last two slots to the right are fixed slots and the remaining 12 are universal slots.

The second rack has a total of 16 slots. The first slot from the left is a fixed slot and the remaining 15 are universal slots.

If you have upgraded the system firmware to V1R3 and later in the old ETERNITY LENX system, the Expansion Slots license will be applicable for the universal slots. No universal slots will be functional by default. You must purchase the SARVAM EXP4 ENT license to activate the universal slots as required.

If you have purchased the new ETERNITY LENX system with the firmware V1R3 and later, the Expansion Slots license will be applicable for the universal slots. The first eight universal slots after the power supply card in the first rack will be functional by default. If you require more functional universal slots, you must purchase the SARVAM EXP4 ENT license.

Each SARVAM EXP4 ENT license will provide the activation for next four universal slots in sequence.

For details, see [“Expansion Slots”](#) under [“License Management”](#).

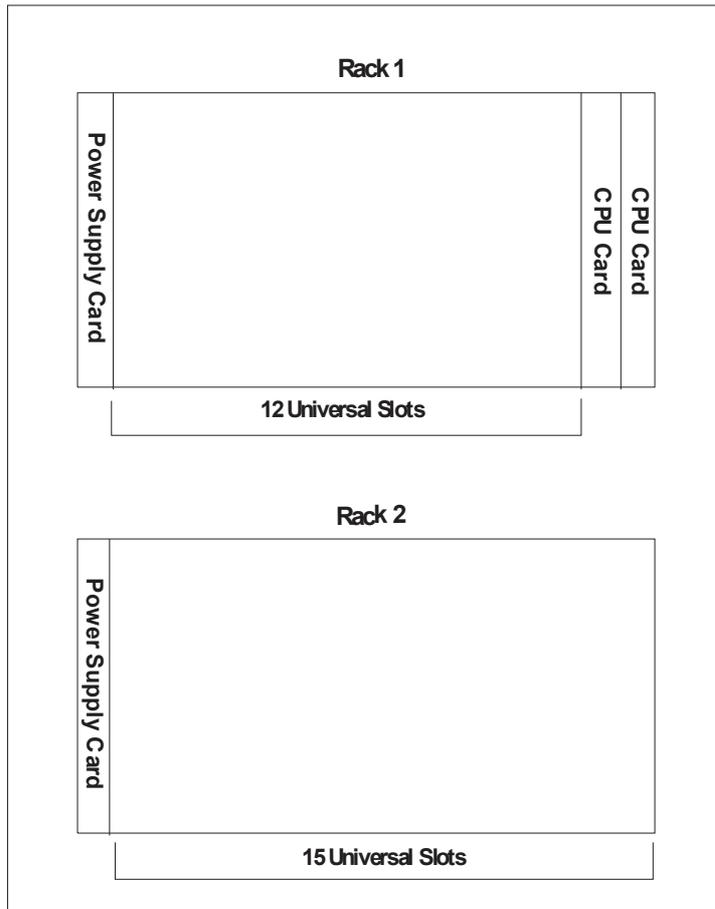

The Matrix ETERNITY LENX is shipped factory fitted with the Power Supply Card, the CPU Card in their respective fixed slots (refer the section [“Know Your SARVAM UCS”](#)). VoIP and VMS are in-skin to the CPU Card. Hence, separate VMS and VoIP Cards are not required.

The Slave Cards - BRI, T1E1PRI, GSM, DKP, CO, SLT, E&M, Radio, Data, Magneto, E1FO - are shipped separately as per the order placed by individual customers. These Cards are installed in any of the Universal slots.

ETERNITY LENX supports ETERNITY LE PS48VDC card, ETERNITY MENX-LENX CPU card, ETERNITY LE SLT48 card, ETERNITY LE ILC48 card and all other cards of ETERNITY ME (except ETERNITY ME Power Supply card.)

Illustrated below is the position of the fixed and universal slots in ETERNITY LENX.

ETERNITY LENX

The extreme left slot of each rack is reserved for the Power Supply Cards and the two extreme right slots of the first rack are reserved for the CPU Cards.

Follow the installation instructions for Cards described here also when you expand the system (add more Cards) or remove or swap Cards for maintenance and repair.

1. Unpack the box. Check the package contents (see [“Packing List”](#)). Contact your Dealer/Distributor if any of the items is missing, faulty or damaged. Do not discard the packaging material.

Mounting the System

2. Decide where to mount the ETERNITY LENX - on a table or wall - taking into consideration the mechanical dimensions and the weight. If mounting the system on a wall, you may refer the mechanical dimensions and the Mounting Template for drilling holes at appropriate places on the wall. Make sure the system orientation is horizontal.
3. When installing the system in a rack, allow adequate space between the system and other units for air circulation. Make sure the system orientation is horizontal.
4. Mount the system at the selected site. Make sure that the system is placed such that you have full access to the front and back panels. The holes in the panels are provided for ventilation; Make sure that these are not blocked, to prevent overheating.

Connecting Input Power Supply

5. Ensure that a proper electrical earth and telecom earth are in place.
6. Check the voltage at the power point from where the supply is to be given to the system. It should be as per the specifications. Earth the system properly. (Refer [“How to Make the Telecom Earth”](#)).

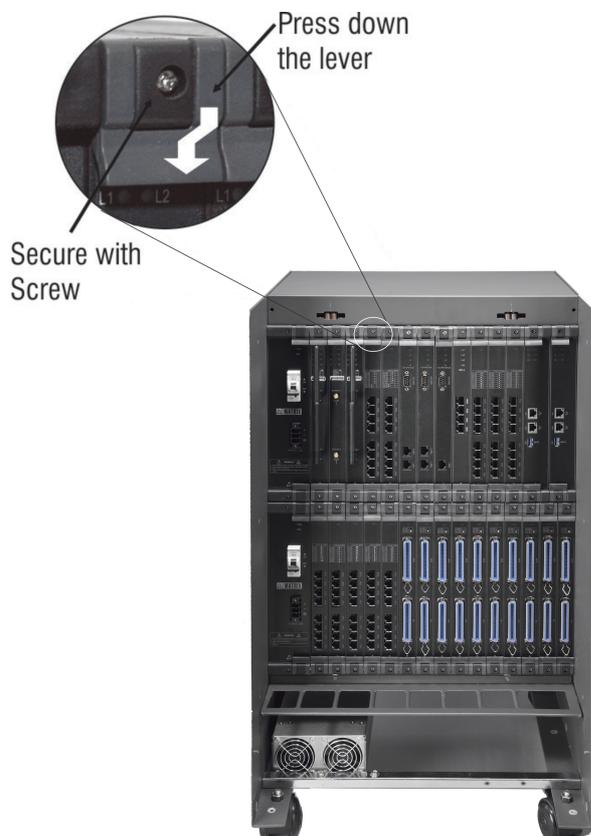

Inserting Cards

7. Make sure that the ETERNITY LENX power is off and the power cord is unplugged.
8. Select a free slot from the universal slots.
9. Unscrew and remove the filler bracket that covers the card-slot opening of the slot you intend to use.
10. Hold the card with the connectors facing you. Do not grab the card from both ends.
11. Slide the card into the slot, along the guide rails provided for each slot at the top and bottom planes.
12. Ensure that the cards are inserted deep enough for all the connector pins on the cards make complete contact with those of the motherboard on the backplane.

Do not force the card into the slot. Doing so can damage the card or the slot connector.

13. When the card is firmly seated in the connector, push down the levers on the card mounting bracket and secure the card with the screw provided.

14. Tighten the screws on either side of the bracket.

15. Following the above steps, install each card into the universal slots.

Detailed installing instructions are provided for each card - DKP, SLT, CO, ISDN BRI, ISDN T1E1PRI, GSM, E&M, E1FO, Magneto, Radio - later in this section. Refer to them when installing each card type.

16. To remove a card:

- Switch off power supply, unplug the power cord.
- Disconnect any cables connected to the card.
- Remove the screws from the card-mounting bracket.
- Lift the levers on the mounting bracket to release the card.
- The card will emerge out of the slot.
- Grasp the card by its mounting bracket, and ease it out of its slot.

- *If you are removing the card permanently or for a certain period of time, install a filler bracket over the empty card opening in the chassis.*
- *Installing filler brackets over empty card-slot openings is necessary to protect the system from dust, dirt, insects and damage.*

17. Using the cables supplied with each card, and terminate the cables in the Main Distribution Frame (SLT, DKP, CO, and E&M lines), the NT1 device (ISDN BRI lines), ISDN Modem (ISDN PRI Lines), as applicable.

Lead the cables neatly and tangle-free into the MDF.

18. After you have completed inserting and connecting the cards, power ON the system and observe the Reset cycle and the LED pattern of each card, where applicable.

The Power Supply Card

Matrix ETERNITY LENX supports PS48V Card with 48VDC (+20% to -15%) as Input DC Power Supply Voltage. A Float cum Boost Charger (FCBC) or 48VDC power supply is required to feed 48VDC power (Emerson Power Supply supplied by Matrix or any other) to the card. The FCBC works on input AC mains. This card is available in DC to DC 1000W power.

The card has two LEDs, a power ON/OFF Switch, protection MCB and a 3-way termination block for connecting the power cord. The PS48V Card provide DC output voltages as: +3.5V, +5.0V, -27V and -85V. These are indicated by LEDs.

The ETERNITY provides Redundancy and Hot Swap option for the Power Supply card.

The ETERNITY LENX supports two PS48V power supply cards. Whenever there is a fault in one, the other takes over the control, providing uninterrupted communication.

Installing the Power Supply Card

The Power Supply Card is located in a fixed slot. No other card can be inserted in this slot.

The Power Supply Card is delivered factory fitted, when you buy the system. However, if you want to remove the card for the purpose of maintenance or replace it with a new one, please follow the instructions below:

1. Unpack the Power Supply Card and verify the package contents.

If already installed, switch OFF power supply, unplug the power cord. Remove the screws securing the card. Lift the levers on the mounting bracket to release the card. As the card emerges from the slot, ease it out of the slot.

2. Insert the Power Supply card into the guide rails into the slot designated for the Power Supply Card. Make sure that the card is inserted deep enough to make perfect contact with the connectors on the motherboard at the backplane.
3. Now, press down the levers on the card mounting bracket to secure the card in its slot.
4. Secure the card in the slot by screwing the bracket on both ends.
5. If installing the **PS48V card**, connect the Float cum Boost Charger (FCBC) or Emerson PS or any 48VDC power source. Terminate the power cord from the FCBC output or the Emerson PS into the 3-way termination block (female connector) on the PS48V card.

Polarity is critical. Ensure that the wires are connected with the correct polarity. Follow the standard color codes used by FCBC manufacturers:

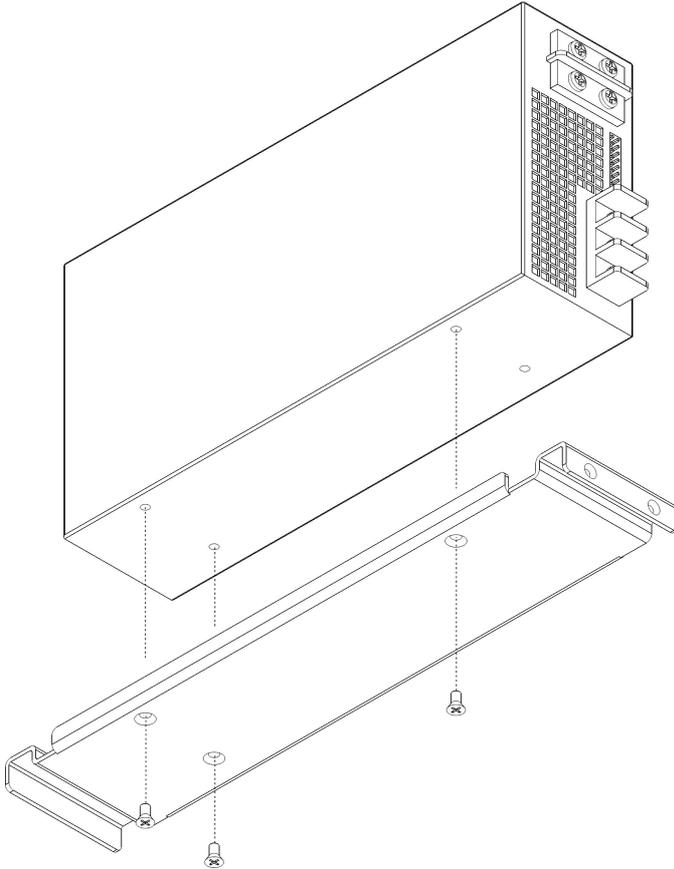

Color	Signal
Red	+48VDC
Black	GND
Yellow-Green	Earth

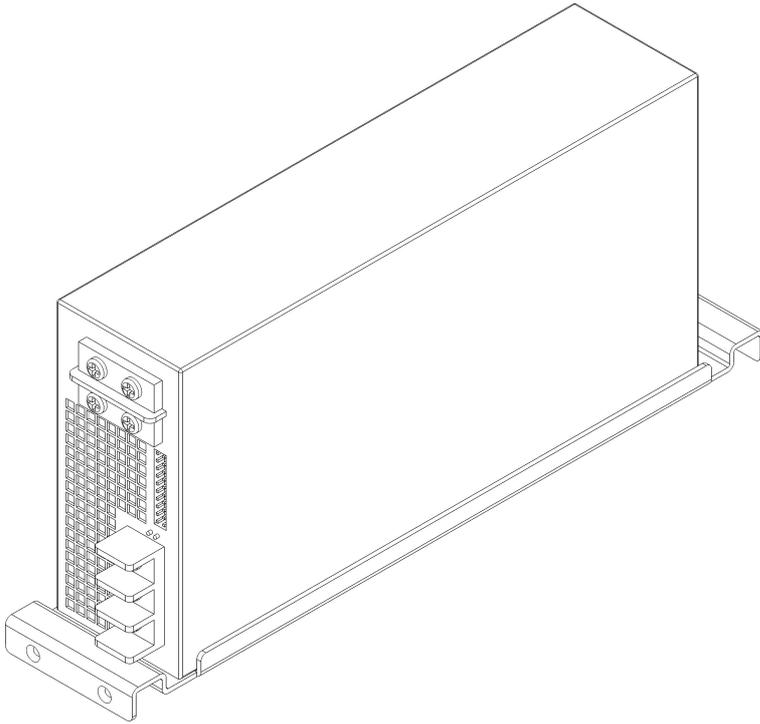

If connecting the Emerson PS, refer [“Connecting an Emerson Power Supply to the ETERNITY LENX”](#).

It is recommended that you measure the voltage before connecting the power cable to the power supply card. Ensure that the earth is connected.

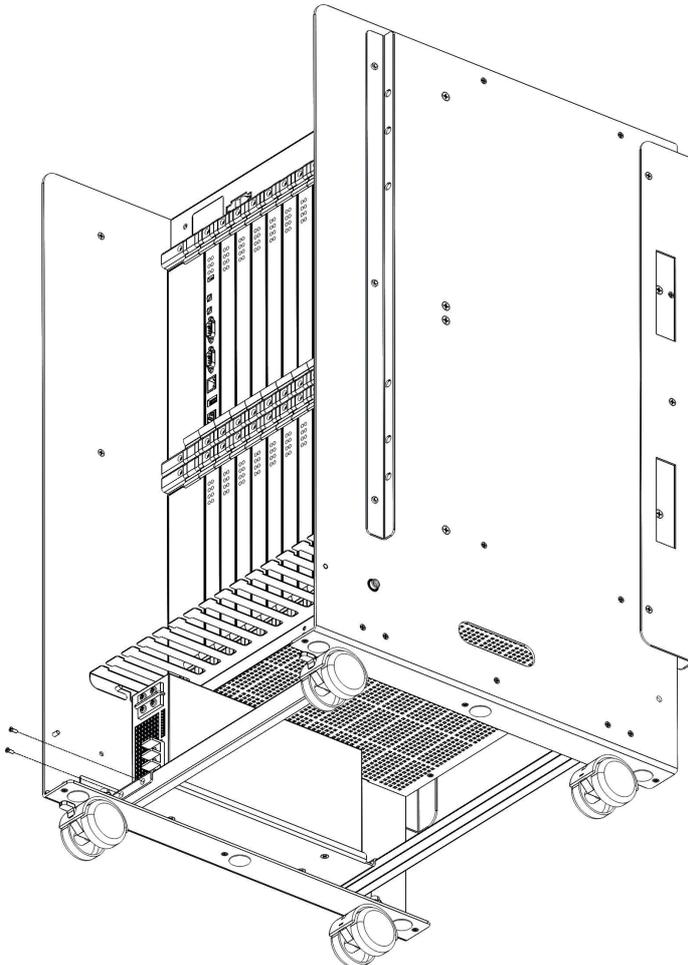

Connecting an Emerson Power Supply to the ETERNITY LENX

- Unpack the Emerson PS and the Emerson PS Tray. Check the package contents. Refer [“ETERNITY LENX”](#).
- Affix the Emerson PS unit onto the Emerson PS tray supplied by Matrix with the help of three screws.

- Now insert the tray into the last slot of the system rack and affix the tray onto the rack with the help of screws.

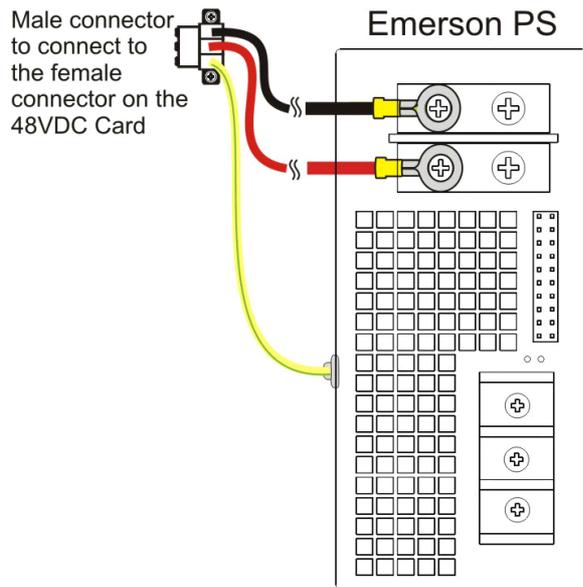

- The Emerson PS has an Input Terminal and an Output Terminal. The Input Terminal is used to connect the Emerson PC to the Mains Power Supply. The Output Terminal is used to connect the Emerson PS to the 48VDC Power Supply Card.
- The Input Terminal has three screws. Unfasten and remove the screws. Use the Power cable (not supplied by Matrix) to connect the Emerson PS to the Mains. The cable has three wires — Red, Black and Yellow-Green. At one end of the cable a plug is connected and the wires are free on the other end. A lug is affixed to each wire.
- Insert the lugs onto the screws as per the color codes mentioned below and fix the screws back.

Color	Label on the Emerson PS
Red	L (Line)
Black	N (Neutral)
Yellow-Green	 (Earth)

- Insert the Plug into the Main power source.
- The Output Terminal has four screws — two to carry V+ signaling and two to carry V- signaling as the system supports two 48VDC PS cards.
- A cable is supplied by Matrix with each 48VDC Power Supply card to connect the card to the Emerson PS. The cable has three wires — Red, Black and Yellow-Green. At one end of the cable a male connector is connected and the wires are free on the other end. A lug is affixed to each wire. A separate screw is placed on the top cover of the Emerson PS for earthing.
- To connect one card, unfasten and remove two screws, one that carries V+ signal and the other one that carries V- signal. Similarly, also remove the screw provided for earthing. Insert the lugs onto the screw as per the color code given below:

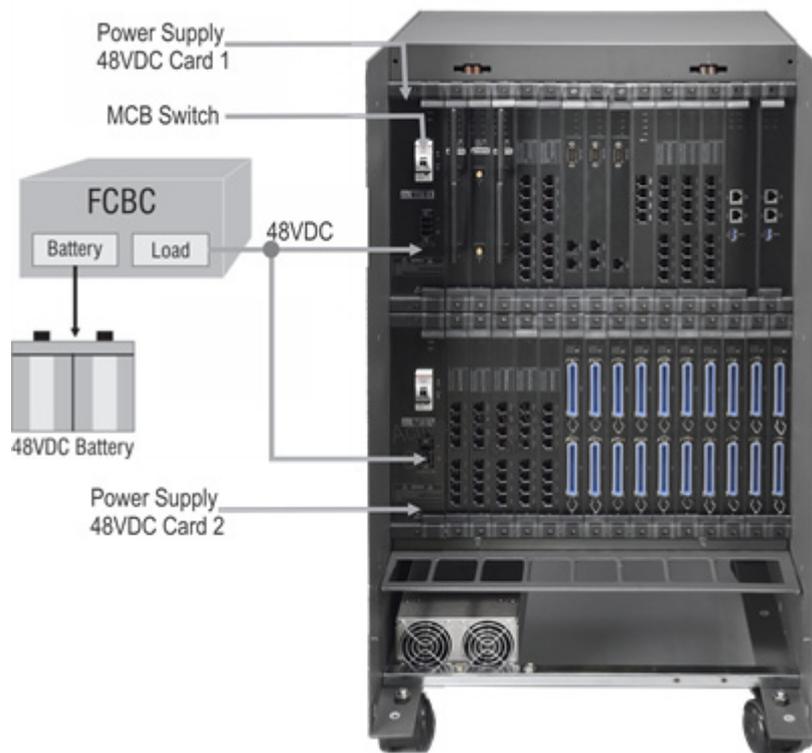

Color	Label on the Emerson PS
Red	V+
Black	V-
Yellow-Green	Earth

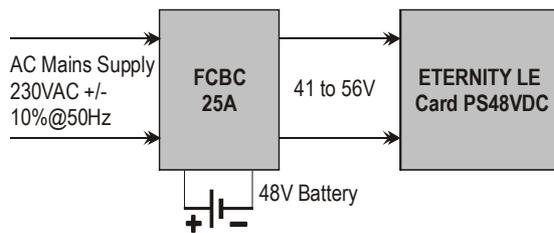

- Fix the screws back.

- Follow the same steps to connect another 48VDC Power Supply card with the Emerson PS.
- Now insert the male connector into the female connector (3-way termination block) on the card.

Connecting FCBC to the ETERNITY LENX

6. Connect Battery back up to the FCBC²⁶.

Battery backup time depends upon the total load. The total load is the sum of system's load and load of active extensions.

The Battery back up time depends on the 'Ah' rating of the battery connected to the FCBC. If 48V/26Ah batteries are connected to the FCBC for the system then backup time of 2.5 to 3²⁷ hrs can be ensured. The FCBC uses the constant voltage charging method. So, the batteries get charged faster if less power is consumed by the system when in mains mode.

7. Switch on power supply, after completing all other installation.

LED Pattern

LED L1 is a dual color LED for Power.

LED 2 is a single color LED that indicates Reverse Input Voltage.

Condition	LED	Color	Cadence
All modules operating inside the card are OK	L1 (PWR)	GREEN	Continuously ON
Any one or more modules operating inside the card are faulty	L1 (PWR)	RED	Continuously ON
Reverse Input	L2 (REV)	RED	Continuously ON

-
26. When the batteries are drained, the FCBC goes into the boost mode and begins to charge the batteries at higher current. When the batteries reach a preset voltage level (typically set to 56.0 volts), the FCBC goes to float mode. In the float mode the FCBC keeps charging the battery but at lower current. The FCBC monitors the voltage level of the batteries. As soon as the battery voltage goes below preset voltage (typically set to 50.4 volts), FCBC goes from float mode to boost mode. The change over from mains to battery and vice-versa is automatic. The advantage of using an FCBC is that batteries get charged faster, since the batteries are charged with higher current initially.
 27. This is calculated taking into consideration 25% SLT load of the System.

The CPU Card

The ETERNITY MENX-LENX CPU Card hosts the SARVAM UCS Application. It supports four VOCODER modules and one VMS module. Both the modules — NX DBM VOCODER64 and NX DBM VMS64 are optional and can be purchased separately.

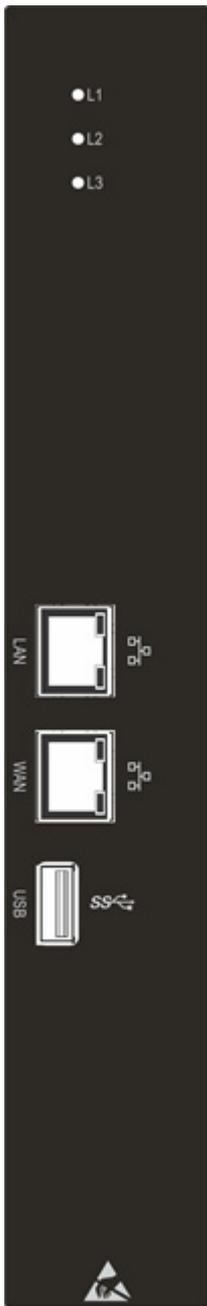

This card hosts Communication Manager, Feature Server, VoIP Server, VMS Server and other important servers and modules which controls all other slave cards (SLT, DKP, CO+SLT, DKP+SLT, E&M, BRI, T1E1, E1FO, GSM etc.). All the configuration and programming information is stored on this card.

ETERNITY LENX supports redundancy along with Hot Swap for the CPU Card. An additional CPU Card can be installed for redundancy. If the main CPU Card fails, the other card takes over, providing uninterrupted communication. To know more, refer to [“Redundancy”](#).

The CPU Card occupies fixed slots, the first two slots from the extreme right of the first Rack, with a unique arrangement of connectors. So no other card can be inserted in the slots of the CPU Card.

The CPU Card has a WAN Port, LAN Port and USB Port on the front panel. It also has an Internal USB Port with a factory fitted pendrive.

Ports and Connectors:

Port	Connector	Description
LAN	RJ45	Used for connecting the Ethernet cable into LAN Port to connect to a PC or a LAN Switch.
WAN	RJ45	Used for connecting the Ethernet cable into WAN Port to connect to a Broadband Router/Modem.

Port	Connector	Description
USB	USB to COM Converter (Optional)	<p>The External USB can be used as COM Port by connecting the USB to COM Converter.</p> <p>The USB to COM Port can be used to:</p> <ul style="list-style-type: none"> • set up and run software applications — PMS and CAS. • capture System Activity Log, System Fault log and Hotel Motel Activity logs. • generate SMDR reports.

If you buy a spare CPU Card separately, the default pendrive will not be provided along with it.

LAN Interface

The LAN Port is provided to connect:

- the system to a PC or a LAN. This port is used for operating the web-based programming software Jeeves.
- the CPU Card to the Local Area Network to register SIP extensions through the LAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “[System Activity Log](#)”, “[System Fault Log](#)” and Hotel Motel Activity Log.

WAN Interface

The WAN Port is provided to connect:

- a LAN Switch/Hub/Router/Modem.
- the CPU Card to the public network over a Router/Modem. Any user on the public network can be registered as SIP Extension through the WAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “[System Activity Log](#)”, “[System Fault Log](#)” and Hotel Motel Activity Log.

VoIP Interface

The CPU Card supports four NX DBM VOCODER64 modules. You must purchase the module separately for VoIP functionality.

VOCODER Channels

The system supports four NX DBM VOCODER64 Modules. Each module supports 64 VOCODER Channels²⁸. You must purchase the modules separately. The system provides 4 pre-activated VOCODER channels by default which can be used after installing NX DBM VOCODER64 module. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VOCODER CHNL4 and SARVAM VOCODER CHNL16.

If you require more than 64 VOCODER channels, you can install another NX DBM VOCODER64 Module.

²⁸. *The number of VOCODER channels that will be supported would be as per the license you purchase.*

A call made from a SIP Extension or SIP Trunk to another SIP Extension or SIP Trunk will consume two VOCODER channels, whereas a call made from a SLT or DKP extension to a SIP Extension or SIP Trunk will consume one VOCODER channel. Thus, the number of speech paths available to make simultaneous calls will depend not only on the number of VOCODER channels, but also on the number of channels consumed by such SIP-to-SIP and Analog/Digital extension to SIP Trunk/SIP Extension calls.

VMS Interface

The system supports a full-fledged, 'in-skin' Voice Mail System module to provide mailbox facility to all its extensions users. The Voice Mail System also forms the basis of other features like Conversation Recording and Call Taping.

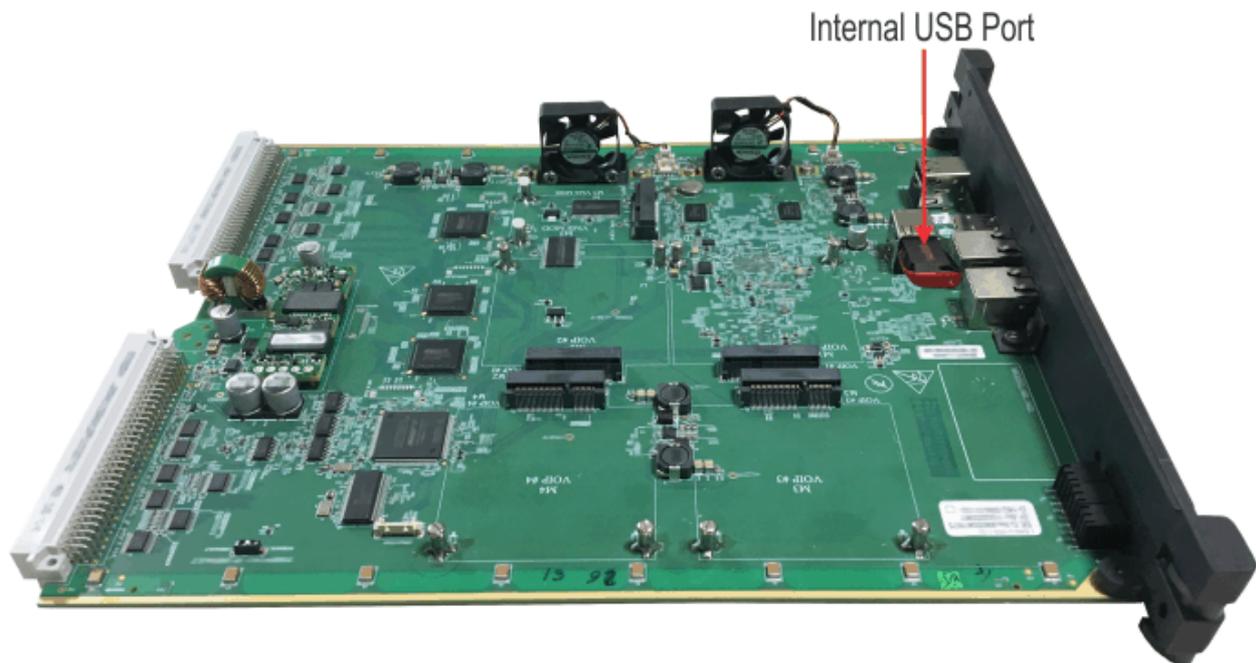

Each Mailbox has the capacity of storing 15,000 voice messages. The maximum size of each Mailbox is 60,000 minutes. By default, the size of each Mailbox is set to 5 minutes. The maximum Message Length for each Mailbox is 9,999 seconds. By default, the Maximum Message Length for each Mailbox is set to 15 seconds. The NX DBM VMS64 Module is an optional module. It must be purchased separately. The factory fitted Pen Drive provided also contains the VMS configuration files, and voice messages for prompts and greetings along with the SARVAM UCS ENT Application. The Pen Drive is also the storage device for mailbox messages.

If required, you may use a Pen Drive of upto 64GB by replacing the factory fitted pendrive with a new one.

The system supports a maximum of 64 channels out of which 4 channels are provided by default. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VMS CHNL4 and SARVAM VMS CHNL16.

Internal USB Port

The CPU Card has an Internal USB Port with a pendrive inserted into it.

The pendrive supports FAT32 file format. It contains the SARVAM UCS Application, VMS greetings, messages, Matrix Extended IP phone firmwares and SMS Server firmware.

 **Do not remove the pendrive.**

When you select the SARVAM UCS ENT Application, the system fetches the application from the pendrive.

External USB Port (Device Port) 3.0

The CPU Card has an External USB Port on the fascia. This can be used as a COM Port by connecting the USB to COM Converter.

 *The USB to COM Converter will not be provided by Matrix.*

The following USB to COM Converters are supported:

- Prolific PL2303 by BAFO
- CH341 by Winchiphead

 *If you use any other USB to COM Converter, it may not function properly.*

The USB to COM Port has a DB-9 connector.

The port allows you to connect a PC to the system, so that you can install and operate the following features:

- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “[System Activity Log](#)” and “[System Fault Log](#)”, Hotel Motel Activity Log.

LED

The CPU Card has three dual color LEDs:

- Heart beat (L1)
- Layer Communication indications (L2)
- Slave Switch indications (L3)

LED for both Active and Standby Card:

State	Color	Cadence
At Power ON		
	L1 and L3 – RED	Continuous ON for 15 sec (approximately)
	L1 and L3	OFF for 30 sec (approximately)
When L1 and L3 has been OFF for 10 sec	L2 – ORANGE	Continuously ON for 3 sec
	L2 – OFF	OFF

LED for Active Card:

State	Color	Cadence
L1 Pattern		
During initialization process	ORANGE	Continuous ON
After initialization process	-	OFF
In normal condition	GREEN	Toggle
L2 Pattern		
During initialization process	GREEN, RED, ORANGE	500 ms GREEN – 500 ms RED – 500 ms ORANGE
After initialization process	-	OFF
In normal condition	-	OFF
L3 Pattern		
When sync is received by Active card from Standby Card	RED	Continuous ON
When Sync is completed	-	OFF
When Data transfer done by Active card	RED	Continuous ON

LED for Standby Card:

State	Color	Cadence
L1 Pattern		
During initialization process	ORANGE	Continuous ON
After initialization process	-	OFF
In normal condition	RED	1 sec ON – 1 sec OFF
L2 Pattern		
During initialization process	GREEN, RED, ORANGE	500 ms GREEN – 500 ms RED – 500 ms ORANGE
After initialization process	-	OFF
PLL Lock (standby card clock is in sync with active card)	GREEN	Continuous ON
PLL is not lock (standby card clock is not in sync with active card)	-	OFF
L3 Pattern		
When sync is sent by Standby card to Active card	RED	Continuous ON
When Sync is completed	-	OFF

The CPU Card has a Password IP Default Switch (SW1) on the board:

Switch	Position	Function
SW1	ON	Password IP Default
	OFF (default)	Normal

Installing the VOCODER Module

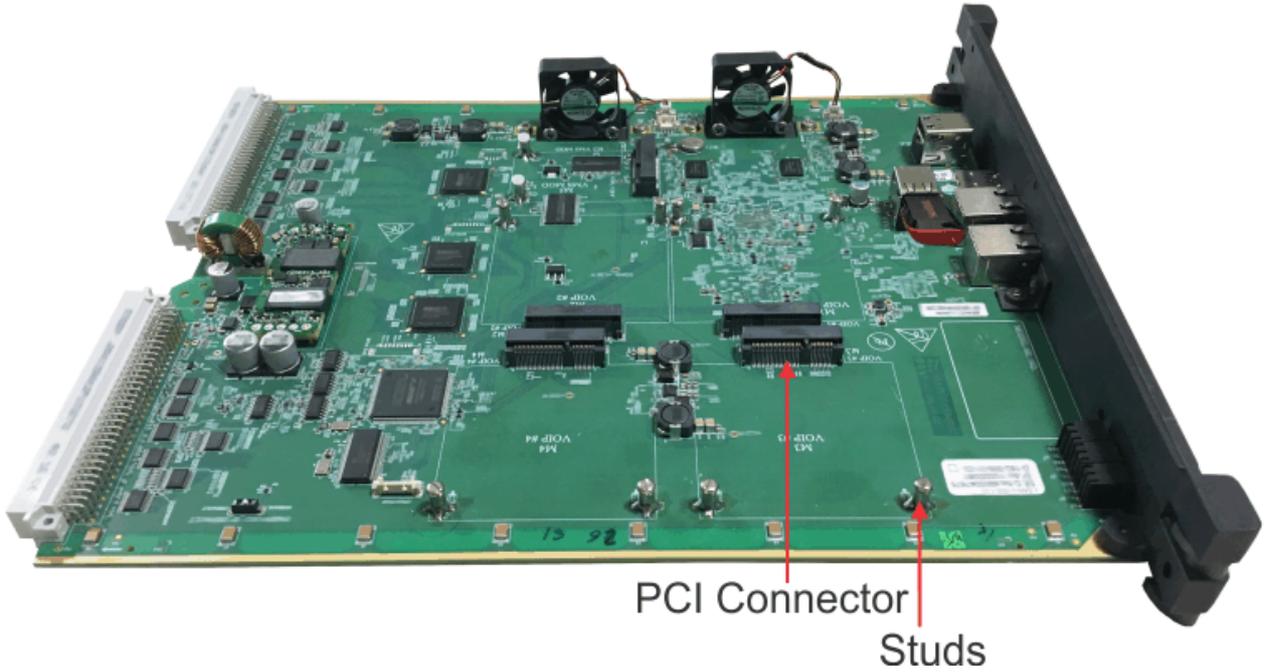

To install,

- Unpack the NX DBM VOCODER64 Module.

- If the CPU Card is already installed, switch off power supply, unplug the power cord. Remove the screws securing the card. Lift the levers on the mounting bracket to release the card. As the card emerges from the slot, ease it out of the slot.
- Place the card carefully on a table with some packing underneath it. Avoid any physical contact with the PCB part of the card as this could cause Electrostatic discharge (ESD) and may damage the hardware.

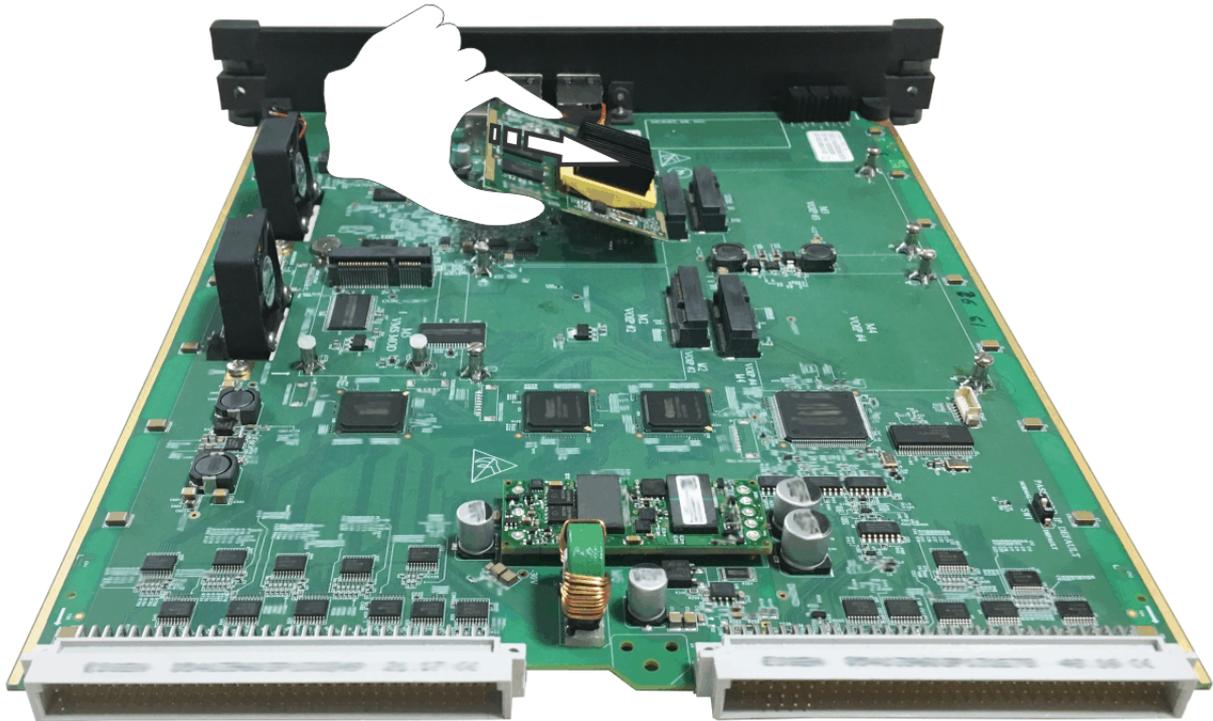

- There are 5 PCI Connectors (4 for VoIP and 1 for VMS) and five pairs of studs on the CPU board.

- Locate the **VOIP #1** label on the CPU board. The first NX DBM VOCODER64 Module should be mounted here.
- Remove the screws on the studs for the module and keep them aside.
- Carefully hold the NX DBM VOCODER64 Module from the edges. Make sure you do not touch the PCB area.

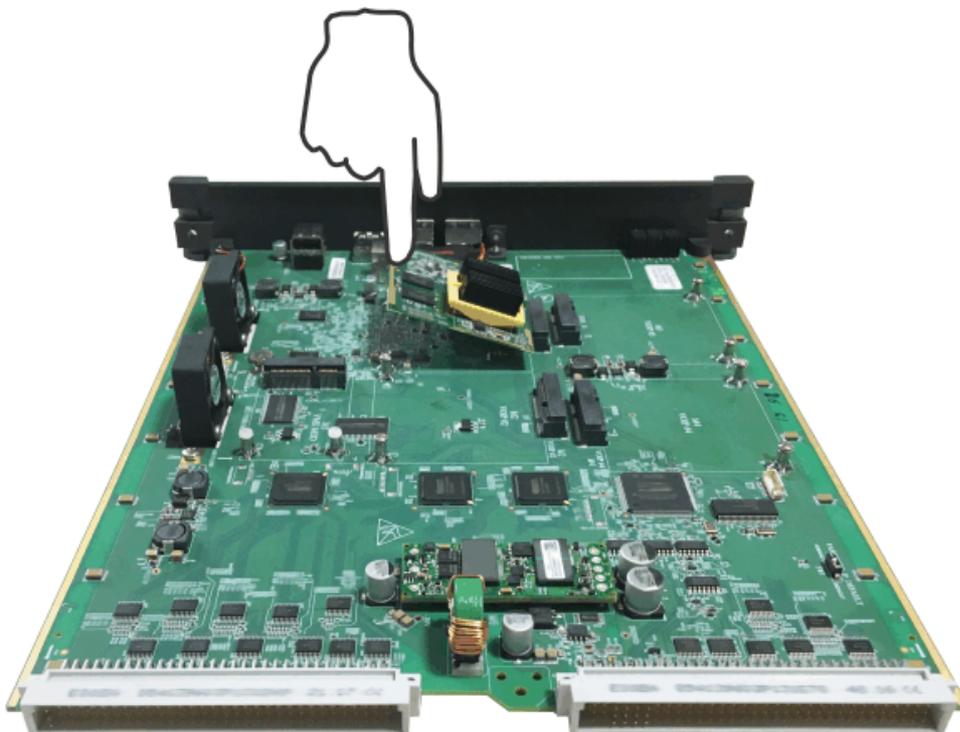

- Insert the NX DBM VOCODER64 Module into the PCI Connector socket.

- Press the Module with a finger and match the mounting holes perfectly with the stud holes. Make sure you do not touch the PCB area of the module except the yellow line provided for grounding at the front end of the module.

Do not apply excessive pressure.

- Secure the module with the screws on the studs.

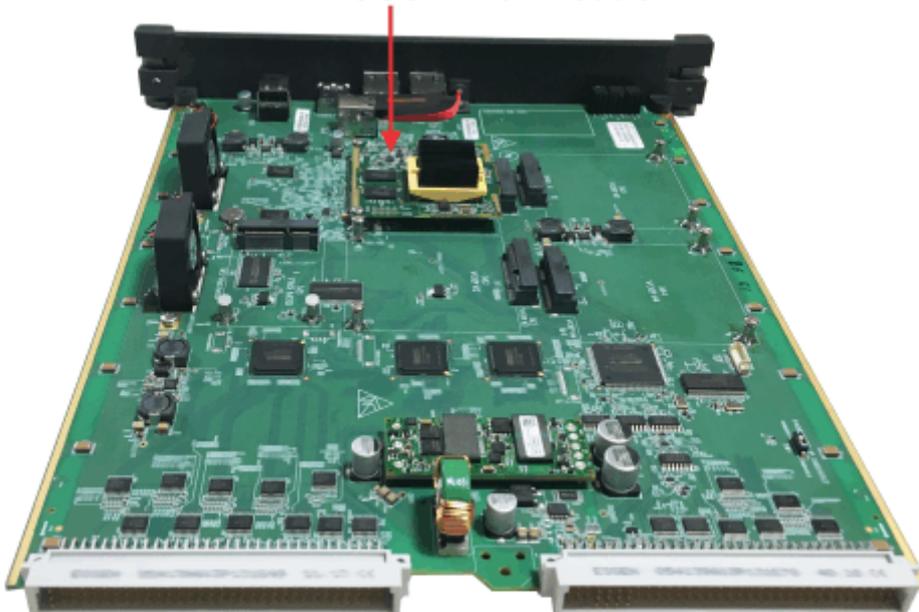

You may install the second NX DBM VOCODER64 Module by locating the **VOIP #2** label on the CPU board and follow the same steps as above. Similarly, install the other modules if required.

Removing the VOCODER Module

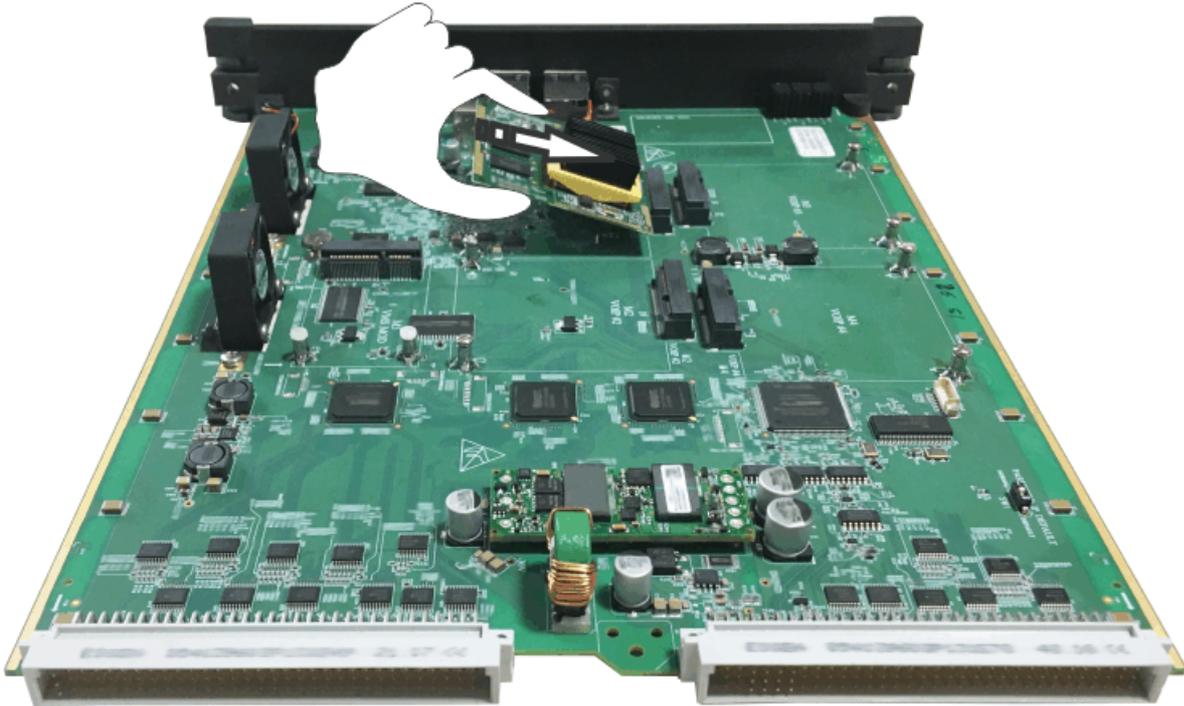

- Locate the VOCODER Module you want to remove from the CPU Card.

NX DBM VOCODER64 Module

- Remove the screws from the module and keep them aside.

- Firmly hold the module and ease it out of the PCI connector carefully.

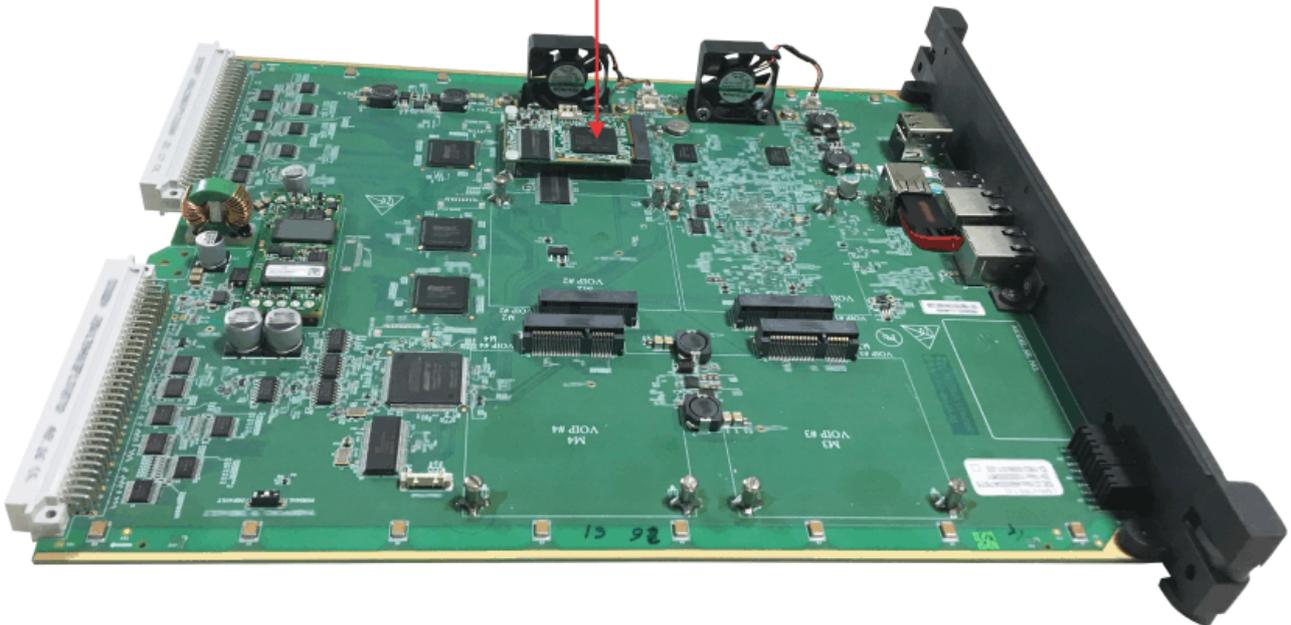

- Replace the screws on the studs.

Installing the VMS Module

To install the NX DBM VMS64 Module, locate the **VMS MOD** label on the CPU board and follow the same steps as described for [“Installing the VOCODER Module”](#).

NX DBM VMS64 Module

Make sure you use the plastic screws provided to affix the VMS Module over the studs.

- The pendrive which is provided to you by default contains VMS data and VMS firmware. You will be able to use the VMS features once you activate the VMS License.

If you want to store more voice mail messages or greetings then you will need more space to store the same. You can replace this default pendrive with a new one having more space.

To do so, you need to format your new pendrive with FAT32 file format and then copy all the contents of the factory fitted pendrive into the new pendrive.

Switch-off the system and then replace the pendrive. The system will not detect the new pendrive if you do not restart the system after replacement.

Make sure while replacing the pendrive, you insert it in the same USB Port where the factory fitted pendrive was inserted.

- If you have no other modules to install, insert the card back into the ETERNITY LENX.
- Connect a computer to the LAN/WAN Port of the system with the ethernet cable supplied for the port.
- Open a Web browser on the computer to access the embedded Web server, Jeeves.
- Activate the VMS License Voucher. See [“License Management”](#) for instructions.
- Configure VMS. For detailed instructions, see [“Configuring Voice Mail System”](#).

For removing the VMS Module, follow the same steps as described for removing the VOCODER Module. See [“Removing the VOCODER Module”](#).

The Single Line Telephone Card

The Single Line Telephone (SLT) Card provides the interface to connect as extension phones, any standard, two-wire, analog single line telephone instrument - rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification.

The SLT Card is available in the following configurations. SLT interface also is available in combination with Two-wire trunk interfaces on a single card.

SLT Cards for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY LE Card SLT48	48-port card to connect 48 Single Line Telephones
ETERNITY ME Card SLT32	32-port card to connect 32 Single Line Telephones
ETERNITY ME Card SLT16	16-port card to connect 16 Single Line Telephones
ETERNITY ME Card SLT8	8-port card to connect 8 Single Line Telephones
ETERNITY ME Card CO8+SLT24	Combination card, with 8-ports to connect to 8 Two-wire Analog trunk lines and 24 Single Line Telephones This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .

The maximum number of SLT ports supported are 1296²⁹.

Connectors

The SLT Cards have RJ45 connectors, with each connector having 4 SLT ports. A multi-pair, MDF cable is supplied for each connector.

Only the SLT48 card has a 50-pin Centronics connector for the ports.

LEDs

The SLT cards have a single, tri-color LED to indicate:

- the health of the card during the Reset Cycle.
- the status of any one extension during normal functioning of the system.

You may monitor any of the SLT Extension ports by assigning the LED to that port³⁰.

29. Using commands you can configure upto 999 ports. The remaining ports can be configured from Jeeves only.

30. To do this, enter SE mode, and dial the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

Installing Single Line Telephones

To be able to connect Single Line Telephones as Extensions to your system, you must install at least one of the aforementioned SLT Cards in the System.

1. Decide the number of SLT extensions required and arrange for as many telephone instruments.

You may use any standard telephone instrument like a rotary phone, a pulse-tone switchable push-button phone, a feature phone or a cordless phone.

Use SLTs equipped with a 'Flash' key, as several of the features and facilities of the system require you to press Flash. If any of the SLTs you have selected does not have a Flash key, tap the Hook switch of the phone to dial Flash.

2. Unpack the SLT Card and check the package contents. Ensure that the power supply is switched off, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
3. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Do not discard the filler bracket! You may require it at a later stage.
4. Insert the SLT Card into the guide rails of the free slot you selected for the card.

Make sure that the connectors on the card make perfect contact with those on the motherboard on the backplane.

5. Press down the levers on the mounting bracket to secure the card in its slot. Now, secure the mounting bracket with the two screws provided.

If you are installing more than one SLT Card, you can install the second card in any other free slot. It is not necessary to install the second/third card in the subsequent slots.

6. Use the cables supplied with the SLT Card to connect the SLT wires with the Main Distribution Frame.

For each connector on the SLT Card, there is a separate 4-pair cable with an RJ45 jack on one end and free at the other end.

Refer the illustrations below for pin out details of each connector.

ETERNITY LE Card SLT48

	Orange - (Orange & White)	SLT	18
	Green - (Green & White)	SLT	19
	Brown - (Brown & White)	SLT	20
RJ45-6	Blue - (Blue & White)	SLT	21
	Orange - (Orange & White)	SLT	22
	Green - (Green & White)	SLT	23
	Brown - (Brown & White)	SLT	24
RJ45-7	Blue - (Blue & White)	TWT	01
	Orange - (Orange & White)	TWT	02
	Green - (Green & White)	TWT	03
	Brown - (Brown & White)	TWT	04
RJ45-8	Blue - (Blue & White)	TWT	05
	Orange - (Orange & White)	TWT	06
	Green - (Green & White)	TWT	07
	Brown - (Brown & White)	TWT	08

7. Plug in the RJ45 end of the MDF cables supplied with the card into the respective connectors. Refer to the pinout details of the connectors of each SLT Card type illustrated above.
8. Terminate the open end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the ["The Main Distribution Frame \(MDF\)"](#).

Each wire-pair from the SLT Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic ["The Main Distribution Frame \(MDF\)"](#) for illustration.

9. Repeat the same steps to install another SLT Card.
10. If you have completed all installation tasks, power ON the system, observe the Reset Cycle and the LED Pattern of the SLT Card.

LED Pattern of the SLT Card

Stage	LED Color	Cadence
Auto Upgradation ^a		
Card waiting for application	RED	ON-200ms-OFF 200ms
Card is up, loaded with new application	GREEN	ON-200ms-OFF 200ms
Initialization		
	RED	ON 500ms-OFF 500ms
	GREEN	ON 500ms - OFF 500ms
	ORANGE	ON 500ms - OFF 500ms
Stand-by task	ORANGE	1 sec Orange -1 sec Green
Errors		
Flash Failure	None	None
RAM Failure	None	None

a. Done by the Boot Loader Application.

Status of Selected Port

PORT Status	LED Color	LED Cadence
Selected port data transmitted to Master Card	RED	Toggle ^a
Selected port data received from Master Card	RED	Toggle

a. The current LED state will remain the same until the next command is received from the application on the SLT Port. For example, if the current LED state is Green/Red ON, on the next command received, the LED will be turned OFF. It will remain OFF until the next command is received. When the next command is received it will be turned Green/Red ON again. This process continues.

Jumpers on the Main Board

Jumper Number	Position	Function

	BC	For uploading software using COM Port
J2 & J4	AB (default)	Normal Operation
	BC	For uploading software using COM Port

Connecting SLT instruments

11. Connect the SLT instruments you have arranged for. Plug in the SLTs into the wall socket/outlets.

- For the purpose of testing, you may connect one or two Single Line Telephone instruments by plugging in the phone cables into the RJ45 connectors on the card.

- *When you plug the RJ11 connector of SLT into an RJ45 connector on the SLT Card, the SLT will be connected on the first port on the connector.*

The Intercom Line Card³¹

For the Building Intercom application, the system supports the Intercom Line Card (ILC).

You can connect any standard, two-wire, analog single line telephone instrument - rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification to the Intercom Line Card.

ILC Cards for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY LE Card ILC48	48-port card to connect 48 Single Line Telephones
ETERNITY ME Card ILC32	32-port card to connect 32 Single Line Telephones

Choose an ILC Card with the configuration that meets your requirement for intercom ports. Also, consider the maximum Port capacity of the system you are installing. The maximum number of intercom ports supported are 1296.

Connectors

The ILC32 Cards have RJ45 connectors with four ports on each connector. A multi-pair, MDF cable is supplied for each connector.

Only the ILC48 card has a 50-pin Centronics connector for the ports.

LEDs

The ILC cards have a single, tri-color LED to indicate the health of the card during the Reset Cycle.

Installing Intercom Telephones

To be able to connect intercom telephones to the system, you must install at least one of the aforementioned intercom line cards in the system.

1. Decide the number of intercom extensions required and arrange for as many telephone instruments.
2. Ensure that the extension wiring is completed according to your requirements. The extension cables from the wall jack are terminated in the Main Distribution Frame and the telephones are connected to the wall jacks.
3. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat to prevent damage to the components of the card.
4. Unpack the ILC card and check the package contents. You may switch off power supply before you install the card. Since, ETERNITY LENX supports Hot Swap, you can install the card in power on condition.
5. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Keep the filler bracket for future use.

³¹. This card has been phased-out. if required, only support will be provided for the same.

6. Insert the ILC Card into the guide rails of the free slot you selected for the card.

Make sure that the connectors on the card make perfect contact with those on the motherboard on the backplane.

7. Press down the levers on the mounting bracket to secure the card in its slot. Now, secure the mounting bracket with the two screws provided.
8. Repeat these steps to install another card.
9. Now, use the cables supplied with the ILC Card to connect the card to the Main Distribution Frame to which the intercom phones are connected.

For each connector on the card, there is a separate 4-pair cable with an RJ45 jack on one end and free at the other end. Refer the illustrations of the pinout of the intercom cards to connect the wires.

The Digital Key Phone Card

The Digital Key Phone (DKP) Card provides the interface to connect the proprietary digital key phones of the EON series, the proprietary PC-based phone EONSOFT, the Direct Station Selection (DSS) Consoles, with the system.

DKP Cards for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME DKP32	32-port card to connect 32 DKP/DSS Consoles
ETERNITY ME DKP16	16-port card to connect 16 DKP/DSS Consoles.
ETERNITY ME DKP8	8-port card to connect 8 DKP/DSS Consoles

Select a DKP Card with the configuration that meets your requirement for DKP Ports. To connect the proprietary digital key phones with the system, you must have at least one of the above mentioned DKP Cards installed in the system.

The maximum number of DKP Ports supported by the system are 128.

Connectors

The DKP Cards have RJ45 connectors, with each connector having 4 DKP ports. A multi-pair MDF cable is supplied for each connector on the card.

LEDs

The DKP cards have a single, tri-color LED to indicate:

- the health of the card during the Reset Cycle.
- the status of any one of the ports during normal functioning of the system. By default, it is assigned to DKP Port 1.

You may monitor any of the DKP ports by assigning the LED to that port³².

Installing the Digital Key Phone Card

Decide the number of DKP extensions and DSS Consoles required and arrange for as many EON, EONSOFT and DSS Consoles.

Decide the locations of the DKP extensions and make sure that the necessary wiring for the DKP extensions, from the wall jack to the MDF, is done.

1. Unpack the DKP Card and check the package contents³³. Before handling the card, make sure that power supply is switched off and you are wearing an antistatic-wrist strap/belt and have a grounding mat.
2. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Do not discard the filler bracket, keep for future use to cover empty slots.

32. You can do this from the SE mode, by dialing the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

33. See "ETERNITY GENX Cards" under 'Packing List' of Appendix topic.

3. Insert the DKP Card into the guide rails of the free slot you have selected for the card. All the pins on the connector of the card should make perfect contact with those on the connector of the slot on the backplane motherboard.
4. Press down the levers on the mounting bracket to secure the card in its slot. Now, fix the card in its slot with the two screws provided.

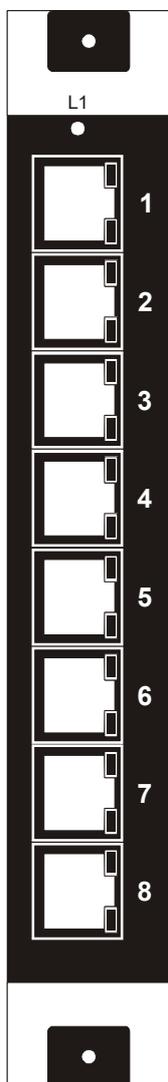

If you are installing more than one DKP Card, it is not necessary to install the next card in the subsequent slot.

5. Using the MDF Cables supplied with the DKP Card connect the DKP ports to the Main Distribution Frame.

Refer the connector pin details for each DKP Card type given in the following.

ETERNITY ME Card DKP32

	Orange - (Orange & White)	DKP	06
	Green - (Green & White)	DKP	07
	Brown - (Brown & White)	DKP	08

6. Plug in the RJ45 end of the MDF cables provided with the DKP card into the respective connectors.
7. Terminate the free end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the Main Distribution Frame (MDF).

Each wire-pair from the DKP Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic [“The Main Distribution Frame \(MDF\)”](#) for illustration.

8. Connect the Digital Key Phones to the wall jacks at their respective locations. Detailed installations instructions for EON, EONSOFT are provided separately.

If you have completed all installation tasks, power on the system and observe the Reset Cycle and the LED Pattern of the DKP Card.

LED Pattern DKP Card

Stage	LED Color	Cadence
Auto Upgradation

Status of Selected DKP Port

PORT Status	LED Color	LED Cadence
Selected DKP's data are transmitted to CPU Card	RED	Toggle ^a on each event
Selected DKP's data are received from CPU Card	RED	Toggle ^b on each request from Master

- a. The current LED state will remain the same until the next event is received from the application on the DKP Port. For example, if the current LED state is Green/Red ON, on the next event, the LED will be turned OFF. It will remain OFF until the next event occurs. When the next event is received it will be turned Green/Red ON again. This process continues.

- b. Same as the above note.

Jumpers on the Main Board

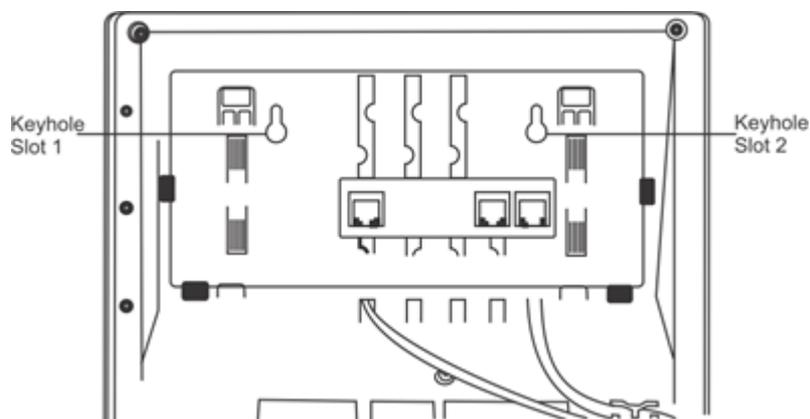

Jumper Number	Position	Function
J1	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J2 & J4	AB	NA
	BC (default)	Normal Operation/ Debug

Installing EON48

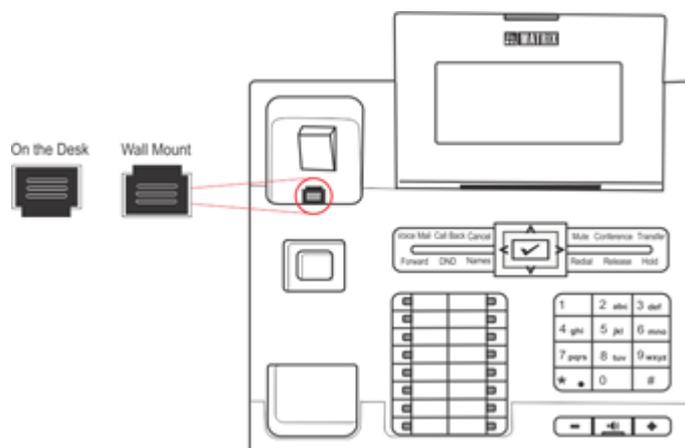

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

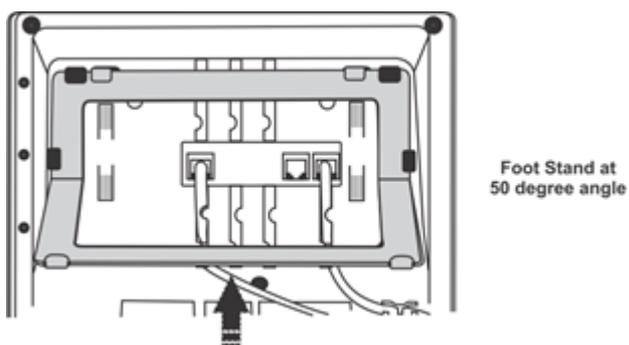

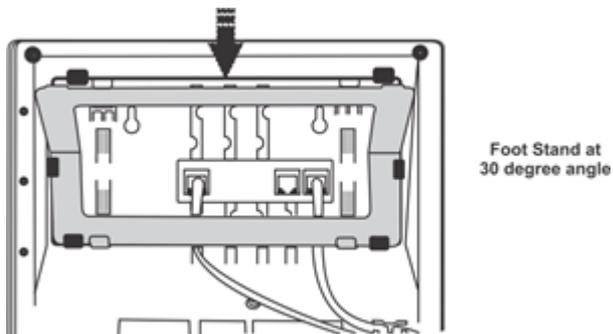

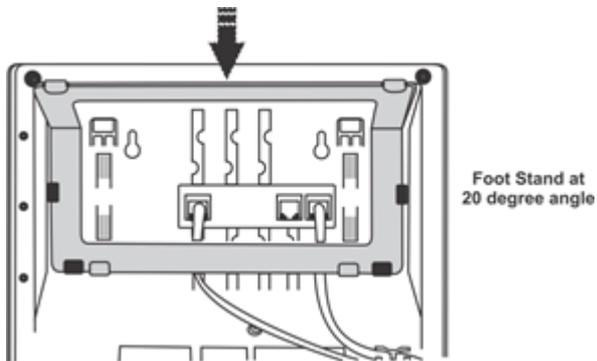

- Now, mount the phone with the screws fitting into the keyhole slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

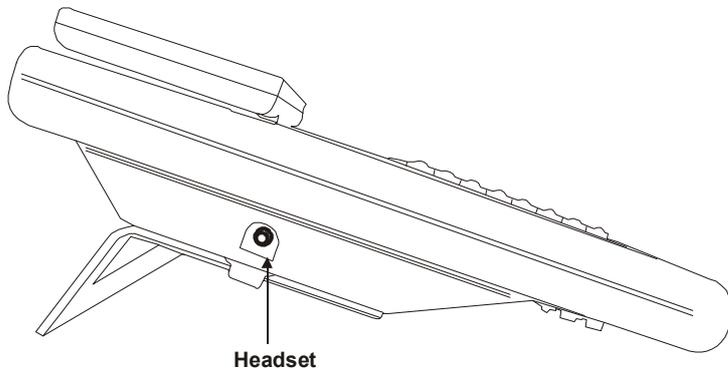

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **20° Angle** or at **30° Angle** or at **50° Angle**.

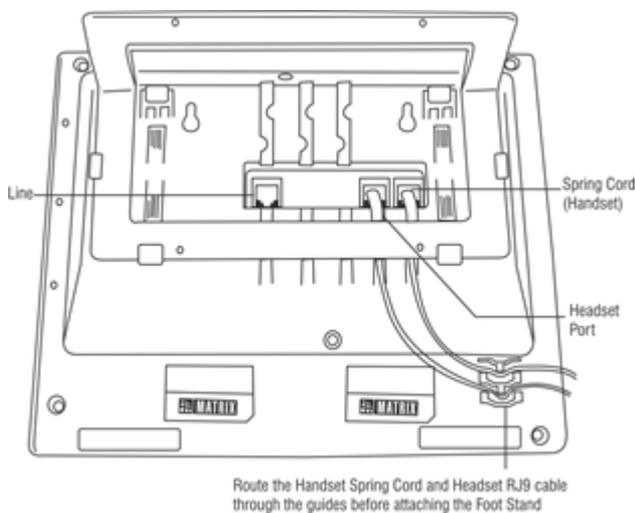

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.
- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
- Connect the handset of the EON48 to the phone body using the spring cord.

- To use a Headset (not supplied with the phone), plug any standard stereo headset with 2.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.

You may also plug in a stereo headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as '**LINE**' and the other end into the wall jack/DKP Port.

- When the system is powered ON, the EON will reset. The EON communicates with the system. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message 'Please wait'... appear on the LCD display.

- After successful handshaking and reset cycle, if the DKP Parameters have been configured, the LCD display of the EON will show the extension number and the extension name in one line and the day, date and time and the time zone in the other line.

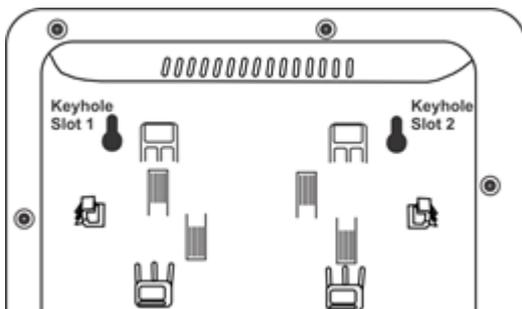

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#) for instructions.

Installing EON310

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

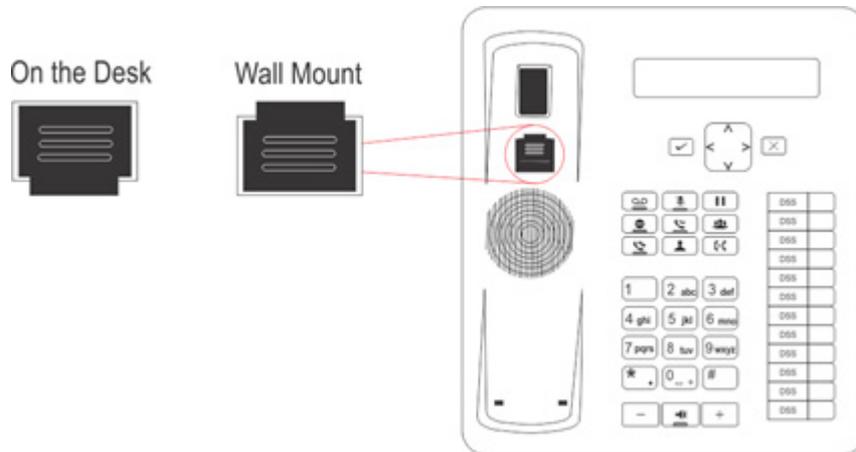

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

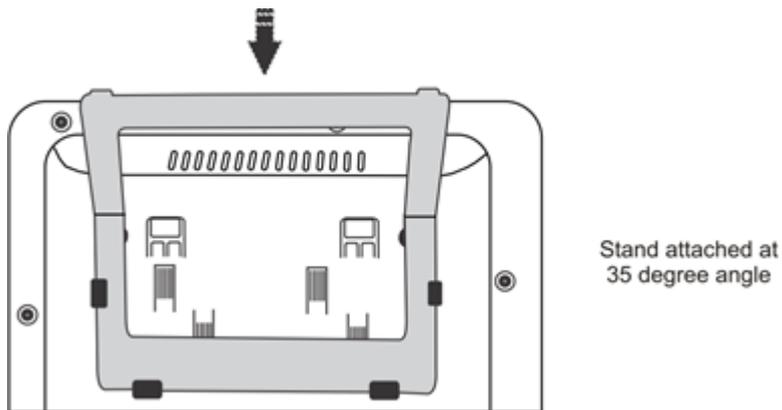

- Now, mount the phone with the screws fitting into the keyhole slots.

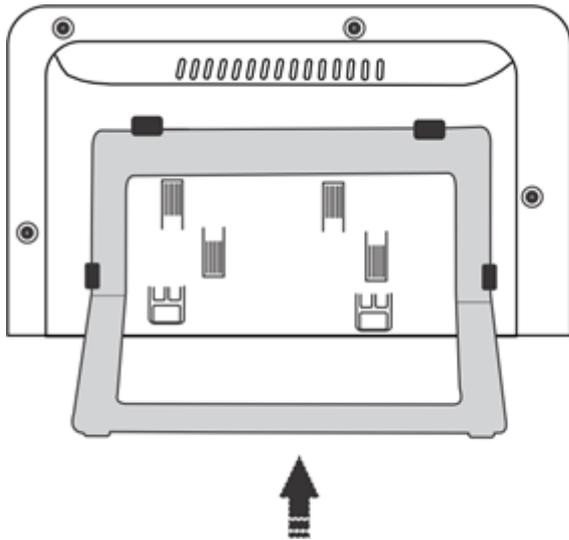

- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

Mount the phone on the Desk

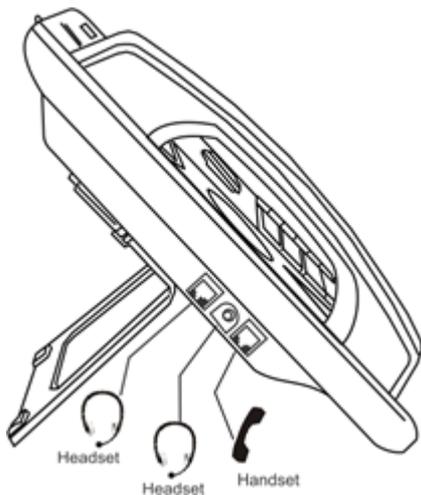

- You can attach the Foot Stand in the following ways—at an angle of **35° Angle** or at **50° Angle**.

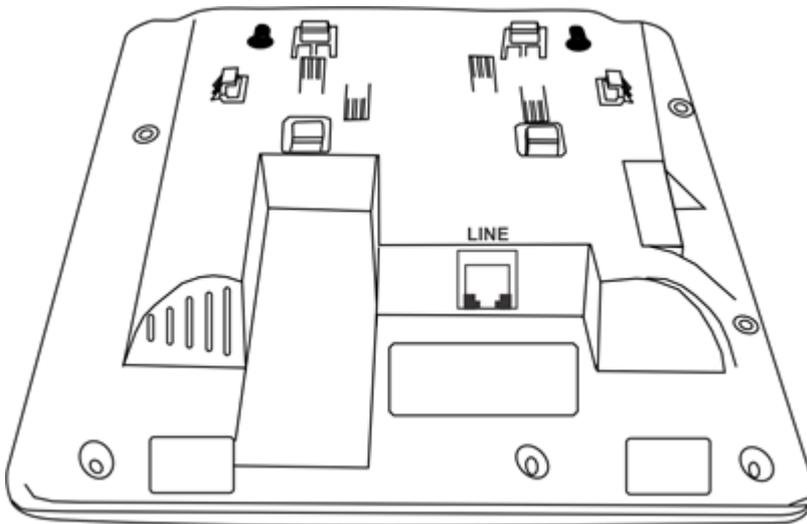

Stand attached at
50 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
- Connect the handset of the EON310 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.
You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as **'LINE'** and the other end into the wall jack/DKP Port.

- When the system is powered ON, the EON will get reset and the message "Welcome to Matrix. Booting" ...appears on the LCD display.

- The EON communicates with the system. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message "Please Wait" ...appears on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear on the LCD.

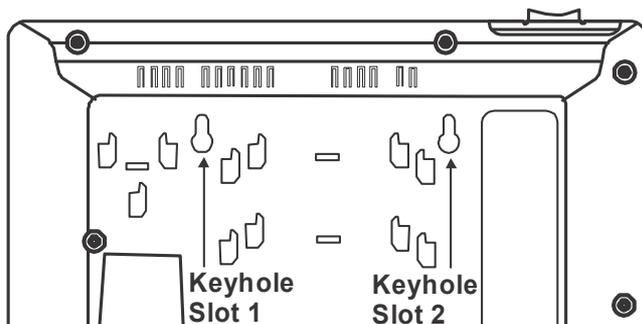

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#).

Installing EON510

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

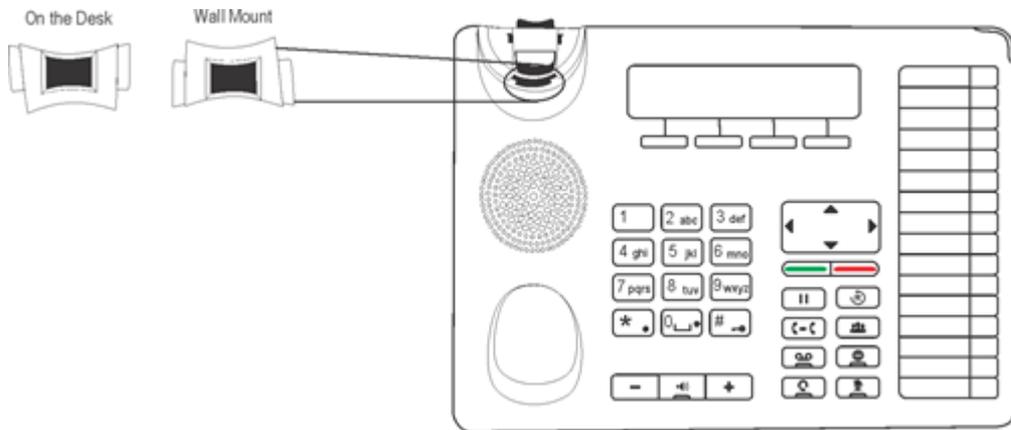

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

- Now, mount the phone with the screws fitting into the keyhole slots.

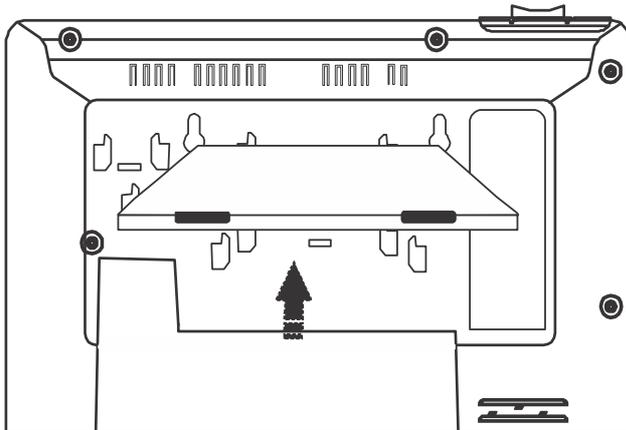

- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

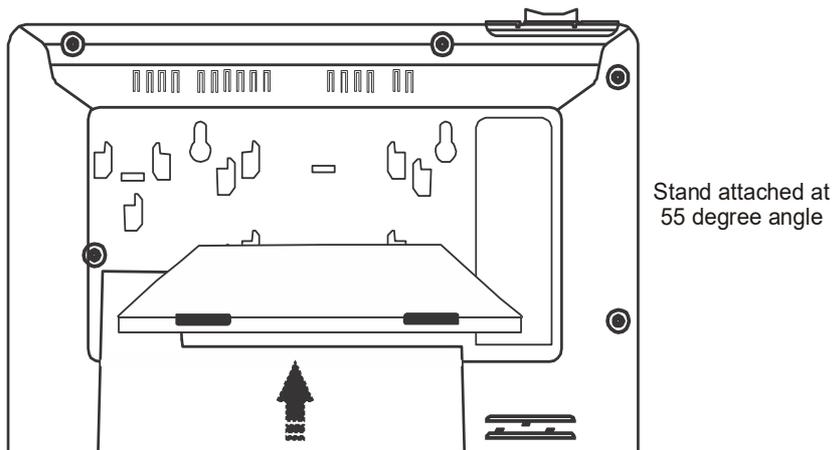

If you are unable to remove the wall mount tab, you may use a tool like a minus screw driver to remove it.

Mount the phone on the Desk

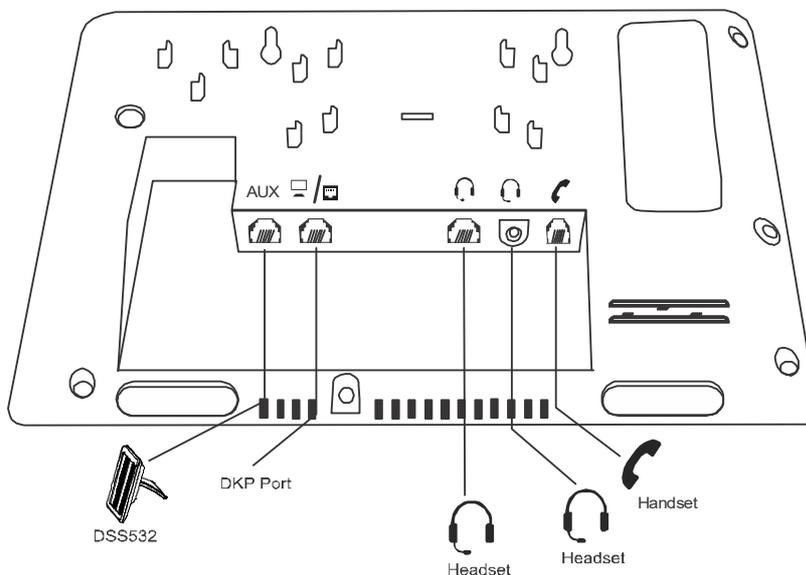

- You can attach the Foot Stand in the following ways—at an angle of **45° Angle** or at **55° Angle**.

Stand attached at 45 degree angle

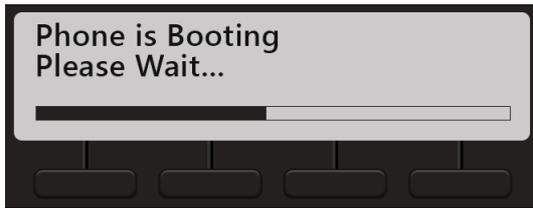

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

- Connect the handset of the EON510 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.
You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.
- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone marked with the symbol  and the other end into the wall jack/DKP Port.
- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with EON510”](#).

- When the system is powered ON, the EON will get reset and the message 'Phone is Booting; Please wait...' appear on the LCD display.

- The EON communicates with the system. The handshaking lasts for 5-6 seconds. The message 'Loading Firmware Version-Revision; Please wait...' appear on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear, as illustrated below.

You may adjust the LCD for brightness, contrast and backlight. Refer the topic, ["Digital Key Phone-Operation"](#).

Installing DSS Consoles

Installing DSS64

Once you have installed EON48/310 with SARVAM UCS, installing the DSS Consoles can be done in a few simple steps, very much similar to those involved in the installation of EON.

1. Unpack the box and verify the package contents³⁴.
2. Place the DSS Console next to the DKP to which it is to be attached.
3. Decide which DKP Ports on the DKP Card are to be assigned to the DSS Consoles. You may select any free (unused) port on the card for DSS Consoles. It is not necessary for the DSS Console ports to be in a sequence with the DKP ports to which they are attached.

34. See ["Packing List"](#) of Appendix topic.

For example: you have connected DKP1 to Port 1 on the first RJ45 connector of the DKP8 card. You want to attach two DSS Consoles to DKP1. The two DSS Consoles may be connected to any port on the second connector of the card, not necessarily to Port 2 and Port 3 on the first connector.

4. The wire-pairs from the DKP Ports designated for DSS Consoles should be terminated on the bottom of the Krone Connector (of 'Station Lines' on the MDF).
5. The wire-pairs of the DSS Consoles should be terminated into the top of the Krone Connector (of 'Station Lines' on the MDF). Refer the topic "[The Main Distribution Frame \(MDF\)](#)" for illustration.

You can connect maximum two DSS64 with a single EON48/310.

6. The system automatically detects the DSS Console you connect and it will be will appear under **Unassigned DSS64** in "[DSS Status](#)". You must first assign these DSS Consoles to the respective DKP Ports and thereafter you will be able to configure the DSS Keys.
7. To assign the DSS Consoles, see "[DSS Status](#)" and to configure the DSS Keys, see "[Programming DSS Console Keys](#)".

Installing DSS532 with EON510

The instructions for installing DSS532 with EON510 or SPARSH VP510 are same. For detailed instructions, refer to "[Installing DSS532 with SPARSH VP510](#)".

Installing EONSOFT

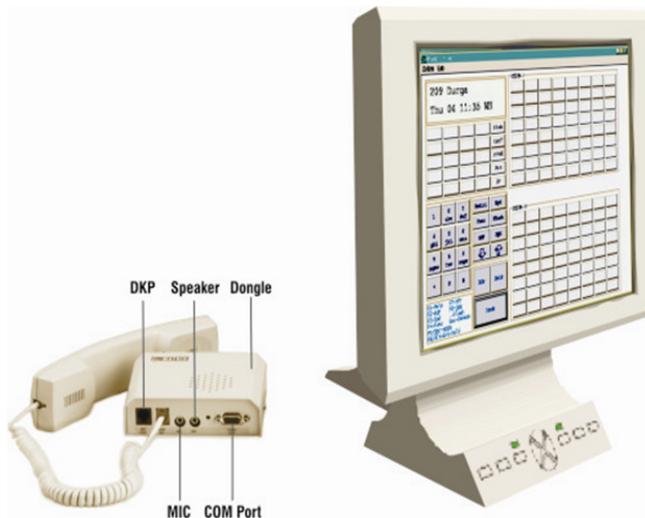

To install EONSOFT, you must have a computer with Windows as the operating system. The EONSOFT is compatible with the following Operating Systems of Windows:

- Windows 98
- Windows XP
- Windows NT
- Windows 2003
- Windows Vista
- Windows 2007

1. Unpack the box and verify the package contents³⁵.

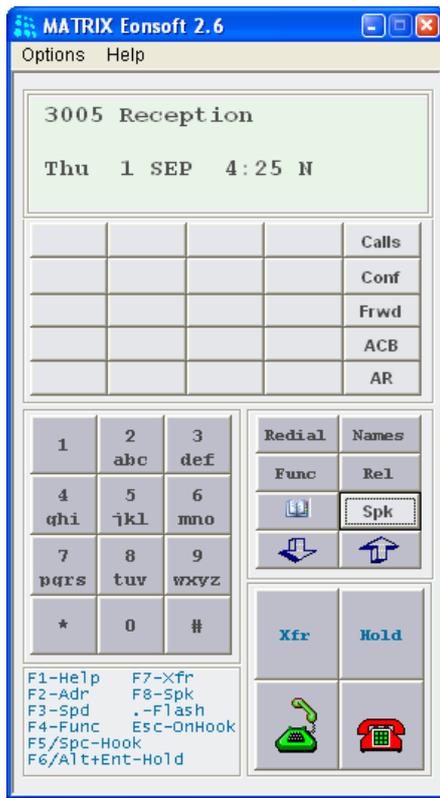

35. See "[EONSOFT](#)" under 'Packing List' of Appendix topic.

2. Connect the Handset to the dongle in the handset jack. If using a headset, connect the microphone and the speaker connectors into the dongle.

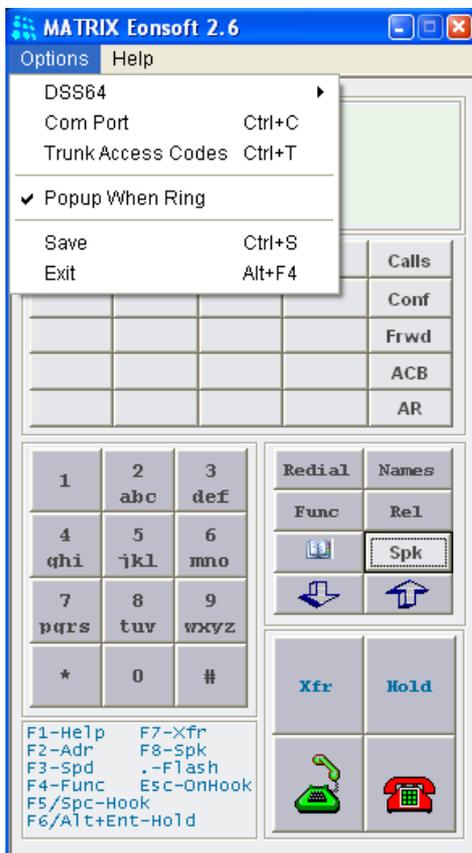

3. Connect one end of the Communication cable to the COM port of the dongle. Connect the other end of the communication cable into the COM port of the computer.
4. Connect a wire-pair of a DKP port to the RJ11 port marked 'DKP' on the dongle.
5. Switch ON the computer. The computer must have Windows Operating System installed on it.
6. Copy the EONSOFT Application Software provided by the Support Team onto your PC and install the application.
7. After the program has been installed and run, a shortcut will be automatically created and appear on your desktop.

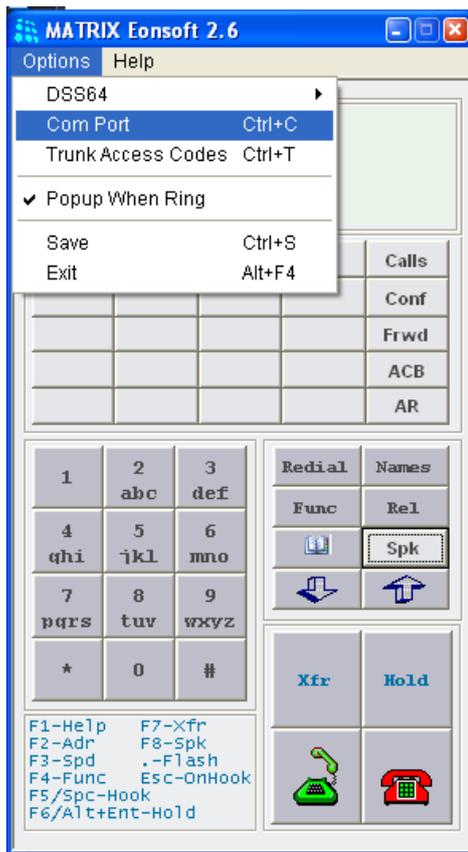

- Click the shortcut to open the program. The EONSOFT window will open:

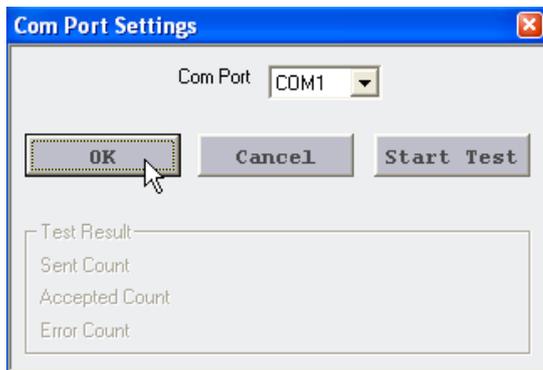

- Click **Options** at the top left of the window. A drop down menu will appear.

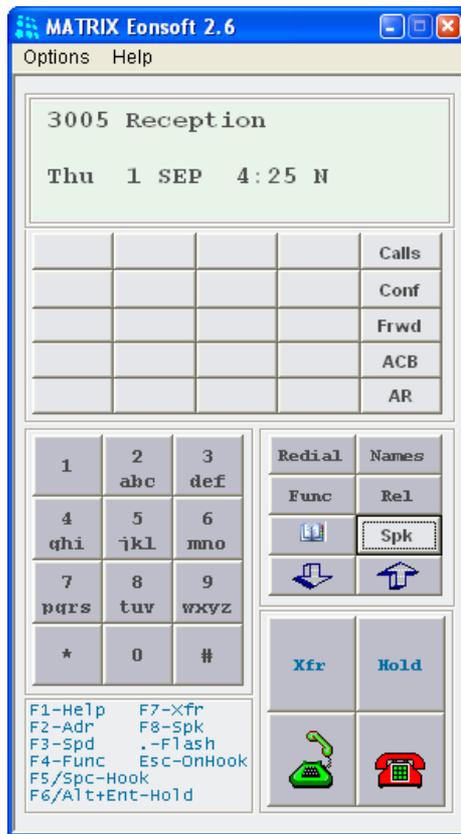

10. Click the option **COM Port**.

11. Select the COM Port to which the communication cable is connected.

- EONSOFT is now connected. If you have already configured the DKP parameters like Access Code and Name for the port to which EONSOFT is connected, these will appear.

- If this window does not appear after you have selected the COM Port Option, test the COM Port for data transfer.
- If the wrong COM port has been selected, a dialog box will pop up on your screen with the message: "COMx is invalid or busy, please select another COM Port". Select the correct COM Port.

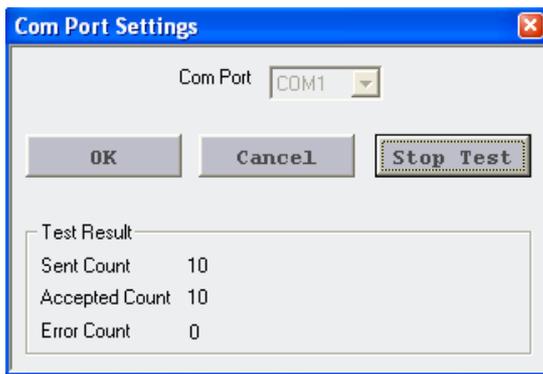

Test the functioning of the COM Port of the PC and the communication cable, before you install the EONSOFT.

Testing the COM Port

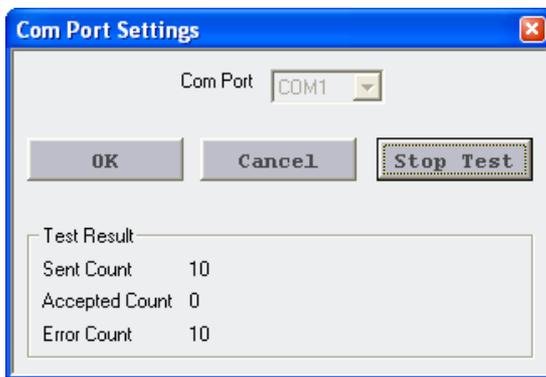

- From the drop down menu of **Options**, select the **COM Port** to which you have connected the communication cable.
- The COM Port Settings dialog box will open.
- Connect the communication cable to the COM Port of the PC.
- Short pin2 and pin3 of the DB-9 connector at the free end of the cable.
- Click the button labeled **Start Test** in the COM Port Settings dialog box.
- After clicking this button, observe the Test Result section on the dialog box.

- The **Error Count** value shows zero, if both the communication cable and the COM port are working.

The above screen shows that the COM Port/communication cable is working.

- If the **Error Count** shows a value other than zero, it means that either the communication cable or the COM port of the PC is faulty.

Above screen shows the faulty COM Port/Communication Cable.

- Remove the communication cable from the COM Port of the PC.
- Short pin2 and pin3 of the communication port of the computer and click 'Start Test' in the COM Port Settings dialog box.
- Now, if the error count is zero, please check the Communication Cable.
- If the error count is not a zero, the COM Port of the PC is faulty. Try another communication port.

The CO Card

The CO Card provides the interface to connect the system with the Two-Wire Analog Trunk lines from the CO Network. The CO Card supports the different standards and features of CO Networks across the world.

The CO Card is available in the following configurations. CO interface is also available in combination with SLT ports on a single card.

CO Cards for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card CO16	16-port card to connect 16 Two-wire Trunk lines from the CO network
ETERNITY ME Card CO8	8-port card to connect 8 Two-wire Trunk lines from the CO network
ETERNITY ME Card CO8+SLT24	Combination card, with 8 CO ports to connect 8 CO analog trunk lines and 24 SLT ports to connect 24 Single Line Telephones This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .

Choose a CO Card with the configuration that meets your requirement for CO trunk ports, keeping in mind the maximum CO Trunk Port capacity of the system you are installing.

The maximum CO Trunk Ports supported are 128.

Connectors

The CO Card has RJ45 connectors, with 4 CO ports on each connector. A multi-pair, MDF cable is supplied for each connector on the card.

LED

The CO Cards have a single tri-color LED to indicate:

- the health of the card during the Reset Cycle.
- the status of a selected Trunk port during normal functioning of the system.

You can assign the LED to any CO port on the card which you want to monitor³⁶.

Installing the CO Card

For CO connectivity, you must install at least one of the above mentioned CO Cards in the system.

1. Take all the necessary precautions prescribed for handling the cards and electronic equipment. Make sure that power supply is turned off before you begin the installation of the card. Put on an electrostatic-discharge preventive wrist strap/belt and use a grounding mat.

36. To assign the LED to a selected port for monitoring its functioning, you must enter SE mode and dial the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

2. Unpack the CO card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Preserve the filler bracket for future use!
4. Insert the CO Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.
5. Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

If installing more than one CO Card, it is not necessary to insert the other cards in subsequent slots. Any card can be inserted in any of the Universal Slots.

6. Use the cables supplied for each connector on the CO Card to connect the Trunk Lines with the Main Distribution Frame.

Refer the illustrations below for the pinout details of the connectors on each card.

ETERNITY ME Card C016

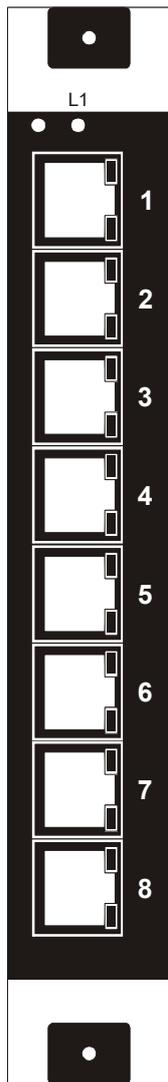

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Green - (Green & White)	CO	03
	Brown - (Brown & White)	CO	04
RJ45-2	Blue - (Blue & White)	CO	05
	Orange - (Orange & White)	CO	06
	Green - (Green & White)	CO	07
	Brown - (Brown & White)	CO	08
RJ45-3	Blue - (Blue & White)	CO	09
	Orange - (Orange & White)	CO	10
	Green - (Green & White)	CO	11
	Brown - (Brown & White)	CO	12
RJ45-4	Blue - (Blue & White)	CO	13
	Orange - (Orange & White)	CO	14
	Green - (Green & White)	CO	15
	Brown - (Brown & White)	CO	16

ETERNITY ME Card C08

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Green - (Green & White)	CO	03
	Brown - (Brown & White)	CO	04
RJ45-2	Blue - (Blue & White)	CO	05
	Orange - (Orange & White)	CO	06
	Green - (Green & White)	CO	07
	Brown - (Brown & White)	CO	08
RJ45-3	Unused		
RJ45-4	Unused		

ETERNITY ME Card CO8+SLT24

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	SLT	05
	Orange - (Orange & White)	SLT	06
	Green - (Green & White)	SLT	07
	Brown - (Brown & White)	SLT	08
RJ45-3	Blue - (Blue & White)	SLT	09
	Orange - (Orange & White)	SLT	10
	Green - (Green & White)	SLT	11
	Brown - (Brown & White)	SLT	12
RJ45-4	Blue - (Blue & White)	SLT	13
	Orange - (Orange & White)	SLT	14
	Green - (Green & White)	SLT	15
	Brown - (Brown & White)	SLT	16
RJ45-5	Blue - (Blue & White)	SLT	17
	Orange - (Orange & White)	SLT	18
	Green - (Green & White)	SLT	19
	Brown - (Brown & White)	SLT	20
RJ45-6	Blue - (Blue & White)	SLT	21
	Orange - (Orange & White)	SLT	22
	Green - (Green & White)	SLT	23
	Brown - (Brown & White)	SLT	24
RJ45-7	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Green - (Green & White)	CO	03
	Brown - (Brown & White)	CO	04
RJ45-8	Blue - (Blue & White)	CO	05
	Orange - (Orange & White)	CO	06
	Green - (Green & White)	CO	07
	Brown - (Brown & White)	CO	08

7. Plug in the RJ45 end of the Trunk Card cables into the respective connectors.
8. Terminate the free end of the CO Card cable into the punch down blocks of the Krone modules designated for 'Trunk Lines' on ["The Main Distribution Frame \(MDF\)"](#).

Trunk cables from the system are to be connected with the Trunk Lines from the PSTN/CO terminated on the MDF. Each wire-pair from the CO Port must be terminated on the bottom of the Krone Connector, while the wire-pair of the trunk line from the CO Network to be connected to this port must be terminated on the top of the Krone Connector.

Refer the topics ["The Main Distribution Frame \(MDF\)"](#) and ["Terminating Trunk and Extension Cables on the MDF"](#).

9. Repeat these steps to install other CO Cards, if applicable.
10. If you have completed all other installation tasks, power ON the system.

LED Pattern of the CO Card

Stage	LED Color	Cadence
Auto Upgradation ^a		
Card waiting for application	RED	ON-200ms-OFF 200ms
Card is up, loaded with new application	GREEN	ON-200ms-OFF 200ms
Initialization		
	RED	ON 500ms-OFF 500ms
	GREEN	ON 500ms - OFF 500ms
	ORANGE	ON 500ms - OFF 500ms
Stand-by task	ORANGE	1 sec GREEN - 1Sec Orange
Errors		
Flash Failure	None	None
RAM Failure	None	None

a. Done by the boot loader application.

Status of Selected CO Port

PORT Status	LED Color	LED Cadence
Selected CO's data are transmitted to CPU Card	RED	Toggle ^a on each event
Selected CO's data are received from CPU Card	RED	Toggle ^b on each request from Master

a. The current LED state will remain the same until the next event is received from the application on the CO Port. For example, if the current LED state is Green/Red ON, on the next event, the LED will be turned OFF. It will remain OFF until the next event occurs. When the next event is received it will be turned Green/Red ON again. This process continues.

b. Same as above note.

Jumpers on the Main Board

Jumper Number	Position	Function
J1	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J2 & J4	AB	NA
	BC (default)	Normal Operation/ Debug

The BRI Card

The BRI Card provides the interface to connect system with ISDN BRI Lines. The BRI lines may be from a public ISDN exchange, a private ISDN exchange.

BRI Cards of ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card BRI8	8-Port card to connect 8 ISDN BRI Lines or ISDN Compatible Devices
ETERNITY ME Card BRI4	4-Port card to connect 4 ISDN BRI Lines or ISDN Compatible Devices

The maximum number of BRI lines supported are 32.

Connectors

The BRI cards have RJ45 connectors. The ETERNITY ME BRI8 card has 8 RJ45 connectors for 8 BRI ports.

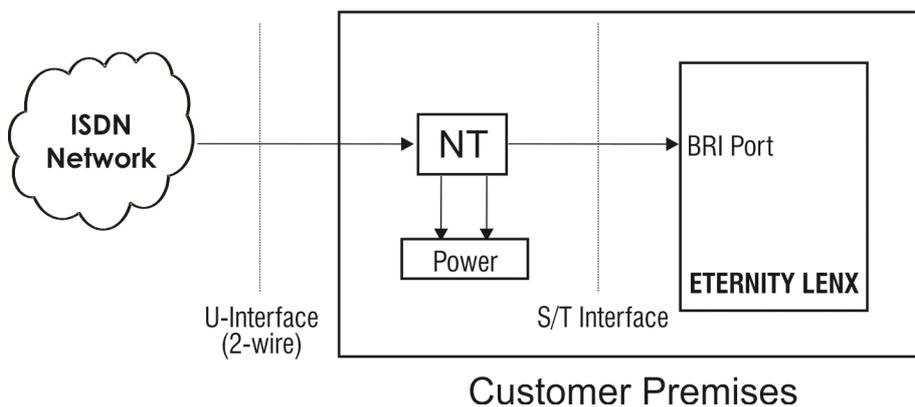

The ETERNITY ME BRI4 card has 4 RJ45 connectors for 4 BRI ports. A separate cable is supplied for each connector.

LEDs

The ETERNITY ME BRI8 and ETERNITY ME BRI4 has 4 LEDs.

ISDN BRI - Installation Scenarios

Most ISDN Service Providers also provide the NT1 device along with the BRI line. The BRI Line from the ISDN central office is terminated on the NT1 on the Customer's Premises, as illustrated below.

Where,

- U Interface = between the NT1 equipment and the ISDN central office.
- S/T Interface = between the ISDN user equipment, in this case, ETERNITY LENX and the Network Interface Equipment (NT1).

The BRI line is terminated on the NT1. The S/T interface of the NT1 is connected to BRI port of the ETERNITY LENX.

TE and NT Modes

In this illustration, the BRI line from ISDN Service Provider is directly connected to BRI port of the ETERNITY LENX via the NT1 device. Here, the ETERNITY LENX is the Terminal Equipment, so the BRI Port must be programmed to work in the TE mode.

When an ISDN Phone is to be connected to the BRI port of ETERNITY LENX, the BRI port must be programmed to work in NT mode.

When a BRI port of another ISDN System is to be connected to the BRI port of the ETERNITY LENX, in such a configuration, you may configure

- the BRI port of the other ISDN System in the TE mode and the BRI Port of the ETERNITY LENX in the NT mode.

OR

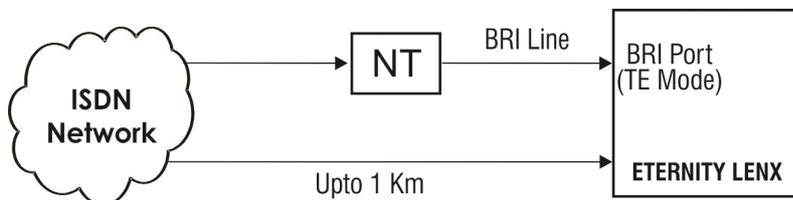

- the BRI port of the other ISDN System in the NT mode and the BRI Port of the ETERNITY LENX in the TE mode

Also refer the topic "[Configuring BRI Trunks](#)" to know more.

Types of BRI Configuration

There are two types of configurations in BRI: Point-to-Point Configuration and Point-to-Multipoint Configuration. Each of these is discussed below.

Point-to-Point Configuration

The maximum distance between the NT (Network Termination, NT1 or NT2) and a single Terminal Equipment, in this case ETERNITY LENX, can be up to 1 kilometer.

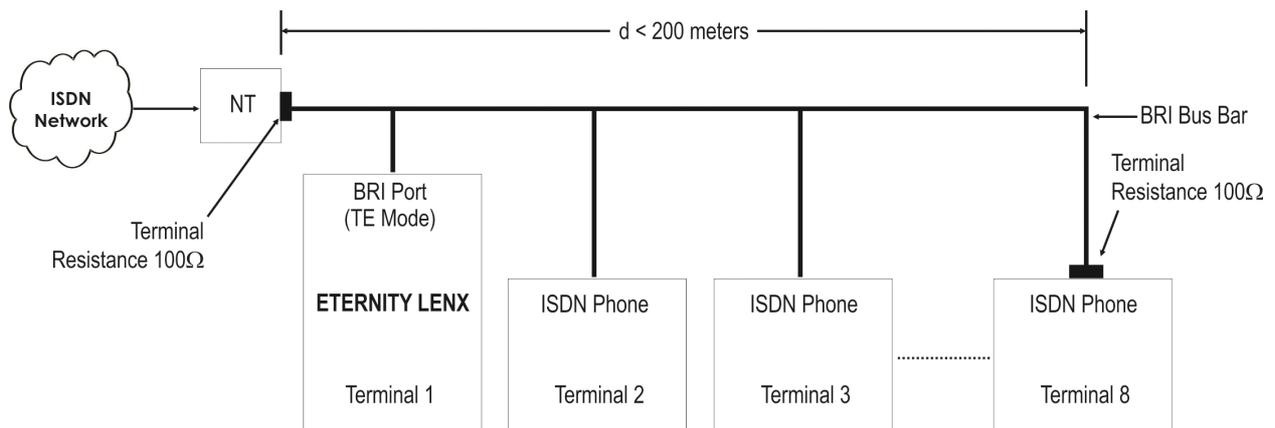

Point-to-Multipoint Configuration

A maximum of 8 ISDN equipment can be connected on a single BRI Bus line in a Point-to-Multipoint configuration.

Further, two configurations are possible in a Point-to-Multipoint configuration:

- a. Short Passive Bus Configuration
- b. Extended Passive Bus Configuration

Short Passive Bus Configuration

Where,

TE = Terminal Equipment or ISDN device (End user device)

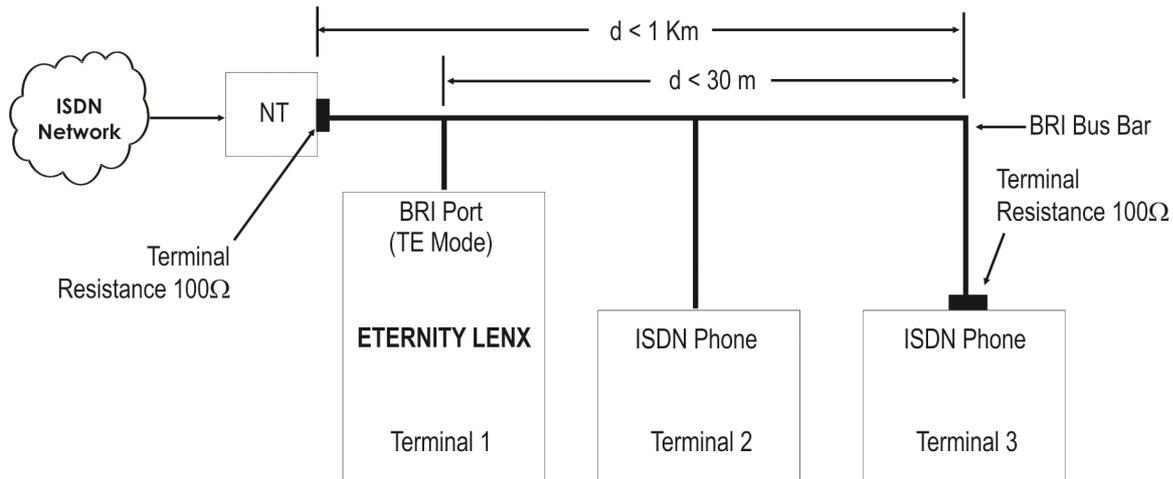

NT = Network Termination provided by the ISDN Service Provider

d = distance from NT to the last TE equipment.

In a Short Passive Bus Configuration,

- A maximum of 8 TEs or ISDN devices can be connected to a single NT on a bus up to 200 meters from the NT.
- 100Ω Terminal Resistance is required to be inserted at the NT side as well as the last TE Equipment as shown in the figure.
- Using this configuration, any subscriber from ETERNITY LENX can access a BRI line and can make outgoing calls. At the same time, another subscriber from ETERNITY LENX or any ISDN phone shown in the figure can make outgoing call from the same BRI. In the same way, incoming calls are possible on the same BRI.
- Only two simultaneous speech paths can be established, as BRI supports 2 voice channels only.
- This configuration is useful on the smaller premises, where a single BRI line and multiple ISDN devices are used.

Extended Passive Bus Configuration

Where,

TE = Terminal equipment of any ISDN Equipment

NT = Network Termination provided by Service Provider

TR Terminal Resistance 100Ω

d = distance from NT to the last TE Equipment

d_1 = the total distance from first TE equipment and the last TE equipment.

In an Extended Passive Bus Configuration,

- You can connect only 3 Terminal Equipment or ISDN devices. These devices are grouped together at one end of the bus, with may extend to a distance of up to 1 kilometer from the NT.
- However, all the 3 Terminal Equipment/ISDN devices must be located within a range of 30 meters, as shown in the figure.
- Using this configuration, any subscriber from ETERNITY LENX can access the BRI line and make outgoing calls. At the same time, another subscriber from the ETERNITY LENX or any ISDN phone shown in the figure can make outgoing calls from the same BRI. In the same way, incoming calls are possible on the same BRI.
- Only two simultaneous speech paths can be established, as BRI supports 2 voice channels only.
- This configuration is useful on large premises where a limited number of ISDN devices (maximum 3) are to be used within a range of 30 meters.

Installing the BRI Card

1. Take all the necessary precautions prescribed for handling the cards and electronic equipment: turn off power supply, always wear an electrostatic-discharge preventive wrist strap/belt and use a grounding mat.
2. Unpack the BRI Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket! Preserve it for future use!

Setting Orientation Type of BRI Port

- The BRI Ports can be configured for different applications and can be interfaced directly with the BRI Network with Terminal Equipment like an ISDN Phone, with an ISDN-System.

To connect the BRI Port to the public network, BRI Port must configured in the TE mode.

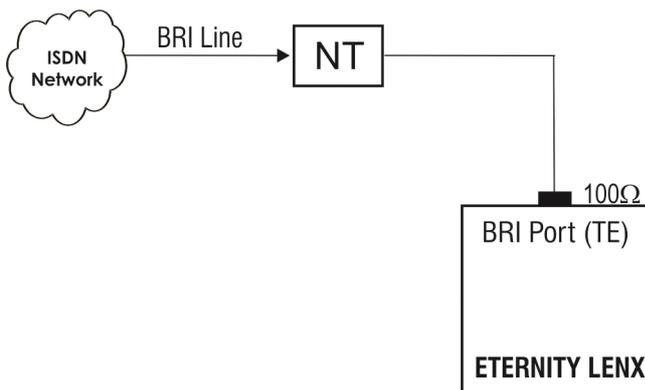

To connect ISDN phones, an ISDN System or any ISDN equipment, the BRI Port must be configured in the NT mode.

By default, BRI Ports are configured in the TE mode.

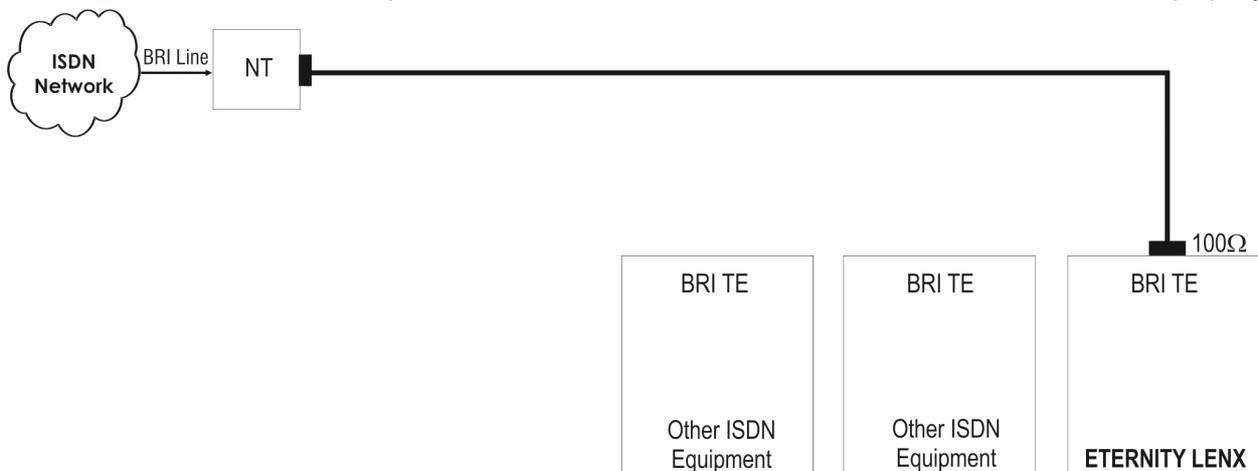

To set Orientation Type of the BRI Port, under **Configuration**, open the **BRI Configuration** link, and under **BRI Parameters**, set the **Orientation Type**.

Inserting Termination Resistance

- Termination of 100Ω should be inserted in the following cases:
 - When the BRI port is configured in the TE mode and connected in a Point-to-Point configuration as shown below.

- When the BRI port is configured in the TE mode in a Point-to-Multipoint configuration as shown below. 100Ω Termination is required on the last Terminal connected on the S0 bus to terminate calls properly.

In a Point-to-Multipoint configuration, 100Ω termination can be provided on either of the following:

- Last TE equipment
- Last point of the bus bar where the last TE equipment is connected.
- When BRI port is configured in the NT mode.
-  If the S0 bus itself supports Terminating resistors, Termination Resistance need not be inserted when
 - BRI Port is configured as TE and connected in a Point-to-Point Configuration as illustrated above.
 - BRI Port is configured as NT.
- Termination need not be inserted if the BRI port of ETERNITY LENX (configured in TE mode) is connected as any terminal other than the last terminal on the S0 bus (in a Multi-point configuration).

Termination in TE Equipment (BRI Port)

6. To set the 100Ω termination on the BRI port set the Jumpers on the BRI Module (daughter-board) to the position described below:

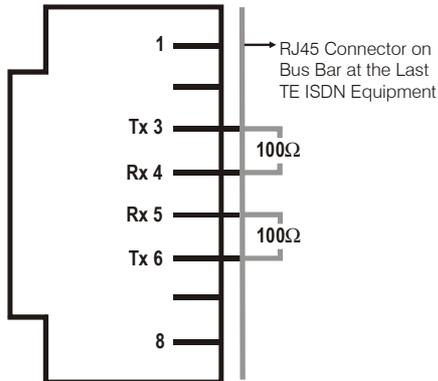

Function	Module 2 (M2)				Module 3 (M3)			
	BRI Port 1		BRI Port 2		BRI Port 3		BRI Port 4	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J6	J8	J7	J9	J6	J8	J7	J9
To insert 100Ω termination	AB	AB	AB	AB	AB	AB	AB	AB
To remove 100Ω termination	BC	BC	BC	BC	BC	BC	BC	BC

Function	Module 4 (M4)				Module 5 (M5)			
	BRI Port 5		BRI Port 6		BRI Port 7		BRI Port 8	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J6	J8	J7	J9	J6	J8	J7	J9
To insert 100Ω termination	AB	AB	AB	AB	AB	AB	AB	AB
To remove 100Ω termination	BC	BC	BC	BC	BC	BC	BC	BC

 By default, Termination Resistance of 100Ω is set on the BRI port (the Jumpers are in AB position).

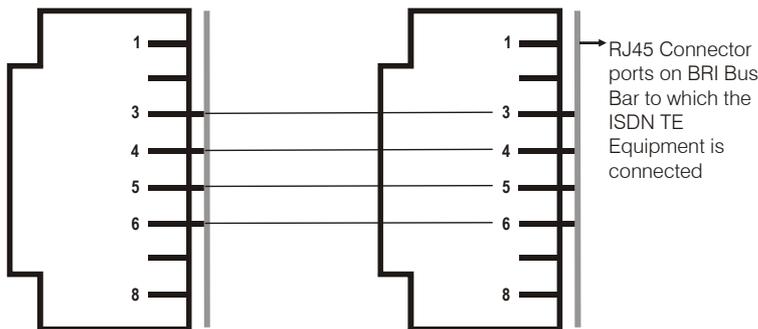

Termination in the Bus Bar

7. 100Ω termination resistor can be connected between TX and RX, between pin number 3-4 and 5-6 in the RJ45 connector as illustrated below.

As shown in the application diagrams for Point-to-Multipoint connectivity, each ISDN TE device is connected in a Bus Bar, which may be Short Passive Bus Bar configuration or an Extended Passive Bus Bar configuration.

Illustrated below is the connection diagram of two ports connected with each other on the same BRI bus bar.

- The above figure shows the connection details of two ports on the BRI Bus Bar. Similarly, you can connect 8 ports on the Bus Bar, keeping in mind the Termination Resistor for the NT and the Last TE on the Bus bar.
- Pin number 3, 4, 5 and 6 of the RJ45 connector are used for connectivity.
- Pin number 3 and 6 are used for Transmit (Tx) and pin number 4 and 5 are used for Receive (Rx) from the ISDN TE side.
- Pin number 3 and 6 are used for Receive (Rx) and pin number 4 and 5 are used for Transmit (Tx) from the NT side.

Feeding Power to the Terminal

8. When the BRI Port of the ETERNITY LENX is used as BRI-NT, you can feed power to the terminal equipment connected to the BRI-NT Port from the ETERNITY LENX.

To do this,

- Enable Feed Power on the BRI Port. For instructions see Power Feed under "[Configuring BRI Trunks](#)".

- By default, the Jumpers are set in AB position to feed power through Tx and Rx wires (Phantom Power). If you want to feed power through a separate pair of wires, you may change the position of the Jumpers on the BRI module as mentioned in the table below.

Function	Module 2 (M2)				Module 3 (M3)			
	BRI Port 1		BRI Port 2		BRI Port 3		BRI Port 4	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J4	J5	J2	J3	J4	J5	J2	J3
To feed power on Tx and Rx wires (Phantom Power)	AB	AB	AB	AB	AB	AB	AB	AB
To feed power on separate pair of wires	BC	BC	BC	BC	BC	BC	BC	BC

Function	Module 4 (M4)				Module 5 (M5)			
	BRI Port 5		BRI Port 6		BRI Port 7		BRI Port 8	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J4	J5	J2	J3	J4	J5	J2	J3
To feed power on Tx and Rx wires (Phantom Power)	AB	AB	AB	AB	AB	AB	AB	AB
To feed power on separate pair of wires	BC	BC	BC	BC	BC	BC	BC	BC

- *The maximum power that can be fed to a single BRI port is 50mA.*
- *From signaling point of view, a maximum of 8 terminal equipment can be connected on the BRI port configured in the NT mode.*
- *The number of ISDN Terminals that can be connected on the BRI port configured in the NT mode depends on the power consumed by the ISDN terminals.*

9. Insert the BRI Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.

Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

If installing more than one BRI Card, it is not necessary to insert the other cards in subsequent slots. Any card can be inserted in any of the Universal Slots. Remember to set the Orientation Type, Termination Resistance and Power Feed, as required.

10. Use the straight cables supplied for each connector on the BRI card to connect the BRI Ports to the NT1 device supplied by your ISDN service provider. Refer the configuration and pinout details given below for guidance.

Configuration details of the U interface (RJ-45) at NT1

Pin Number	Pin Details
4	Tx
5	Rx

Configuration details of the S/T interface (RJ-45) on NT1

Pin Number	Pin Details
3	Rx1
4	Tx1
5	Tx2
6	Rx2

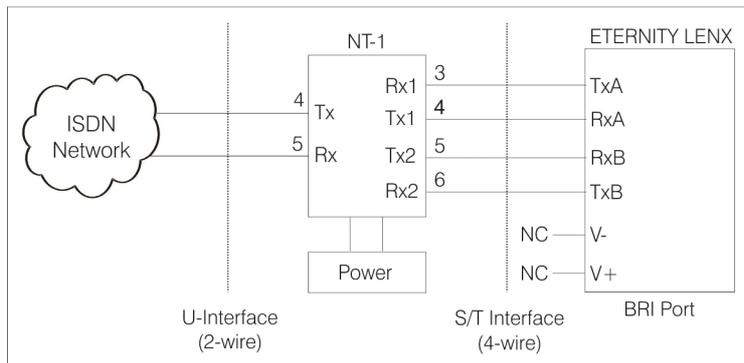

Pinout and Cable Details of BRI4 Port in TE Mode

Pin	Color	Connection
1	Orange-White	Not connected
2	Orange	Not connected
3	Green-White	TxA
4	Blue	RxA
5	Blue-White	RxB
6	Green	TxB
7	Brown-White	V-
8	Brown	V+

Pinout and Cable Details of BRI4 Port in NT Mode

Pin	Color	Connection
1	Orange-White	Not connected
2	Orange	Not connected
3	Green-White	RxA
4	Blue	TxA
5	Blue-White	TxB
6	Green	RxB
7	Brown-White	V-
8	Brown	V+

The following diagram shows how to connect a BRI Line to the BRI port in the TE mode.

11. If you have completed all other installation tasks, you may turn ON the system and observe the Reset Cycle and the LED pattern of the BRI Card.

LED Pattern of the BRI Card

- The BRI8 Card has 8 LEDs: L1³⁷, L2, L3, L4, L5³⁸, L6, L7 and L8. These display the status of each port.
- The BRI4 Card has 4 LEDs: L1³⁹, L2, L3 and L4. These display the status of each port.

The LEDs show the Status of the Ports as summarized in the table below:

Port Status	LED Color	LED Cadence
Port is not active	RED	Continuously ON
Port is active	GREEN	Continuously ON

37. This LED keeps blinking. It displays the system heart bits, at the rate of 100ms. It will remain OFF for 100ms and will show the status of port 1 for the next 100ms.

38. This LED keeps blinking. It displays the system heart bits, at the rate of 100ms. It will remain OFF for 100ms and will show the status of port 1 for the next 100ms.

39. This LED keeps blinking. It displays the system heart bits, at the rate of 100ms. It will remain OFF for 100ms and will show the status of port 1 for the next 100ms.

The T1E1PRI Card

The ETERNITY ME T1E1PRI Card provides the interface to connect the system to ISDN Network.

When connected to T1 carrier lines, the Card supports the following signaling types:

- PRI
- Robbed Bit Signaling
- Q-Signaling (QSIG)
- E&M

When connected to E1 carrier lines, the Card supports the following signaling types:

- PRI
- Channel Associated Signaling (CAS)
- Q-Signaling (QSIG)
- E&M

The T1E1PRI Card is available in the following configurations:

T1E1PRI Card for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card T1E1PRI Dual	2-Port card with QSIG support to connect 2 ISDN T1/E1 PRI Lines or ISDN Compatible Devices
ETERNITY ME Card T1E1PRI Single	1-Port card with QSIG support to connect 1 ISDN T1/E1 PRI Line or ISDN Compatible Device

The maximum number of PRI Lines supported are 24.

Connectors

The T1E1PRI card has an RJ45 Connector for each port. The ETERNITY ME T1E1PRI Dual card has 2 RJ45 Connectors for the two ports, while the ETERNITY ME T1E1PRI Single card has a single RJ45 Connector.

A cable with RJ45 plugs on both ends is supplied for each connector.

LEDs

The ETERNITY ME T1E1PRI Dual Card has four LEDs: L1, L2, L3 and L4.

The ETERNITY ME T1E1PRI Single Card has two LEDs L1 and L2.

Installing the T1E1PRI Card

1. Before installing the card, take the necessary precautions prescribed for handling the cards. Always wear an electrostatic-discharge preventive wrist strap and use a grounding mat. Make sure the power supply is turned off.
2. Unpack the T1E1PRI Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket.

Setting Line Termination Resistor

4. The default positions of SW3, SW4, SW6, SW7 switches should be as follows:

Pin1	Pin2	Pin3	Pin4	Termination Resistance (Ω)
OFF	OFF	OFF	ON	0 (Default)

Do Not Change the positions of any of these switches!

5. By default, termination resistance of PRI port is set as 120 Ω , which is for E1 connectivity.
- To use the PRI Port for T1 connectivity, termination resistance must be changed to 100 Ω .
 - Use DIP Switch SW5 to change the Termination Resistance of PRI Port 1. Set the Pins of SW5 as shown below:

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

- If using the ETERNITY ME T1E1PRI Dual Card, use DIP Switch SW2 to change the Termination Resistance of PRI Port 2. Set the Pins of SW2 as shown below:

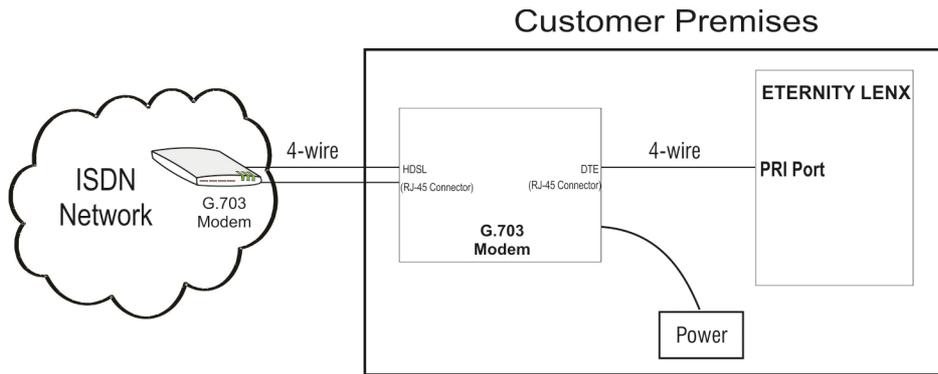

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

6. Insert the T1E1PRI Card into the guide rails of the free slot you selected for the card. Make sure that the connectors on the card make perfect contact with those of the slot on the backplane motherboard.
7. Now, press down the levers on the card mounting brackets to secure the card in its slot. Fix the card in place with the two screws provided.

Connecting ISDN T1/E1 PRI Lines

8. Use the cable supplied with the T1E1PRI Card to connect the system to the T1/E1 PRI network interface equipment (modem), which is usually supplied by your ISDN Service Provider along with the PRI line.

The diagram below illustrates this.

- Most Service Providers insist on connecting an ISDN modem at both the ends of the PRI line—one at the Local Exchange and other at the Customer's Premises.
 - At the Customer's Premises, the PRI line is terminated on the HDSL interface of the modem.
 - The DTE interface of the modem is to be connected to the PRI port (RJ-45 connector on the ETERNITY ME T1E1PRI Card).
9. Plug in one end of the RJ45 cable supplied with the card into the card's connector. Plug the other end of the RJ45 cable into the Network Termination Unit.
 10. Refer the following pin details for connecting the Network Termination Unit with the system.

Pin details of HDSL Interface of the G.703 Modem. (HDSL Network Termination Unit)

Pin Number	Pin Details
1	Line A
2	Line A
3	Not used
4	Line B
5	Line B
6	Not used
7	Not used
8	Not used

Pin details of DTE Interface of G.703 Modem. (HDSL Network Interface Unit)

Pin Number	Pin Details
1	TX1 (Tip)
2	TX2 (Ring)
3	Not used
4	RX1 (Ring)

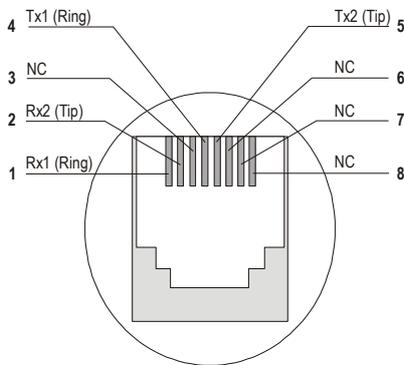

Pin Number	Pin Details
5	RX2 (Tip)
6	Not used
7	Not used
8	Not used

Most of the HDSL Network Termination Unit manufacturers use these connectors. But you are advised to read the installation guide of the HDSL Network Termination Unit being used by you.

Pin details of the System's T1E1PRI Port

The T1E1PRI Port of the system terminates in an 8-pin RJ45, female connector and is wired according to the table below.

The cable wires may have to be crossed depending on the pinout of the DTE Interface of the modem.

11. Repeat the same steps to install another card. It is not necessary to install the other T1E1PRI Cards in a sequence. Any card can be installed in any of the slots.
12. If you have completed all other installation tasks. Power the system. After the Reset Cycle, observe the LED patterns of the T1E1PRI Card.

LED Patterns

The ETERNITY ME T1E1PRI Dual Card has four LEDs: L1, L2, L3 and L4.

- L1 and L2 are assigned to PRI Port 1 (PRI#1)
- L3 and L4 are assigned to PRI Port 2 (PR1#2)
- L1⁴⁰ shows Card Heart Bit as well as status of Port 1.

The ETERNITY ME T1E1PRI Single Card has two LEDs: L1 and L2.

Given below are the LED Patterns defined for indicating port states in the signaling types supported by the ETERNITY LENX.

40. This LED keeps blinking. It displays the system heart bits, at the rate of one second. It will remain OFF for one second and will show the status of port 1 for the next one second.

1. Port Active Mode

Signaling Type: E1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: E1-CAS

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
MFA Alarm	RED	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
Y-Bit Alarm	GREEN	100ms ON-100 ms OFF
AIS16 Alarm	RED	100ms ON-100 ms OFF
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: T1-RBS or T1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
No Alarm	GREEN	Continuous ON
BFA Alarm or MFA Alarm	RED	500ms ON-500 ms OFF
AIS Alarm	RED	100ms ON-100 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI or LOS Alarm	RED	Continuous ON

2. Port Maintenance Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Maintenance Mode	RED -GREEN	500 ms RED-500 ms GREEN

LED2/LED4 Pattern:

Port Status	Color	Cadence
Near end loop back wait before activate	RED	100ms ON-100 ms OFF
Near end loop active	RED	Continuous ON
Near end loop back wait before deactivate	RED	500ms ON-500 ms OFF
Far end loop back wait after activate	GREEN	100ms ON-100 ms OFF
Far end loop active	GREEN	Continuous ON
Far end loop back wait after deactivate	GREEN	500ms ON-500 ms OFF

3. Port Disable Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Port Disable	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Port Disabled	OFF	OFF

Jumpers on the Main Board

Jumper Number	Position	Function
J5 ^a	AB	Dual T1E1
	BC	Single T1E1
J6	AB	JTAG Mode
	BC (default)	Embedded ICE
J7	AB	Internal Boot
	BC (default)	External Boot
J8 & J12	AB (default)	Debug
	BC	UART
J9, J10 & J11	BC (default)	Normal
	AB	Boot

a. In T1E1 PRI Dual Card, default jumper position will be AB. In T1E1 PRI Single Card, default jumper position will be BC.

The E1FO Card

The ETERNITY LE E1FO Card provides the interface to connect the ETERNITY to the ISDN PRI Network. For E1 carrier lines the card supports the signaling types PRI, Q-Sig and CAS. For T1 carrier lines the card supports the signaling types PRI, Q-Sig and Robbed Bit Signaling. The T1/E1 ports can be set in Terminal or Network mode.

The E1FO Card supports Copper and Fiber Optic (FO) interfaces. At a time, either the Copper interface or the FO interface can be used. The FO interface supports only Single-mode (Mono mode) fiber connectivity and will work within a range of 30km.

E1 connectivity is supported over, the Copper interface as well as the Fiber Optic interface. The T1 connectivity is supported over the Copper interface only.

The E1FO Card is available in the following configurations:

E1FO Card for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card E1FO Dual	2-Port card to connect 2 ISDN T1/E1 Lines.
ETERNITY ME Card E1FO Single	1-Port card to connect 1 ISDN T1/E1 Line.

Connectors

The E1FO Dual card has two RJ45 Connectors and two Fiber Optic connectors. The E1FO Single card has one RJ45 Connector and one Fiber Optic connector.

LEDs

The ETERNITY ME E1FO Dual Card has four LEDs: L1, L2, L3 and L4.

The ETERNITY ME E1FO Single Card has two LEDs L1 and L2.

Installing the E1FO Card

1. Before installing the card, take the necessary precautions prescribed for handling the cards. Always wear an electrostatic-discharge preventive wrist strap and use a grounding mat. Make sure the power supply is turned off.
2. Unpack the E1FO Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket.

Setting Line Termination Resistor

4. The default positions of SW3, SW4, SW6, SW7 switches should be as follows:

Pin1	Pin2	Pin3	Pin4	Termination Resistance (Ω)
OFF	OFF	OFF	ON	0 (Default)

Do Not Change the positions of any of these switches!

5. By default, termination resistance of PRI port is set as 120 Ω , which is for E1 connectivity.
- To use the PRI Port for T1 connectivity, termination resistance must be changed to 100 Ω .
 - Use DIP Switch SW5 to change the Termination Resistance of PRI Port 1. Set the Pins of SW5 as shown below:

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

- If using the ETERNITY ME E1FO Dual Card, use DIP Switch SW2 to change the Termination Resistance of PRI Port 2. Set the Pins of SW2 as shown below:

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

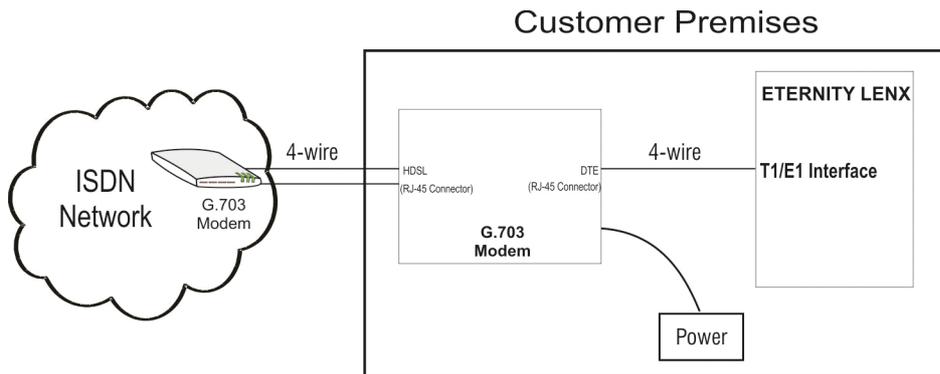

6. Insert the E1FO Card into the guide rails of the free slot you selected for the card. Make sure that the connectors on the card make perfect contact with those of the slot on the backplane motherboard.
7. Now, press down the levers on the card mounting brackets to secure the card in its slot. Fix the card in place with the two screws provided.

Connecting the T1/E1 Lines

Copper Interface Connectivity

8. Use the cable to connect the T1/E1 Port to the T1/E1 network interface equipment (modem), which is usually supplied by your ISDN Service Provider along with the PRI line.

The diagram below illustrates this.

- Most Service Providers insist on connecting an ISDN modem at both the ends of the PRI line—one at the Local Exchange and other at the Customer's Premises.
 - At the Customer's Premises, the PRI line is terminated on the HDSL interface of the modem.
 - The DTE interface of the modem is to be connected to the PRI port (RJ45 connector on the Matrix ETERNITY ME CARD E1FOPRI Single).
9. Plug in one end of the RJ45 cable into the card's connector. Plug the other end of the RJ45 cable into the Network Termination Unit.
 10. Refer the following pin details for connecting the Network Termination Unit with the system.

Pin details of HDSL Interface of the G.703 Modem. (HDSL Network Termination Unit)

Pin Number	Pin Details
1	Line A
2	Line A
3	Not used
4	Line B
5	Line B
6	Not used
7	Not used
8	Not used

Pin details of DTE Interface of G.703 Modem. (HDSL Network Interface Unit)

Pin Number	Pin Details
1	TX1 (Tip)
2	TX2 (Ring)
3	Not used
4	RX1 (Ring)

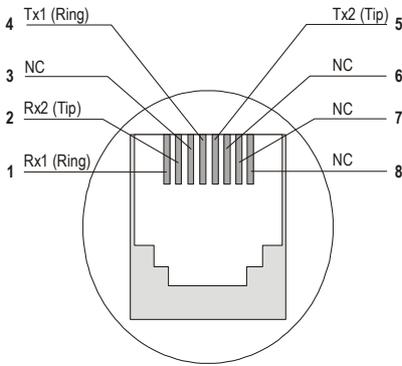

Pin Number	Pin Details
5	RX2 (Tip)
6	Not used
7	Not used
8	Not used

Most of the HDSL Network Termination Unit manufacturers use these connectors. But you are advised to read the installation guide of the HDSL Network Termination Unit being used by you.

Pin details of the T1/E1 PRI Interface

The T1/E1 Interface of the ETERNITY ME CARD E1FOPRI Single terminates in an 8-pin RJ45, female connector and is wired according to the table below.

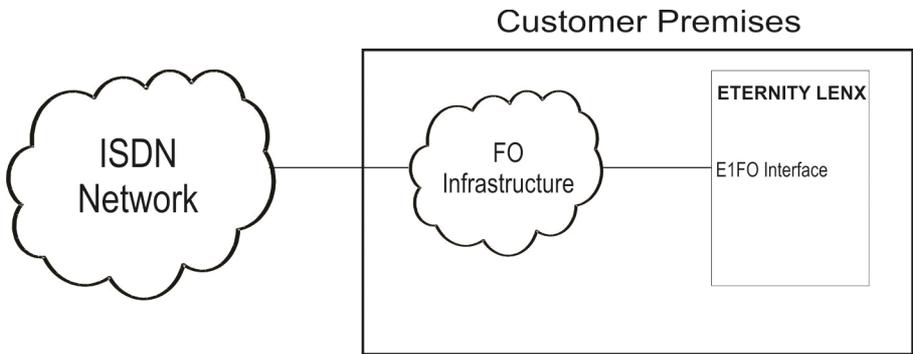

The cable wires may have to be crossed depending on the pinout of the DTE Interface of the modem.

Fiber Optic Interface Connectivity

- Fiber Optic interface supports E1 connectivity only.
- The Fiber Option (FO) interface supports only Single-mode (Mono mode) fiber connectivity and will work within a range of 30km.

- If your service provider provides Fiber Optic connectivity or you have an existing Fiber Optic infrastructure, you can connect the FO line to the E1FO interface of the E1FO Card.

To use Fiber Optic interface, make sure you select **Line Coding Mechanism** as **NRZ (Fiber Optic)**. For details, see [“Configuring E1 Trunks”](#).

- Repeat the same steps to install another card. It is not necessary to install the other E1FO Cards in a sequence. Any card can be installed in any of the slots.
- If you have completed all other installation tasks. Power the system. After the Reset Cycle, observe the LED patterns of the E1FO Card.

LED Patterns

The ETERNITY ME E1FO Dual Card has four LEDs: L1, L2, L3 and L4.

- L1 and L2 are assigned to PRI Port 1 (PRI#1)
- L3 and L4 are assigned to PRI Port 2 (PRI#2)
- L1⁴¹ shows Card Heart Bit as well as status of Port 1.

The ETERNITY ME E1FO Single Card has two LEDs: L1 and L2.

Given below are the LED Patterns defined for indicating port states in the signaling types supported by the ETERNITY LENX.

1. Port Active Mode

Signaling Type: E1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

41. This LED keeps blinking. It displays the system heart bits, at the rate of one second. It will remain OFF for one second and will show the status of port 1 for the next one second.

Signaling Type: E1-CAS

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
MFA Alarm	RED	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
Y-Bit Alarm	GREEN	100ms ON-100 ms OFF
AIS16 Alarm	RED	100ms ON-100 ms OFF
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: T1-RBS or T1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
No Alarm	GREEN	Continuous ON
BFA Alarm or MFA Alarm	RED	500ms ON-500 ms OFF
AIS Alarm	RED	100ms ON-100 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI or LOS Alarm	RED	Continuous ON

2. Port Maintenance Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Maintenance Mode	RED -GREEN	500 ms RED-500 ms GREEN

LED2/LED4 Pattern:

Port Status	Color	Cadence
Near end loop back wait before activate	RED	100ms ON-100 ms OFF
Near end loop active	RED	Continuous ON
Near end loop back wait before deactivate	RED	500ms ON-500 ms OFF
Far end loop back wait after activate	GREEN	100ms ON-100 ms OFF
Far end loop active	GREEN	Continuous ON
Far end loop back wait after deactivate	GREEN	500ms ON-500 ms OFF

3. Port Disable Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Port Disable	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Port Disabled	OFF	OFF

The E&M Card

The E&M Card of the system provides the interface for analog trunking to connect various communication equipment telephone switches, Routers, Leased Lines, etc. using Tie-Lines.

The E&M Card is required for the following applications:

- Power Line Carrier Communication (PLCC) Networks, where several systems are connected with each other through E&M tie lines. Refer [“PLCC-An Introduction”](#) to know more.
- [“Closed User Group \(CUG\)”](#), where several systems are connected with each other through E&M tie lines⁴².
- System expansion, where two systems are connected with each other with E&M tie lines.
- Connecting remote systems over E&M tie lines.

Refer the topic [“E&M Connectivity”](#) to know more.

An E&M Port can be programmed to behave as a Trunk Interface, a Subscriber (Station) Interface or both, as a Tie Line with the dual personality of a Trunk and a Subscriber.

The E&M Card supports

- E&M Interface - Types IV and V
- Speech Interface - Two-wire and four-wire.
- E&M Trunk Seizure Type⁴³: Immediate, Immediate + Wink, Immediate with Ack, Immediate with Ack+Wink, Seizure Pulse, Seizure Pulse + Wink, Express, and Compander Control Signal.
- Address Signaling: Pulse dial (Pulse 10PPS, Pulse 20PPS) and Tone Dial (DTMF).

The E&M Card is available in the following configurations:

E&M Card for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card E&M8	8-port card to connect 8 E&M Tie Lines
ETERNITY ME Card E&M4	4-port card to connect 4 E&M Tie Lines

The maximum number of E&M ports supported are 64.

Connectors

The E&M Card has RJ45 Connectors. A separate MDF cable is supplied for each connector.

42. The Systems in a [“Closed User Group \(CUG\)”](#) can be connected over ISDN T1E1PRI Lines as well. Refer the topic [Closed User Groups to know more](#).

43. This is the line protocol that defines how the equipment seizes the E&M trunk. Also referred to as Start Dial Supervision Signaling Protocol.

LEDs

The ETERNITY ME Card E&M8 has eight tri-color LEDs. The ETERNITY ME Card E&M4 has 4 LEDs, to indicate the functioning of the ports.

Installing the E&M Card

An E&M port can be programmed to take on the function of:

- **a Station** - works like an extension interface, receiving incoming calls.

OR

- **a Trunk** - works like a trunk interface when any of the extensions of the system makes an outgoing call through it.

OR

- **a Tie Line** - takes on a dual personality: functioning as both as an extension and a trunk. The E&M port works like an extension interface for incoming calls. It works like a trunk interface when any extension makes an outgoing call through it.

This dual function is used in systems that are used as Transit Exchanges as in a PLCC Network. Read ["PLCC-An Introduction"](#) to know more.

You cannot connect a trunk line or an SLT / DKP to an E&M port.

1. Have the necessary wiring for the E&M Analog trunk in place. Take the necessary safety precautions before you begin handling the card; switch off power supply and always wear an antistatic wrist strap and use a grounding mat.
2. Unpack the E&M Card and check the package contents.
3. The E&M Card supports E&M Interface Type IV and Type V connection. To select the appropriate Interface Type out of the two, you need to change the Jumper Settings.

Refer the table below to select the desired Interface Type and Speech Interface.

Jumper Number	Position	Function
J1 and J2	AB	Type IV E&M Interface
	BC	Type V E&M Interface

- By default all the E&M Ports are set to support Type-IV.
- To select the Type-V connection for the E&M Port, set Jumpers J1 and J2 (located on the E&M module) in BC Position.

4. Select the speech interface - 2-wire speech or 4-wire speech - as required, by changing the jumper settings. Refer the table below.

Jumper Number	Position	Function
J3 and J4	AB	4-wire speech interface
	BC	2-wire speech interface

- By default all the E&M Ports are set to support 2-wire Speech Interface.
- To select 2-wire speech interface for the E&M Port, set Jumpers J3 and J4 (given on E&M module) to BC Position.
- To select 4-wire speech interface for the E&M Port, set Jumpers J3 and J4 on E&M module to AB Position.

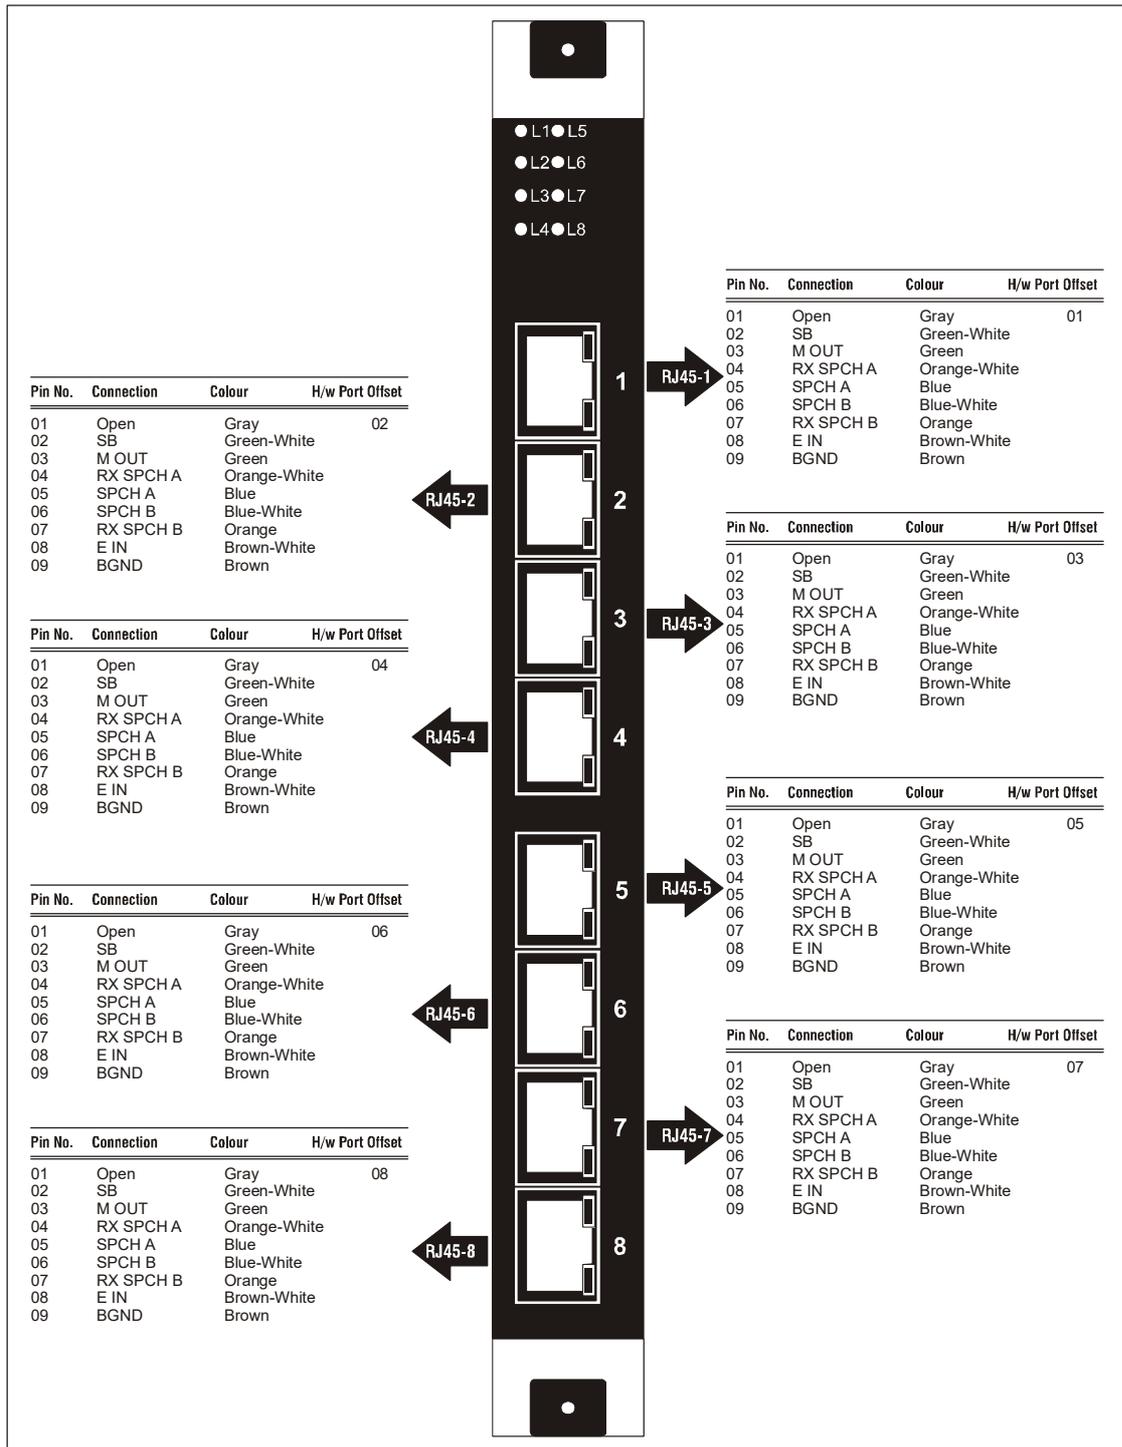

Keep Jumper number J5 in BC position and Jumper number J6 in BC/Open position.

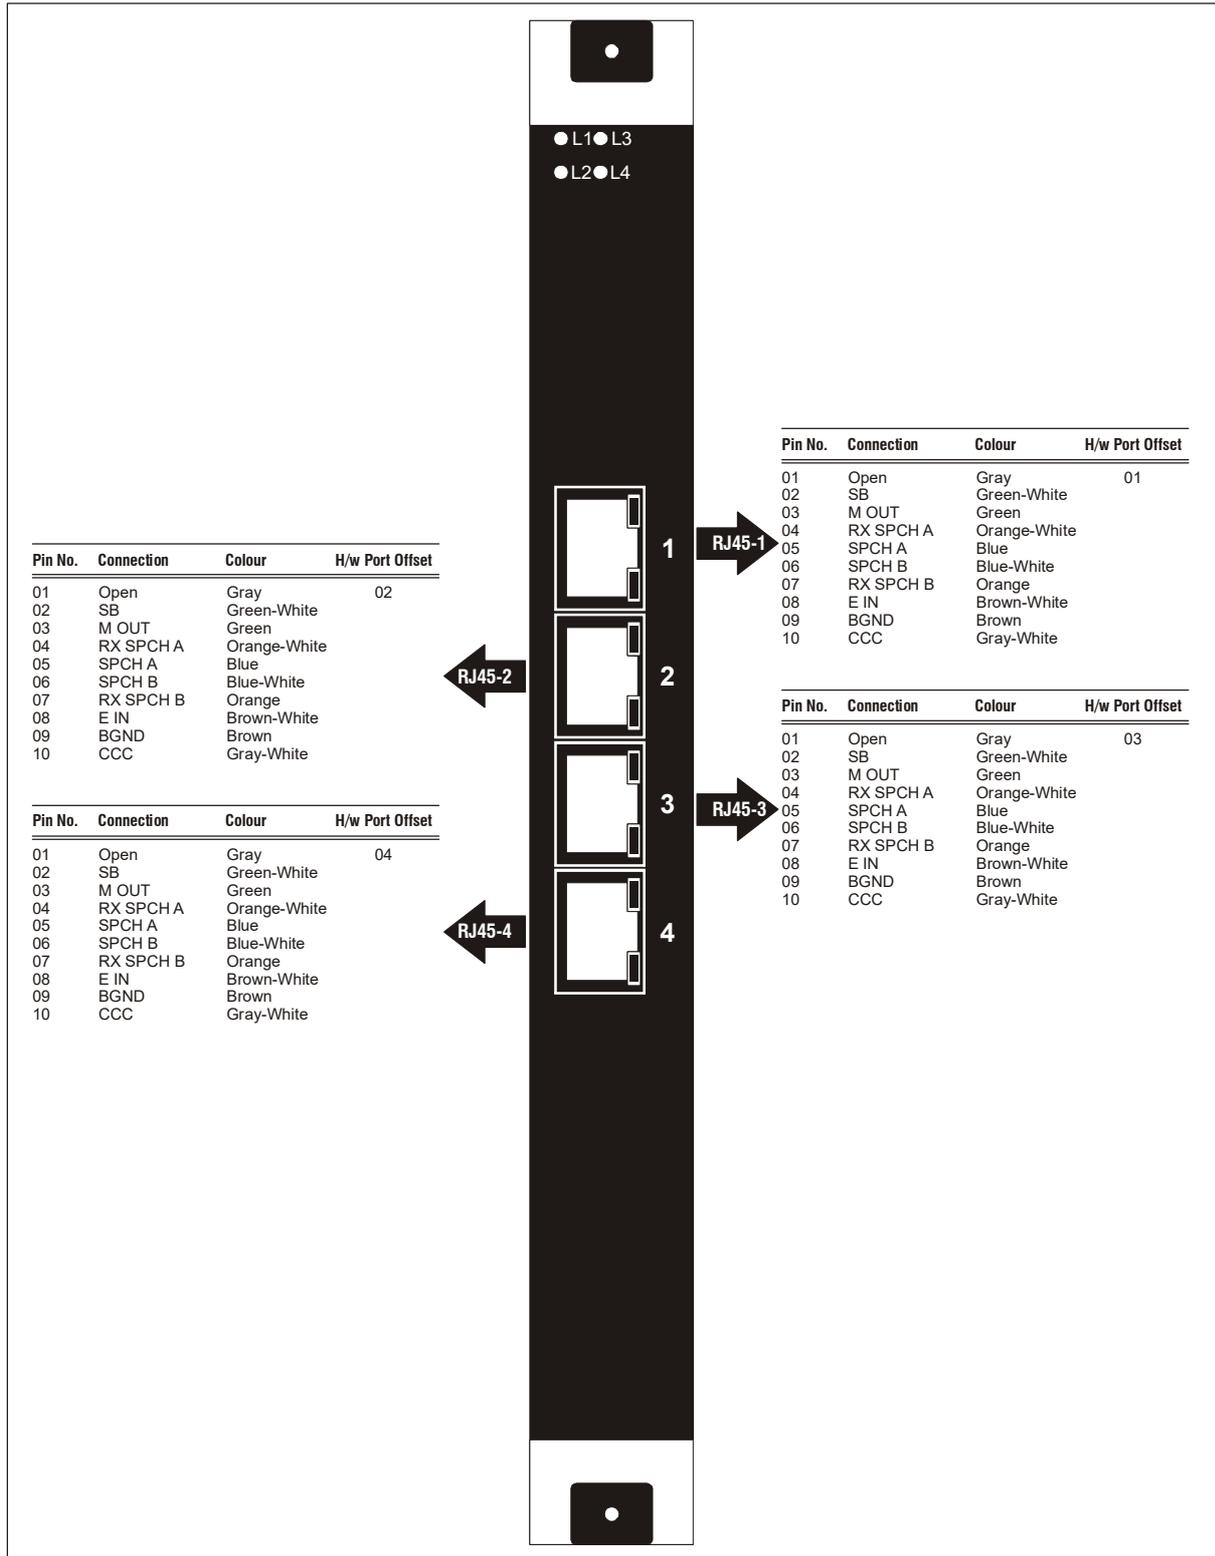

5. Now, select a free slot for the E&M Card. Unscrew and remove the filler bracket by pushing up the levers on the bracket. Preserve the filler bracket for future use.
6. Insert the E&M Card into guide rails of the empty slot. Make sure the connectors on the card make perfect contact with those on the backplane motherboard. Secure the card by pressing down the levers and fix the bracket with the screws provided with the card.
7. Connect the cables supplied with the E&M Card into the RJ45 connectors on the E&M Card.
8. Connect the free ends of the cables into the E&M Ports of the other System/PBX/Router/Tie Line equipment by appropriate crossing of the wires.

Refer the following pin-out details for the E&M Card and for each Interface and Speech Interface Type.

Pinout details of ETERNITY ME Card E&M8 - RJ45 Connectors

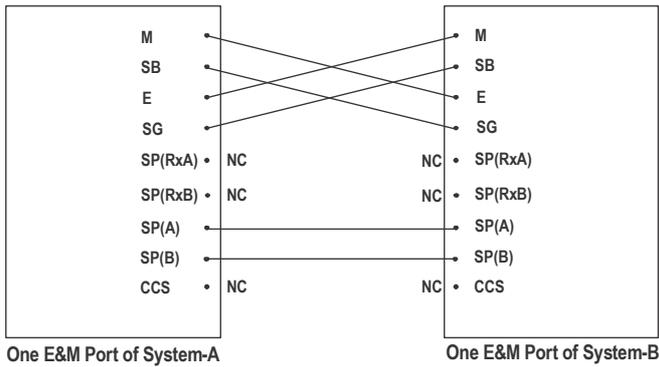

Pinout details of ETERNITY ME Card E&M4 - RJ45 Connectors

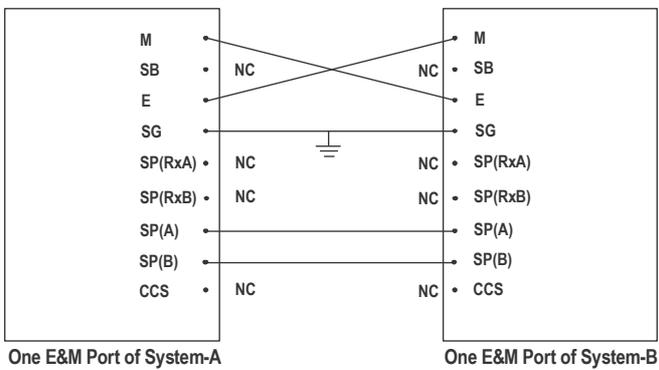

2 Wire, Type IV E&M Connection

2 Wire / Type IV E&M Connection

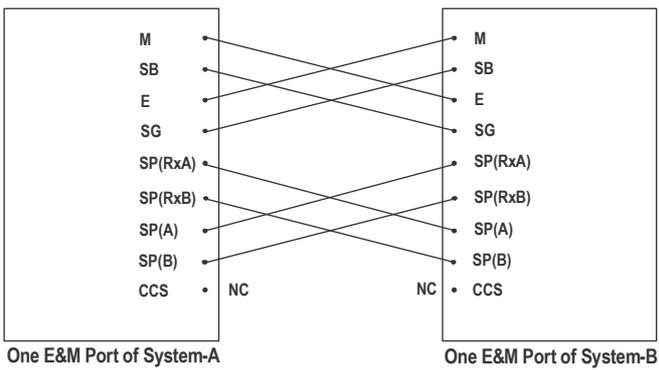

2 Wire, Type V E&M Connection

2 Wire / Type V E&M Connection

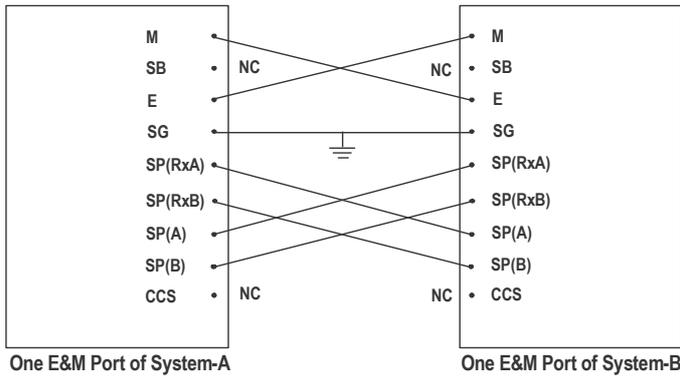

4 Wire, Type IV E&M Connection

4 Wire / Type IV E&M Connection

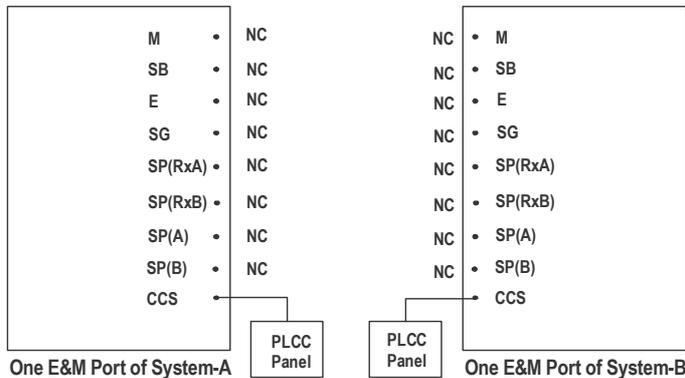

4 Wire, Type V E&M Connection

4 Wire / Type V E&M Connection

9. If you are connecting two PLCC EPAX in a Power Line Carrier Communication Network Componder Control Signal (CCS) Connection should be made as illustrated in the block diagram below for any of the four combinations of E&M and Speech Interfaces illustrated in the previous step.

Componder Control Signal (CCS) is a special type of signal used by Power Line Carrier Communication Networks to improve quality of speech transmission. The PLCC network expects this signal from the system when speech is established and the E&M Card supports this facility. The system sends CCS signal to the PLCC panel.

- *When the E&M port is used as an Endpoint; the system sends a CCS to the PLCC panel while making an outgoing call through the E&M port or when a call is received at the E&M port.*
 - *When the E&M port is used for Transit Exchange; the system sends a CCS to the PLCC panel while there is a Transit call through the E&M port.*
10. If you have completed all installation tasks, power ON the system, observe the Reset Cycle and the LED pattern of the E&M Card.

LED Pattern of the E&M Card

Stage	LED Color	LED Cadence
Initialization		
At Power ON	RED	L1 to L8 glow one after the other in a sequence, ON 100ms -OFF. L1 ON 100ms-OFF, L2 100ms ON-OFF, L3 100ms ON-OFF, L4 100ms ON-OFF.....L8 100ms ON-OFF
	GREEN	L1 to L8 glow one after the other in a sequence, ON 100ms -OFF. L1 ON 100ms-OFF, L2 100ms ON-OFF, L3 100ms ON-OFF, L4 100ms ON-OFF.....L8 100ms ON-OFF
Stand-By ^a	GREEN, ORANGE	L1 toggles GREEN ON 1 sec, ORANGE ON 1 sec
Normal (Port Event)		
M-Wire High	GREEN	LED of the Port continuously ON
M-Wire Low		LED of the Port continuously OFF
E-Wire High	RED	LED of the Port continuously ON
M-Wire Low		LED of the Port continuously OFF
E-Wire and M-Wire High	ORANGE	LED of the Port continuously ON
Errors		
Controller RAM failure	ORANGE	All LEDs Toggle at 1 sec
External RAM failure	ORANGE	All LEDs Toggle at 2 sec
Eprom failure	ORANGE	All LEDs Toggle at 3 sec
Invalid Slot detected	ORANGE	All LEDs Toggle at 6 sec

a. Waiting to be detected by Master Card.

Jumpers on the Main Board

Jumper Number	Position	Function
J1	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J4 & J5	AB (default)	Normal Operation
	BC	For uploading software using COM Port

The Mobile Card

The Mobile Card interfaces the system with 2G/3G/4G networks. It routes calls made and received over mobile networks, like a mobile handset.

The Mobile Cards are available in 2G, 3G and 4G variants.

The Mobile Card does not support GPRS features, Fax and Data services, network supported services, except CLIR and USSD.

For compatibility and use of Matrix GSM products (2G/3G/4G) in Russia and Iran Province connect with Matrix Sales or Technical Support Team.

The Mobile Card for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card GSM8	<p>8-port card to connect to 8 GSM networks (8 SIM Cards can be installed). To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G without SIM Hot-swap”.</p> <p>For Hardware Design V3R2, CPLD V3R2 and PCB Version Revision V3R1 This version onwards SIM Hot Swap is supported, that is the SIM card can be removed and inserted in the SIM Slots without turning off the system. To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap”.</p>
ETERNITY ME Card GSM8 3G	<p>8-port card to connect to 8 GSM networks with 3G support (8 SIM Cards can be installed), refer to “ETERNITY ME Card GSM8/GSM8 3G without SIM Hot-swap”.</p> <p>For Hardware Design V3R2, CPLD V3R2 and PCB Version Revision V3R1 This version onwards SIM Hot Swap is supported, that is the SIM card can be removed and inserted in the SIM Slots without turning off the system. To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap”.</p>
ETERNITY ME CARD GSM8 4G	<p>8-port card to connect to 8 GSM networks with 4G support (8 SIM Cards can be installed) with SIM Hot Swap. To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap”.</p>

Just like mobile handsets, each Mobile Port has a unique IMEI (International Mobile Equipment Identity) number, pasted on the mobile engine.

The maximum Mobile ports supported are 64.

SIM cards from different service providers can be used.

Antenna

There is a single rooftop (RT) antenna for four GSM ports. A splitter connects all the four ports on the card into a single antenna. An antenna cable is also provided, giving you the flexibility to move the antenna to another position (in case of weak signal).

Personal Identification Number (PIN)

The SIM cards can be protected from unauthorized use by programming a Personal Identification Number (PIN) on the SIM. If the wrong SIM PIN is entered thrice in a row, by a user, the SIM card suspects the user and asks for the Personal Unlock Keyword (PUK).

LEDs

There is a tri-color LED for each mobile port on the card to indicate the functioning of the card and the status of the ports.

Installing the Mobile Card

To be able to connect the system to 2G/3G/4G networks, you must have one of the above mobile cards installed in the system.

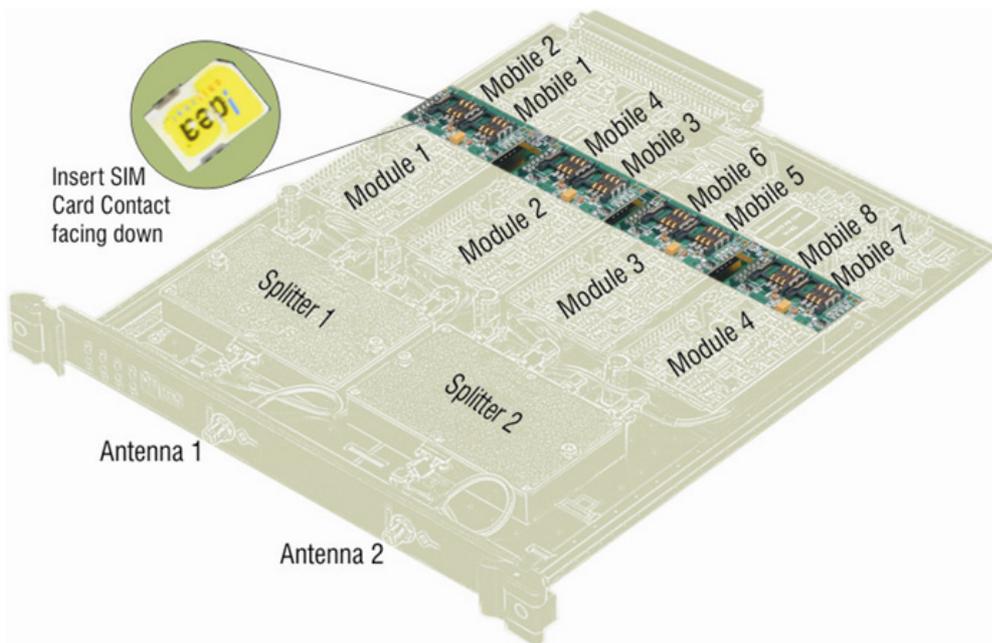

1. To install the Mobile Card,
 - If using a 2G/3G/4G card, get the SIM Card from the 2G/3G/4G service provider of your choice ready. Use SIM PIN protection, if required.

Disable Call Waiting in the SIM, else it may result in call disconnection.

2. Make sure that the system is installed at a location where sufficient network coverage is available. The power supply should be turned off, and you must be wearing an electrostatic discharge preventive wrist strap and must have a grounding mat, before you begin handling the card.
3. Unpack the Mobile Card and verify the package contents.

ETERNITY ME Card GSM8/GSM8 3G without SIM Hot-swap

Enabling PIN Protection on SIM

4. For the 2G/3G Card, enable SIM PIN before installing the SIM card in the system.
 - insert the SIM into a mobile handset first.
 - enable PIN Protection from the mobile handset.
 - change the SIM PIN to 1234 (this is the default PIN for all SIM cards used in the system). Changing the SIM PIN to '1234' enables you to change the SIM PIN from the Jeeves later (Refer SIM PIN under [“Configuring Mobile Trunks”](#) for instructions).
 - remove the SIM from the mobile handset.

If you do not want to use PIN protection, insert the SIM in the mobile handset and disable PIN protection. Remove the SIM Card from the mobile handset.

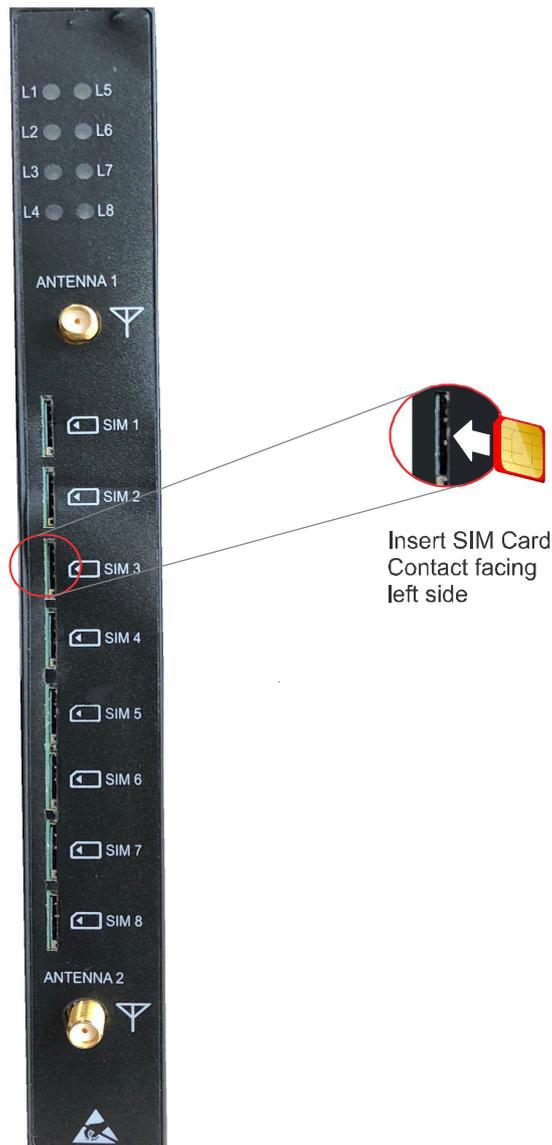

5. Insert the SIM card (PIN changed to 1234), with its connector side down into the SIM holder on the Mobile card. You can insert multiple SIM cards of the same GSM service provider or of different service providers.
6. Insert the Mobile Card into the guide rails of the Universal Slot you have selected for this card. Make sure that the card is inserted deep enough to make perfect contact with the connectors in the backplane. Now, press down the levers on the card mount bracket to secure the card in its slot.
7. Connect the antenna provided with the card on the splitter connector on the front panel of the card. You may also use the antenna cable to place the antenna at another position.
8. Repeat Steps 1-7 to insert another Mobile Card.
9. If you have completed all installations tasks, power the system.

10. Wait for the system to register with the Mobile network. By default, the Mobile ports are set to select and register with the Mobile networks automatically. Now, observe the LED Patterns of the Mobile Ports.

- At every power up of the system, it takes about 3 minutes for the Mobile ports to get registered with the network. Once registration with the GSM network is completed, the mobile port can be used.
- Each time the Mobile Port sends a request, such as Registration Request, the system waits for the duration of the Network Response Timer. This Timer signifies the time for which the Mobile Port waits for a response from the Mobile network. It is fixed for 150 seconds for all Mobile ports.

ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap

Enabling PIN Protection on SIM

1. For the 2G/3G/4G Card, enable SIM PIN before installing the SIM card in the system.
 - insert the SIM into a mobile handset first.
 - enable PIN Protection from the mobile handset.

- change the SIM PIN to 1234 (this is the default PIN for all SIM cards used in the system). Changing the SIM PIN to '1234' enables you to change the SIM PIN from the Jeeves later (Refer SIM PIN under “Configuring Mobile Trunks” for instructions).
- remove the SIM from the mobile handset.

If you do not want to use PIN protection, insert the SIM in the mobile handset and disable PIN protection. Remove the SIM Card from the mobile handset.

2. Insert the SIM with its contact side facing left into the SIM slot located on the fascia of ETERNITY ME Card.
3. Push the SIM backwards into the slot until you hear a click and the SIM is locked in place.
4. To unlock the SIM, push the protruded portion of the SIM backwards again and release it.

The Mobile cards with SIM Hot - swap are designed keeping in mind the Standard Nano SIM size. In case, you face any issues due to the SIM size, contact your respective Service Provider for assistance.

5. Repeat the same steps to insert another SIM Card. You can insert multiple SIM cards of the same GSM service provider or of different service providers.
6. Insert the Mobile Card into the guide rails of the Universal Slot you have selected for this card. Make sure that the card is inserted deep enough to make perfect contact with the connectors in the backplane. Now, press down the levers on the card mount bracket to secure the card in its slot.
7. Connect the antenna provided with the card on the splitter connector on the front panel of the card. You may also use the antenna cable to place the antenna at another position.
8. Repeat Steps 1-7 to insert another Mobile Card.
9. If you have completed all installations tasks, power the system.
10. Wait for the system to register with the Mobile network. By default, the Mobile ports are set to select and register with the Mobile networks automatically. Now, observe the LED Patterns of the Mobile Ports.

- *At every power up of the system, it takes about 3 minutes for the Mobile ports to get registered with the network. Once registration with the GSM network is completed, the mobile port can be used.*
- *Each time the Mobile Port sends a request, such as Registration Request, the system waits for the duration of the Network Response Timer. This Timer signifies the time for which the Mobile Port waits for a response from the Mobile network. It is fixed for 150 seconds for all Mobile ports.*

LED Pattern of Mobile Ports

The number of tri-color LEDs on the GSM card corresponds with the number of mobile ports on the card.

At Power On: All LEDs will blink 1 second ON and 1 second OFF in the color sequence: Red-Green-Orange until the Reset cycle is complete.

In the Stand-by state: All LEDs will glow Orange for a second and turn Green for a second, repeatedly.

During normal functioning: The LEDs will various events on the Mobile port in the color and cadence described in the table below:

Event	Color	Cadence in msec (1 cadence is of 3000 msec)
Port disabled	-	LED OFF
Port idle	-	LED OFF
Port Active (All States other than Ring and Speech)	Red	Continuous ON
Ring Event	Green	400ms ON-200ms OFF400ms ON-200ms OFF
Speech	Green	Continuous ON
GSM initialization	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-1200ms OFF (5 blinks)
PUK required	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-1600ms OFF-
SIM PIN faulty	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-2000ms OFF (3 blinks)
SIM Absent	Orange	200ms ON-200ms OFF-200ms ON-2400ms OFF (2 blinks)
Network Link Down (Absence of GSM Network)	Orange	200ms ON-2800ms OFF

The Magneto Card

The Magneto Card is used for connecting the system to Magneto Telephones⁴⁴, which are widely used by the defense establishments as field phones in front lines, and by other establishments such as railroad companies (signaling emergencies, crossings, etc.), electric utilities, pipeline companies, who need to have their networks at places that are too remote to be serviced by public telephone networks.

The Magneto Card lands calls from magneto field telephones on the extensions of the system and places calls from the extensions of the system on magneto telephones.

Magneto Card for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card Magneto8	8-port card to connect 8 Magneto Phones

The maximum number of magneto ports supported are 16.

Connectors

The Magneto Card has RJ45 connectors. A multi-pair cable is provided for each connector.

LED

The ETERNITY Magneto8 has 8 LEDs for each magneto port supported by the card.

The LEDs indicate the health of the cards during the Reset Cycle and the status of the ports during the normal functioning of the system.

Installing the Magneto Card

1. Have the necessary wiring for the Magneto Ports in place.

You may install an MDF to connect the Magneto Ports with the Field Telephone wires.

OR

You may connect the wires from the Magneto Field Telephones directly to the Magneto Port.

You are advised to use a separate set of Krone Modules for connecting the Magneto phones to the Magneto ports of the system

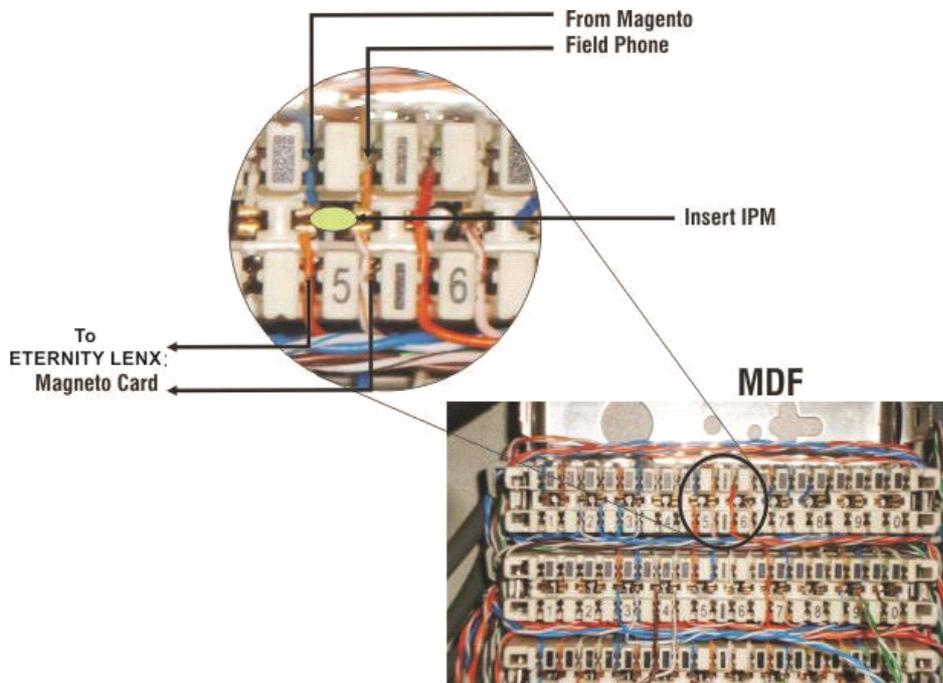

2. Prepare for the card installation by switching off power supply and wearing an electrostatic discharge preventive wrist strap and use a grounding mat.
3. Unpack the Magneto Card and check the package contents.

44. A magneto telephone is a local battery telephone set, in which signaling current is provided by a magneto hand generator, usually a magneto. The hand generator, commonly referred to as 'crank', is located on the right hand side of the telephone set and is turned to produce energy to ring other phones or to signal the CO. The magneto, also called the generator, is used to convert the mechanical motion via the crank to produce sufficient energy to ring other phones or to signal the CO.

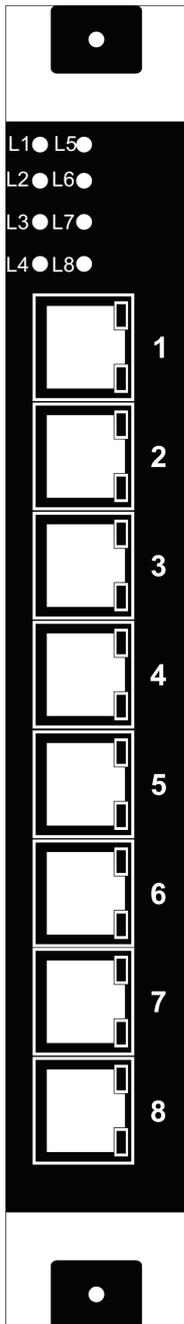

4. Select any universal slot to insert the card. Unscrew the filler bracket and remove it by pushing up the levers on the bracket.
5. Insert the Magneto card into the guide rails of the free slot. The card's connectors must make perfect contact with the connectors on the backplane motherboard. Press down the levers of the mounting bracket to secure the card in its slot and fix the two screws provided with the card on the mounting bracket.
6. Now, plug in the cables supplied with the Magneto Card into the connectors on the card. Terminate the free ends of the cables into the MDF, if applicable.

Refer to the following block diagram for terminating the cables from the Magneto Card and the wires from the Magneto Field Telephones.

Connecting Magneto Telephones to the Magneto Card

- Connect the pairs of wires from the Magneto Field Phones to the appropriate pairs emerging from the Magneto Card on the MDF. Refer the cable diagram below.

Connector	Color	Connection	H/w Port Offset
RJ45-1 (Blue)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-2 (Orange)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-3 (Green)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-4 (Brown)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-5 (Blue)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-6 (Orange)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-7 (Green)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-8 (Brown)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —

- Repeat the same steps to install the other Magneto Cards.
- If you do not have any other Card to insert and have completed the installation procedures, power on the system and observe the Reset Cycle and the LED Pattern of the Magneto Card.

LED Pattern of the Magneto Card

Stage	LED Color	LED Cadence
Auto Upgradation / Auto Downgradation		
Card waiting for application	RED	L1 turned ON for 200ms, turned OFF simultaneously.
Card is up, loaded with new application	GREEN	L1 turned ON for 200ms, turned OFF simultaneously.
Initialization		
	RED	L1 to L8 turned ON 500ms-OFF 500ms
	GREEN	L1 to L8 turned ON 500ms-OFF 500ms
	ORANGE	L1 to L8 turned ON 500ms-OFF 500ms
Stand-By ^a	ORANGE, GREEN,	L1 toggles 1 sec Orange and RED
Normal (Port Event)		
Ring (incoming/outgoing call)	RED	LED of the Port continuously ON
Port Disabled		LED of the Port continuously OFF
OFF-Hook (in Speech) For Outgoing call from Magneto: When called extension answers the call For Incoming call to Magneto: When stopping Ring on Magneto using MRE key or #	GREEN	LED of the Port continuously ON
Port Idle		LED of the Port continuously OFF
Errors		
Invalid Card Configuration Jumper	ORANGE	All LEDs Flash (250ms ON-250ms OFF) twice, OFF 3 sec.
Invalid Slot detection ^b	ORANGE	LEDs Flash (250ms ON-250ms OFF) 6 times, OFF 3 sec.

a. Waiting to be detected by CPU Card.

b. Waiting to be detected by CPU Card.

Jumpers on the Main Board

Jumper Number	Position	Function
J1 & J2	AB	NA
	BC (default)	Normal Operation
J3, J5 & J6	AB (default)	Normal Operation
	BC	For uploading software using COM Port

The Radio Card

The Radio Interface Card (RIC) adds the Two-way Radio functionality in the system. In Two-way radio, the speech can be transmitted as well as received by the radio devices such as Radio Phone, Radio Repeater. Such devices are called Radio Transceivers. The Two-way radio works on High Frequency (HF), Very High Frequency (VHF) or Ultra High Frequency (UHF).

Radio Cards for ETERNITY LENX

Card Name	Configuration and Application
ETERNITY ME Card Radio8	8-port card to connect 8 Radio devices.
ETERNITY ME Card Radio4	4-port card to connect 8 Radio devices.

The maximum number of radio ported supported are 16.

Connectors

The Radio Card has RJ45 connectors. A multi-pair cable is provided for each connector.

LED

The Radio Card has one tri color LED.

Installing the Radio Card

1. Have the necessary wiring for the Radio Ports in place.

You may install an MDF to connect the Radio Ports with the Radio device wires.

OR

You may connect the wires from the Radio device directly to the Radio Port.

You are advised to use a separate set of Krone Modules for connecting the Radio devices to the Radio ports of the system.

2. Prepare for the card installation by switching off power supply and wearing an electrostatic discharge preventive wrist strap and use a grounding mat.
3. Unpack the Radio Card and check the package contents.
4. Select any universal slot to insert the card. Unscrew the filler bracket and remove it by pushing up the levers on the bracket.
5. Insert the Radio Card into the guide rails of the free slot. The card's connectors must make perfect contact with the connectors on the backplane motherboard. Press down the levers of the mounting bracket to secure the card in its slot and fix the two screws provided with the card on the mounting bracket.

6. Now, plug in the cables supplied with the Radio Card into the connectors on the card. Terminate the free ends of the cables into the MDF, if applicable.
7. Connect the pairs of wires from the Radio devices to the appropriate pairs emerging from the Radio Card of the system on the MDF. For more details, see [“The Main Distribution Frame \(MDF\)”](#).

Refer to the Pin-out details given below.

ETERNITY ME Card Radio8

Connector	Color	Pin Number	Signaling	H/w Port Offset
RJ45-1 to RJ45-8	Orange & White	1	PTT	01 to 08
	Orange	2	PTT_RTN	
	Green & White	3	Rx-	
	Blue	4	Tx+	
	Blue & White	5	Tx-	
	Green	6	Rx+	
	Brown & White	7	Unused	
	Brown	8	Unused	

ETERNITY ME Card Radio4

Connector	Color	Pin Number	Signaling	H/w Port Offset
RJ45-1 to RJ45-4	Orange & White	1	PTT	01 to 04
	Orange	2	PTT_RTN	
	Green & White	3	Rx-	
	Blue	4	Tx+	
	Blue & White	5	Tx-	
	Green	6	Rx+	
	Brown & White	7	Unused	
	Brown	8	Unused	

8. Repeat the same steps to install the other Radio Cards.
9. If you do not have any other Card to insert and have completed the installation procedures, power on the system. Observe the Reset Cycle and the LED Pattern of the Radio Card.

LED Pattern

Stage	LED Color	LED Cadence
Auto Upgradation / Auto Downgradation		
Card waiting for application	RED	200ms ON - 200ms OFF

Stage	LED Color	LED Cadence
Card is up, loaded with new application	GREEN	200ms ON - 200ms OFF
Initialization		
	RED	500ms ON - 500ms OFF
	GREEN	500ms ON - 500ms OFF
	ORANGE	500ms ON - 500ms OFF
Stand-By	ORANGE, GREEN	Toggles 1 sec Orange 1 sec Green
Port Status		
Selected Port's data are transmitted to master card	RED	Toggle on each event
Selected Port's data are received from master card	GREEN	Toggle on each event from master

Jumpers on the Main Board

Jumper Number	Position	Function
J3	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J4 and J5	AB (default)	Normal Operation
	BC	For uploading software using COM Port

In PCB-P-200-80-01-01, for 4-wire speech the Jumpers J1 and J2 on the modules must always be set in AB position.

In PCB-P-200-80-01-02 onwards only 4-wire speech is possible therefore there are no Jumpers on the modules.

The Data Card

The Data Card supports four Ethernet 10/100mbps interfaces. Ethernet data coming to ports can be mapped to 2Mb streams. Each data port can be mapped to one 2Mb - E1 stream, that is 30 channels. The remaining channels of E1 can be used for voice applications. The Data Card has a 4-port Ethernet switch on board, which can aggregate multiple data streams to PCM streams of the system.

The Data Card can be installed in any of the Universal Slots of the system.

Ports and Connectors

The Data Card has an RJ45 Connector for each port. Use the cables supplied with the card for connectivity.

You can connect the cables from the LAN switch to these connectors.

LEDs

The Data Card has one dual color LED.

Installing the Data Card

1. Unpack the Data Card and check the package contents. It is recommended that you switch off the power supply, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
2. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket! Preserve it for future use!
3. Insert the Data Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.

Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

4. Use the cable supplied with the card to connect the Data Ports to the Ethernet Network (Switch/PC).
5. If you have completed all other installation tasks, you may turn ON the system and observe the Reset Cycle and the LED pattern of the Data Card.

LED Pattern of the Data Card

Status	Color	Cadence
Waiting for Master to start Up-gradation procedure (waits for 10 seconds)	Red	Blinking 200ms ON - 200ms OFF
Up-gradation in progress	Green	Blinking 200ms ON - 200ms OFF
Application run error after up-gradation procedure	Red	Continuous ON
Auto upgradation completed successfully and in process to start new application	Green	Continuous ON

Status	Color	Cadence
Main application is being executed	Red	Blinking 1 sec ON - 1 sec OFF

Jumpers

Jumper Number	Position	Function
J9	AB (default)	External Boot - Normal
	BC	Internal Boot

SIP Extensions

SARVAM UCS supports up to 2000 SIP/UC Users. The SIP/UC Users function in the same way as DKP/SLT extensions of the system. SIP/UC Users can make and receive calls to any extension user of the system and to external numbers over various telecom networks like CO, Mobile, ISDN PRI, BRI, and VoIP⁴⁵.

You may register any SIP-enabled device — a Matrix UC Client, an IP-phone, a Soft phone, Analog Phone Adapter — as the SIP User of the system.

The Matrix UC Clients also offer UC functionalities in addition to the SIP functionalities.

The SIP Users register with the CPU Card of the system. Five free SIP Users are provided by default. You may register any of the SIP-enabled devices except the Matrix UC Clients with these free SIP Users. For registering the Matrix UC Clients, you must purchase the Matrix VARTA User License. If you require additional SIP Extensions you must purchase the IP Subscribers License.

The system supports two NX DBM VOCODER64 Modules. You must purchase the module separately. Each NX DBM VOCODER64 module supports a maximum of 64 VOCODER channels. The Vocoder channels are required for — VoIP to Non-VoIP calls, VoIP to VMS calls and VoIP to VoIP calls — where transcoding is required.

The system provides 4 pre-activated VOCODER channels by default. To use these channels make sure you have installed atleast one NX DBM VOCODER64 module. If you require more channels, you can purchase the channel licenses according to your requirement.

For more information on Licenses — Matrix VARTA User License, IP Subscribers License and VOCODER Channel License, see [“License Management”](#).

You may connect any Standard Phone or Extended IP Phones of Matrix as SIP Users.

Matrix VARTA WIN200, VARTA ADR100 and VARTA AMP100 can be registered as SIP Users, also offering the support for UC functionalities.

You may also connect/register the following as SIP Extensions of the system:

- Connect SPARSH VP248, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP248 as Extended SIP Extension”](#).
- Connect SPARSH VP310, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP310 as Extended SIP Extension”](#).
- Connect SPARSH VP330, the Touch Screen Extended IP Phone. For instruction, [“Connecting SPARSH VP330 as Extended SIP Extension”](#).
- Connect SPARSH VP510, the Premium IP Phone. For instruction, [“Connecting SPARSH VP510 as Extended SIP Extension”](#).
- Connect Extended SPARSH VP210, the Entry Level IP Phone. For instruction [“Connecting SPARSH VP210 as Extended SIP Extension”](#).
- Connect Extended SPARSH VP710, the Smart Video IP Phone. For instruction, [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#).

45. *Calls between VoIP, Public and Private Networks may be subject to Regulation in your country. You may have to configure your system to allow or restrict call traffic between networks to comply with the telecom regulations of your country. To know more, read [“Logical Partition”](#).*

You can register following UC Clients as SIP Users of the system:

- Matrix VARTA WIN200, Unified Communication Client for Windows. For instruction, refer to the *MATRIX VARTA WIN200* User Guide.
- Matrix Mobile UC Clients, as given below:
 - Matrix VARTA AMP100, the Mobile UC Client for iPhones. For instruction, refer to the *Matrix VARTA AMP100* User Guide.
 - Matrix VARTA ADR100, the Mobile UC Client for Android Smartphones/Tablets. For instruction, refer to the *Matrix VARTA ADR100* User Guide.

Refer to “[SARVAM UCS Features Supported in Terminals](#)” to know the features supported in each client.

The SIP Users may be registered over **WAN** or over **LAN** according to your preference and your IP network installation scenario. Extended SIP Phones and UC Clients can be registered with SARVAM UCS using IPv4 Addresses only.

You can register the same SIP User from three different locations.

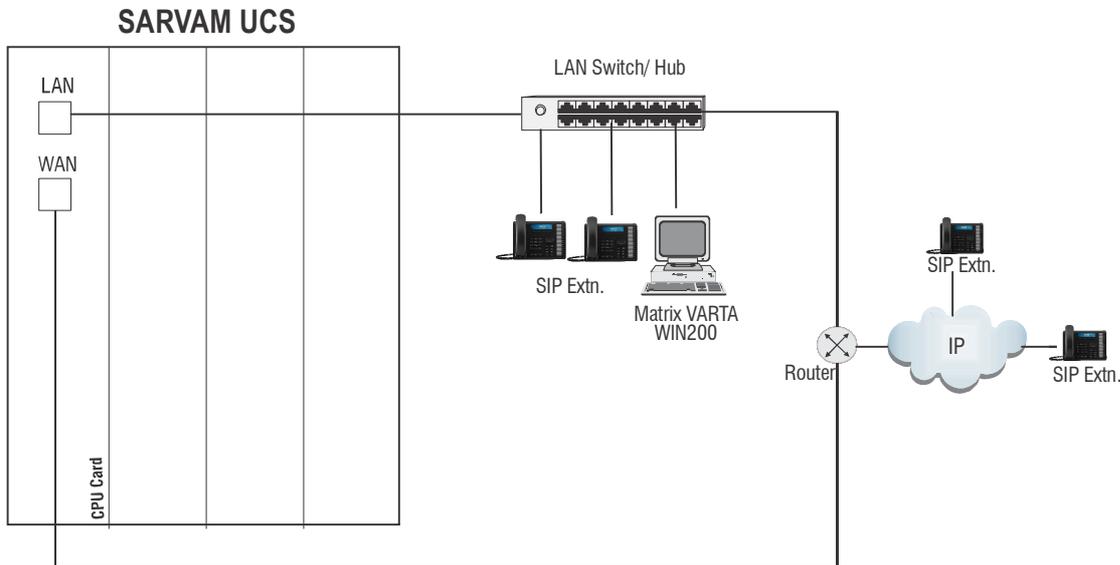

If you register the Extended IP Phone outside the Region/Country selected for SARVAM UCS, the time and Time Zone dependant features, such as Alarms, Reminders, Time Zone Display, of the phone at each location will operate according to the Real Time Clock of SARVAM UCS. Also, Access Codes and Emergency Numbers will work according to the Region/Country selected for SARVAM UCS.

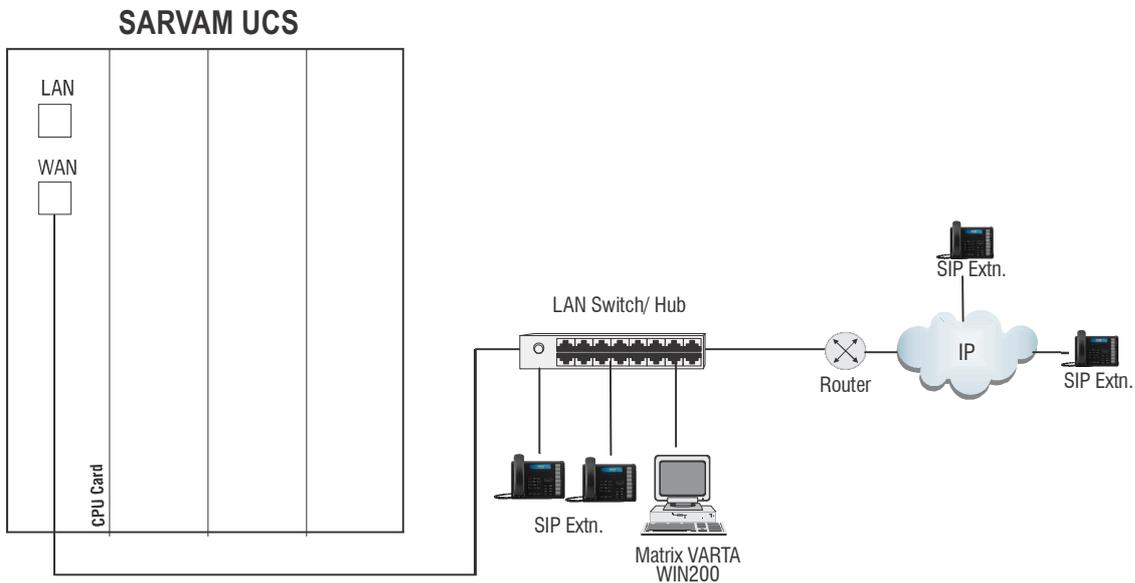

- Connect the Extended IP Phone, or any Standard IP Phone to the LAN Switch.
- Register any SIP device (Extended IP phone/ Soft clients or Standard IP phone) on the public network as SIP Extension.
- When you register the Matrix Extended IP Phone with the system, the WAN/LAN port is used for Auto Configuration as well for Registration of the Extended IP Phones.
- When you register a SIP device other than the Matrix Extended IP Phone on the public network as SIP Extension, do the following:
 - In this SIP device configure the following:
 - the Registrar Server Address of SARVAM UCS
 - the Registrar Server Port
 - the SIP ID
 - Authentication ID and Password.
 - Configure Port Forwarding for the WAN Port of SARVAM UCS on the Router.

If the SARVAM UCS is connected to a **Public Network**,

- Connect the Matrix VARTA WIN200, Extended IP Phone, or any Standard SIP device to the LAN Switch.
- Register any SIP device (Matrix VARTA UC Clients, Extended IP phone or Standard SIP phone) on the public network as SIP extension.

If the SARVAM UCS is connected to a **Private Network (Behind the NAT)**,

- Connect Matrix VARTA WIN200, Extended IP Phones or Standard SIP Phones to the LAN Switch
- You may also register any SIP device (Matrix VARTA UC Clients, Extended IP Phone or Standard SIP phone) on the public network as SIP Extension.

When you register the Matrix Extended IP Phone with SARVAM UCS, configure **Port Forwarding** for the **WAN port of the CPU Card** on the Router. The WAN Port is used for Auto Configuration of the Extended IP Phones.

Connecting SPARSH VP248 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

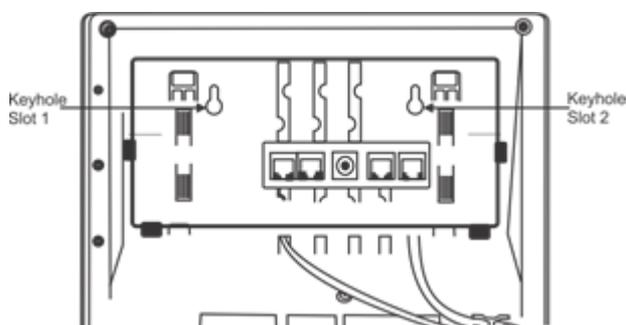

If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as **'String'** and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format **"IP_Address:Port"** in your DHCP Server as per your installation scenario.

- Log in to Jeeves. For instructions, read the topic ["Configuring SARVAM UCS"](#).
- Assign SIP User ID (will work as an extension number) to the Extended IP Phone. For instructions on assigning SIP ID, see ["Configuring SIP Extensions"](#).

For the SIP User ID you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic ["Configuring SIP Extension Settings as per the Extended Phone Type"](#) under *Configuring SIP Extensions*.

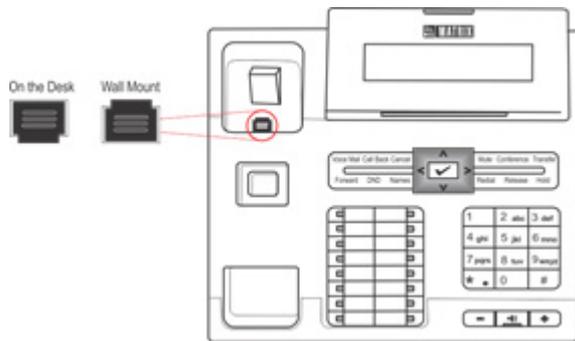

Now, follow the steps described below to install the Extended IP Phone. The instructions are common for all models of the SPARSH VP248. For the purpose of illustration, the premium model, SPARSH VP248P, has been used.

1. Unpack the SPARSH VP248 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.
 - Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

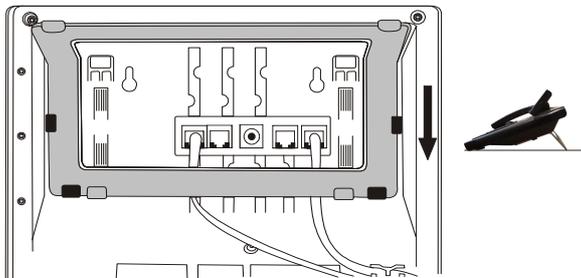

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.

- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

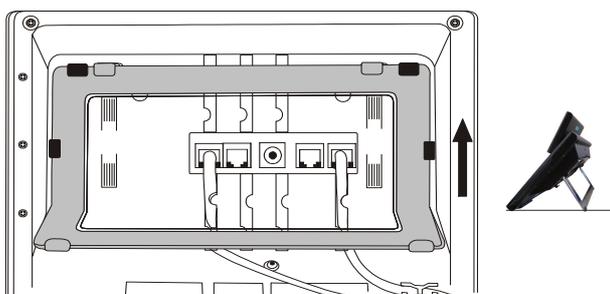

- When you mount the phone on a desk,
 - You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 30° Angle

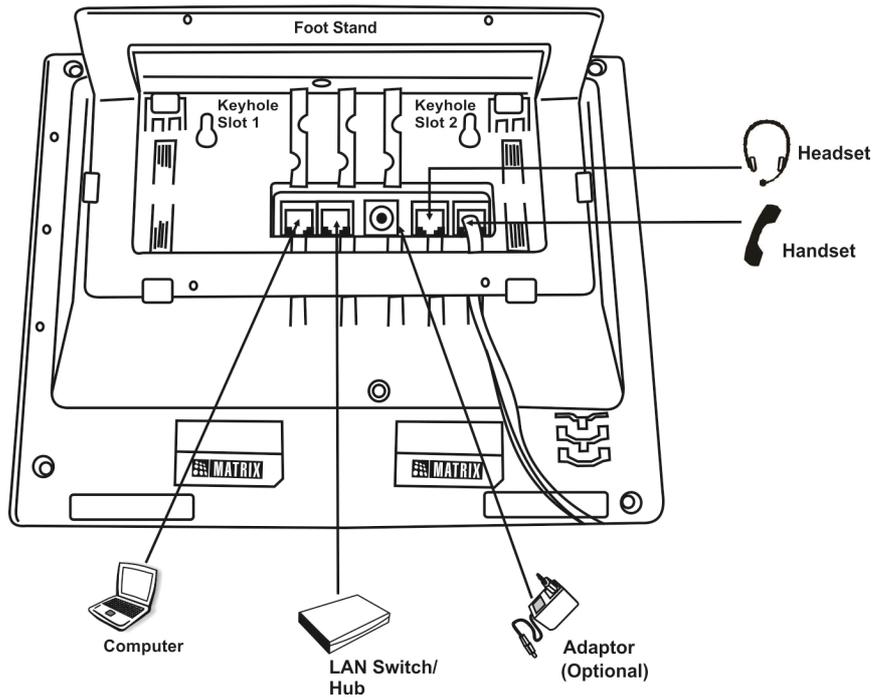

Foot Stand attached at 50° Angle

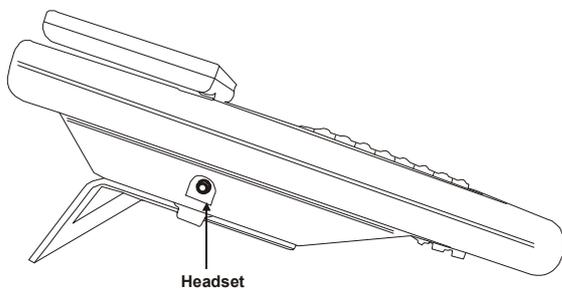

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
3. Connect the Handset to the Phone body.
 - Plug the long straightened end of the phone cord into the handset jack at the bottom of the phone marked with the handset symbol.

- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

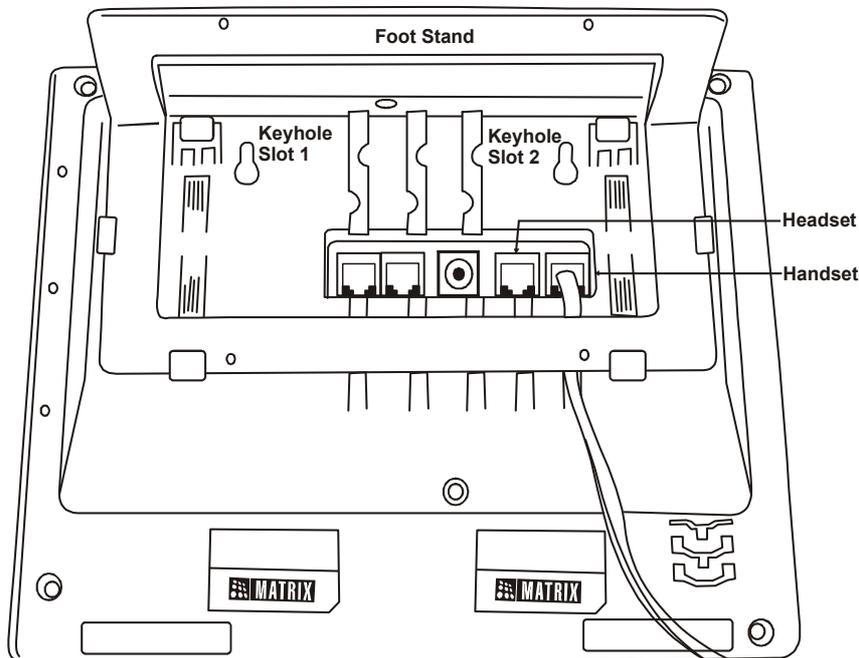

4. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 2.5 mm single connector into the headset jack headset jack with the symbol  on the left side panel of the phone, as illustrated in the figure below.

OR

You may plug a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol , as illustrated in the figure below.

5. Connect the LAN Port of SPARSH VP248 to the LAN Switch/Hub or a Router, according to your installation scenario.
6. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.
7. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

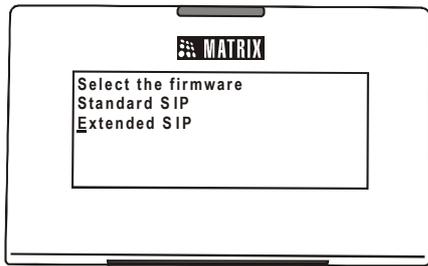

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

8. Switch ON power supply.

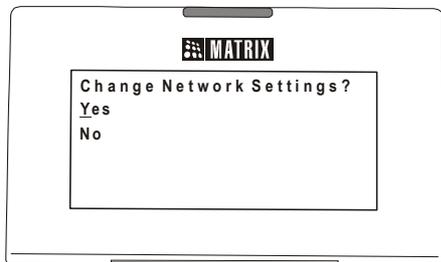

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- As soon as the 'Loading...' message appears on the phone display, press # key.

- Select the firmware **Extended - IP Phone**. Move the cursor by pressing the DOWN navigation key **V**.
- When the cursor is placed under the Extended IP Phone, press Enter key.

- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See [“Network Settings”](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone by accessing the Local Menu of the phone. To move the cursor and scroll through the menu and submenu options, use the following touch sense navigation keys on your phone.

- The Enter key **✓** to make a selection or to complete an action.
- The Up key **^** to move up the Menu.

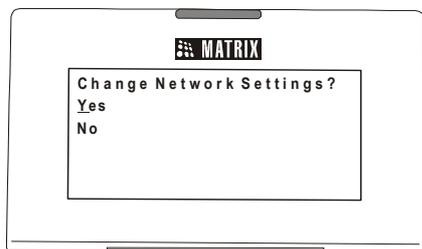

- The Down key **▼** move down the Menu.
- The Forward key **>** move the cursor one character.
- The Back key **<** to move the cursor one character and to return from the submenu to the main menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

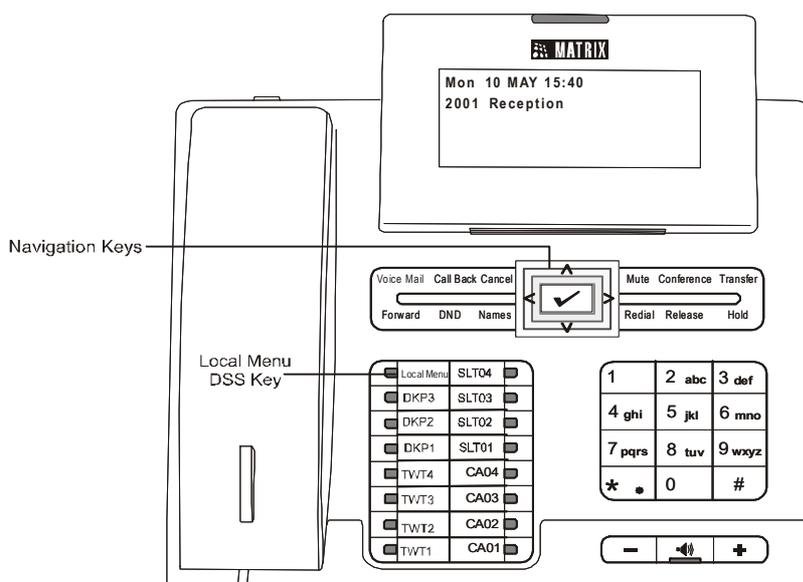

You must press the Enter Key to select Yes and access network settings.

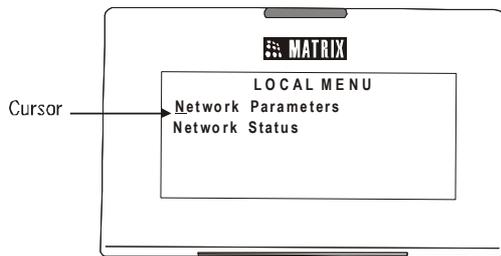

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Enter Key **✓** to access network settings,

3. When the phone is in idle state. You must press the DSS key assigned to 'Local Menu'.

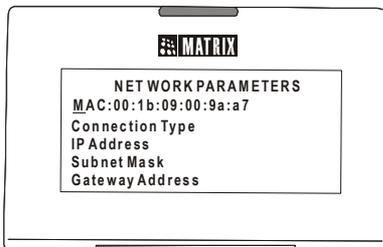

- When you press the Local Menu DSS Key (in idle state) or when you press the Enter key during any process, the Local Menu appears on your phone display.

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.
- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.
- If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '**' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '**' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star '**' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁴⁶.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
- To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.

⁴⁶ The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
- Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
- Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see ["Using PCAP Trace for Matrix SPARSH VP248 Extended IP Phone"](#), under *PCAP Trace*.

When you change the Network Settings, the phone will restart.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?**.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

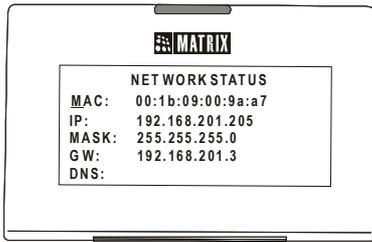

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?**.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

Viewing Network Status

- In the Local Menu of the phone, place the cursor on Network Status and press the Enter key.

- The Network Status submenu appears.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **S. ADD:** The LAN or WAN IP Address / Domain Name of the SARVAM UCS.
- **S. PORT:** The SPARSH Port SARVAM UCS.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Connecting SPARSH VP310 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

*If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.*

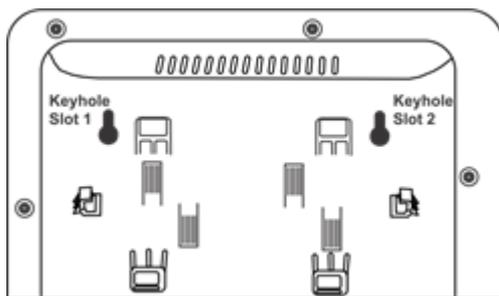

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".

- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see [“Configuring SIP Extensions”](#).

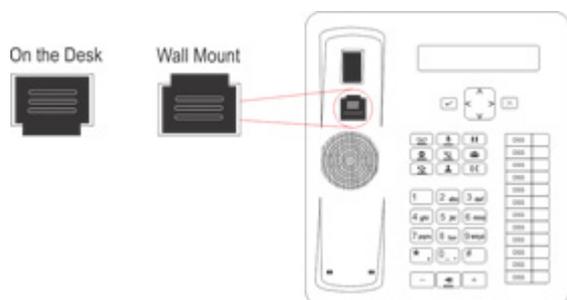

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic [“Configuring SIP Extension Settings as per the Extended Phone Type”](#) under *Configuring SIP Extensions*.

Now, follow the steps described below to install the Extended IP Phone.

1. Unpack the SPARSH VP310 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP310 on a wall,
 - Use the mounting template to drill holes of appropriate size and distance.
 - Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP310. The screws should protrude from the wall to fit into the Keyhole Slots.

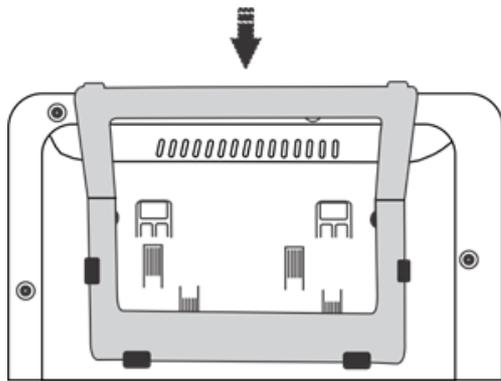

- Now, mount the phone with the screws fitting into the Keyhole Slot.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

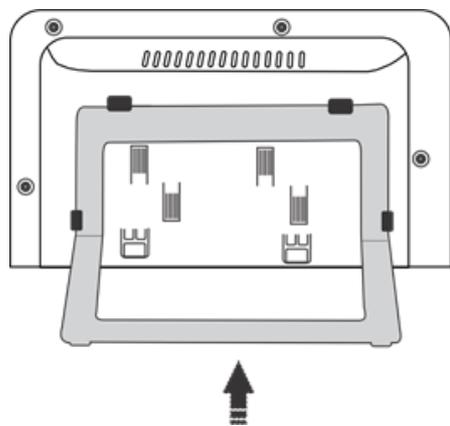

- When you mount the phone on a desk,
 - You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 35° Angle

Stand attached at 35 degree angle

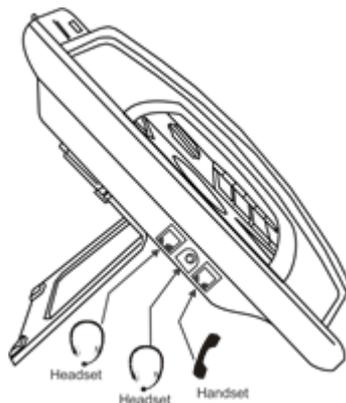

Foot Stand attached at 50° Angle

Stand attached at 50 degree angle

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

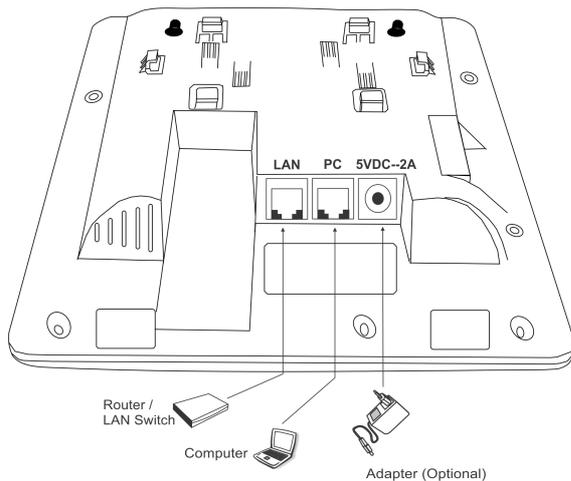

4. Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol .
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

- If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack headset jack with the symbol  on the left side panel of the phone, as illustrated in the figure above.

OR

You may also plug in a headset with RJ9 connector into the headset port on the left side panel of the phone, marked with the symbol .

- Connect the LAN Port of SPARSH VP310 to the LAN Switch/Hub or a Router, according to your installation scenario.
- To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.
- It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

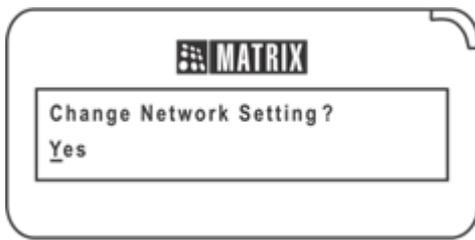

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

- Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the 'Loading...' message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.

- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See “[Network Settings](#)” at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key ▼ when the phone is in idle state. To move the cursor and scroll through the menu and submenu options, use the following navigation keys on your phone.

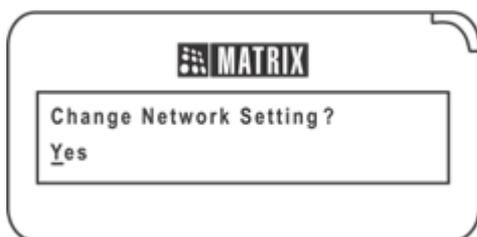

- The Enter key ✓ to make a selection or to complete an action.
- The Up key ▲ to move up the Menu.
- The Down key ▼ move down the Menu.
- The Forward key > move the cursor one character.
- The Back key < to move the cursor one character and to return from the submenu to the main menu.
- The Cancel key ✕ to exit a menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press the Enter key ✓ to select Yes and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Down key ▼ to access network settings.

3. When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.

Configuring Network Parameters

- When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.
- Press Enter key to select Network Parameters.
- The Network Parameters submenu appears.
- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- *To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.*
- *If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.*

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone. Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.
To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Sever Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁴⁷.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).

⁴⁷ The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
- Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
- Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
- Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
- To configure PC VLAN/COS, select **Enable?**.
- Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
- Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see [“Using PCAP Trace for Matrix SPARSH VP310 Matrix Extended IP Phone”](#), under *PCAP Trace*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.

- Again press Down key **▼** to select Network Status and press the Enter key **✓**.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Connecting SPARSH VP330 as Extended SIP Extension

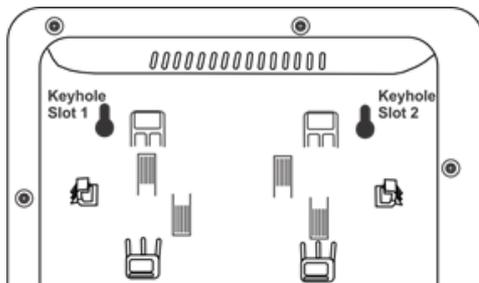

You are recommended to complete the following steps before connecting the Matrix SPARSH VP330 to SARVAM UCS:

- Decide the location where you want to place SPARSH VP330 within your LAN.
- By Default, in SPARSH VP330, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as **'String'** and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format **"IP_Address:Port"** in your LAN DHCP Server as per your installation scenario.
- Log in to *Jeeves*. For instructions, read the topic ["Configuring SARVAM UCS"](#).

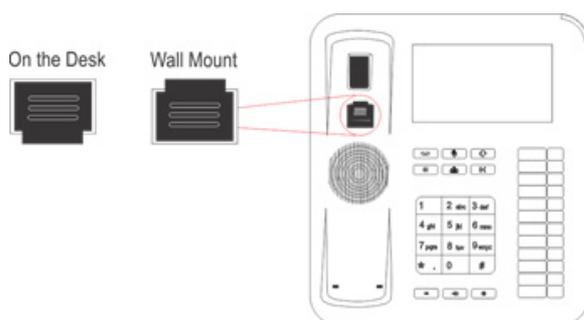

- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP330 can register as a SIP Extension. For instructions, see [“Configuring Matrix SPARSH VP330”](#).

Now, follow the steps described below to install SPARSH VP330.

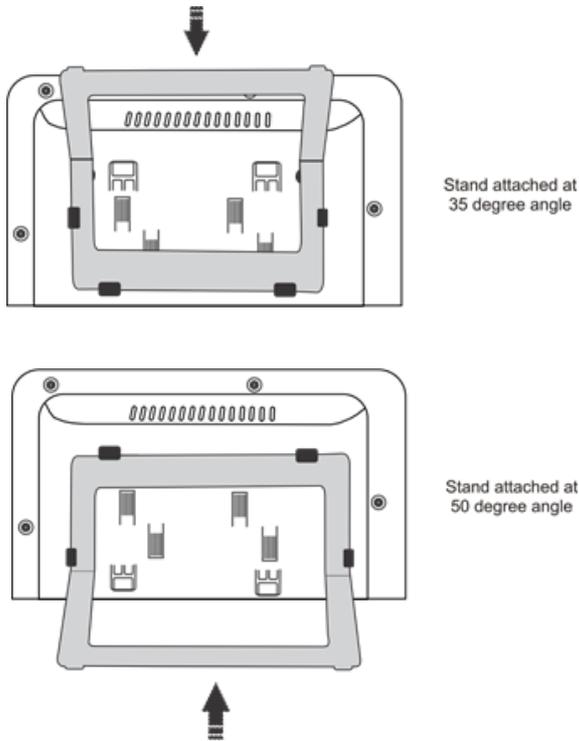

1. Unpack the SPARSH VP330 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.
 - Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

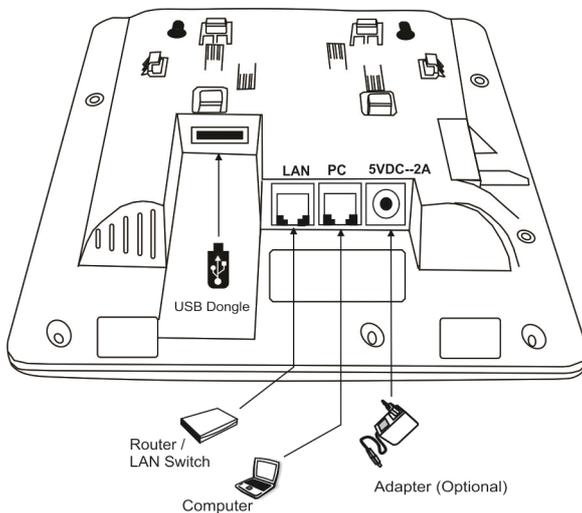

- When you mount the phone on a desk, you can attach the Foot Stand in two ways at **35° Angle** or at **50° Angle**.

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.
- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

- Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol.
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

5. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack with the symbol  on the left side panel of the phone.

OR

You may plug a headset with an RJ9 connector into the headset port on the side panel of the phone, marked with the symbol .

6. Connect the LAN Port of SPARSH VP330 to the IP Network — A Router or LAN Switch — using the Ethernet Cable.

OR

Connect the Wi-Fi USB Adapter into the USB port of the phone.

You can purchase the Wi-Fi USB Adapter from Matrix as an optional peripheral device to support wireless network.

7. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port at the bottom of the phone to the LAN Port of the computer.
8. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

9. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display,
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Network Settings/Server Settings or want to use Wi-Fi for connectivity, press

Settings  .

Refer to the *SPARSH VP330 User Guide*, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the *SPARSH VP330 User Guide* to know more.

Connecting SPARSH VP510 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to the system when used with SARVAM UCS application:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN Port IP Address /Domain Name and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.

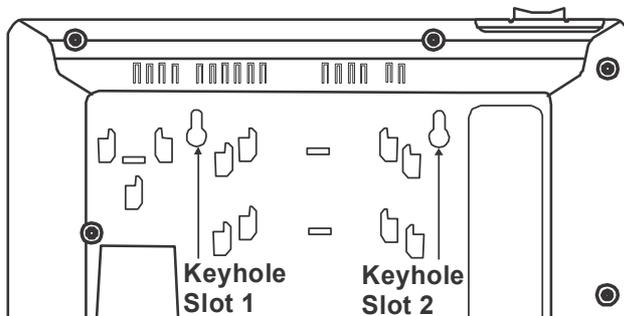

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see "[Configuring SIP Extensions](#)".

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic "[Configuring SIP Extension Settings as per the Extended Phone Type](#)" under *Configuring SIP Extensions*.

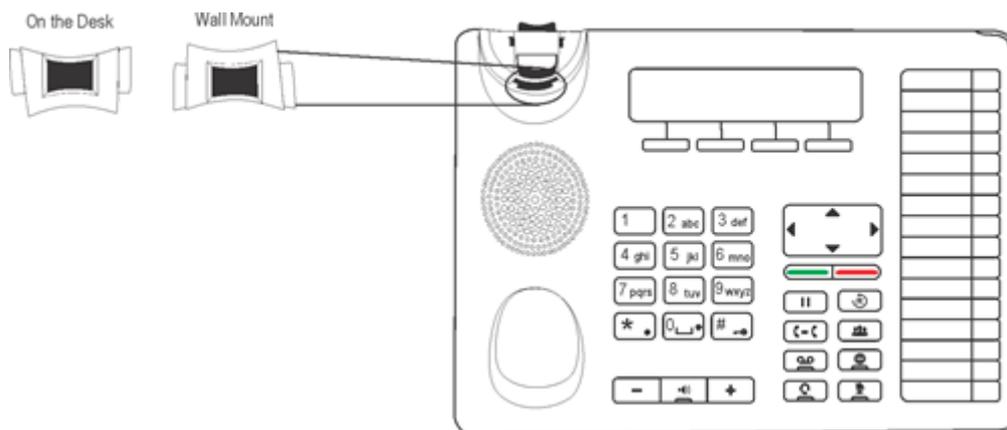

Now, follow the steps described below to install the Extended IP Phone:

1. Unpack the SPARSH VP510 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP510 on a wall,

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP510. The screws should protrude from the wall to fit into the Keyhole Slots.

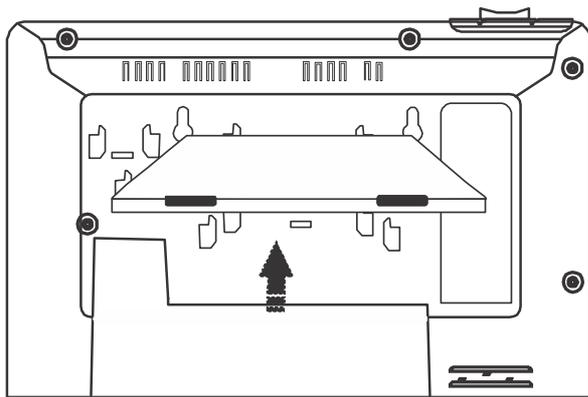

- Now, mount the phone with the screws into the Keyhole Slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

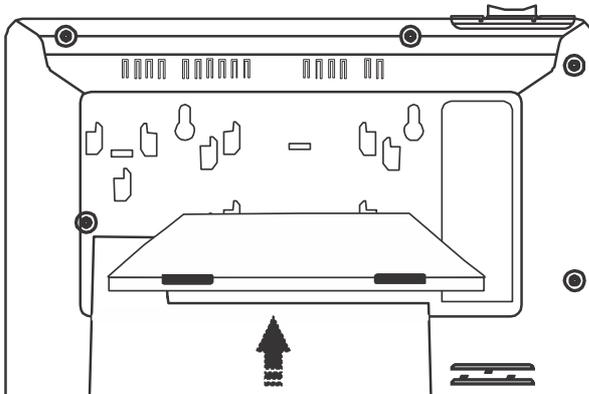

If you are unable to remove the wall mount tab, you may use a tool like a minus screw-driver to remove it.

- When you mount the phone on a desk,

- You can attach the Foot Stand in the following ways — at an angle of 45 degrees or 55 degrees

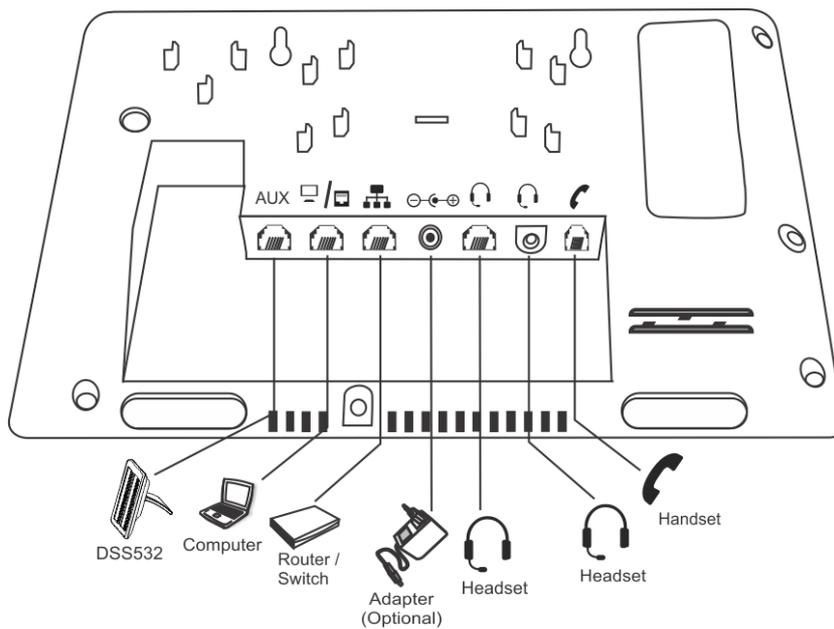

Stand attached at 45 degree angle

Stand attached at 55 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

4. Connect the Handset.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
- Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.

5. Connect the Headset (not supplied by Matrix).

- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset audio jack at the bottom of the phone, marked with the symbol .

OR

You may also plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

6. Connect to the IP Network.

- Plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone, marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.

7. Connect a PC to the Phone.

- Plug one end of the Ethernet Cable into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.

8. Connect DSS532 with the Phone.

- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with SPARSH VP510”](#).

9. Connect the Power Supply.

- It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant).

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

10. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the 'Loading...' message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.
- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press Yes key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See ["Network Settings"](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key  when the phone is in idle state.

To navigate the menu,

- Press the Menu Key when the phone is idle.
- Scroll by pressing the Up/Down Navigation Key to reach the desired Menu option.
- Press the Select / OK  Key to select the desired Menu option.
- Scroll by pressing the Up/Down Navigation Key to reach the desired sub-menu option.
- Press the Select / OK  Key to select the desired sub-menu option.

To exit menu,

- Press Cancel  Key.
- or**
Go ON-Hook.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

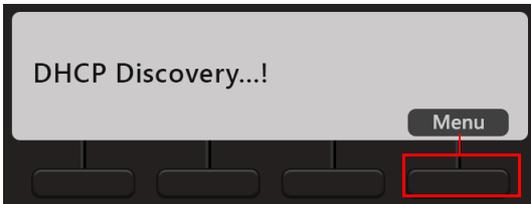

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press **Yes** key and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

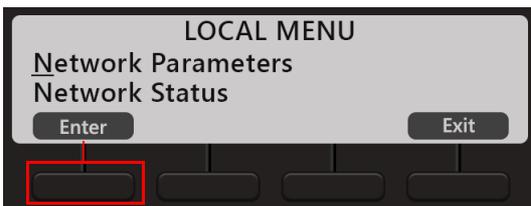

You must press the **Menu** key to access network settings.

3. When the phone is in idle state, press the Down key **▼**.

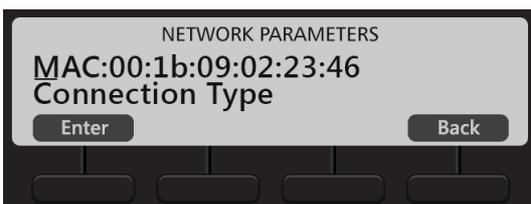

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.

- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select. Change the settings as per your requirements.

- Press **Save** key, to save the changes you make.
- You can configure all network parameters described below, except the MAC Address.

- To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.
- If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Delete key. The digit to the left of the cursor will be deleted.

Before you start configuring the Network Parameters, get acquainted with following context keys:

Context Keys	Description
Enter/OK	To select a particular parameter
Save	To save the changes
Back	To move a step backwards without saving the changes
Delete	To delete previous characters from the cursor position
2Ab/123	2Ab - Alphanumeric Mode 123 - Numeric Mode

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Sever Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁴⁸.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.

⁴⁸ The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
- Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and instructions on how to use PCAP Trace on the phone, refer to the *EON510_SPARSH VP510 User Guide*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.
- Again press Down key **▼** to select Network Status and press the Enter key.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.

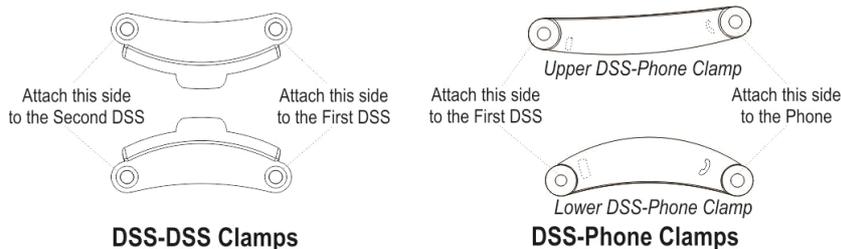

- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Refer to the *EON510_SPARSH VP510 User Guide* to know more.

Installing DSS532 with SPARSH VP510

Once you have installed SPARSH VP510 with SARVAM UCS, you can install the DSS532 by following the steps given below:

1. Unpack the box and verify the package contents⁴⁹.
2. Four clamps are provided with the phone — 2 DSS-Phone Clamps and 2 DSS-DSS Clamp.

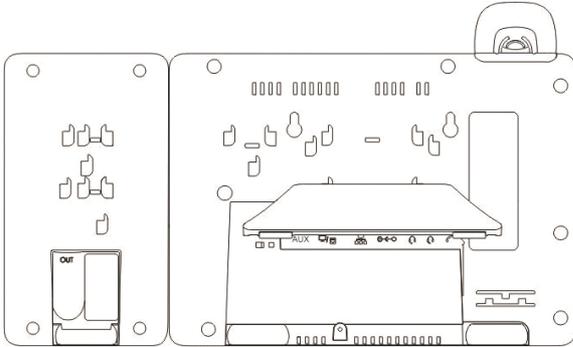

49. See [“Packing List”](#) of Appendix topic.

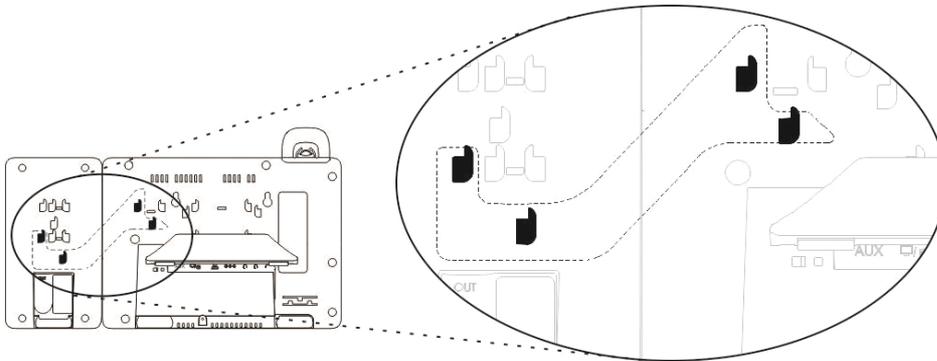

Connecting the First DSS532

Connecting the Extender

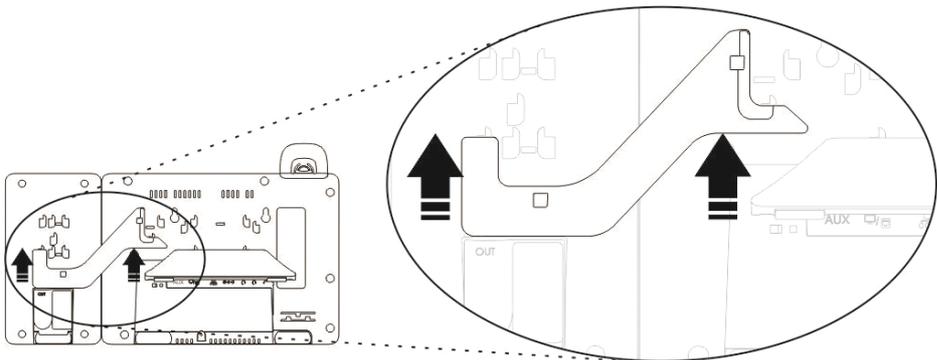

3. Turn the phone upside down on the table and place the inverted DSS532 adjacent to it.

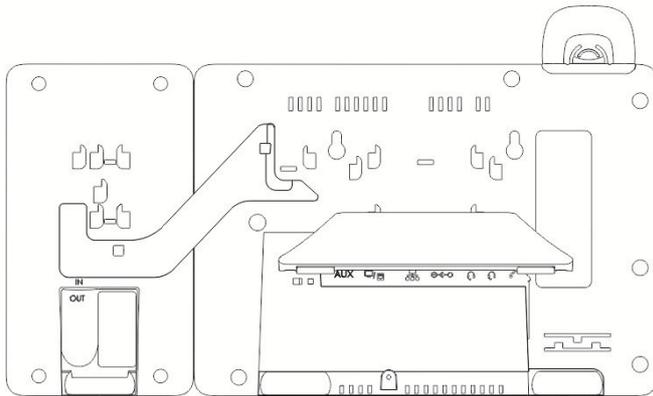

4. To attach the DSS532 with the phone, place the DSS Extender as illustrated below.

5. Insert the hooks on the Extender into the slots provided on the phone and the DSS532.

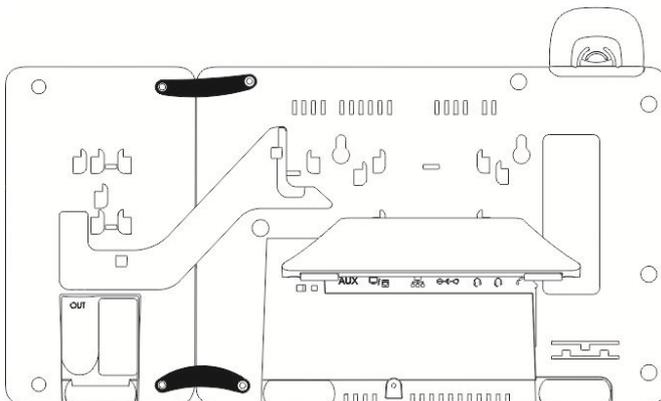

6. Firmly slide the DSS Extender upwards to lock them in place.

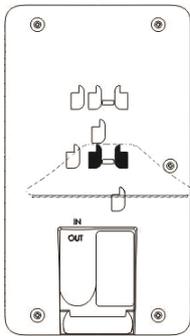

Attaching the Clamps

7. Now attach the clamps. To do so,
 - Remove the screws to attach the clamps.
 - Place the DSS-Phone Clamps between the DSS532 and the phone.
 - Insert the screws back to fix the clamps.

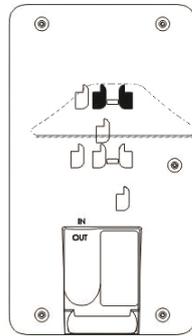

Attaching the Footstand

8. You can mount the DSS532 with the phone on the desk at two angles — **45 degrees** or **55 degrees** by attaching the Foot Stand.

Stand attached at 45 degree angle

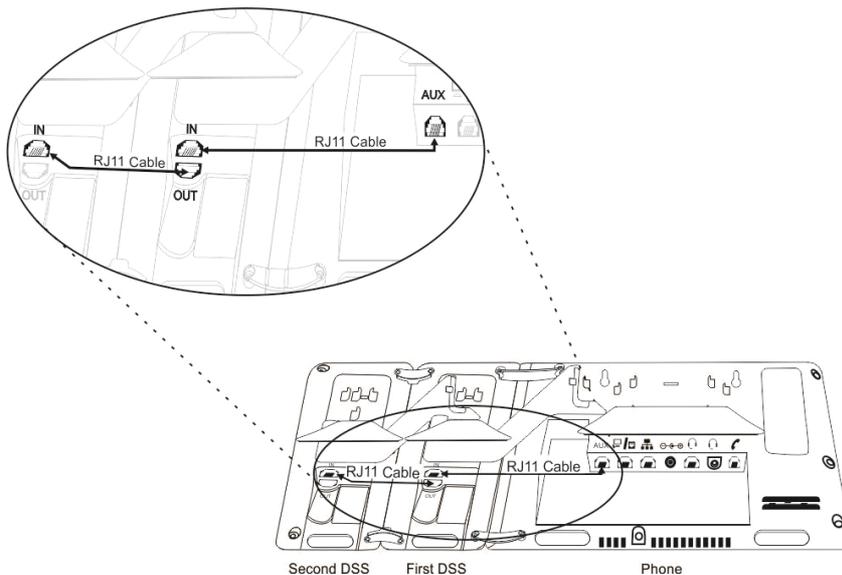

Stand attached at 55 degree angle

Make sure both, the DSS532 and phone are mounted at the same angle.

Connecting the Cables

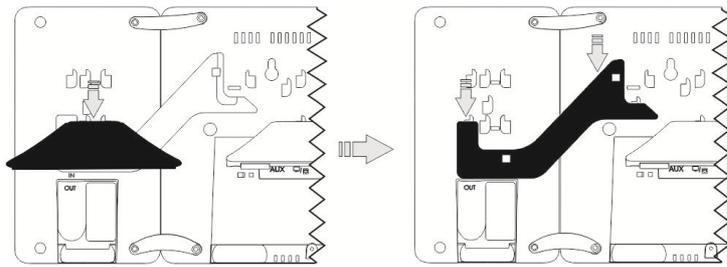

9. To connect the DSS532 with phone, plug one end of RJ11 Cable into **Auxiliary(AUX) Port** of the phone and the other end into the **IN Port** of the DSS532.

Connecting Multiple DSS532

Remove the Foot Stand

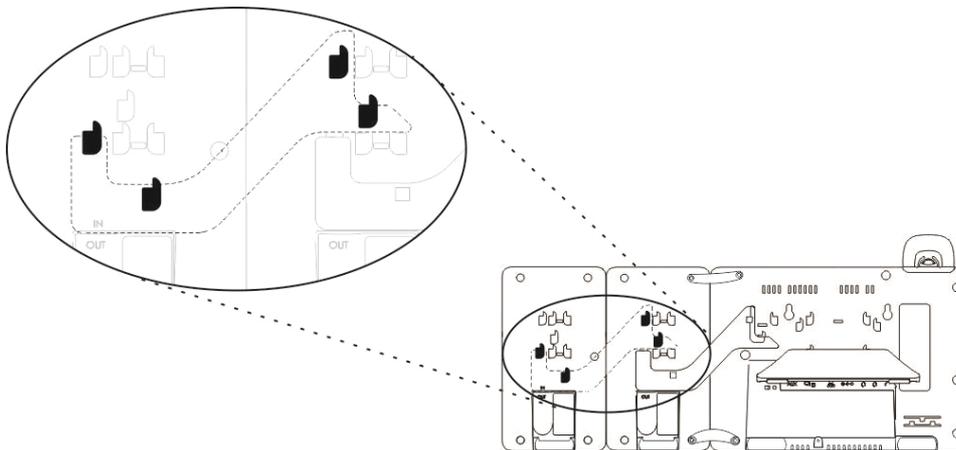

10. Remove the Foot Stand of attached DSS532. To do so,
 - Firmly slide the Foot Stand of the attached DSS532 downward to unlock.
 - Now, slide down the attached DSS Extender in downward direction.

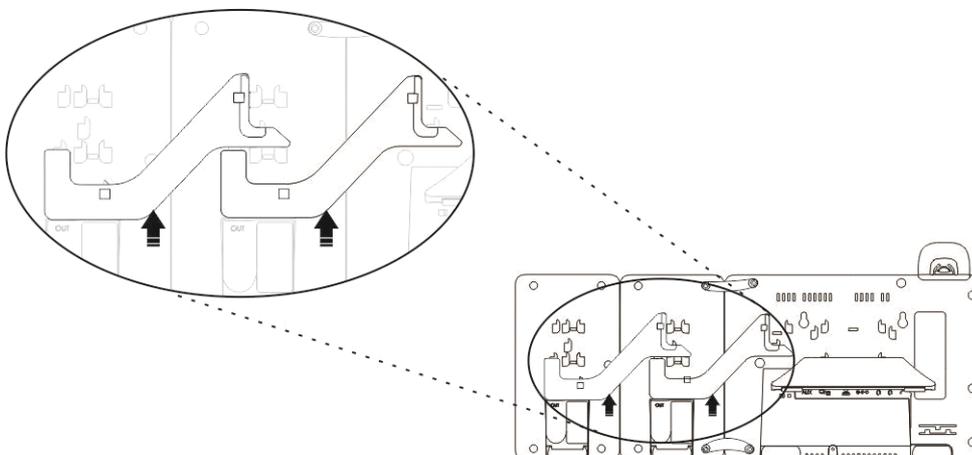

Attach the second DSS Extender

11. To attach the second DSS Extender,

- Place another inverted DSS532 adjacent to the existing assembly.
- Place the DSS Extender as illustrated in the diagram below.
- Insert the hooks on the Extender into the slots provided on both the DSS532.

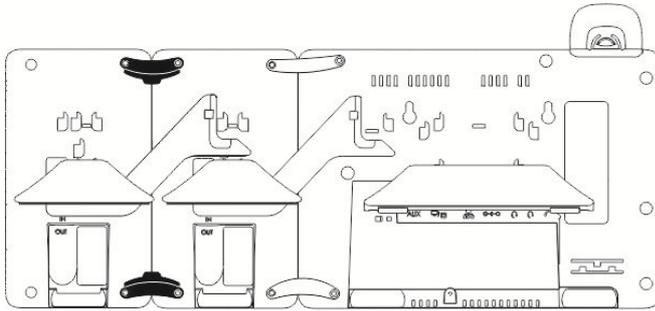

12. Firmly slide both the DSS Extenders upward consecutively (attach the second extender first followed by the existing one attached to the phone) and lock them in place.

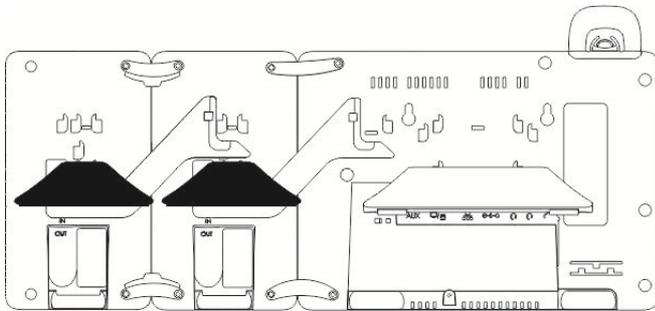

Attach the Clamps

13. Attach the DSS-DSS Clamps between both the DSS532.

Attach the Foot Stand

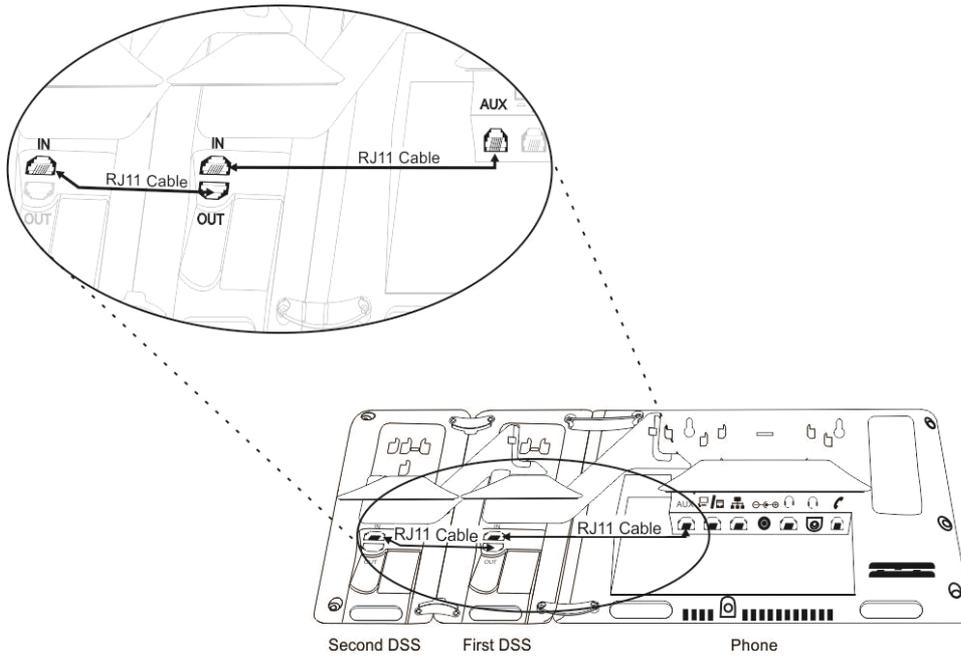

14. Attach the Foot Stand of both the DSS532.

Make sure both, the DSS532 and the phone are mounted at the same angle.

Connect the second DSS532 to the existing assembly

15. Plug one end of the RJ11 Cable into the OUT Port of the existing DSS532 (already connected with the phone) and the other end into the IN Port of the second DSS532.

You can install a maximum of four DSS532 with a phone.

16. After you have connected the DSS532 with the phone, you can configure the DSS Keys. For instructions, see ["Programming DSS Console Keys"](#).

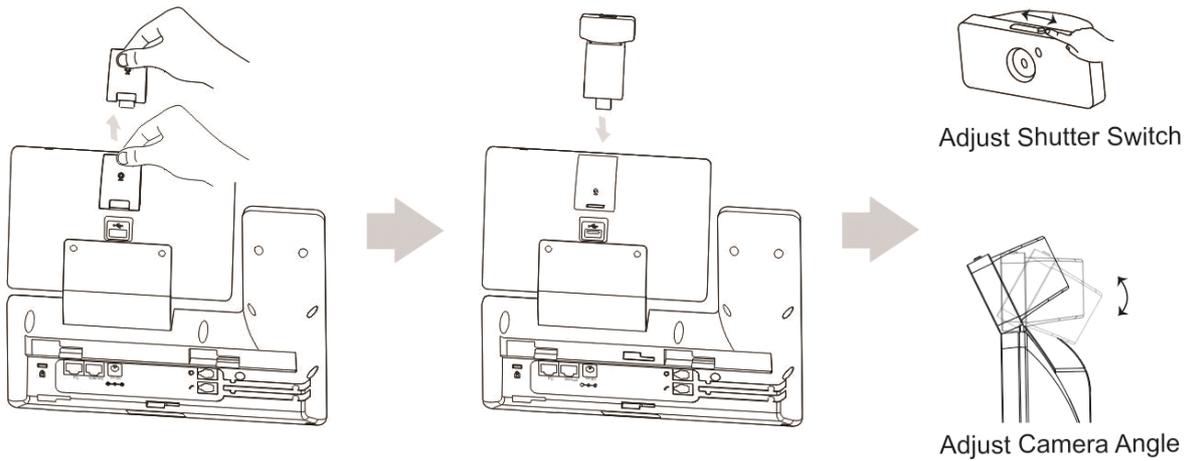

Connecting Extended SPARSH VP710 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended SPARSH VP710 to SARVAM UCS:

- Decide the location where you want to place Matrix Extended SPARSH VP710 within your LAN.
- Log in to *Jeeves*. For instructions, read the topic ["Configuring SARVAM UCS"](#).
- You must configure the necessary parameters in SARVAM UCS so that Extended SPARSH VP710 can register as a SIP Extension. For instructions, see ["Configuring Matrix Extended SPARSH VP710"](#).

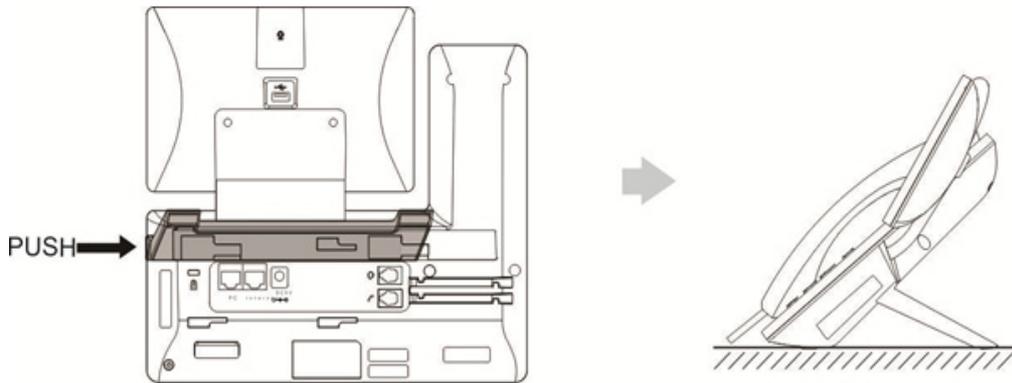

Now, follow the steps described below to install Extended SPARSH VP710.

1. Inserting the camera

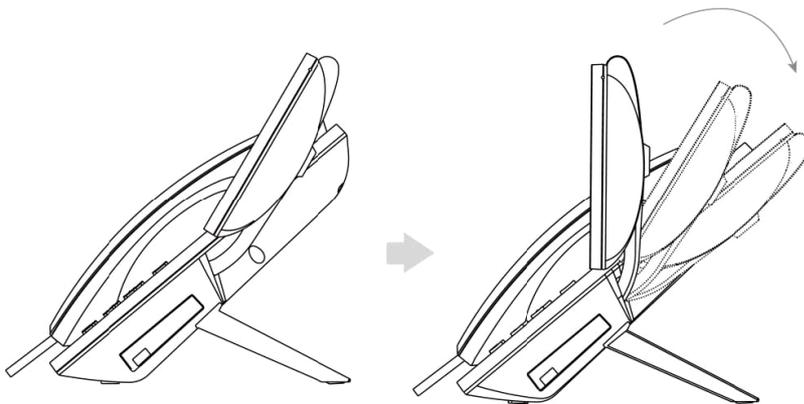

It is recommended to use only the Matrix original Camera, supplied with the IP Phone for video calling. The use of any third-party camera may cause damage to the phone. Damages to the phone caused by using third-party camera is not covered by Matrix warranty.

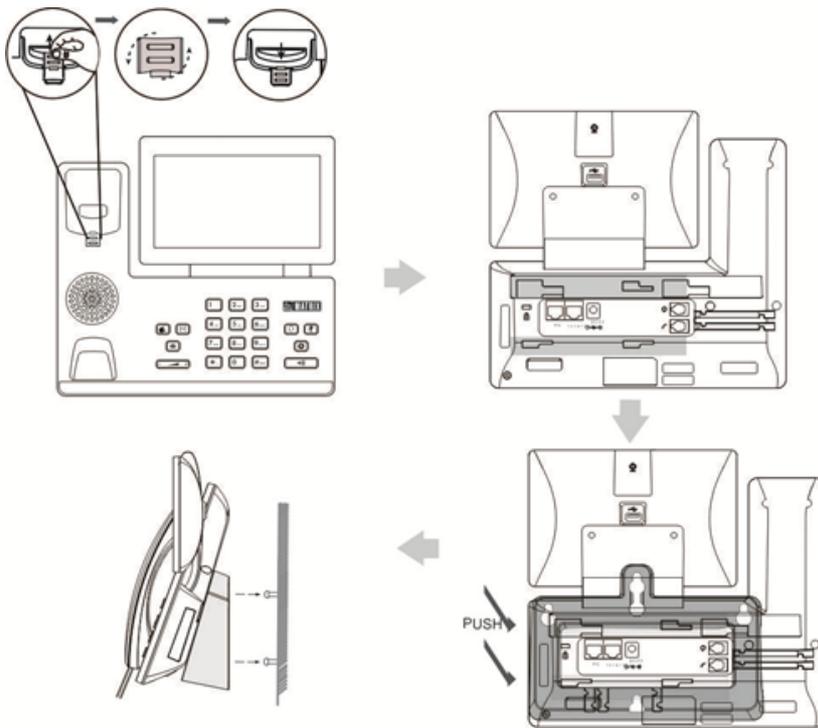

2. Attaching the stand

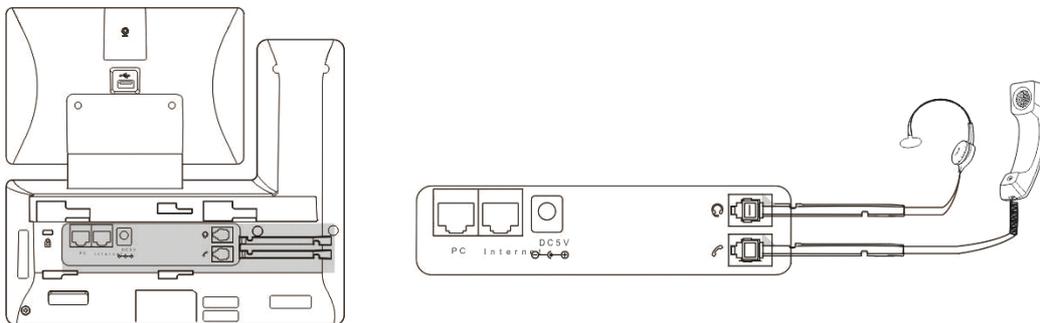

3. Adjusting the angle of the touch screen.

4. Attaching the optional wall mounting bracket

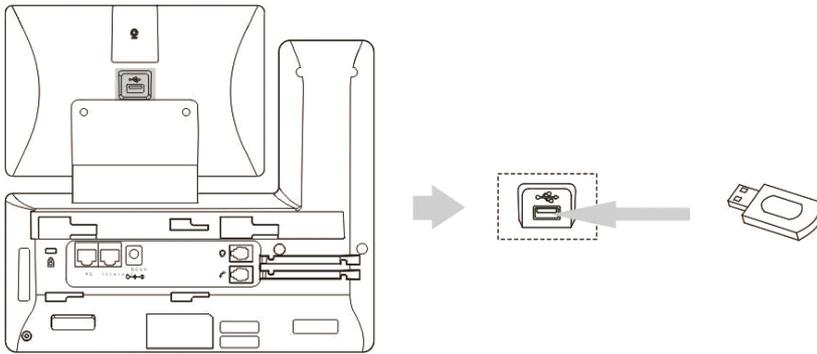

5. Connect the handset and optional headset.

A headset is not included in the packaging contents. Contact your dealer/reseller for more information.

6. Connect the optional USB Flash drive.

7. Connect the network and power.

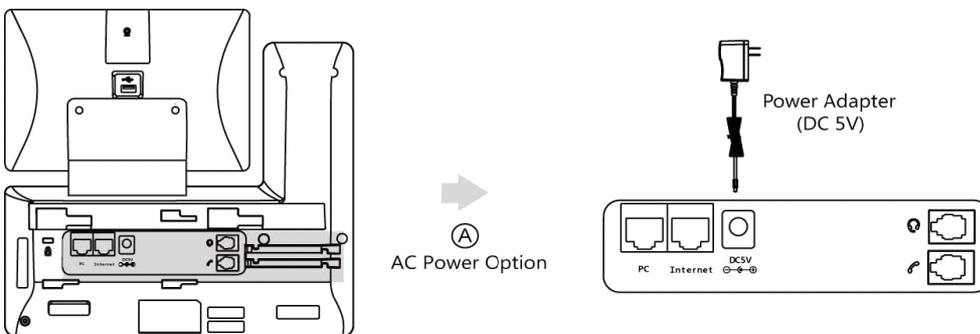

There are two options to connect the power and the network.

- AC power
- Power over Ethernet (PoE)

AC Power

To connect the AC power:

- Connect the DC plug on the power adapter to the DC5V port on the phone and connect the other end of the power adapter into an electrical power outlet.

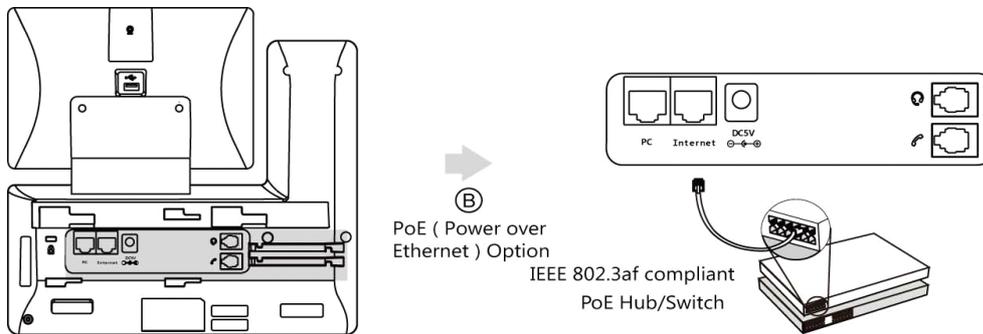

Power over Ethernet (PoE)

With the included or a regular Ethernet cable, the IP Phone can be powered from a PoE-compliant switch or hub.

To connect the PoE:

- Connect the Ethernet cable between the Internet port on the phone and an available port on the in-line power switch/hub.

If in-line power switch/hub is provided, you don't need to connect the phone to the power adapter. Make sure the switch/hub is PoE-compliant.

Do not unplug or remove power while the phone is updating firmware.

After the IP Phone is assembled and connected to the power supply, it automatically begins the initialization process.

During this process, the IP Phone displays the start up screen "Welcome Initializing...please wait".

Once the IP Phone is initialized, it displays two different phone modes:

- Standard SIP
 - Extended SIP
- Select Extended SIP, to operate the IP Phone in the extended mode. As soon as you select this mode, the booting process initiates again and the start up screen displays "Welcome Initializing...please wait". After the IP Phone is initialized, it attempts to contact a DHCP Server in your network to obtain valid IPv4 network settings (example: IP address, Subnet Mask, Gateway address, DNS address). You need to configure the basic network parameters of the IP Phone manually, if these are not provided by the DHCP Server or if your network does not support DHCP.

Refer to the *EXTENDED SPARSH VP710 User Guide*, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration (when DHCP is selected) to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

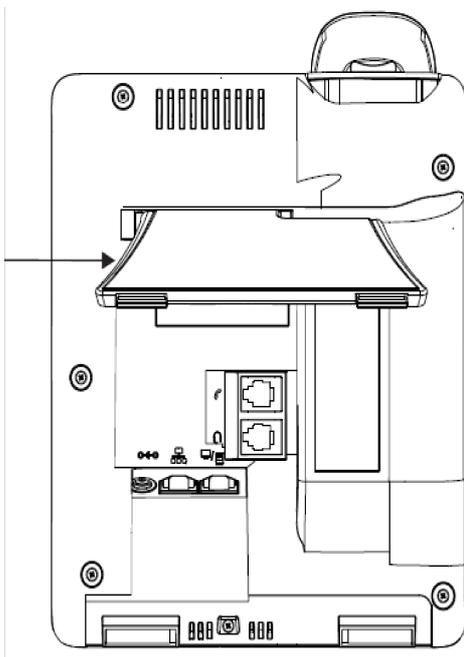

Connecting SPARSH VP210 as Extended SIP Extension

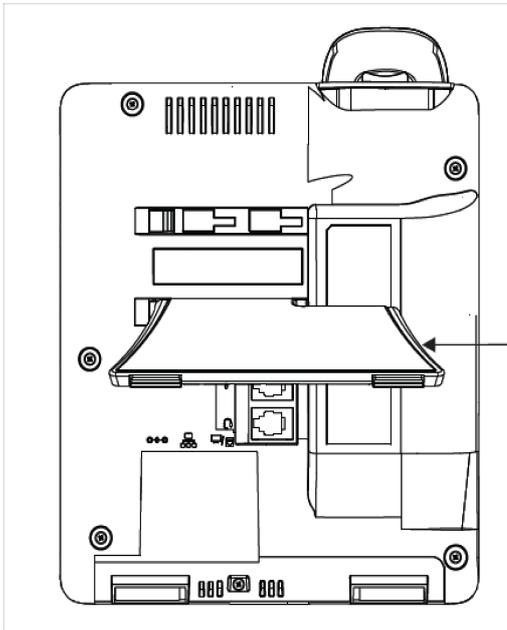

You are recommended to complete the following steps before connecting the Matrix SPARSH VP210 to SARVAM UCS:

- Decide the location where you want to place SPARSH VP210 within your LAN.
- By Default, in SPARSH VP210, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your LAN DHCP Server as per your installation scenario.
- Log in to *Jeeves*. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP210 can register as a SIP Extension. For instructions, see "[Configuring Matrix SPARSH VP210](#)".

Now, follow the steps described below to install SPARSH VP210.

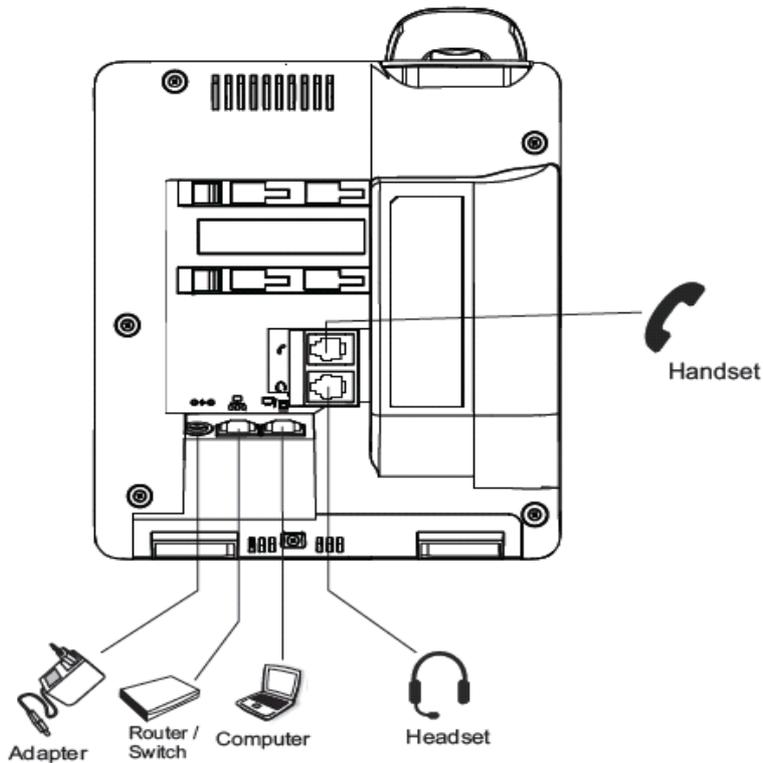

1. Unpack the SPARSH VP210 box and verify package contents.
2. When you mount the phone on a desk, you can attach the Foot Stand in two ways at **45° Angle** or at **55° Angle**.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

3. Connect the Handset to the Phone body.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
 - Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.
4. If you want to use a Headset (not supplied) with your phone, You may plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .
 5. To connect the LAN, Port , plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.
 6. To connect your phone to a computer on your desk, plug one end of the Ethernet Cable (not supplied with this phone) into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.
 7. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/0.6A) only. The use of any third-party power adapter may cause damage to the phone.

8. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display.
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Server Settings, press Settings.

Refer to the SPARSH VP210 (Extended) User Guide, for detailed instructions, to change the Network Settings of the phone and configure the network parameters.

- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the **SPARSH VP210 (Extended) User Guide** to know more.

Starting Up ETERNITY LENX

Power ON

- If you have completed all the installation tasks, switch on power supply. Keep the MCB Switch ON of your PS48V card installed in the system and power the FCBC.
- Observe the Reset Cycle.

Reset Cycle

- Reset Cycle (Power-ON Self Test) takes about 2 minutes to finish.
- All the LEDs of the system, the cards and the keys of the DKP/SIP devices attached to the System are turned on.

Interpreting LEDs

The functioning of the LEDs of the system and the various cards and their meaning are summarized at the end of the installation instructions for each Card Type.

Refer to the LED Patterns described for each Card Type to verify if the system is operating properly and locate faults, where they occur.

When the reset cycle is successful, the default Extension "[Access Codes](#)" loaded by the system and the date and time of the "[Real Time Clock \(RTC\)](#)" of the system will appear on the LCD display of the DKPs/ IP Phones you have connected with the system.

- *The Matrix ETERNITY MENX is to be installed by persons trained and experienced in telecom wiring.*
- *The person installing the ETERNITY MENX must be familiar with trunks, physical wiring of the MDF on both the exchange (System) side and the line side (CO).*
- *When installing any equipment, make sure that you take all the necessary precautions for handling electronic and electrical appliances. Follow proper procedures for static electricity, while handling the system and its cards to prevent damage to the system and harm to yourself.*
- *Use a grounding mat and wear an anti-static strap/belt. Read the do's and don'ts listed in [“Protecting the System and Yourself”](#).*
- *If you have complied with the requirements and instructions described in [“Before You Start”](#), you may now begin the installation of your ETERNITY MENX.*

Firmware Version V1R2 and earlier

ETERNITY MENX can be wall mounted, rack mounted or placed on a table.

ETERNITY MENX has a total of 16 Universal slots.

The Matrix ETERNITY MENX is shipped factory fitted with the Power Supply Card and the CPU Card in their respective fixed slots (refer the section [“Know Your SARVAM UCS”](#)). VoIP and VMS are in-skin to the CPU Card. Hence, separate VMS and VoIP Cards are not required.

ETERNITY MENX has a total of 16 Universal slots. The cards - BRI, T1E1PRI, GSM/CDMA, DKP, CO, SLT, E&M, Magneto - are shipped separately as per the order placed by individual customers. These cards can be installed in any of the Universal slots.

If you upgrade the system firmware to V1R3 and later, the Expansion Slots license will be applicable for the universal slots. No universal slots will be functional by default. You must purchase the SARVAM EXP4 ENT license to activate the universal slots as required.

For details, see [“Expansion Slots”](#) under [“License Management”](#).

Firmware Version V1R3 and later

ETERNITY MENX can be wall mounted, rack mounted or placed on a table.

The Matrix ETERNITY MENX is shipped factory fitted with the Power Supply Card and the CPU Card in their respective fixed slots (refer the section [“Know Your SARVAM UCS”](#)). VoIP and VMS are in-skin to the CPU Card. Hence, separate VMS and VoIP Cards are not required.

ETERNITY LENX has a total of 16 Universal slots. The cards - BRI, T1E1PRI, GSM/CDMA, DKP, CO, SLT, E&M, Magneto - are shipped separately as per the order placed by individual customers. These cards can be installed in any of the Universal slots.

If you have upgraded the system firmware to V1R3 and later in the old ETERNITY MENX system, the Expansion Slots license will be applicable for the universal slots. No universal slots will be functional by default. You must purchase the SARVAM EXP4 ENT license to activate the universal slots as required.

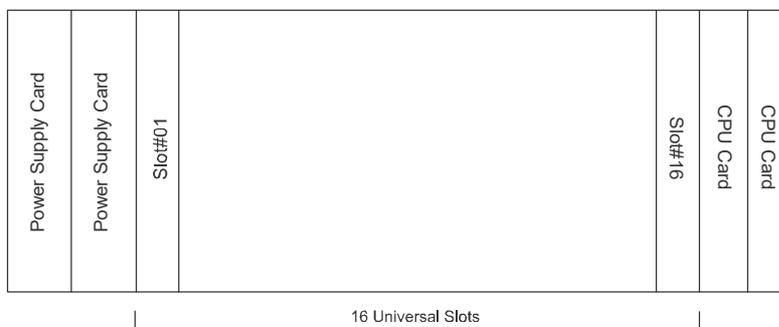

If you have purchased the new ETERNITY MENX system with the firmware V1R3 and later, the Expansion Slots license will be applicable for the universal slots. The first eight universal slots after the power supply card will be functional by default. If you require more functional universal slots, you must purchase the SARVAM EXP4 ENT license.

Each SARVAM EXP4 ENT license will provide the activation for next four universal slots in sequence.

For details, see [“Expansion Slots”](#) under [“License Management”](#).

Illustrated below is the position of the fixed and universal slots in ETERNITY MENX.

ETERNITY MENX

The two extreme left slots are reserved for the Power Supply Cards and the two extreme right slots are reserved for the CPU Cards.

Follow the installation instructions for Cards described here also when you expand the system (add more Cards) or remove or swap Cards for maintenance and repair.

1. Unpack the box. Check the package contents (see [“Packing List”](#)). Contact your Dealer/Distributor if any of the items is missing, faulty or damaged. Do not discard the packaging material.

Mounting the System

2. Decide where to mount the ETERNITY MENX - on a table or wall - taking into consideration the mechanical dimensions and the weight. If mounting the system on a wall, you may refer the mechanical dimensions and the Mounting Template for drilling holes at appropriate places on the wall. Make sure the system orientation is horizontal.
3. When installing the system in a rack, allow adequate space between the system and other units for air circulation. Make sure the system orientation is horizontal.
4. Mount the system at the selected site. Make sure that the system is placed such that you have full access to the front and back panels. The holes in the panels are provided for ventilation; Make sure that these are not blocked, to prevent overheating.

Connecting Input Power Supply

5. Ensure that a proper electrical earth and telecom earth are in place.
6. Check the voltage at the power point from where the supply is to be given to the system. It should be as per the specifications. Earth the system properly. (Refer [“How to Make the Telecom Earth”](#)).

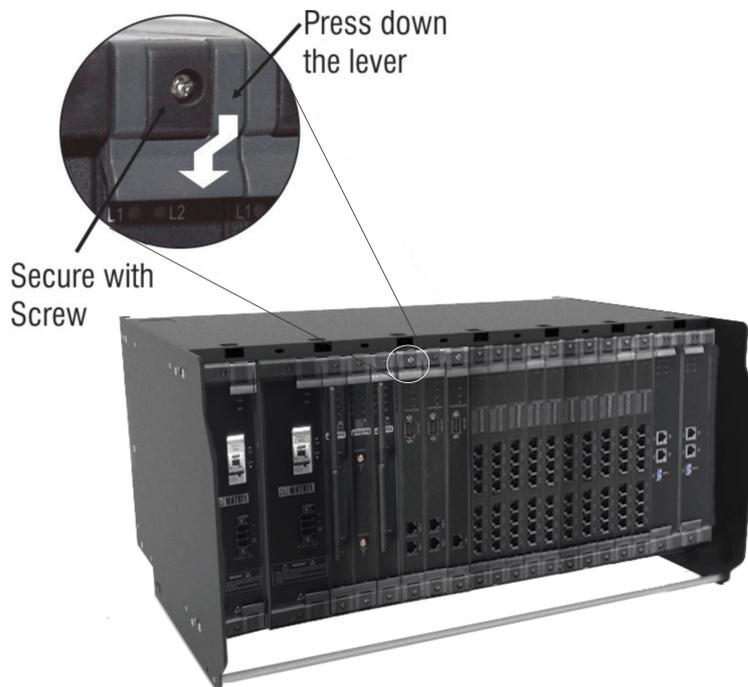

Inserting Cards

7. Make sure that the ETERNITY MENX power is off and the power cord is unplugged.
8. Select a free slot from the universal slots.
9. Unscrew and remove the filler bracket that covers the card-slot opening of the slot you intend to use.
10. Hold the card with the connectors facing you. Do not grab the card from both ends.
11. Slide the card into the slot, along the guide rails provided for each slot at the top and bottom planes.
12. Ensure that the cards are inserted deep enough for all the connector pins on the cards make complete contact with those of the motherboard on the backplane.

Do not force the card into the slot. Doing so can damage the card or the slot connector.

13. When the card is firmly seated in the connector, push down the levers on the card mounting bracket and secure the card with the screw provided.

14. Tighten the screws on either side of the bracket.
15. Following the above steps, install each card into the universal slots.

Detailed installing instructions are provided for each card - DKP, SLT, CO, ISDN BRI, ISDN T1E1PRI, GSM/CDMA, E&M, E1FO, Magneto, Radio - later in this section. Refer to them when installing each card type.

16. To remove a card:

- Switch off power supply, unplug the power cord.
- Disconnect any cables connected to the card.
- Remove the screws from the card-mounting bracket.
- Lift the levers on the mounting bracket to release the card.
- The card will emerge out of the slot.
- Grasp the card by its mounting bracket, and ease it out of its slot.

- *If you are removing the card permanently or for a certain period of time, install a filler bracket over the empty card opening in the chassis.*

- *Installing filler brackets over empty card-slot openings is necessary to protect the system from dust, dirt, insects and damage.*

17. Using the cables supplied with each card, and terminate the cables in the Main Distribution Frame (SLT, DKP, CO, and E&M lines), the NT1 device (ISDN BRI lines), ISDN Modem (ISDN PRI Lines), as applicable.

Lead the cables neatly and tangle-free into the MDF.

18. After you have completed inserting and connecting the cards, power ON the system and observe the Reset cycle and the LED pattern of each card, where applicable.

The Power Supply Card

Two types of Power Supply Cards are supported by the Matrix ETERNITY MENX: PS UNI Card and PS48V Card.

- **PS UNI Card** with 100-240VAC, 47-63Hz Mains as Input AC Voltage Power Supply.

This card is designed on the SMPS scheme. As this card does not have any provision for battery backup, it is recommended that a UPS be connected to keep the system powered during outages.

This card has four LEDs, a Mains Switch, and a Socket assembly for connecting the mains cord.

- **PS48V Card** with 48VDC as Input DC Power Supply Voltage. A Float cum Boost Charger (FCBC) is required to feed 48VDC power to the card. The FCBC works on input AC mains.

This card is available in one variant - DC to DC 500 W.

The card has four LEDs, an MCB Switch, a power ON/OFF Switch, and a 3-way termination block for connecting the power cord.

Both, the PS UNI card and the PS48V Card provide DC output voltages as: +3.5V, +5.0V, -27V and -85V. These are indicated by LEDs.

- *Redundancy option is provided for the Power Supply Card and the CPU Card.*
- The ETERNITY MENX supports two power supply cards. Whenever there is a fault in one, the other takes over the control, providing uninterrupted communication.
- It also support 'Hot Swap' for the Power Supply Card.
- The maximum number of ports supported by the GSM, SLT and DKP Cards may vary according to the type of Power Supply used. Refer the following table for maximum ports supported with Universal Power (PSUNI) and DC Power Supply.

ETERNITY MENX - Universal Power Supply (PSUNI)

Type of Port	Maximum Number of Ports Supported
GSM	32 ports in Talk mode
SLT	128 ports in Talk mode for short loop 10 extensions in Talk mode for long loop 472 extensions permanently connected
DKP	96 ports maximum

Analog SLT ports supported for Short Loop with Loop Current programmed

Loop Current Programmed	25mA	30mA	35mA	40mA
Number of ports supported in talk mode (OFF-Hook short loop) according to loop current programmed	200	172	150	128

ETERNITY MENX DC to DC 500W Power Supply

Type of Port	Maximum Number of Ports Supported
GSM	112 ports in Talk mode
SLT	256 ports in Talk mode for short loop 20 extensions Talk mode for long loop 512 extensions permanently connected
DKP	128 ports maximum

Installing the Power Supply Card

The Power Supply Card is located in a fixed slot. No other card can be inserted in this slot.

The Power Supply Card is delivered factory fitted, when you buy the system. However, if you want to remove the card for the purpose of maintenance or replace it with a new one, please follow the instructions below:

1. Unpack the Power Supply Card and verify the package contents.

If already installed, switch OFF power supply, unplug the power cord. Remove the screws securing the card. Lift the levers on the mounting bracket to release the card. As the card emerges from the slot, ease it out of the slot.

2. Insert the Power Supply card into the guide rails of the first slot on the extreme left, designated for the Power Supply Card. Make sure that the card is inserted deep enough to make perfect contact with the connectors on the motherboard at the backplane.
3. Now, press down the levers on the card mounting bracket to secure the card in its slot.
4. Secure the card in the slot by screwing the bracket on both ends.

To install a second card for redundancy insert the second card on the next slot.

5. If installing the **PSUNI card**, connect the three-pin power cord into the socket of the PS UNI card and plug in the cord into the mains supply.

You may connect the PSUNI Card to a UPS to keep the system live during power outages.

Select a UPS considering the typical power consumption of ETERNITY MENX presented in the table below:

Model	Power Consumption (Typical)
ETERNITY MENX16S	100 watts

6. If installing the **PS48V card**, connect the Float cum Boost Charger (FCBC). Terminate the power cord from the FCBC output into the 3-way termination block on the PS48V card.

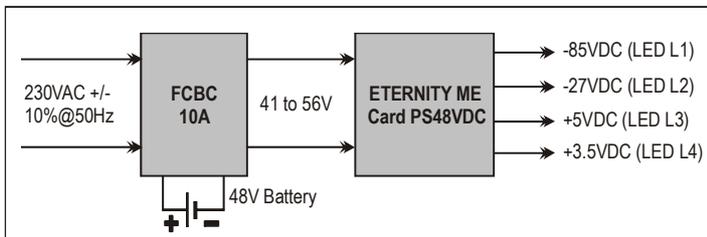

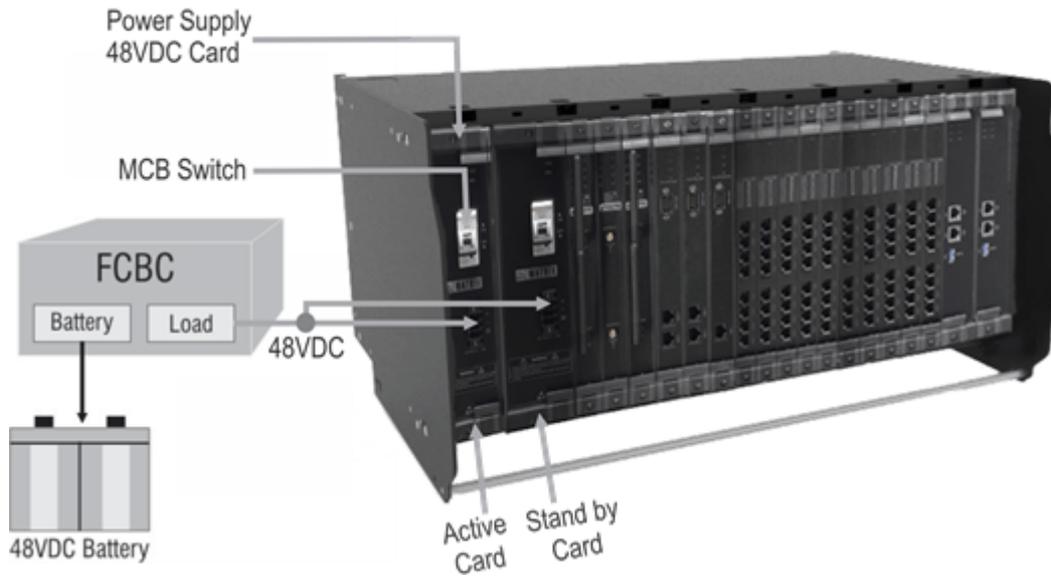

Polarity is critical. Ensure that the wires are connected with the correct polarity. Follow the standard color codes used by FCBC manufacturers:

Color	Signal
Red	+48VDC

Color	Signal
Black	GND
Green	Earth

It is recommended that you measure the voltage before connecting the power cable to the power supply card. Ensure that the earth is connected.

Connecting FCBC to the ETERNITY MENX

If two PS48V cards are installed for redundancy, each must be connected to a separate FCBC and each FCBC must be connected to a separate source of power supply.

7. Connect Battery back up to the FCBC⁵⁰.

50. When the batteries are drained, the FCBC goes into the boost mode and begins to charge the batteries at higher current. When the batteries reach a preset voltage level (typically set to 56.0 volts), the FCBC goes to float mode. In the float mode the FCBC keeps charging the battery but at lower current. The FCBC monitors the voltage level of the batteries. As soon as the battery voltage goes below preset voltage (typically set to 50.4 volts), FCBC goes from float mode to boost mode. The change over from mains to battery and vice-versa is automatic. The advantage of using an FCBC is that batteries get charged faster, since the batteries are charged with higher current initially.

Battery backup time depends upon the total load. The total load is the sum of system's load and load of active extensions. The power consumed by the variants of ETERNITY MENX is given in the table below:

Model	Power Consumption (Typical)
ETERNITY MENX16S	100 watts

The Battery back up time depends on the 'Ah' rating of the battery connected to the FCBC. The FCBC uses the constant voltage charging method. So, the batteries get charged faster if less power is consumed by the system when in mains mode.

8. Switch on power supply, after completing all other installation.

The CPU Card

The ETERNITY MENX-LENX CPU Card hosts the SARVAM UCS Application. It supports four VOCODER modules and one VMS module. Both the modules — NX DBM VOCODER64 and NX DBM VMS64 are optional and can be purchased separately.

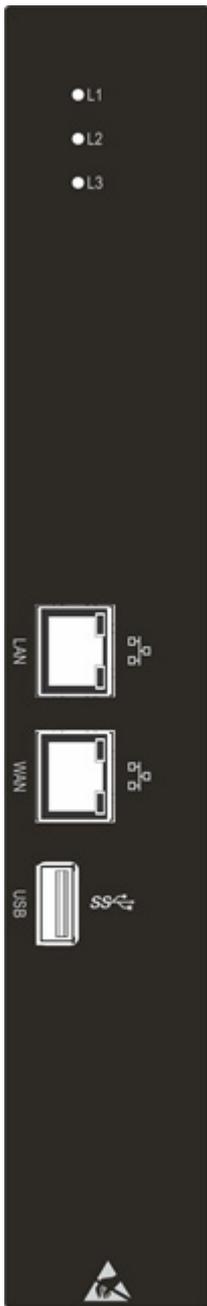

This card hosts Communication Manager, Feature Server, VoIP Server, VMS Server and other important servers and modules which controls all other slave cards (SLT, DKP, CO+SLT, DKP+SLT, E&M, BRI, T1E1, E1FO, GSM etc.). All the configuration and programming information is stored on this card.

ETERNITY MENX supports redundancy along with Hot Swap for the CPU Card. An additional CPU Card can be installed for redundancy. If the main CPU Card fails, the other card takes over, providing uninterrupted communication. To know more, refer to [“Redundancy”](#).

The CPU Card occupies fixed slots, the first two slots from the extreme right of the first Rack, with a unique arrangement of connectors. So no other card can be inserted in the slots of the CPU Card.

The CPU Card has a WAN Port, LAN Port and USB Port on the front panel. It also has an Internal USB Port with a factory fitted pendrive.

Ports and Connectors:

Port	Connector	Description
LAN	RJ45	Used for connecting the Ethernet cable into LAN Port to connect to a PC or a LAN Switch.
WAN	RJ45	Used for connecting the Ethernet cable into WAN Port to connect to a Broadband Router/Modem.

Port	Connector	Description
USB	USB to COM Converter (Optional)	<p>The External USB can be used as COM Port by connecting the USB to COM Converter.</p> <p>The USB to COM Port can be used to:</p> <ul style="list-style-type: none"> • set up and run software applications — PMS and CAS. • capture System Activity Log, System Fault log and Hotel Motel Activity logs. • generate SMDR reports.

If you buy a spare CPU Card separately, the default pendrive will not be provided along with it.

LAN Interface

The LAN Port is provided to connect:

- the system to a PC or a LAN. This port is used for operating the web-based programming software Jeeves.
- the CPU Card to the Local Area Network to register SIP extensions through the LAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “[System Activity Log](#)”, “[System Fault Log](#)” and Hotel Motel Activity Log.

WAN Interface

The WAN Port is provided to connect:

- a LAN Switch/Hub/Router/Modem.
- the CPU Card to the public network over a Router/Modem. Any user on the public network can be registered as SIP Extension through the WAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “[System Activity Log](#)”, “[System Fault Log](#)” and Hotel Motel Activity Log.

VoIP Interface

The CPU Card supports four NX DBM VOCODER64 modules. You must purchase the module separately for VoIP functionality.

VOCODER Channels

The system supports four NX DBM VOCODER64 Modules. Each module supports 64 VOCODER Channels⁵¹. You must purchase the modules separately. The system provides 4 pre-activated VOCODER channels by default which can be used after installing NX DBM VOCODER64 module. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VOCODER CHNL4 and SARVAM VOCODER CHNL16.

If you require more than 64 VOCODER channels, you can install another NX DBM VOCODER64 Module.

⁵¹. The number of VOCODER channels that will be supported would be as per the license you purchase.

A call made from a SIP Extension or SIP Trunk to another SIP Extension or SIP Trunk will consume two VOCODER channels, whereas a call made from a SLT or DKP extension to a SIP Extension or SIP Trunk will consume one VOCODER channel. Thus, the number of speech paths available to make simultaneous calls will depend not only on the number of VOCODER channels, but also on the number of channels consumed by such SIP-to-SIP and Analog/Digital extension to SIP Trunk/SIP Extension calls.

VMS Interface

The system supports a full-fledged, 'in-skin' Voice Mail System module to provide mailbox facility to all its extensions users. The Voice Mail System also forms the basis of other features like Conversation Recording and Call Taping.

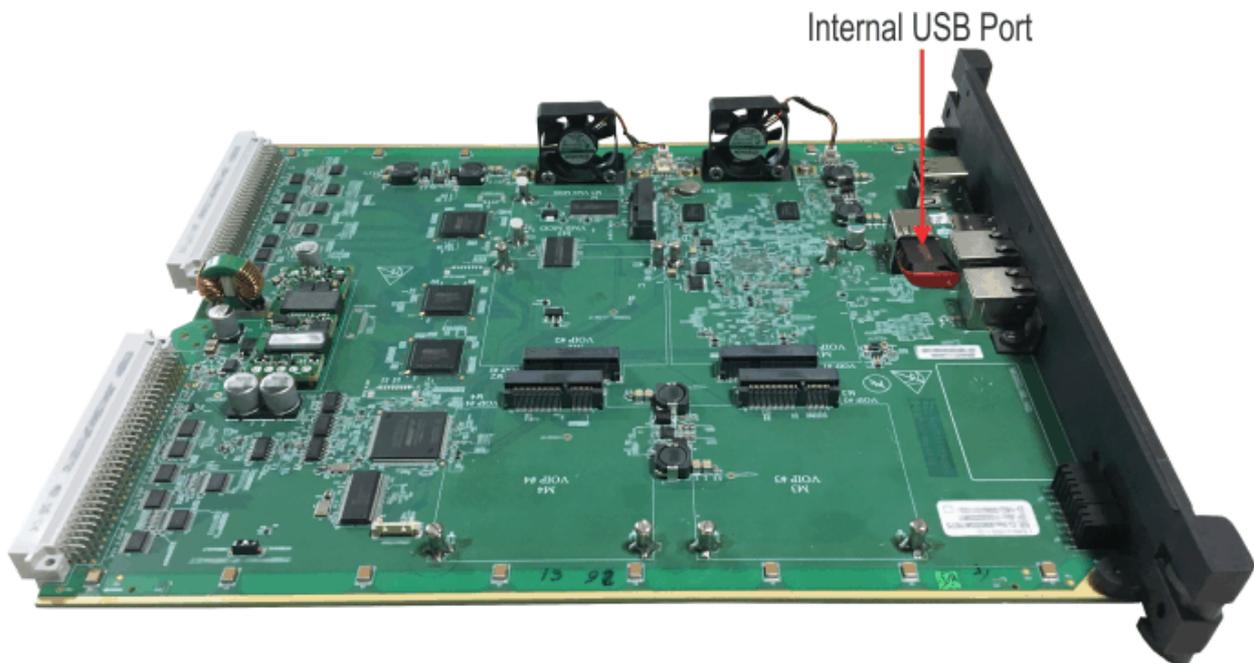

Each Mailbox has the capacity of storing 15,000 voice messages. The maximum size of each Mailbox is 60,000 minutes. By default, the size of each Mailbox is set to 5 minutes. The maximum Message Length for each Mailbox is 9,999 seconds. By default, the Maximum Message Length for each Mailbox is set to 15 seconds. The NX DBM VMS64 Module is an optional module. It must be purchased separately. The factory fitted Pen Drive provided also contains the VMS configuration files, and voice messages for prompts and greetings along with the SARVAM UCS ENT Application. The Pen Drive is also the storage device for mailbox messages.

If required, you may use a Pen Drive of upto 64GB by replacing the factory fitted pendrive with a new one.

The system supports a maximum of 64 channels out of which 4 channels are provided by default. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VMS CHNL4 and SARVAM VMS CHNL16.

Internal USB Port

The CPU Card has an Internal USB Port with a pendrive inserted into it.

The pendrive supports FAT32 file format. It contains the SARVAM UCS Application, VMS greetings, messages, Matrix Extended IP phone firmwares and SMS Server firmware.

Do not remove the pendrive.

When you select the SARVAM UCS ENT Application, the system fetches the application from the pendrive.

External USB Port (Device Port) 3.0

The CPU Card has an External USB Port on the fascia. This can be used as a COM Port by connecting the USB to COM Converter.

The USB to COM Converter will not be provided by Matrix.

The following USB to COM Converters are supported:

- Prolific PL2303 by BAFO
- CH341 by Winchiphead

If you use any other USB to COM Converter, it may not function properly.

The USB to COM Port has a DB-9 connector.

The port allows you to connect a PC to the system, so that you can install and operate the following features:

- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “[System Activity Log](#)” and “[System Fault Log](#)”, Hotel Motel Activity Log.

LED

The CPU Card has three dual color LEDs:

- Heart beat (L1)
- Layer Communication indications (L2)
- Slave Switch indications (L3)

LED for both Active and Standby Card:

State	Color	Cadence
At Power ON		
	L1 and L3 – RED	Continuous ON for 15 sec (approximately)
	L1 and L3	OFF for 30 sec (approximately)
When L1 and L3 has been OFF for 10 sec	L2 – ORANGE	Continuously ON for 3 sec
	L2 – OFF	OFF

LED for Active Card:

State	Color	Cadence
L1 Pattern		
During initialization process	ORANGE	Continuous ON
After initialization process	-	OFF
In normal condition	GREEN	Toggle
L2 Pattern		
During initialization process	GREEN, RED, ORANGE	500 ms GREEN – 500 ms RED – 500 ms ORANGE
After initialization process	-	OFF
In normal condition	-	OFF
L3 Pattern		
When sync is received by Active card from Standby Card	RED	Continuous ON
When Sync is completed	-	OFF
When Data transfer done by Active card	RED	Continuous ON

LED for Standby Card:

State	Color	Cadence
L1 Pattern		
During initialization process	ORANGE	Continuous ON
After initialization process	-	OFF
In normal condition	RED	1 sec ON – 1 sec OFF
L2 Pattern		
During initialization process	GREEN, RED, ORANGE	500 ms GREEN – 500 ms RED – 500 ms ORANGE
After initialization process	-	OFF
PLL Lock (standby card clock is in sync with active card)	GREEN	Continuous ON
PLL is not lock (standby card clock is not in sync with active card)	-	OFF
L3 Pattern		
When sync is sent by Standby card to Active card	RED	Continuous ON
When Sync is completed	-	OFF

The CPU Card has a Password IP Default Switch (SW1) on the board:

Switch	Position	Function
SW1	ON	Password IP Default
	OFF (default)	Normal

Installing the VOCODER Module

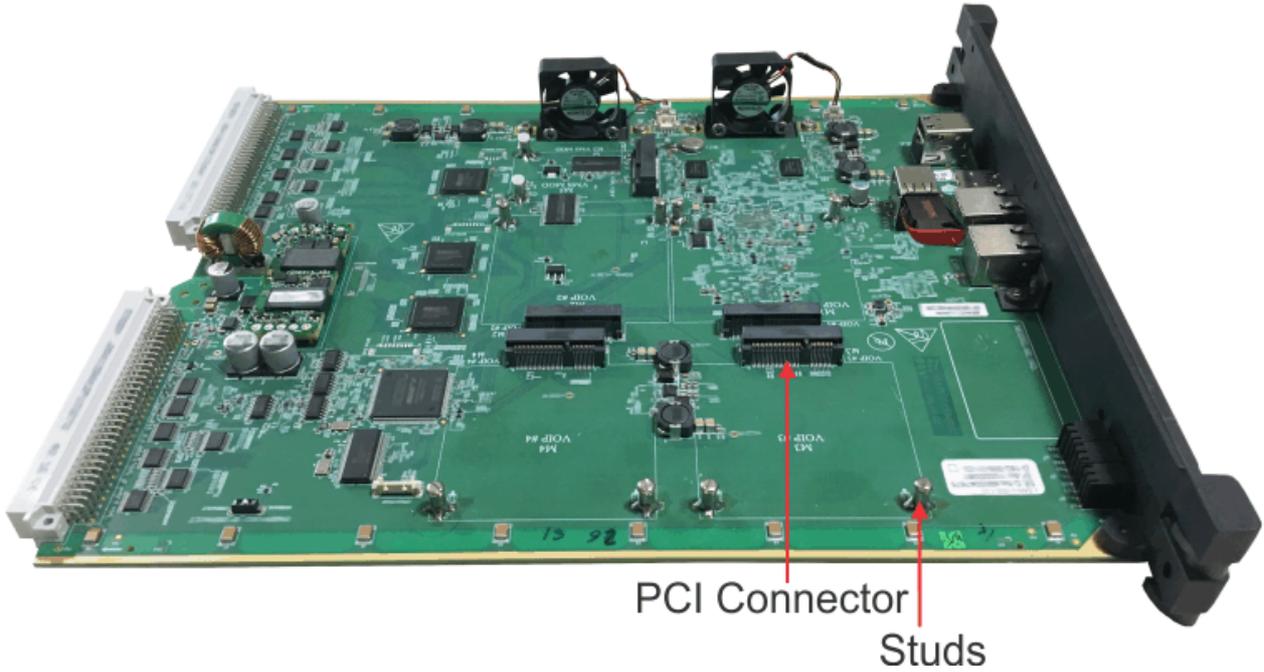

To install,

- Unpack the NX DBM VOCODER64 Module.

- If the CPU Card is already installed, switch off power supply, unplug the power cord. Remove the screws securing the card. Lift the levers on the mounting bracket to release the card. As the card emerges from the slot, ease it out of the slot.
- Place the card carefully on a table with some packing underneath it. Avoid any physical contact with the PCB part of the card as this could cause Electrostatic discharge (ESD) and may damage the hardware.

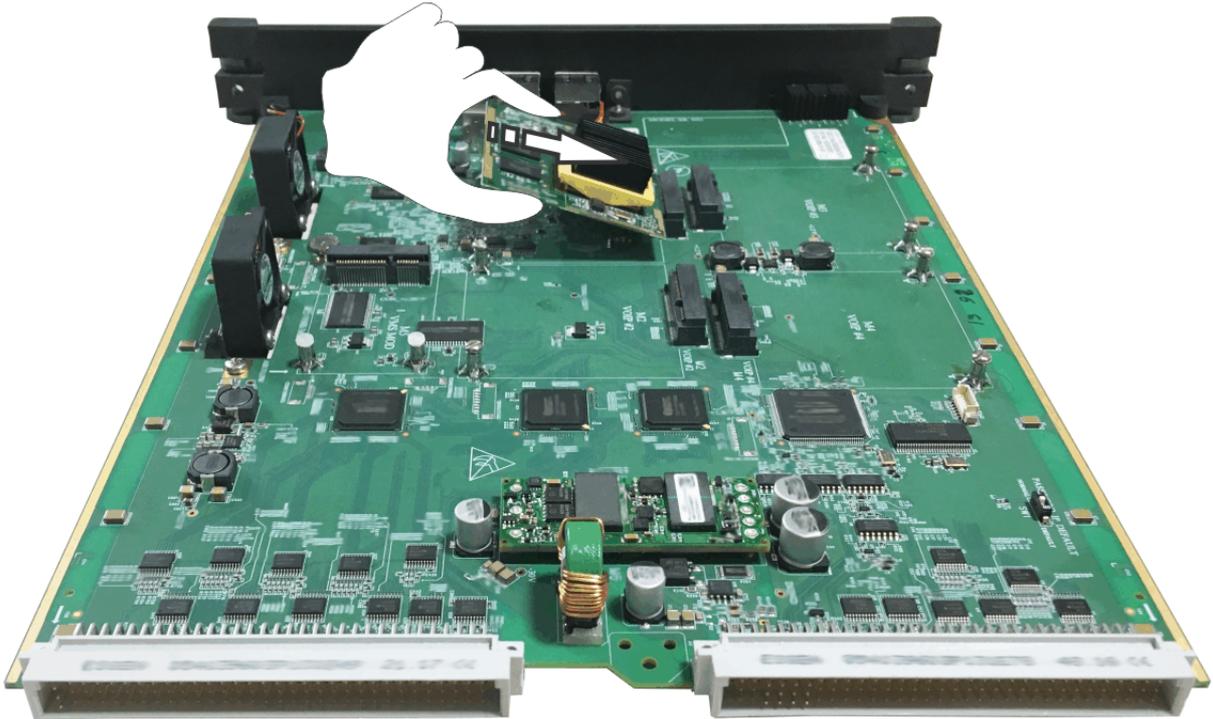

- There are 5 PCI Connectors (4 for VoIP and 1 for VMS) and five pairs of studs on the CPU board.

- Locate the **VOIP #1** label on the CPU board. The first NX DBM VOCODER64 Module should be mounted here.
- Remove the screws on the studs for the module and keep them aside.
- Carefully hold the NX DBM VOCODER64 Module from the edges. Make sure you do not touch the PCB area.

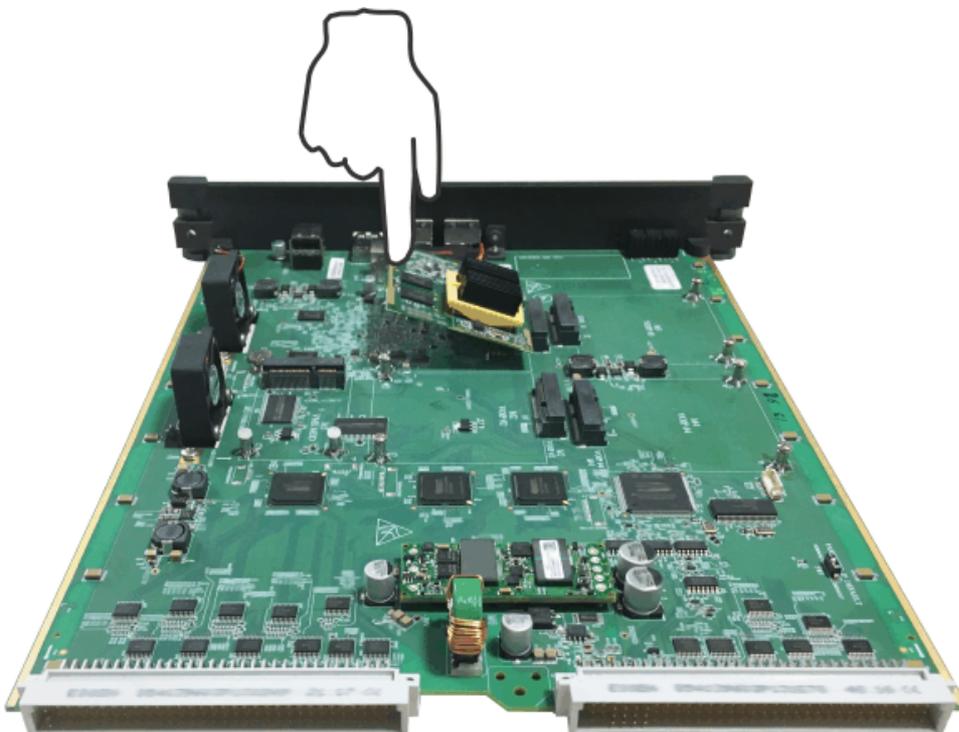

- Insert the NX DBM VOCODER64 Module into the PCI Connector socket.

- Press the Module with a finger and match the mounting holes perfectly with the stud holes. Make sure you do not touch the PCB area of the module except the yellow line provided for grounding at the front end of the module.

Do not apply excessive pressure.

- Secure the module with the screws on the studs.

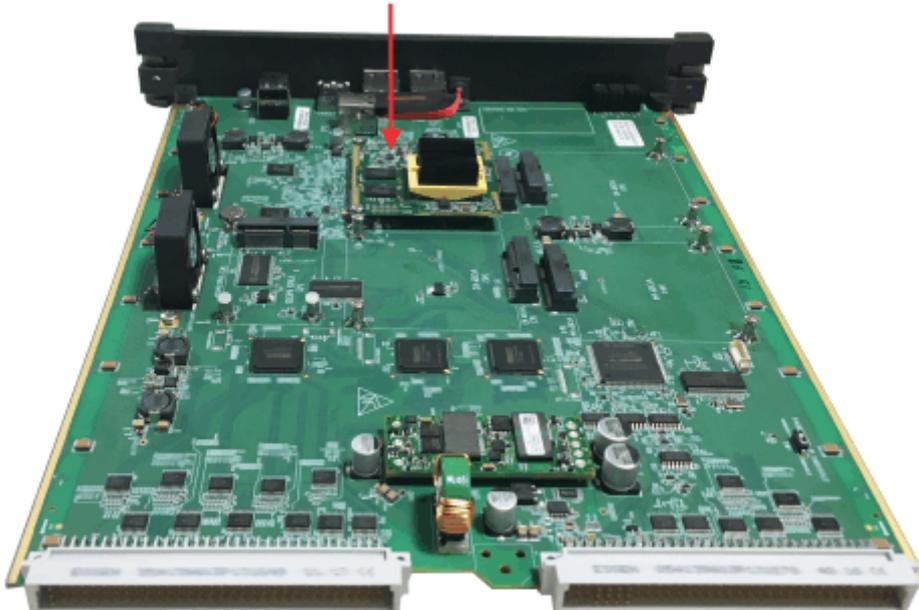

You may install the second NX DBM VOCODER64 Module by locating the **VOIP #2** label on the CPU board and follow the same steps as above. Similarly, install the other modules if required.

Removing the VOCODER Module

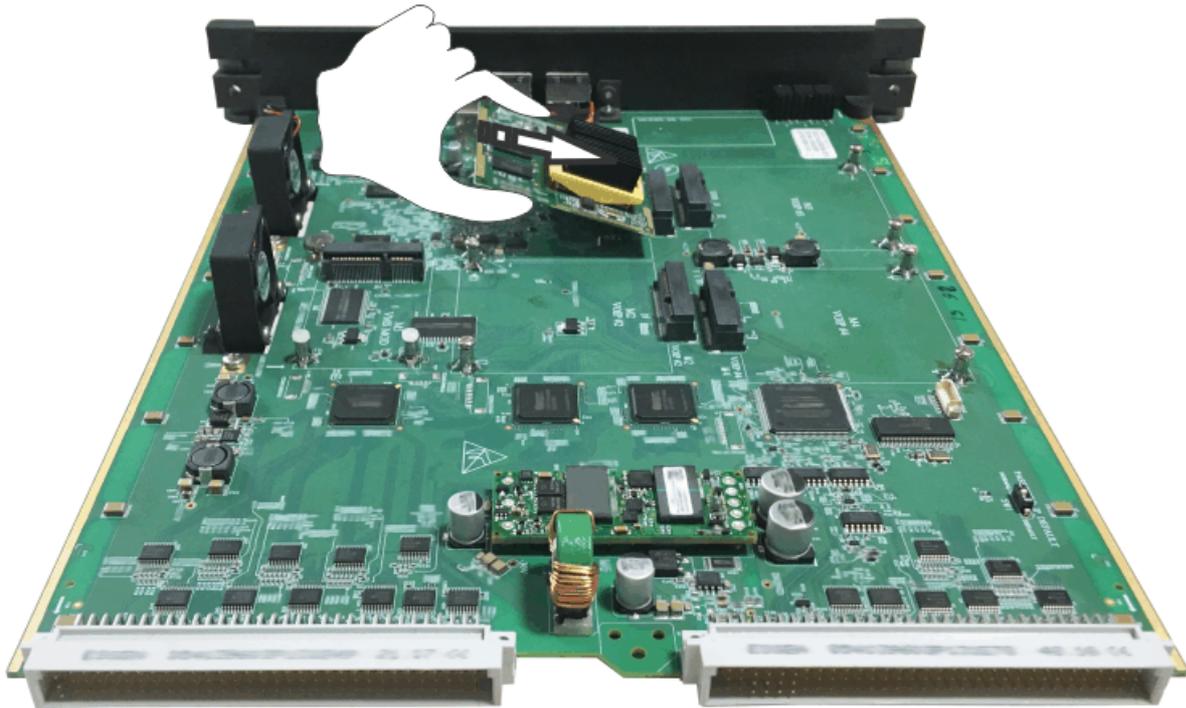

- Locate the VOCODER Module you want to remove from the CPU Card.

NX DBM VOCODER64 Module

- Remove the screws from the module and keep them aside.

- Firmly hold the module and ease it out of the PCI connector carefully.

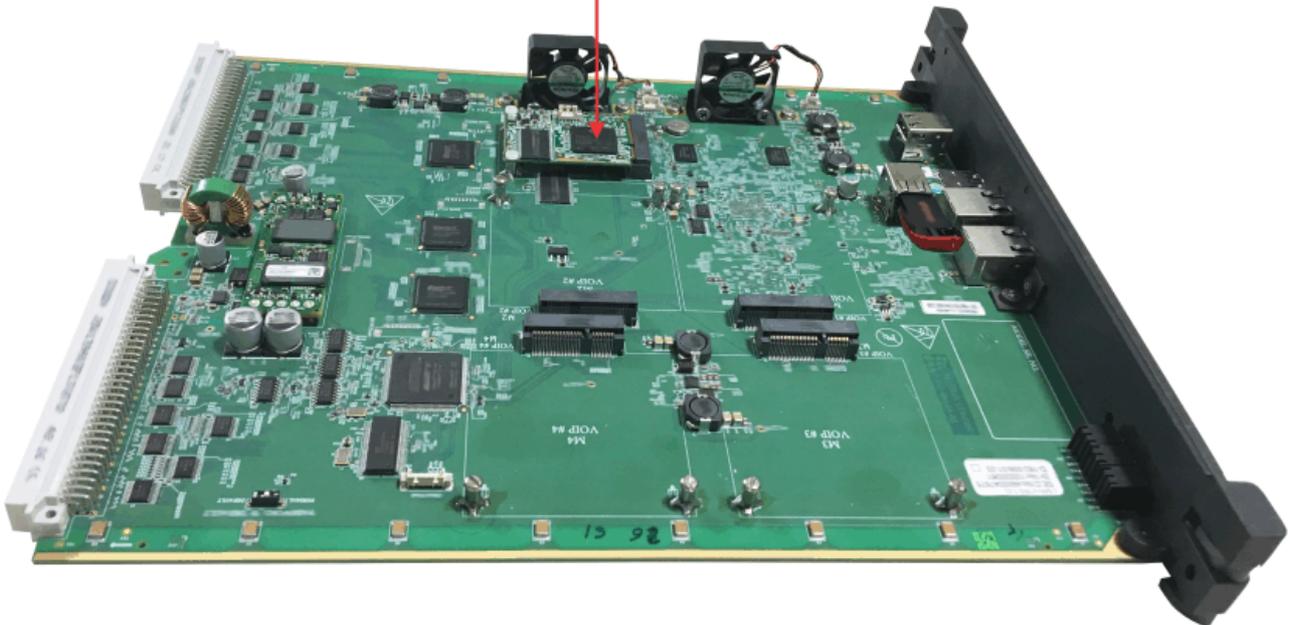

- Replace the screws on the studs.

Installing the VMS Module

To install the NX DBM VMS64 Module, locate the **VMS MOD** label on the CPU board and follow the same steps as described for [“Installing the VOCODER Module”](#).

NX DBM VMS64 Module

Make sure you use the plastic screws provided to affix the VMS Module over the studs.

- The pendrive which is provided to you by default contains VMS data and VMS firmware. You will be able to use the VMS features once you activate the VMS License.

If you want to store more voice mail messages or greetings then you will need more space to store the same. You can replace this default pendrive with a new one having more space.

To do so, you need to format your new pendrive with FAT32 file format and then copy all the contents of the factory fitted pendrive into the new pendrive.

Switch-off the system and then replace the pendrive. The system will not detect the new pendrive if you do not restart the system after replacement.

Make sure while replacing the pendrive, you insert it in the same USB Port where the factory fitted pendrive was inserted.

- If you have no other modules to install, insert the card back into the ETERNITY MENX.
- Connect a computer to the LAN/WAN Port of the system with the ethernet cable supplied for the port.
- Open a Web browser on the computer to access the embedded Web server, Jeeves.
- Activate the VMS License Voucher. See [“License Management”](#) for instructions.
- Configure VMS. For detailed instructions, see [“Configuring Voice Mail System”](#).

For removing the VMS Module, follow the same steps as described for removing the VOCODER Module. See [“Removing the VOCODER Module”](#).

The Single Line Telephone Card

The Single Line Telephone (SLT) Card provides the interface to connect as extension phones, any standard, two-wire, analog single line telephone instrument - rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification.

The SLT Card is available in the following configurations. SLT interface also is available in combination with Two-wire trunk interfaces on a single card.

SLT Cards for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card SLT32	32-port card to connect 32 Single Line Telephones
ETERNITY ME Card SLT16	16-port card to connect 16 Single Line Telephones
ETERNITY ME Card SLT8	8-port card to connect 8 Single Line Telephones
ETERNITY ME Card CO8+SLT24	Combination card, with 8-ports to connect to 8 Two-wire Analog trunk lines and 24 Single Line Telephones This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .

The maximum number of SLT ports supported are 288.

Connectors

The SLT Cards have RJ45 connectors, with each connector having 4 SLT ports. A multi-pair, MDF cable is supplied for each connector.

Only the SLT48 card has a 50-pin Centronics connector for the ports.

LEDs

The SLT cards have a single, tri-color LED to indicate:

- the health of the card during the Reset Cycle.
- the status of any one extension during normal functioning of the system.

You may monitor any of the SLT Extension ports by assigning the LED to that port⁵².

Installing Single Line Telephones

To be able to connect Single Line Telephones as Extensions to your system, you must install at least one of the aforementioned SLT Cards in the System.

1. Decide the number of SLT extensions required and arrange for as many telephone instruments.

52. To do this, enter SE mode, and dial the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

You may use any standard telephone instrument like a rotary phone, a pulse-tone switchable push-button phone, a feature phone or a cordless phone.

Use SLTs equipped with a 'Flash' key, as several of the features and facilities of the system require you to press Flash. If any of the SLTs you have selected does not have a Flash key, tap the Hook switch of the phone to dial Flash.

2. Unpack the SLT Card and check the package contents. Ensure that the power supply is switched off, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
3. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Do not discard the filler bracket! You may require it at a later stage.
4. Insert the SLT Card into the guide rails of the free slot you selected for the card.

Make sure that the connectors on the card make perfect contact with those on the motherboard on the backplane.

5. Press down the levers on the mounting bracket to secure the card in its slot. Now, secure the mounting bracket with the two screws provided.

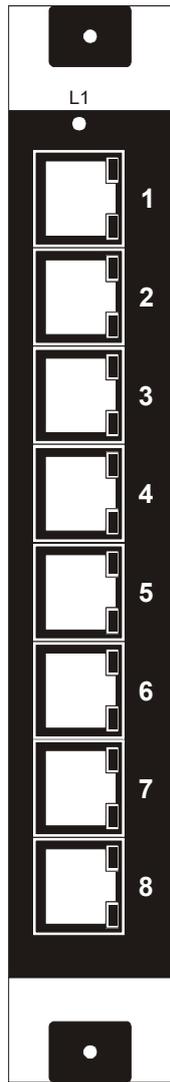

If you are installing more than one SLT Card, you can install the second card in any other free slot. It is not necessary to install the second/third card in the subsequent slots.

6. Use the cables supplied with the SLT Card to connect the SLT wires with the Main Distribution Frame.

For each connector on the SLT Card, there is a separate 4-pair cable with an RJ45 jack on one end and free at the other end.

Refer the illustrations below for pin out details of each connector.

ETERNITY ME Card SLT32

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04

RJ45-7	Blue - (Blue & White)	TWT	01
	Orange - (Orange & White)	TWT	02
	Green - (Green & White)	TWT	03
	Brown - (Brown & White)	TWT	04
RJ45-8	Blue - (Blue & White)	TWT	05
	Orange - (Orange & White)	TWT	06
	Green - (Green & White)	TWT	07
	Brown - (Brown & White)	TWT	08

7. Plug in the RJ45 end of the MDF cables supplied with the card into the respective connectors. Refer to the pinout details of the connectors of each SLT Card type illustrated above.
8. Terminate the open end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the ["The Main Distribution Frame \(MDF\)"](#).

Each wire-pair from the SLT Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic ["The Main Distribution Frame \(MDF\)"](#) for illustration.

9. Repeat the same steps to install another SLT Card.
10. If you have completed all installation tasks, power ON the system, observe the Reset Cycle and the LED Pattern of the SLT Card.

LED Pattern of the SLT Card

Stage	LED Color	Cadence
Auto Upgradation ^a		
Card waiting for application	RED	ON-200ms-OFF 200ms
Card is up, loaded with new application	GREEN	ON-200ms-OFF 200ms
Initialization		
	RED	ON 500ms-OFF 500ms
	GREEN	ON 500ms - OFF 500ms
	ORANGE	ON 500ms - OFF 500ms
Stand-by task	ORANGE	1 sec Orange -1 sec Green
Errors		
Flash Failure	None	None
RAM Failure	None	None

a. Done by the Boot Loader Application.

Status of Selected Port

PORT Status	LED Color	LED Cadence
Selected port data transmitted to Master Card	RED	Toggle ^a
Selected port data received from Master Card	RED	Toggle

a. The current LED state will remain the same until the next command is received from the application on the SLT Port. For example, if the current LED state is Green/Red ON, on the next command received, the LED will be turned OFF. It will remain OFF until the next command is received. When the next command is received it will be turned Green/Red ON again. This process continues.

Jumpers on the Main Board

Jumper Number	Position	Function
J1	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J2 & J4	AB (default)	Normal Operation
	BC	For uploading software using COM Port

Connecting SLT instruments

11. Connect the SLT instruments you have arranged for. Plug in the SLTs into the wall socket/outlets.

- For the purpose of testing, you may connect one or two Single Line Telephone instruments by plugging in the phone cables into the RJ45 connectors on the card.

- *When you plug the RJ11 connector of SLT into an RJ45 connector on the SLT Card, the SLT will be connected on the first port on the connector.*

The Intercom Line Card⁵³

For the Building Intercom application, the system supports the Intercom Line Card (ILC).

You can connect any standard, two-wire, analog single line telephone instrument - rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification to the Intercom Line Card.

ILC Cards for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card ILC32	32-port card to connect 32 Single Line Telephones

Choose an ILC Card with the configuration that meets your requirement for intercom ports. Also, consider the maximum Port capacity of the system you are installing. The maximum number of intercom ports supported are 288.

Connectors

The ILC32 Cards have RJ45 connectors with four ports on each connector. A multi-pair, MDF cable is supplied for each connector.

LEDs

The ILC cards have a single, tri-color LED to indicate the health of the card during the Reset Cycle.

Installing Intercom Telephones

To be able to connect intercom telephones to the system, you must install at least one of the aforementioned intercom line cards in the system.

1. Decide the number of intercom extensions required and arrange for as many telephone instruments.
2. Ensure that the extension wiring is completed according to your requirements. The extension cables from the wall jack are terminated in the Main Distribution Frame and the telephones are connected to the wall jacks.
3. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat to prevent damage to the components of the card.
4. Unpack the ILC card and check the package contents. You may switch off power supply before you install the card. Since, ETERNITY MENX supports Hot Swap, you can install the card in power on condition.
5. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Keep the filler bracket for future use.
6. Insert the ILC Card into the guide rails of the free slot you selected for the card.

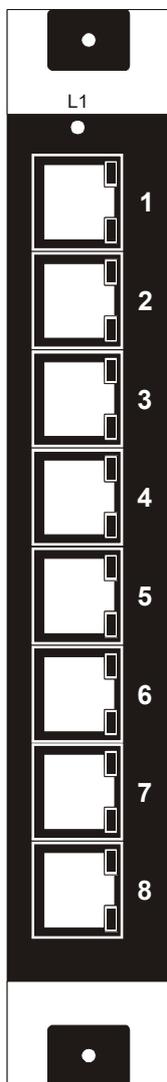

53. *This card has been phased-out. if required, only support will be provided for the same.*

Make sure that the connectors on the card make perfect contact with those on the motherboard on the backplane.

7. Press down the levers on the mounting bracket to secure the card in its slot. Now, secure the mounting bracket with the two screws provided.
8. Repeat these steps to install another card.
9. Now, use the cables supplied with the ILC Card to connect the card to the Main Distribution Frame to which the intercom phones are connected.

For each connector on the card, there is a separate 4-pair cable with an RJ45 jack on one end and free at the other end. Refer the illustrations of the pinout of the intercom cards to connect the wires.

ETERNITY ME Card ILC32

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04

	BC	For uploading software using COM Port
J2 & J4	AB (default)	Normal Operation
	BC	For uploading software using COM Port

The Digital Key Phone Card

The Digital Key Phone (DKP) Card provides the interface to connect the proprietary digital key phones of the EON series, the proprietary PC-based phone EONSOFT and the Direct Station Selection (DSS) Consoles with the system.

DKP Cards for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME DKP32	32-port card to connect 32 DKP/DSS Consoles
ETERNITY ME DKP16	16-port card to connect 16 DKP/DSS Consoles
ETERNITY ME DKP8	8-port card to connect 8 DKP/DSS Consoles

Select a DKP Card with the configuration that meets your requirement for DKP Ports. To connect the proprietary digital key phones with the system, you must have at least one of the above mentioned DKP Cards installed in the system.

The maximum number of DKP Ports supported by the system are 128.

Connectors

The DKP Cards have RJ45 connectors, with each connector having 4 DKP ports. A multi-pair MDF cable is supplied for each connector on the card.

LEDs

The DKP cards for ETERNITY ME have a single, tri-color LED to indicate:

- the health of the card during the Reset Cycle.
- the status of any one of the ports during normal functioning of the system. By default, it is assigned to DKP Port 1.

You may monitor any of the DKP ports by assigning the LED to that port⁵⁴.

Installing the Digital Key Phone Card

Decide the number of DKP extensions and DSS Consoles required and arrange for as many EON, EONSOFT and DSS Consoles.

Decide the locations of the DKP extensions and make sure that the necessary wiring for the DKP extensions, from the wall jack to the MDF, is done.

1. Unpack the DKP Card and check the package contents⁵⁵. Before handling the card, make sure that power supply is switched off and you are wearing an antistatic-wrist strap/belt and have a grounding mat.

54. You can do this from the SE mode, by dialing the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

55. See "ETERNITY GENX Cards" under 'Packing List' of Appendix topic.

2. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Do not discard the filler bracket, keep for future use to cover empty slots.
3. Insert the DKP Card into the guide rails of the free slot you have selected for the card. All the pins on the connector of the card should make perfect contact with those on the connector of the slot on the backplane motherboard.
4. Press down the levers on the mounting bracket to secure the card in its slot. Now, fix the card in its slot with the two screws provided.

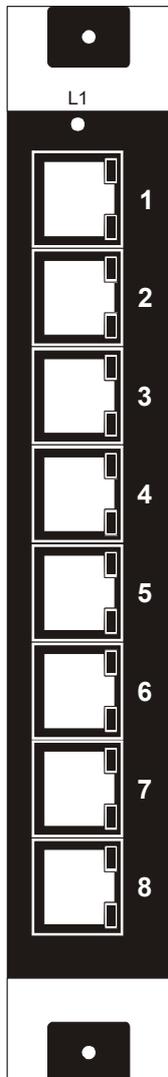

If you are installing more than one DKP Card, it is not necessary to install the next card in the subsequent slot.

5. Using the MDF Cables supplied with the DKP Card connect the DKP ports to the Main Distribution Frame.

Refer the connector pin details for each DKP Card type given in the following.

ETERNITY ME Card DKP32

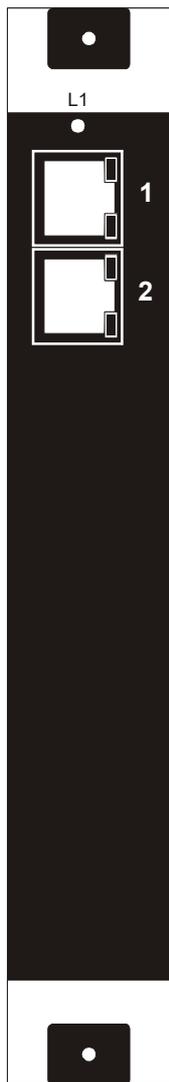

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	DKP	01
	Orange - (Orange & White)	DKP	02
	Green - (Green & White)	DKP	03
	Brown - (Brown & White)	DKP	04

	Orange - (Orange & White)	DKP	10
	Green - (Green & White)	DKP	11
	Brown - (Brown & White)	DKP	12
RJ45-4	Blue - (Blue & White)	DKP	13
	Orange - (Orange & White)	DKP	14
	Green - (Green & White)	DKP	15
	Brown - (Brown & White)	DKP	16

ETERNITY ME Card DKP8

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	DKP	01
	Orange - (Orange & White)	DKP	02
	Green - (Green & White)	DKP	03
	Brown - (Brown & White)	DKP	04
RJ45-2	Blue - (Blue & White)	DKP	05
	Orange - (Orange & White)	DKP	06
	Green - (Green & White)	DKP	07
	Brown - (Brown & White)	DKP	08

6. Plug in the RJ45 end of the MDF cables provided with the DKP card into the respective connectors.
7. Terminate the free end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the Main Distribution Frame (MDF).

Each wire-pair from the DKP Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic [“The Main Distribution Frame \(MDF\)”](#) for illustration.

8. Connect the Digital Key Phones to the wall jacks at their respective locations. Detailed installations instructions for EON, EONSOFT are provided separately.

If you have completed all installation tasks, power on the system and observe the Reset Cycle and the LED Pattern of the DKP Card.

LED Pattern DKP Card

Stage	LED Color	Cadence
Auto Upgradation		
Card waiting for application	RED	ON-200ms-OFF 200ms
Card is up, loaded with new application	GREEN	ON-200ms-OFF 200ms
Initialization		
	RED	ON 500ms-OFF 500ms
	GREEN	ON 500ms-OFF 500ms
	ORANGE	ON 500ms-OFF 500ms
Stand-by task	ORANGE, GREEN	1 sec Orange-1 sec Green
Errors		
Flash Failure	None	None
RAM Failure	None	None

Status of Selected DKP Port

PORT Status	LED Color	LED Cadence
Selected DKP's data are transmitted to CPU Card	RED	Toggle ^a on each event
Selected DKP's data are received from CPU Card	RED	Toggle ^b on each request from Master

- a. The current LED state will remain the same until the next event is received from the application on the DKP Port. For example, if the current LED state is Green/Red ON, on the next event, the LED will be turned OFF. It will remain OFF until the next event occurs. When the next event is received it will be turned Green/Red ON again. This process continues.

- b. Same as the above note.

Jumpers on the Main Board

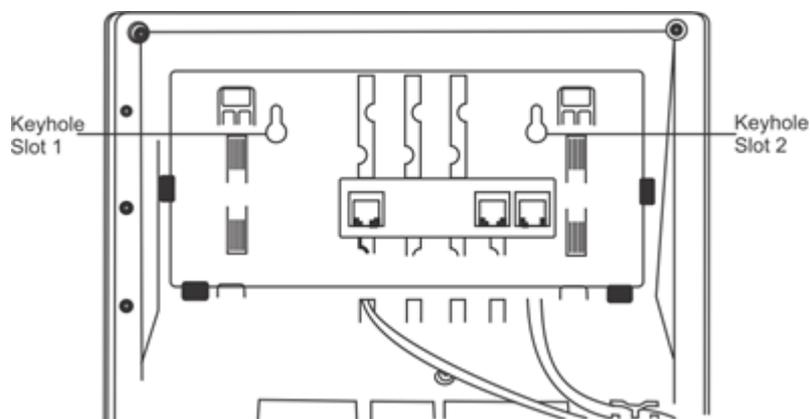

Jumper Number	Position	Function
J1	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J2 & J4	AB	NA
	BC (default)	Normal Operation/ Debug

Installing EON48

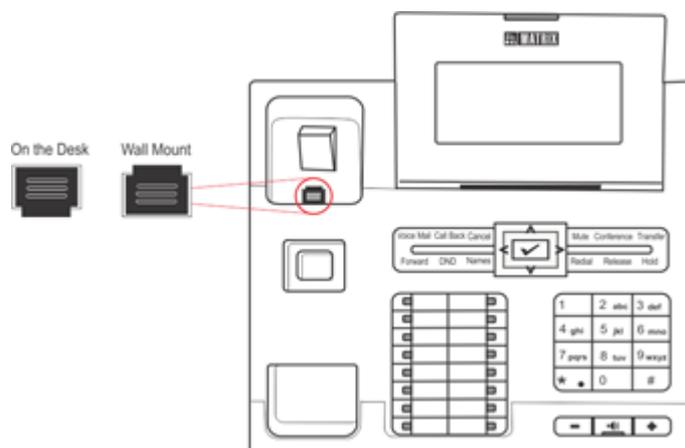

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

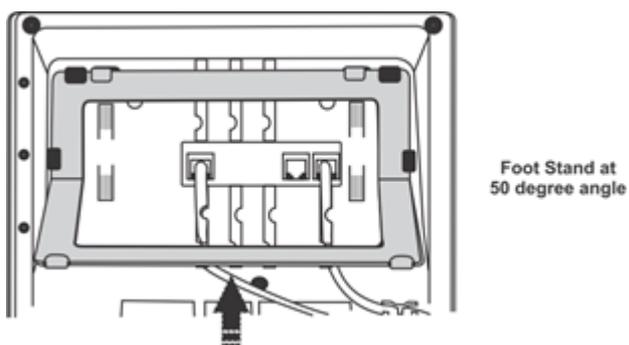

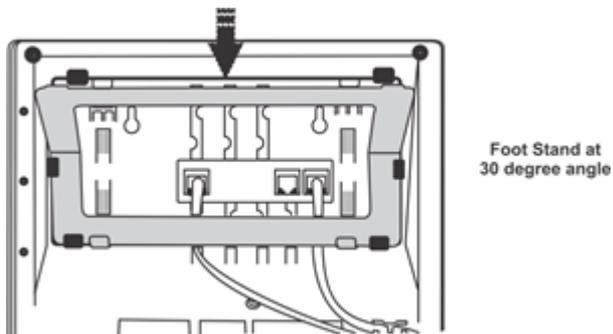

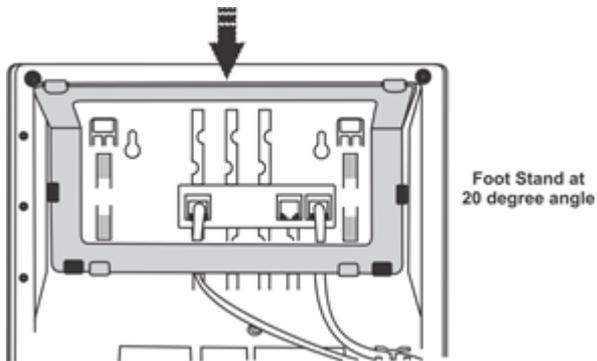

- Now, mount the phone with the screws fitting into the keyhole slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

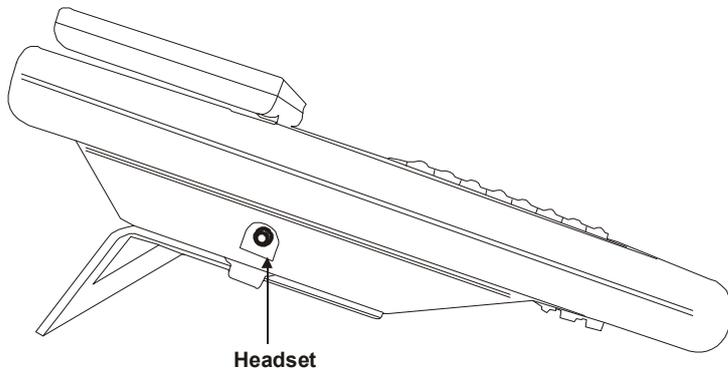

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **20° Angle** or at **30° Angle** or at **50° Angle**.

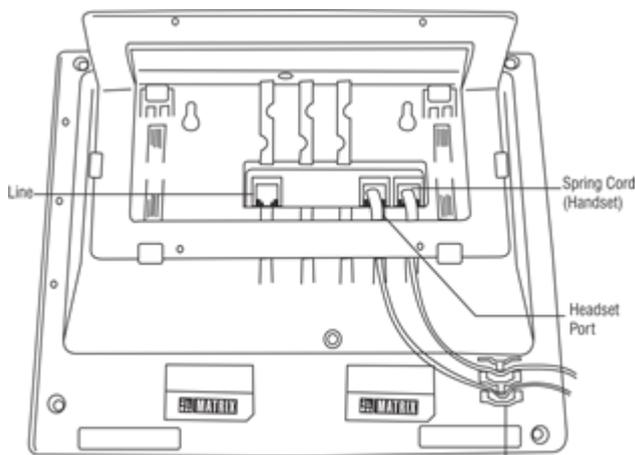

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.
- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
- Connect the handset of the EON48 to the phone body using the spring cord.

- To use a Headset (not supplied with the phone), plug any standard stereo headset with 2.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.

You may also plug in a stereo headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as '**LINE**' and the other end into the wall jack/DKP Port.

Route the Handset Spring Cord and Headset RJ9 cable through the guides before attaching the Foot Stand

- When the system is powered ON, the EON will reset. The EON communicates with the system. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message '*Please wait*'... appear on the LCD display.

- After successful handshaking and reset cycle, if the DKP Parameters have been configured, the LCD display of the EON will show the extension number and the extension name in one line and the day, date and time and the time zone in the other line.

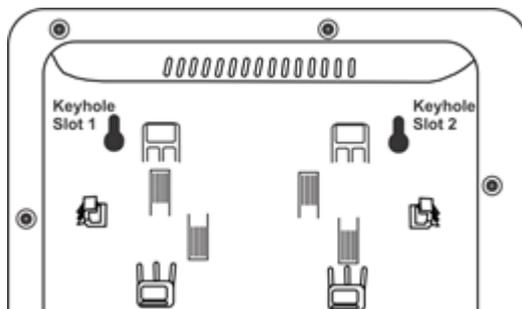

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#) for instructions.

Installing EON310

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

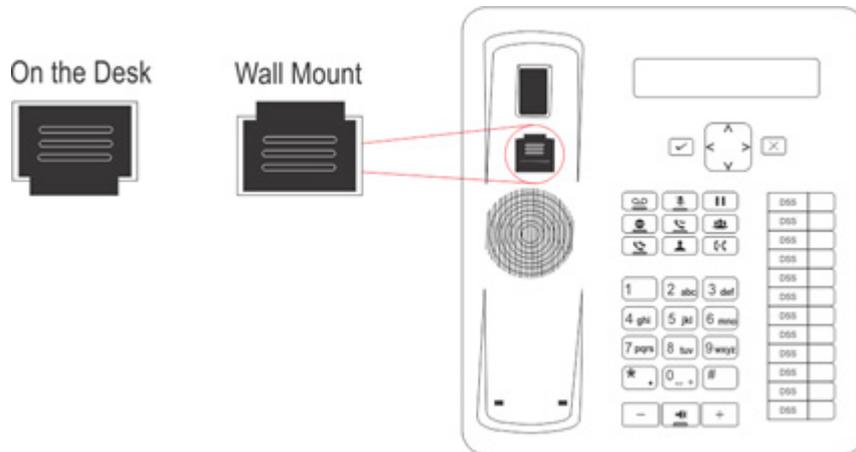

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

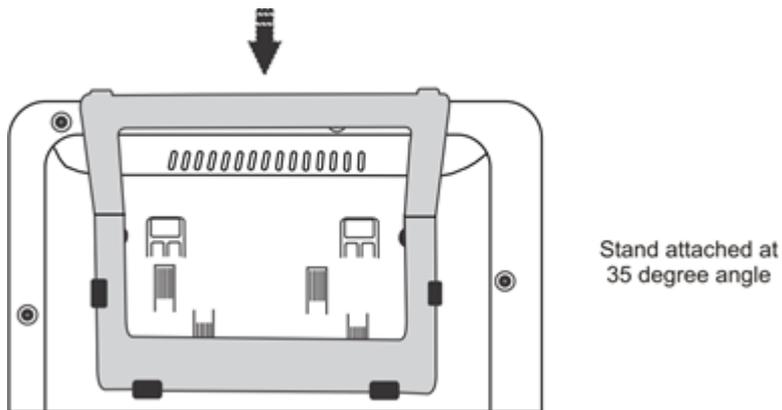

- Now, mount the phone with the screws fitting into the keyhole slots.

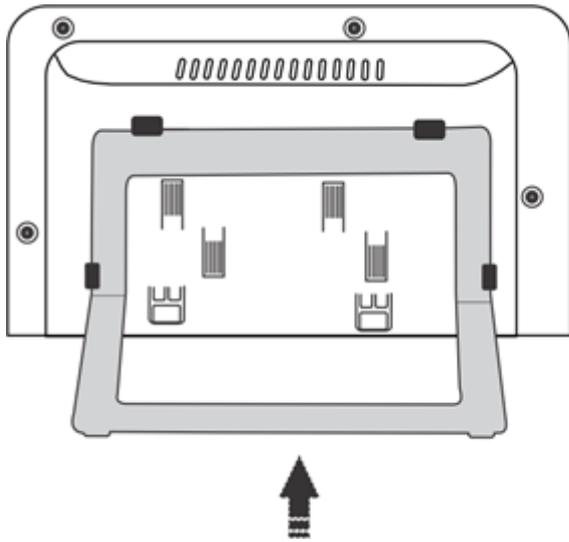

- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

Mount the phone on the Desk

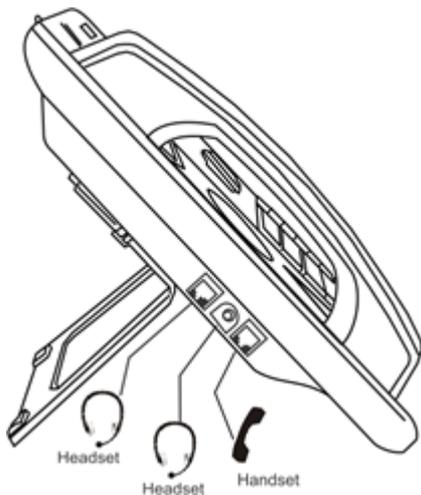

- You can attach the Foot Stand in the following ways—at an angle of **35° Angle** or at **50° Angle**.

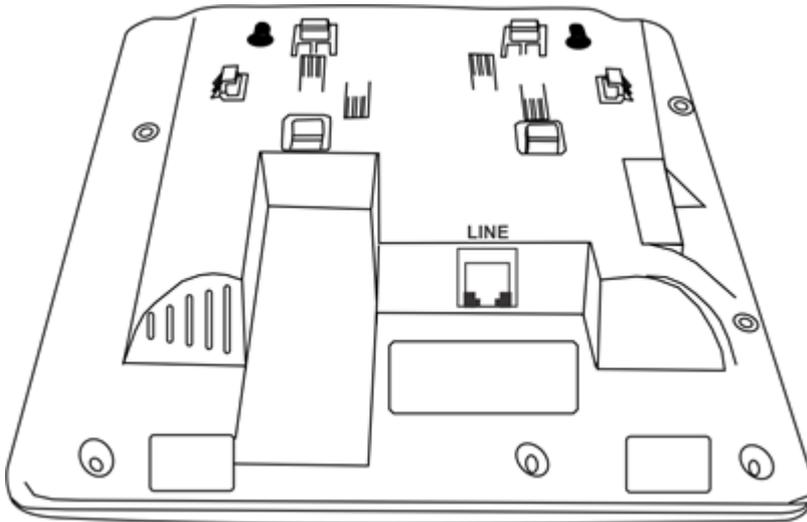

Stand attached at 50 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
- Connect the handset of the EON310 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.
You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as **'LINE'** and the other end into the wall jack/DKP Port.

- When the system is powered ON, the EON will get reset and the message "Welcome to Matrix. Booting" ...appears on the LCD display.

- The EON communicates with the system. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message "Please Wait" ...appears on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear on the LCD.

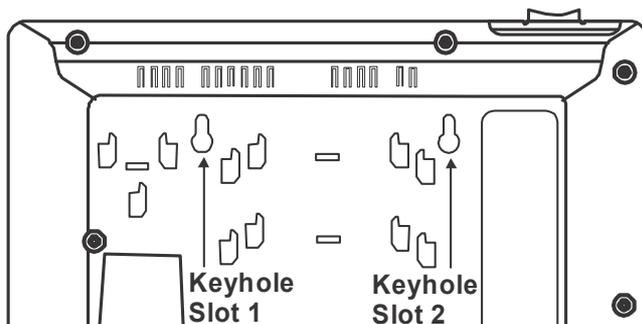

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#).

Installing EON510

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

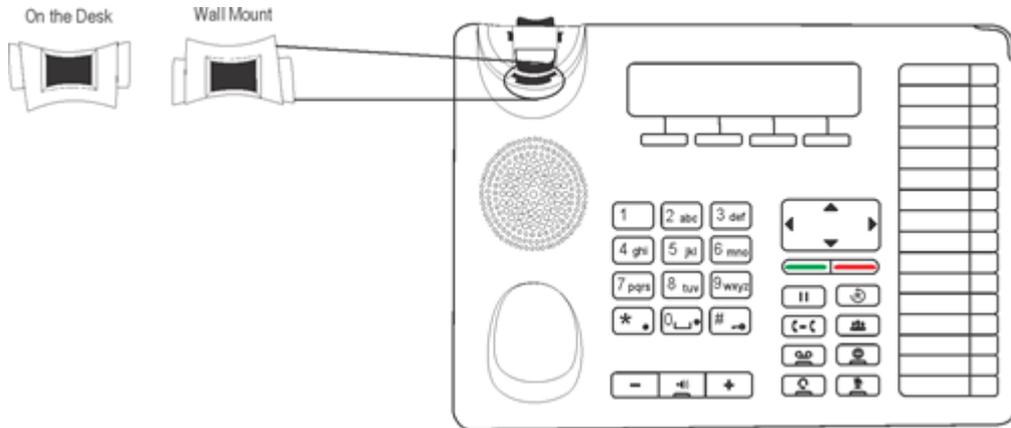

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

- Now, mount the phone with the screws fitting into the keyhole slots.

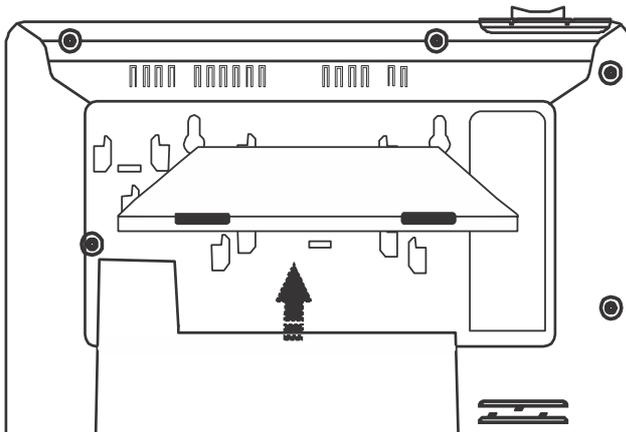

- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

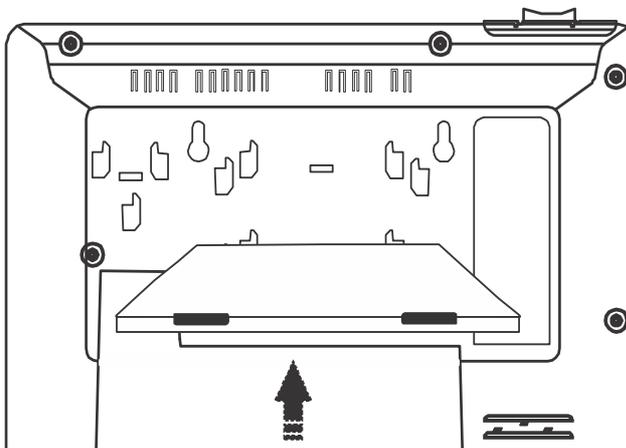

If you are unable to remove the wall mount tab, you may use a tool like a minus screw driver to remove it.

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **45° Angle** or at **55° Angle**.

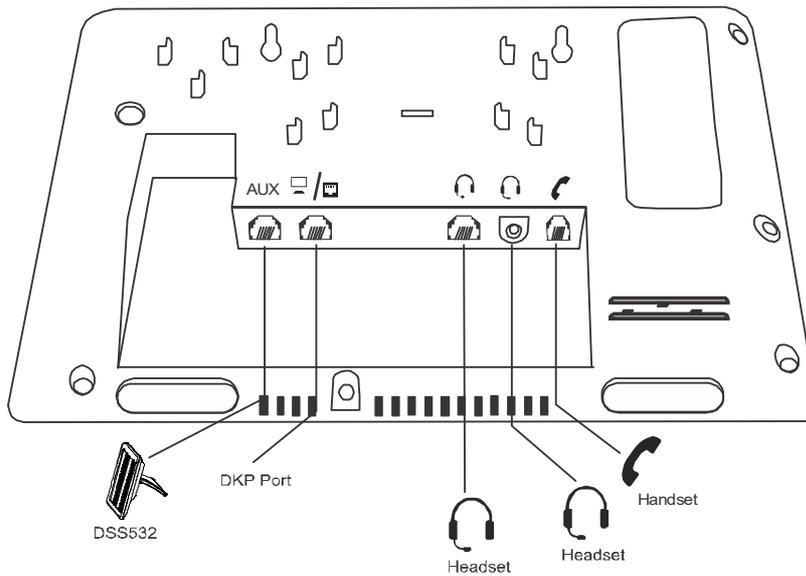

Stand attached at 45 degree angle

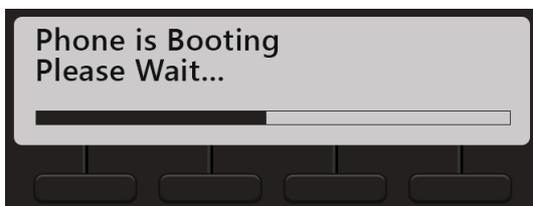

Stand attached at 55 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

- Connect the handset of the EON510 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone. You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.
- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone marked with the symbol  and the other end into the wall jack/DKP Port.
- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with EON510”](#).
- When the system is powered ON, the EON will get reset. and the message 'Phone is Booting; Please wait...' appear on the LCD display.

- The EON communicates with the system. The handshaking lasts for 5-6 seconds. The message 'Loading Firmware Version-Revision; Please wait...' appear on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear, as illustrated below.

You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#).

Installing DSS Consoles

Installing DSS64

Once you have installed EON48/310 with SARVAM UCS, installing the DSS Consoles can be done in a few simple steps, very much similar to those involved in the installation of EON.

1. Unpack the box and verify the package contents⁵⁶.
2. Place the DSS Console next to the DKP to which it is to be attached.
3. Decide which DKP Ports on the DKP Card are to be assigned to the DSS Consoles. You may select any free (unused) port on the card for DSS Consoles. It is not necessary for the DSS Console ports to be in a sequence with the DKP ports to which they are attached.

For example: you have connected DKP1 to Port 1 on the first RJ45 connector of the DKP8 card. You want to attach two DSS Consoles to DKP1. The two DSS Consoles may be connected to any port on the second connector of the card, not necessarily to Port 2 and Port 3 on the first connector.

4. The wire-pairs from the DKP Ports designated for DSS Consoles should be terminated on the bottom of the Krone Connector (of 'Station Lines' on the MDF).
5. The wire-pairs of the DSS Consoles should be terminated into the top of the Krone Connector (of 'Station Lines' on the MDF). Refer the topic [“The Main Distribution Frame \(MDF\)”](#) for illustration.

You can connect maximum two DSS64 with a single EON48/310.

⁵⁶. See [“Packing List”](#) of Appendix topic.

6. The system automatically detects the DSS Console you connect and it will be will appear under **Unassigned DSS64** in “[DSS Status](#)”. You must first assign these DSS Consoles to the respective DKP Ports and thereafter you will be able to configure the DSS Keys.
7. To assign the DSS Consoles, see “[DSS Status](#)” and to configure the DSS Keys, see “[Programming DSS Console Keys](#)”.

Installing DSS532 with EON510

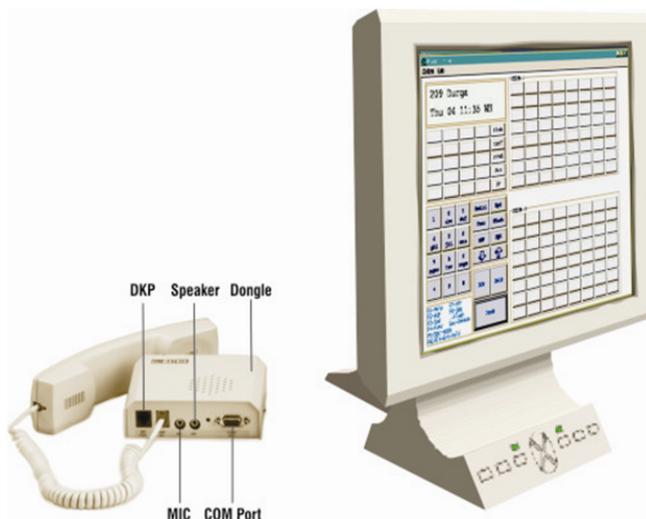

The instructions for installing DSS532 with EON510 or SPARSH VP510 are same. For detailed instructions, refer to “[Installing DSS532 with SPARSH VP510](#)”.

Installing EONSOFT

To install EONSOFT, you must have a computer with Windows as the operating system. The EONSOFT is compatible with the following Operating Systems of Windows:

- Windows 98
- Windows XP
- Windows NT
- Windows 2003
- Windows Vista
- Windows 2007

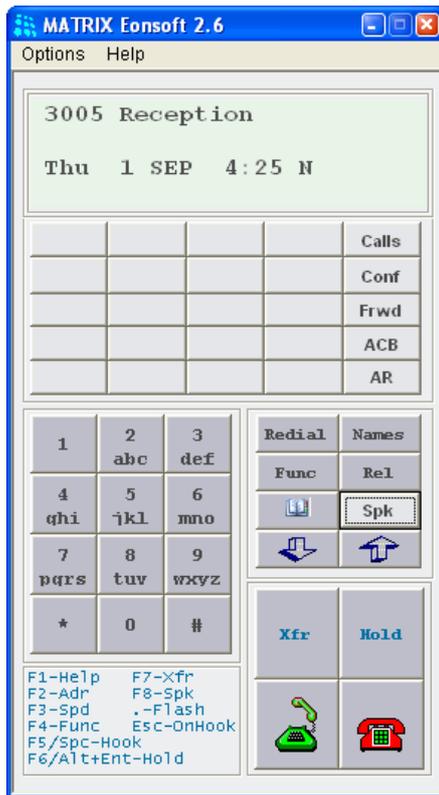

1. Unpack the box and verify the package contents⁵⁷.
2. Connect the Handset to the dongle in the handset jack. If using a headset, connect the microphone and the speaker connectors into the dongle.

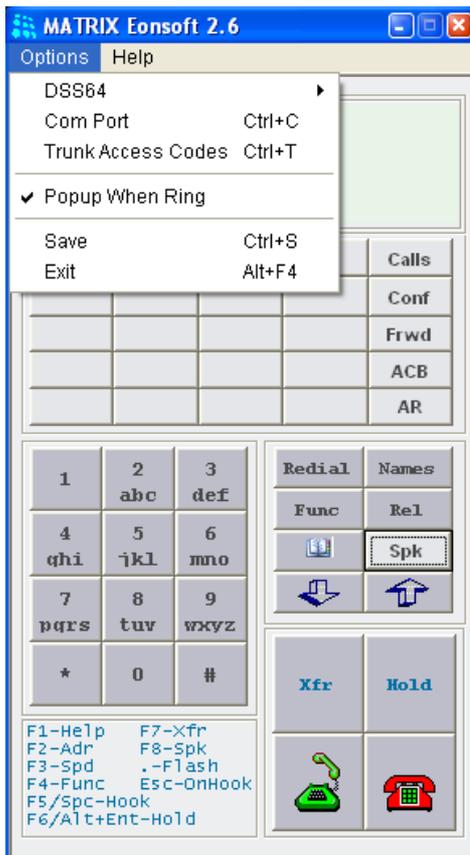

3. Connect one end of the Communication cable to the COM port of the dongle. Connect the other end of the communication cable into the COM port of the computer.
4. Connect a wire-pair of a DKP port to the RJ11 port marked 'DKP' on the dongle.

57. See “[EONSOFT](#)” under ‘Packing List’ of Appendix topic.

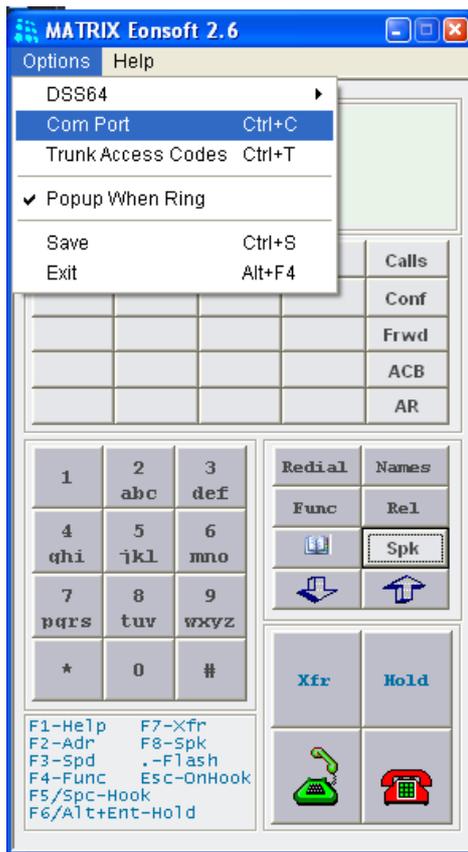

5. Switch ON the computer. The computer must have Windows Operating System installed on it.
6. Copy the EONSOFT Application Software provided by the Support Team onto your PC and install the application.
7. After the program has been installed and run, a shortcut will be automatically created and appear on your desktop.
8. Click the shortcut to open the program. The EONSOFT window will open:

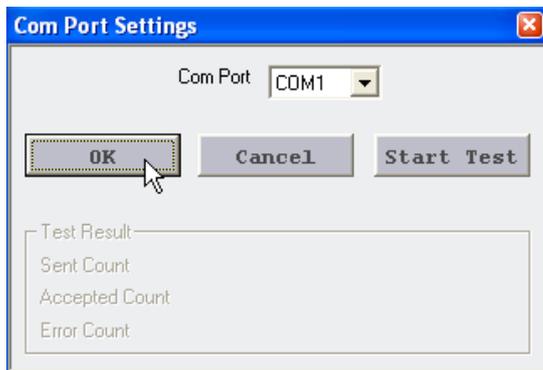

- Click **Options** at the top left of the window. A drop down menu will appear.

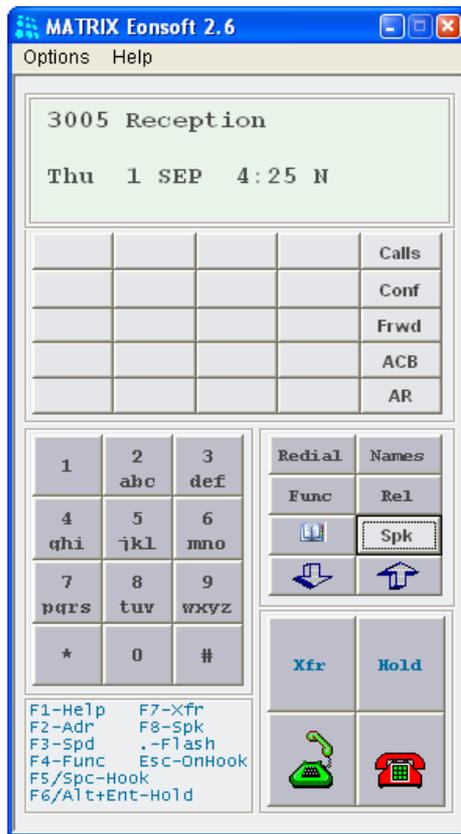

10. Click the option **COM Port**.

11. Select the COM Port to which the communication cable is connected.

- EONSOFT is now connected. If you have already configured the DKP parameters like Access Code and Name for the port to which EONSOFT is connected, these will appear.

- If this window does not appear after you have selected the COM Port Option, test the COM Port for data transfer.
- If the wrong COM port has been selected, a dialog box will pop up on your screen with the message: "COMx is invalid or busy, please select another COM Port". Select the correct COM Port.

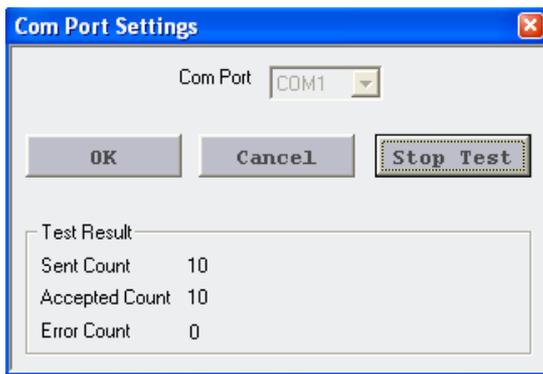

Test the functioning of the COM Port of the PC and the communication cable, before you install the EONSOFT.

Testing the COM Port

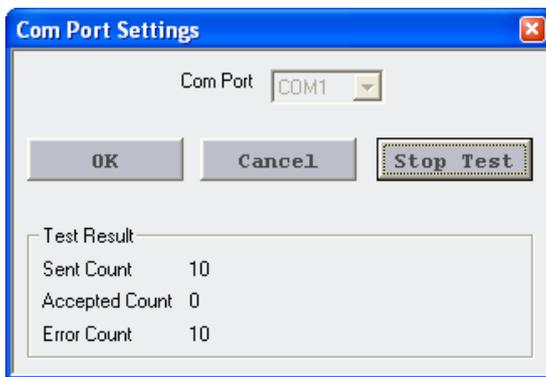

- From the drop down menu of **Options**, select the **COM Port** to which you have connected the communication cable.
- The COM Port Settings dialog box will open.
- Connect the communication cable to the COM Port of the PC.
- Short pin2 and pin3 of the DB-9 connector at the free end of the cable.
- Click the button labeled **Start Test** in the COM Port Settings dialog box.
- After clicking this button, observe the Test Result section on the dialog box.

- The **Error Count** value shows zero, if both the communication cable and the COM port are working.

The above screen shows that the COM Port/communication cable is working.

- If the **Error Count** shows a value other than zero, it means that either the communication cable or the COM port of the PC is faulty.

Above screen shows the faulty COM Port/Communication Cable.

- Remove the communication cable from the COM Port of the PC.
- Short pin2 and pin3 of the communication port of the computer and click 'Start Test' in the COM Port Settings dialog box.
- Now, if the error count is zero, please check the Communication Cable.
- If the error count is not a zero, the COM Port of the PC is faulty. Try another communication port.

The CO Card

The CO Card provides the interface to connect the system with the Two-Wire Analog Trunk lines from the CO Network. The CO Card supports the different standards and features of CO Networks across the world.

The CO Card is available in the following configurations. CO interface is also available in combination with SLT ports on a single card.

CO Cards for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card CO16	16-port card to connect 16 Two-wire Trunk lines from the CO network
ETERNITY ME Card CO8	8-port card to connect 8 Two-wire Trunk lines from the CO network
ETERNITY ME Card CO8+SLT24	Combination card, with 8 CO ports to connect 8 CO analog trunk lines and 24 SLT ports to connect 24 Single Line Telephones This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .

Choose a CO Card with the configuration that meets your requirement for CO trunk ports, keeping in mind the maximum CO Trunk Port capacity of the system you are installing.

The maximum CO Trunk Ports supported are 128.

Connectors

The CO Card has RJ45 connectors, with 4 CO ports on each connector. A multi-pair, MDF cable is supplied for each connector on the card.

LED

The CO Cards have a single tri-color LED to indicate:

- the health of the card during the Reset Cycle.
- the status of a selected Trunk port during normal functioning of the system.

You can assign the LED to any CO port on the card which you want to monitor⁵⁸.

Installing the CO Card

For CO connectivity, you must install at least one of the above mentioned CO Cards in the system.

1. Take all the necessary precautions prescribed for handling the cards and electronic equipment. Make sure that power supply is turned off before you begin the installation of the card. Put on an electrostatic-discharge preventive wrist strap/belt and use a grounding mat.

⁵⁸. To assign the LED to a selected port for monitoring its functioning, you must enter SE mode and dial the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

2. Unpack the CO card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Preserve the filler bracket for future use!
4. Insert the CO Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.
5. Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

If installing more than one CO Card, it is not necessary to insert the other cards in subsequent slots. Any card can be inserted in any of the Universal Slots.

6. Use the cables supplied for each connector on the CO Card to connect the Trunk Lines with the Main Distribution Frame.

Refer the illustrations below for the pinout details of the connectors on each card.

ETERNITY ME Card C016

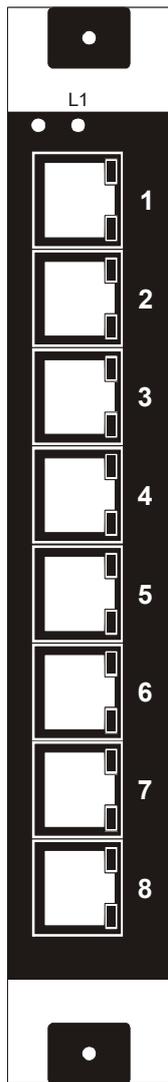

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Green - (Green & White)	CO	03
	Brown - (Brown & White)	CO	04
RJ45-2	Blue - (Blue & White)	CO	05
	Orange - (Orange & White)	CO	06
	Green - (Green & White)	CO	07
	Brown - (Brown & White)	CO	08
RJ45-3	Blue - (Blue & White)	CO	09

	Green - (Green & White)	CO	11
	Brown - (Brown & White)	CO	12
RJ45-4	Blue - (Blue & White)	CO	13
	Orange - (Orange & White)	CO	14
	Green - (Green & White)	CO	15
	Brown - (Brown & White)	CO	16

ETERNITY ME Card C08

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Green - (Green & White)	CO	03
	Brown - (Brown & White)	CO	04
RJ45-2	Blue - (Blue & White)	CO	05
	Orange - (Orange & White)	CO	06
	Green - (Green & White)	CO	07
	Brown - (Brown & White)	CO	08
RJ45-3	Unused		
RJ45-4	Unused		

ETERNITY ME Card CO8+SLT24

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	SLT	05
	Orange - (Orange & White)	SLT	06
	Green - (Green & White)	SLT	07
	Brown - (Brown & White)	SLT	08
RJ45-3	Blue - (Blue & White)	SLT	09
	Orange - (Orange & White)	SLT	10
	Green - (Green & White)	SLT	11
	Brown - (Brown & White)	SLT	12
RJ45-4	Blue - (Blue & White)	SLT	13
	Orange - (Orange & White)	SLT	14
	Green - (Green & White)	SLT	15
	Brown - (Brown & White)	SLT	16
RJ45-5	Blue - (Blue & White)	SLT	17
	Orange - (Orange & White)	SLT	18
	Green - (Green & White)	SLT	19
	Brown - (Brown & White)	SLT	20
RJ45-6	Blue - (Blue & White)	SLT	21
	Orange - (Orange & White)	SLT	22
	Green - (Green & White)	SLT	23
	Brown - (Brown & White)	SLT	24
RJ45-7	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Green - (Green & White)	CO	03
	Brown - (Brown & White)	CO	04
RJ45-8	Blue - (Blue & White)	CO	05
	Orange - (Orange & White)	CO	06
	Green - (Green & White)	CO	07
	Brown - (Brown & White)	CO	08

7. Plug in the RJ45 end of the Trunk Card cables into the respective connectors.
8. Terminate the free end of the CO Card cable into the punch down blocks of the Krone modules designated for 'Trunk Lines' on ["The Main Distribution Frame \(MDF\)"](#).

Trunk cables from the system are to be connected with the Trunk Lines from the PSTN/CO terminated on the MDF. Each wire-pair from the CO Port must be terminated on the bottom of the Krone Connector, while the wire-pair of the trunk line from the CO Network to be connected to this port must be terminated on the top of the Krone Connector.

Refer the topics ["The Main Distribution Frame \(MDF\)"](#) and ["Terminating Trunk and Extension Cables on the MDF"](#).

9. Repeat these steps to install other CO Cards, if applicable.
10. If you have completed all other installation tasks, power ON the system.

LED Pattern of the CO Card

Stage	LED Color	Cadence
Auto Upgradation ^a		
Card waiting for application	RED	ON-200ms-OFF 200ms
Card is up, loaded with new application	GREEN	ON-200ms-OFF 200ms
Initialization		
	RED	ON 500ms-OFF 500ms
	GREEN	ON 500ms - OFF 500ms
	ORANGE	ON 500ms - OFF 500ms
Stand-by task	ORANGE	1 sec GREEN - 1Sec Orange
Errors		
Flash Failure	None	None
RAM Failure	None	None

a. Done by the boot loader application.

Status of Selected CO Port

PORT Status	LED Color	LED Cadence
Selected CO's data are transmitted to CPU Card	RED	Toggle ^a on each event
Selected CO's data are received from CPU Card	RED	Toggle ^b on each request from Master

a. The current LED state will remain the same until the next event is received from the application on the CO Port. For example, if the current LED state is Green/Red ON, on the next event, the LED will be turned OFF. It will remain OFF until the next event occurs. When the next event is received it will be turned Green/Red ON again. This process continues.

b. Same as above note.

Jumpers on the Main Board

Jumper Number	Position	Function
J1	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J2 & J4	AB	NA
	BC (default)	Normal Operation/ Debug

The BRI Card

The BRI Card provides the interface to connect system with ISDN BRI Lines. The BRI lines may be from a public ISDN exchange, a private ISDN exchange.

BRI Cards of ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card BRI8	8-Port card to connect 8 ISDN BRI Lines or ISDN Compatible Devices
ETERNITY ME Card BRI4	4-Port card to connect 4 ISDN BRI Lines or ISDN Compatible Devices

The maximum number of BRI lines supported are 32.

Connectors

The BRI cards have RJ45 connectors. The ETERNITY ME BRI8 card has 8 RJ45 connectors for 8 BRI ports.

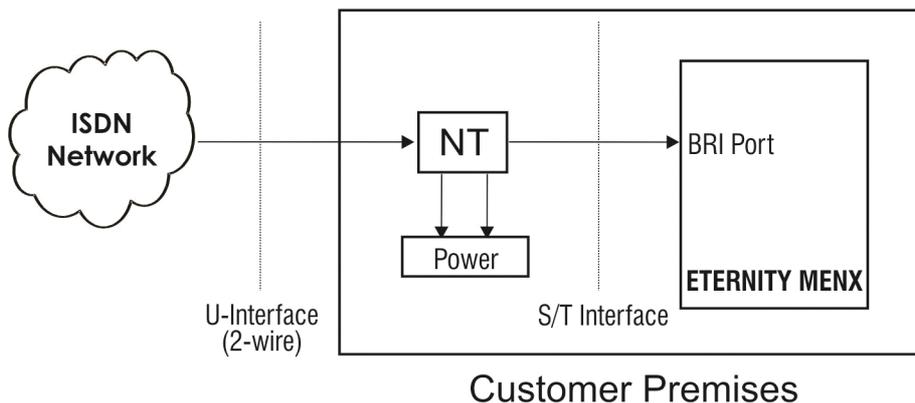

The ETERNITY ME BRI4 card has 4 RJ45 connectors for 4 BRI ports. A separate cable is supplied for each connector.

LEDs

The ETERNITY ME BRI8 and ETERNITY ME BRI4 has 4 LEDs.

ISDN BRI - Installation Scenarios

Most ISDN Service Providers also provide the NT1 device along with the BRI line. The BRI Line from the ISDN central office is terminated on the NT1 on the Customer's Premises, as illustrated below.

Where,

- U Interface = between the NT1 equipment and the ISDN central office.
- S/T Interface = between the ISDN user equipment, in this case, ETERNITY MENX and the Network Interface Equipment (NT1).

The BRI line is terminated on the NT1. The S/T interface of the NT1 is connected to BRI port of the ETERNITY MENX.

TE and NT Modes

In this illustration, the BRI line from ISDN Service Provider is directly connected to BRI port of the ETERNITY MENX via the NT1 device. Here, the ETERNITY MENX is the Terminal Equipment, so the BRI Port must be programmed to work in the TE mode.

When an ISDN Phone is to be connected to the BRI port of ETERNITY MENX, the BRI port must be programmed to work in NT mode.

When a BRI port of another ISDN System is to be connected to the BRI port of the ETERNITY MENX, in such a configuration, you may configure

- the BRI port of the other ISDN System in the TE mode and the BRI Port of the ETERNITY MENX in the NT mode.

OR

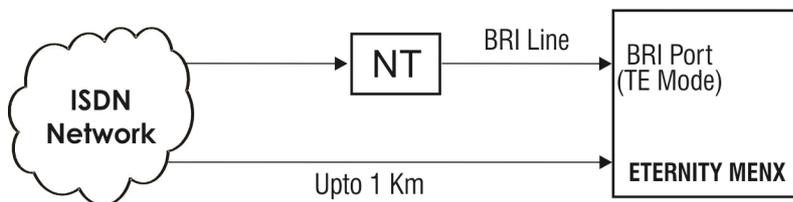

- the BRI port of the other ISDN System in the NT mode and the BRI Port of the ETERNITY MENX in the TE mode

Also refer the topic [“Configuring BRI Trunks”](#) to know more.

Types of BRI Configuration

There are two types of configurations in BRI: Point-to-Point Configuration and Point-to-Multipoint Configuration. Each of these is discussed below.

Point-to-Point Configuration

The maximum distance between the NT (Network Termination, NT1 or NT2) and a single Terminal Equipment, in this case ETERNITY MENX, can be up to 1 kilometer.

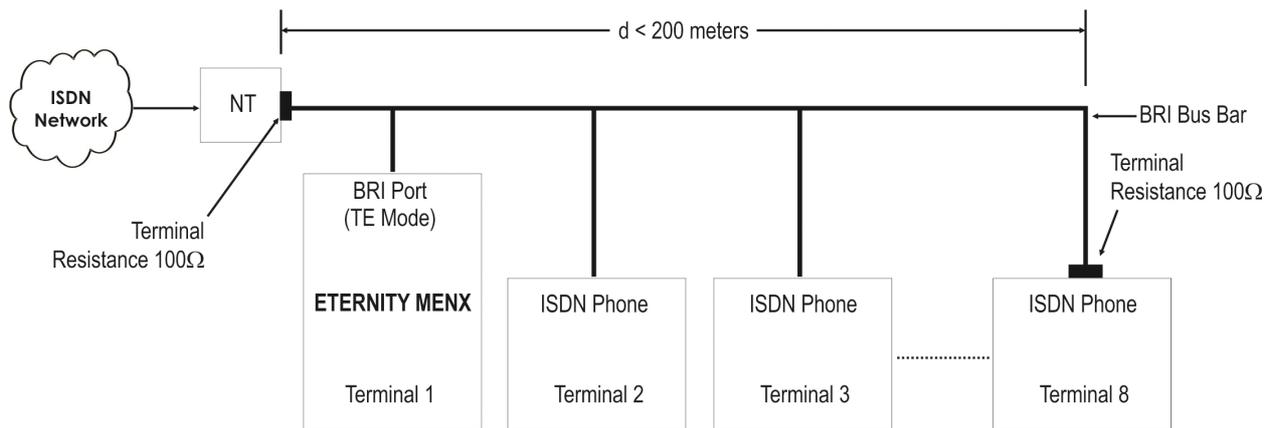

Point-to-Multipoint Configuration

A maximum of 8 ISDN equipment can be connected on a single BRI Bus line in a Point-to-Multipoint configuration.

Further, two configurations are possible in a Point-to-Multipoint configuration:

- a. Short Passive Bus Configuration
- b. Extended Passive Bus Configuration

Short Passive Bus Configuration

Where,

TE = Terminal Equipment or ISDN device (End user device)

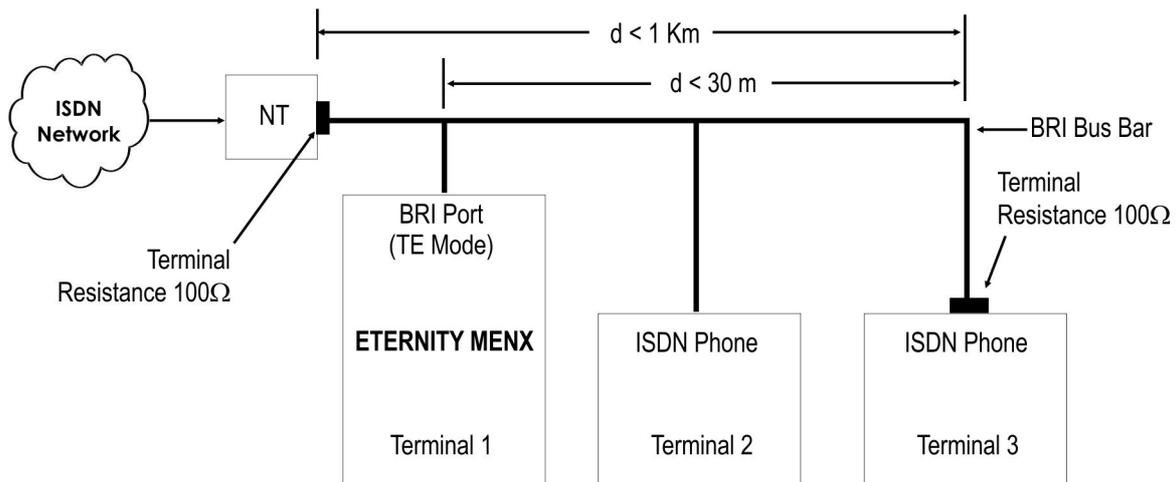

NT = Network Termination provided by the ISDN Service Provider

d = distance from NT to the last TE equipment.

In a Short Passive Bus Configuration,

- A maximum of 8 TEs or ISDN devices can be connected to a single NT on a bus up to 200 meters from the NT.
- 100Ω Terminal Resistance is required to be inserted at the NT side as well as the last TE Equipment as shown in the figure.
- Using this configuration, any subscriber from ETERNITY MENX can access a BRI line and can make outgoing calls. At the same time, another subscriber from ETERNITY MENX or any ISDN phone shown in the figure can make outgoing call from the same BRI. In the same way, incoming calls are possible on the same BRI.
- Only two simultaneous speech paths can be established, as BRI supports 2 voice channels only.
- This configuration is useful on the smaller premises, where a single BRI line and multiple ISDN devices are used.

Extended Passive Bus Configuration

Where,

TE = Terminal equipment of any ISDN Equipment

NT = Network Termination provided by Service Provider

TR Terminal Resistance 100Ω

d = distance from NT to the last TE Equipment

d1 = the total distance from first TE equipment and the last TE equipment.

In an Extended Passive Bus Configuration,

- You can connect only 3 Terminal Equipment or ISDN devices. These devices are grouped together at one end of the bus, with may extend to a distance of up to 1 kilometer from the NT.
- However, all the 3 Terminal Equipment/ISDN devices must be located within a range of 30 meters, as shown in the figure.
- Using this configuration, any subscriber from ETERNITY MENX can access the BRI line and make outgoing calls. At the same time, another subscriber from the ETERNITY MENX or any ISDN phone shown in the figure can make outgoing calls from the same BRI. In the same way, incoming calls are possible on the same BRI.
- Only two simultaneous speech paths can be established, as BRI supports 2 voice channels only.
- This configuration is useful on large premises where a limited number of ISDN devices (maximum 3) are to be used within a range of 30 meters.

Installing the BRI Card

1. Take all the necessary precautions prescribed for handling the cards and electronic equipment: turn off power supply, always wear an electrostatic-discharge preventive wrist strap/belt and use a grounding mat.
2. Unpack the BRI Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket! Preserve it for future use!

Setting Orientation Type of BRI Port

- The BRI Ports can be configured for different applications and can be interfaced directly with the BRI Network with Terminal Equipment like an ISDN Phone, with an ISDN-System.

To connect the BRI Port to the public network, BRI Port must configured in the TE mode.

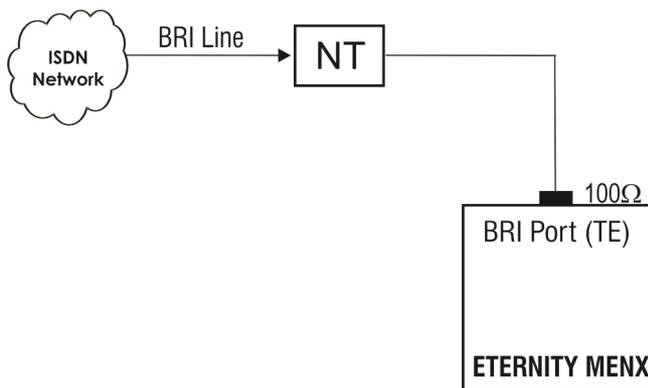

To connect ISDN phones, an ISDN System or any ISDN equipment, the BRI Port must be configured in the NT mode.

By default, BRI Ports are configured in the TE mode.

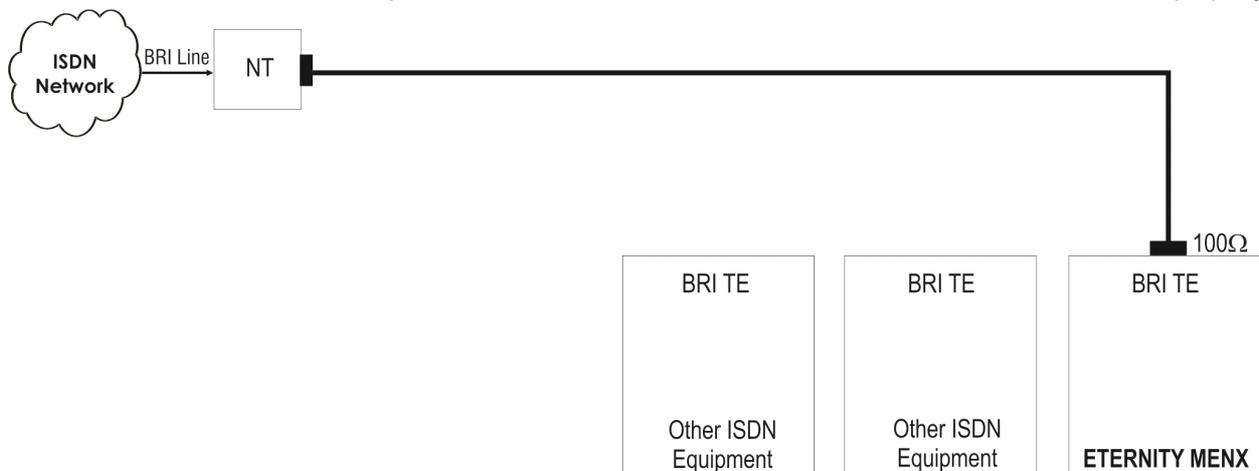

To set Orientation Type of the BRI Port, under **Configuration**, open the **BRI Configuration** link, and under **BRI Parameters**, set the **Orientation Type**.

Inserting Termination Resistance

- Termination of 100Ω should be inserted in the following cases:
 - When the BRI port is configured in the TE mode and connected in a Point-to-Point configuration as shown below.

- When the BRI port is configured in the TE mode in a Point-to-Multipoint configuration as shown below. 100Ω Termination is required on the last Terminal connected on the S0 bus to terminate calls properly.

In a Point-to-Multipoint configuration, 100Ω termination can be provided on either of the following:

- Last TE equipment
- Last point of the bus bar where the last TE equipment is connected.
- When BRI port is configured in the NT mode.
-  If the S0 bus itself supports Terminating resistors, Termination Resistance need not be inserted when
 - BRI Port is configured as TE and connected in a Point-to-Point Configuration as illustrated above.
 - BRI Port is configured as NT.
- Termination need not be inserted if the BRI port of ETERNITY MENX (configured in TE mode) is connected as any terminal other than the last terminal on the S0 bus (in a Multi-point configuration).

Termination in TE Equipment (BRI Port)

6. To set the 100Ω termination on the BRI port set the Jumpers on the BRI Module (daughter-board) to the position described below:

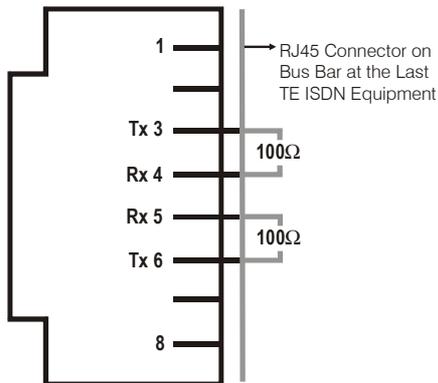

Function	Module 2 (M2)				Module 3 (M3)			
	BRI Port 1		BRI Port 2		BRI Port 3		BRI Port 4	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J6	J8	J7	J9	J6	J8	J7	J9
To insert 100Ω termination	AB	AB	AB	AB	AB	AB	AB	AB
To remove 100Ω termination	BC	BC	BC	BC	BC	BC	BC	BC

Function	Module 4 (M4)				Module 5 (M5)			
	BRI Port 5		BRI Port 6		BRI Port 7		BRI Port 8	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J6	J8	J7	J9	J6	J8	J7	J9
To insert 100Ω termination	AB	AB	AB	AB	AB	AB	AB	AB
To remove 100Ω termination	BC	BC	BC	BC	BC	BC	BC	BC

 By default, Termination Resistance of 100Ω is set on the BRI port (the Jumpers are in AB position).

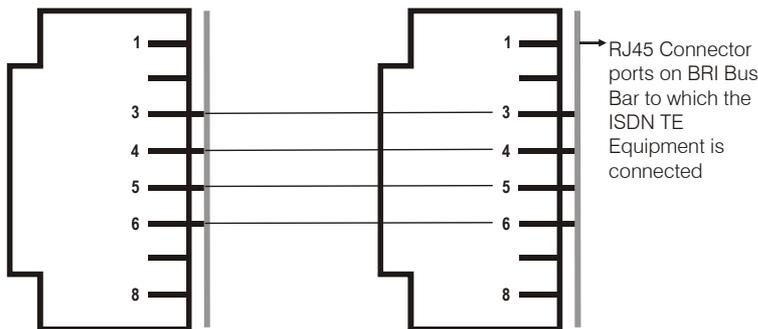

Termination in the Bus Bar

7. 100Ω termination resistor can be connected between TX and RX, between pin number 3-4 and 5-6 in the RJ45 connector as illustrated below.

As shown in the application diagrams for Point-to-Multipoint connectivity, each ISDN TE device is connected in a Bus Bar, which may be Short Passive Bus Bar configuration or an Extended Passive Bus Bar configuration.

Illustrated below is the connection diagram of two ports connected with each other on the same BRI bus bar.

- The above figure shows the connection details of two ports on the BRI Bus Bar. Similarly, you can connect 8 ports on the Bus Bar, keeping in mind the Termination Resistor for the NT and the Last TE on the Bus bar.
- Pin number 3, 4, 5 and 6 of the RJ45 connector are used for connectivity.
- Pin number 3 and 6 are used for Transmit (Tx) and pin number 4 and 5 are used for Receive (Rx) from the ISDN TE side.
- Pin number 3 and 6 are used for Receive (Rx) and pin number 4 and 5 are used for Transmit (Tx) from the NT side.

Feeding Power to the Terminal

8. When the BRI Port of the ETERNITY MENX is used as BRI-NT, you can feed power to the terminal equipment connected to the BRI-NT Port from the ETERNITY MENX.

To do this,

- Enable Feed Power on the BRI Port. For instructions see Power Feed under "[Configuring BRI Trunks](#)".

- By default, the Jumpers are set in AB position to feed power through Tx and Rx wires (Phantom Power). If you want to feed power through a separate pair of wires, you may change the position of the Jumpers on the BRI module as mentioned in the table below.

Function	Module 2 (M2)				Module 3 (M3)			
	BRI Port 1		BRI Port 2		BRI Port 3		BRI Port 4	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J4	J5	J2	J3	J4	J5	J2	J3
To feed power on Tx and Rx wires (Phantom Power)	AB	AB	AB	AB	AB	AB	AB	AB
To feed power on separate pair of wires	BC	BC	BC	BC	BC	BC	BC	BC

Function	Module 4 (M4)				Module 5 (M5)			
	BRI Port 5		BRI Port 6		BRI Port 7		BRI Port 8	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J4	J5	J2	J3	J4	J5	J2	J3
To feed power on Tx and Rx wires (Phantom Power)	AB	AB	AB	AB	AB	AB	AB	AB
To feed power on separate pair of wires	BC	BC	BC	BC	BC	BC	BC	BC

- *The maximum power that can be fed to a single BRI port is 50mA.*
- *From signaling point of view, a maximum of 8 terminal equipment can be connected on the BRI port configured in the NT mode.*
- *The number of ISDN Terminals that can be connected on the BRI port configured in the NT mode depends on the power consumed by the ISDN terminals.*

9. Insert the BRI Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.

Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

If installing more than one BRI Card, it is not necessary to insert the other cards in subsequent slots. Any card can be inserted in any of the Universal Slots. Remember to set the Orientation Type, Termination Resistance and Power Feed, as required.

10. Use the straight cables supplied for each connector on the BRI card to connect the BRI Ports to the NT1 device supplied by your ISDN service provider. Refer the configuration and pinout details given below for guidance.

Configuration details of the U interface (RJ-45) on NT1

Pin Number	Pin Details
4	Tx
5	Rx

Configuration details of the S/T interface (RJ-45) on NT1

Pin Number	Pin Details
3	Rx1
4	Tx1
5	Tx2
6	Rx2

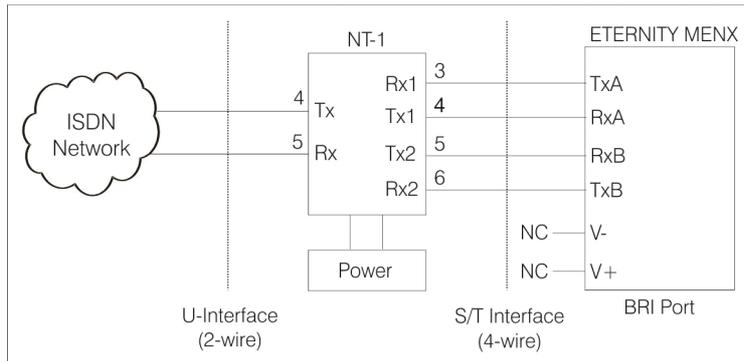

Pinout and Cable Details of BRI4 Port in TE Mode

Pin	Color	Connection
1	Orange-White	Not connected
2	Orange	Not connected
3	Green-White	TxA
4	Blue	RxA
5	Blue-White	RxB
6	Green	TxB
7	Brown-White	V-
8	Brown	V+

Pinout and Cable Details of BRI4 Port in NT Mode

Pin	Color	Connection
1	Orange-White	Not connected
2	Orange	Not connected
3	Green-White	RxA
4	Blue	TxA
5	Blue-White	TxB
6	Green	RxB
7	Brown-White	V-
8	Brown	V+

The following diagram shows how to connect a BRI Line to the BRI port in the TE mode.

- If you have completed all other installation tasks, you may turn ON the system and observe the Reset Cycle and the LED pattern of the BRI Card.

LED Pattern of the BRI Card

- The BRI8 Card has 8 LEDs: L1⁵⁹, L2, L3, L4, L5⁶⁰, L6, L7 and L8. These display the status of each port.
- The BRI4 Card has 4 LEDs: L1⁶¹, L2, L3 and L4. These display the status of each port.

The LEDs show the Status of the Ports as summarized in the table below:

Port Status	LED Color	LED Cadence
Port is not active	RED	Continuously ON
Port is active	GREEN	Continuously ON

59. This LED keeps blinking. It displays the system heart bits, at the rate of 100ms. It will remain OFF for 100ms and will show the status of port 1 for the next 100ms.

60. This LED keeps blinking. It displays the system heart bits, at the rate of 100ms. It will remain OFF for 100ms and will show the status of port 1 for the next 100ms.

61. This LED keeps blinking. It displays the system heart bits, at the rate of 100ms. It will remain OFF for 100ms and will show the status of port 1 for the next 100ms.

The T1E1PRI Card

The ETERNITY ME T1E1PRI Card provides the interface to connect the system to ISDN Network.

When connected to T1 carrier lines, the Card supports the following signaling types:

- PRI
- Robbed Bit Signaling
- Q-Signaling (QSIG)
- E&M

When connected to E1 carrier lines, the Card supports the following signaling types:

- PRI
- Channel Associated Signaling (CAS)
- Q-Signaling (QSIG)
- E&M

The T1E1PRI Card is available in the following configurations:

T1E1PRI Card for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card T1E1PRI Dual	2-Port card with QSIG support to connect 2 ISDN T1/E1 PRI Lines or ISDN Compatible Devices
ETERNITY ME Card T1E1PRI Single	1-Port card with QSIG support to connect 1 ISDN T1/E1 PRI Line or ISDN Compatible Device

The maximum number of PRI Lines supported are 24.

Connectors

The T1E1PRI card has an RJ45 Connector for each port. The ETERNITY ME T1E1PRI Dual card has 2 RJ45 Connectors for the two ports, while the ETERNITY ME T1E1PRI Single card has a single RJ45 Connector.

A cable with RJ45 plugs on both ends is supplied for each connector.

LEDs

The ETERNITY ME T1E1PRI Dual Card has four LEDs: L1, L2, L3 and L4.

The ETERNITY ME T1E1PRI Single Card has two LEDs L1 and L2.

Installing the T1E1PRI Card

1. Before installing the card, take the necessary precautions prescribed for handling the cards. Always wear an electrostatic-discharge preventive wrist strap and use a grounding mat. Make sure the power supply is turned off.
2. Unpack the T1E1PRI Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket.

Setting Line Termination Resistor

4. The default positions of SW3, SW4, SW6, SW7 switches should be as follows:

Pin1	Pin2	Pin3	Pin4	Termination Resistance (Ω)
OFF	OFF	OFF	ON	0 (Default)

Do Not Change the positions of any of these switches!

5. By default, termination resistance of PRI port is set as 120 Ω , which is for E1 connectivity.
- To use the PRI Port for T1 connectivity, termination resistance must be changed to 100 Ω .
 - Use DIP Switch SW5 to change the Termination Resistance of PRI Port 1. Set the Pins of SW5 as shown below:

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

- If using the ETERNITY ME T1E1PRI Dual Card, use DIP Switch SW2 to change the Termination Resistance of PRI Port 2. Set the Pins of SW2 as shown below:

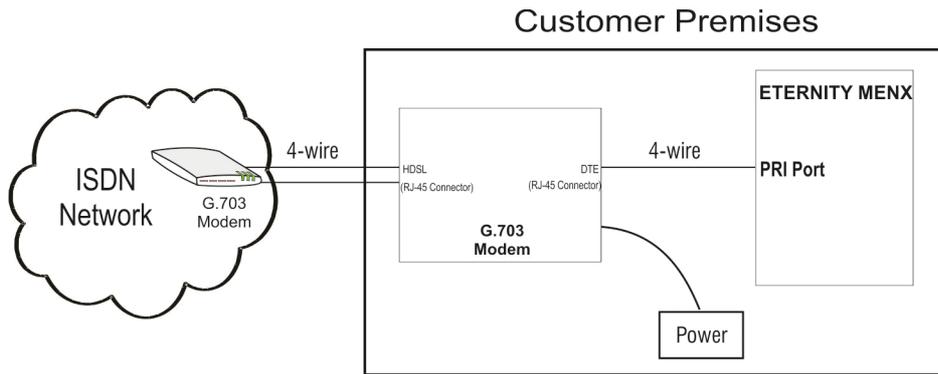

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

6. Insert the T1E1PRI Card into the guide rails of the free slot you selected for the card. Make sure that the connectors on the card make perfect contact with those of the slot on the backplane motherboard.
7. Now, press down the levers on the card mounting brackets to secure the card in its slot. Fix the card in place with the two screws provided.

Connecting ISDN T1/E1 PRI Lines

8. Use the cable supplied with the T1E1PRI Card to connect the system to the T1/E1 PRI network interface equipment (modem), which is usually supplied by your ISDN Service Provider along with the PRI line.

The diagram below illustrates this.

- Most Service Providers insist on connecting an ISDN modem at both the ends of the PRI line—one at the Local Exchange and other at the Customer's Premises.
 - At the Customer's Premises, the PRI line is terminated on the HDSL interface of the modem.
 - The DTE interface of the modem is to be connected to the PRI port (RJ-45 connector on the ETERNITY ME T1E1PRI Card).
9. Plug in one end of the RJ45 cable supplied with the card into the card's connector. Plug the other end of the RJ45 cable into the Network Termination Unit.
 10. Refer the following pin details for connecting the Network Termination Unit with the system.

Pin details of HDSL Interface of the G.703 Modem. (HDSL Network Termination Unit)

Pin Number	Pin Details
1	Line A
2	Line A
3	Not used
4	Line B
5	Line B
6	Not used
7	Not used
8	Not used

Pin details of DTE Interface of G.703 Modem. (HDSL Network Interface Unit)

Pin Number	Pin Details
1	TX1 (Tip)
2	TX2 (Ring)
3	Not used
4	RX1 (Ring)

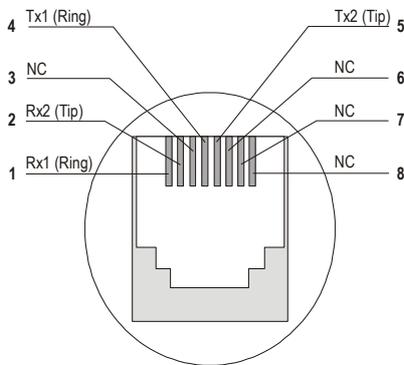

Pin Number	Pin Details
5	RX2 (Tip)
6	Not used
7	Not used
8	Not used

Most of the HDSL Network Termination Unit manufacturers use these connectors. But you are advised to read the installation guide of the HDSL Network Termination Unit being used by you.

Pin details of ETERNITY MENX T1E1PRI Port

The T1E1PRI Port of the system terminates in an 8-pin RJ45, female connector and is wired according to the table below.

The cable wires may have to be crossed depending on the pinout of the DTE Interface of the modem.

11. Repeat the same steps to install another card. It is not necessary to install the other T1E1PRI Cards in a sequence. Any card can be installed in any of the slots.
12. If you have completed all other installation tasks. Power the system. After the Reset Cycle, observe the LED patterns of the T1E1PRI Card.

LED Patterns

The ETERNITY ME T1E1PRI Dual Card has four LEDs: L1, L2, L3 and L4.

- L1 and L2 are assigned to PRI Port 1 (PRI#1)
- L3 and L4 are assigned to PRI Port 2 (PR1#2)
- L1⁶² shows Card Heart Bit as well as status of Port 1.

The ETERNITY ME T1E1PRI Single Card has two LEDs: L1 and L2.

Given below are the LED Patterns defined for indicating port states in the signaling types supported by the ETERNITY MENX.

62. This LED keeps blinking. It displays the system heart bits, at the rate of one second. It will remain OFF for one second and will show the status of port 1 for the next one second.

2. Port Active Mode

Signaling Type: E1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: E1-CAS

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
MFA Alarm	RED	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
Y-Bit Alarm	GREEN	100ms ON-100 ms OFF
AIS16 Alarm	RED	100ms ON-100 ms OFF
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: T1-RBS or T1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
No Alarm	GREEN	Continuous ON
BFA Alarm or MFA Alarm	RED	500ms ON-500 ms OFF
AIS Alarm	RED	100ms ON-100 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI or LOS Alarm	RED	Continuous ON

2. Port Maintenance Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Maintenance Mode	RED -GREEN	500 ms RED-500 ms GREEN

LED2/LED4 Pattern:

Port Status	Color	Cadence
Near end loop back wait before activate	RED	100ms ON-100 ms OFF
Near end loop active	RED	Continuous ON
Near end loop back wait before deactivate	RED	500ms ON-500 ms OFF
Far end loop back wait after activate	GREEN	100ms ON-100 ms OFF
Far end loop active	GREEN	Continuous ON
Far end loop back wait after deactivate	GREEN	500ms ON-500 ms OFF

3. Port Disable Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Port Disable	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Port Disabled	OFF	OFF

Jumpers on the Main Board

Jumper Number	Position	Function
J5 ^a	AB	Dual T1E1
	BC	Single T1E1
J6	AB	JTAG Mode
	BC (default)	Embedded ICE
J7	AB	Internal Boot
	BC (default)	External Boot
J8 & J12	AB (default)	Debug
	BC	UART
J9, J10 & J11	BC (default)	Normal
	AB	Boot

a. In T1E1 PRI Dual Card, default jumper position will be AB. In T1E1 PRI Single Card, default jumper position will be BC.

The E1FO Card

The ETERNITY LE E1FO Card provides the interface to connect the ETERNITY to the ISDN PRI Network. For E1 carrier lines the card supports the signaling types PRI, Q-Sig and CAS. For T1 carrier lines the card supports the signaling types PRI, Q-Sig and Robbed Bit Signaling. The T1/E1 ports can be set in Terminal or Network mode.

The E1FO Card supports Copper and Fiber Optic (FO) interfaces. At a time, either the Copper interface or the FO interface can be used. The FO interface supports only Single-mode (Mono mode) fiber connectivity and will work within a range of 30km.

E1 connectivity is supported over, the Copper interface as well as the Fiber Optic interface. The T1 connectivity is supported over the Copper interface only.

The E1FO Card is available in the following configurations:

E1FO Card for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card E1FO Dual	2-Port card to connect 2 ISDN T1/E1 Lines.
ETERNITY ME Card E1FO Single	1-Port card to connect 1 ISDN T1/E1 Line.

Connectors

The E1FO Dual card has two RJ45 Connectors and two Fiber Optic connectors. The E1FO Single card has one RJ45 Connector and one Fiber Optic connector.

LEDs

The ETERNITY ME E1FO Dual Card has four LEDs: L1, L2, L3 and L4.

The ETERNITY ME E1FO Single Card has two LEDs L1 and L2.

Installing the E1FO Card

1. Before installing the card, take the necessary precautions prescribed for handling the cards. Always wear an electrostatic-discharge preventive wrist strap and use a grounding mat. Make sure the power supply is turned off.
2. Unpack the E1FO Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket.

Setting Line Termination Resistor

- The default positions of SW3, SW4, SW6, SW7 switches should be as follows:

Pin1	Pin2	Pin3	Pin4	Termination Resistance (Ω)
OFF	OFF	OFF	ON	0 (Default)

Do Not Change the positions of any of these switches!

- By default, termination resistance of PRI port is set as 120 Ω , which is for E1 connectivity.
 - To use the PRI Port for T1 connectivity, termination resistance must be changed to 100 Ω .
 - Use DIP Switch SW5 to change the Termination Resistance of PRI Port 1. Set the Pins of SW5 as shown below:

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

- If using the ETERNITY ME E1FO Dual Card, use DIP Switch SW2 to change the Termination Resistance of PRI Port 2. Set the Pins of SW2 as shown below:

Pin-1	Pin-2	Pin-3	Pin-4	Resistance
OFF	OFF	ON	OFF	120 Ω (for E1)
OFF	ON	OFF	OFF	100 Ω (for T1)

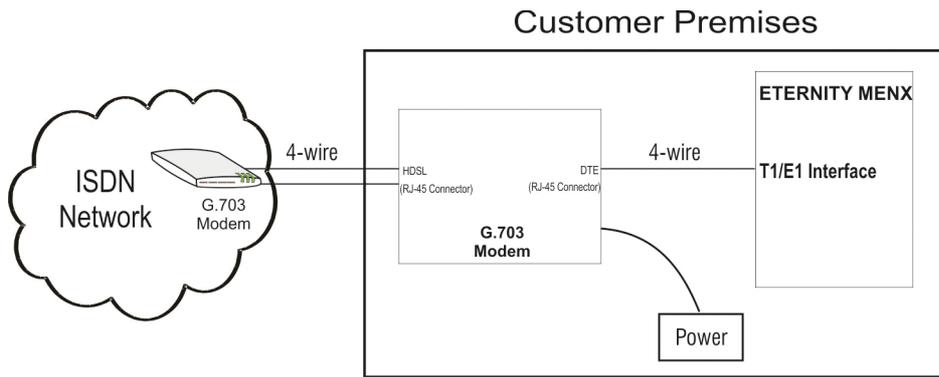

- Insert the E1FO Card into the guide rails of the free slot you selected for the card. Make sure that the connectors on the card make perfect contact with those of the slot on the backplane motherboard.
- Now, press down the levers on the card mounting brackets to secure the card in its slot. Fix the card in place with the two screws provided.

Connecting the T1/E1 Lines

Copper Interface Connectivity

- Use the cable to connect the T1/E1 Port to the T1/E1 network interface equipment (modem), which is usually supplied by your ISDN Service Provider along with the PRI line.

The diagram below illustrates this.

- Most Service Providers insist on connecting an ISDN modem at both the ends of the PRI line—one at the Local Exchange and other at the Customer's Premises.
 - At the Customer's Premises, the PRI line is terminated on the HDSL interface of the modem.
 - The DTE interface of the modem is to be connected to the PRI port (RJ45 connector on the Matrix ETERNITY ME CARD E1FOPRI Single).
9. Plug in one end of the RJ45 cable into the card's connector. Plug the other end of the RJ45 cable into the Network Termination Unit.
 10. Refer the following pin details for connecting the Network Termination Unit with the system.

Pin details of HDSL Interface of the G.703 Modem. (HDSL Network Termination Unit)

Pin Number	Pin Details
1	Line A
2	Line A
3	Not used
4	Line B
5	Line B
6	Not used
7	Not used
8	Not used

Pin details of DTE Interface of G.703 Modem. (HDSL Network Interface Unit)

Pin Number	Pin Details
1	TX1 (Tip)
2	TX2 (Ring)
3	Not used
4	RX1 (Ring)

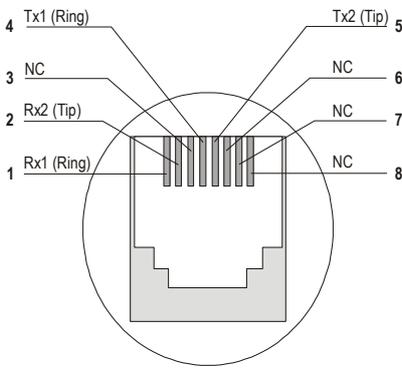

Pin Number	Pin Details
5	RX2 (Tip)
6	Not used
7	Not used
8	Not used

Most of the HDSL Network Termination Unit manufacturers use these connectors. But you are advised to read the installation guide of the HDSL Network Termination Unit being used by you.

Pin details of the T1/E1 PRI Interface

The T1/E1 Interface of the ETERNITY ME CARD E1FOPRI Single terminates in an 8-pin RJ45, female connector and is wired according to the table below.

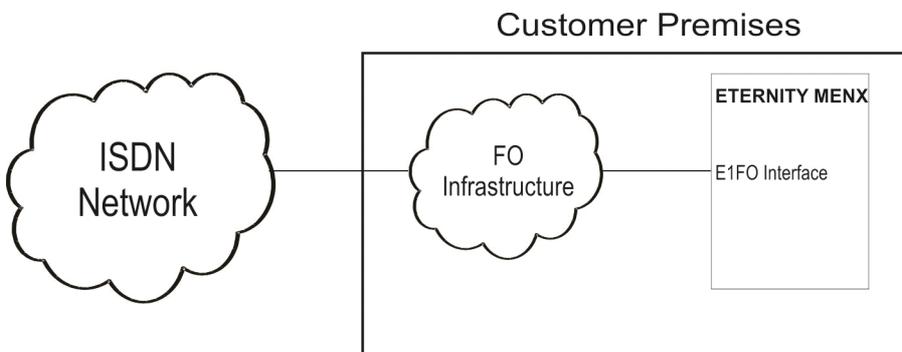

The cable wires may have to be crossed depending on the pinout of the DTE Interface of the modem.

Fiber Optic Interface Connectivity

- Fiber Optic interface supports E1 connectivity only.
- The Fiber Option (FO) interface supports only Single-mode (Mono mode) fiber connectivity and will work within a range of 30km.

- If your service provider provides Fiber Optic connectivity or you have an existing Fiber Optic infrastructure, you can connect the FO line to the E1FO interface of the E1FO Card.

To use Fiber Optic interface, make sure you select **Line Coding Mechanism** as **NRZ (Fiber Optic)**. For details, see [“Configuring E1 Trunks”](#).

- Repeat the same steps to install another card. It is not necessary to install the other E1FO Cards in a sequence. Any card can be installed in any of the slots.

- If you have completed all other installation tasks. Power the system. After the Reset Cycle, observe the LED patterns of the E1FO Card.

LED Patterns

The ETERNITY ME E1FO Dual Card has four LEDs: L1, L2, L3 and L4.

- L1 and L2 are assigned to PRI Port 1 (PRI#1)
- L3 and L4 are assigned to PRI Port 2 (PRI#2)
- L1⁶³ shows Card Heart Bit as well as status of Port 1.

The ETERNITY ME E1FO Single Card has two LEDs: L1 and L2.

Given below are the LED Patterns defined for indicating port states in the signaling types supported by the ETERNITY MENX.

1. Port Active Mode

Signaling Type: E1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

63. This LED keeps blinking. It displays the system heart bits, at the rate of one second. It will remain OFF for one second and will show the status of port 1 for the next one second.

Signaling Type: E1-CAS

LED1/LED3 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
MFA Alarm	RED	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
Y-Bit Alarm	GREEN	100ms ON-100 ms OFF
AIS16 Alarm	RED	100ms ON-100 ms OFF
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: T1-RBS or T1-PRI

LED1/LED3 Pattern:

Port Status	Color	Cadence
No Alarm	GREEN	Continuous ON
BFA Alarm or MFA Alarm	RED	500ms ON-500 ms OFF
AIS Alarm	RED	100ms ON-100 ms OFF
LOS Alarm	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI or LOS Alarm	RED	Continuous ON

2. Port Maintenance Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Maintenance Mode	RED -GREEN	500 ms RED-500 ms GREEN

LED2/LED4 Pattern:

Port Status	Color	Cadence
Near end loop back wait before activate	RED	100ms ON-100 ms OFF
Near end loop active	RED	Continuous ON
Near end loop back wait before deactivate	RED	500ms ON-500 ms OFF
Far end loop back wait after activate	GREEN	100ms ON-100 ms OFF
Far end loop active	GREEN	Continuous ON
Far end loop back wait after deactivate	GREEN	500ms ON-500 ms OFF

3. Port Disable Mode

LED1/LED3 Pattern:

Port Status	Color	Cadence
Port Disable	RED	Continuous ON

LED2/LED4 Pattern:

Port Status	Color	Cadence
Port Disabled	OFF	OFF

The E&M Card

The E&M Card of the system provides the interface for analog trunking to connect various communication equipment telephone switches, Routers, Leased Lines, etc. using Tie-Lines.

The E&M Card is required for the following applications:

- Power Line Carrier Communication (PLCC) Networks, where several systems are connected with each other through E&M tie lines. Refer [“PLCC-An Introduction”](#) to know more.
- [“Closed User Group \(CUG\)”](#), where several systems are connected with each other through E&M tie lines⁶⁴.
- System expansion, where two systems are connected with each other with E&M tie lines.
- Connecting remote systems over E&M tie lines.

Refer the topic [“E&M Connectivity”](#) to know more.

An E&M Port can be programmed to behave as a Trunk Interface, a Subscriber (Station) Interface or both, as a Tie Line with the dual personality of a Trunk and a Subscriber.

The E&M Card supports

- E&M Interface - Types IV and V
- Speech Interface - Two-wire and four-wire.
- E&M Trunk Seizure Type⁶⁵: Immediate, Immediate + Wink, Immediate with Ack, Immediate with Ack+Wink, Seizure Pulse, Seizure Pulse + Wink, Express, and Compander Control Signal.
- Address Signaling: Pulse dial (Pulse 10PPS, Pulse 20PPS) and Tone Dial (DTMF).

The E&M Card is available in the following configurations:

E&M Card for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card E&M8	8-port card to connect 8 E&M Tie Lines
ETERNITY ME Card E&M4	4-port card to connect 4 E&M Tie Lines

The maximum number of E&M ports supported are 64.

Connectors

The E&M Card has RJ45 Connectors. A separate MDF cable is supplied for each connector.

64. The Systems in a [“Closed User Group \(CUG\)”](#) can be connected over ISDN T1E1PRI Lines as well. Refer the topic [Closed User Groups to know more](#).

65. This is the line protocol that defines how the equipment seizes the E&M trunk. Also referred to as Start Dial Supervision Signaling Protocol.

LEDs

The ETERNITY ME Card E&M8 has eight tri-color LEDs. The ETERNITY ME Card E&M4 has 4 LEDs, to indicate the functioning of the ports.

Installing the E&M Card

An E&M port can be programmed to take on the function of:

- **a Station** - works like an extension interface, receiving incoming calls.

OR

- **a Trunk** - works like a trunk interface when any of the extensions of the system makes an outgoing call through it.

OR

- **a Tie Line** - takes on a dual personality: functioning as both as an extension and a trunk. The E&M port works like an extension interface for incoming calls. It works like a trunk interface when any extension makes an outgoing call through it.

This dual function is used in systems that are used as Transit Exchanges as in a PLCC Network. Read "[PLCC-An Introduction](#)" to know more.

You cannot connect a trunk line or an SLT / DKP to an E&M port.

1. Have the necessary wiring for the E&M Analog trunk in place. Take the necessary safety precautions before you begin handling the card; switch off power supply and always wear an antistatic wrist strap and use a grounding mat.
2. Unpack the E&M Card and check the package contents.
3. The E&M Card supports E&M Interface Type IV and Type V connection. To select the appropriate Interface Type out of the two, you need to change the Jumper Settings.

Refer the table below to select the desired Interface Type and Speech Interface.

Jumper Number	Position	Function
J1 and J2	AB	Type IV E&M Interface
	BC	Type V E&M Interface

- By default all the E&M Ports are set to support Type-IV.
- To select the Type-V connection for the E&M Port, set Jumpers J1 and J2 (located on the E&M module) in BC Position.

4. Select the speech interface - 2-wire speech or 4-wire speech - as required, by changing the jumper settings. Refer the table below.

Jumper Number	Position	Function
J3 and J4	AB	4-wire speech interface
	BC	2-wire speech interface

- By default all the E&M Ports are set to support 2-wire Speech Interface.
- To select 2-wire speech interface for the E&M Port, set Jumpers J3 and J4 (given on E&M module) to BC Position.
- To select 4-wire speech interface for the E&M Port, set Jumpers J3 and J4 on E&M module to AB Position.

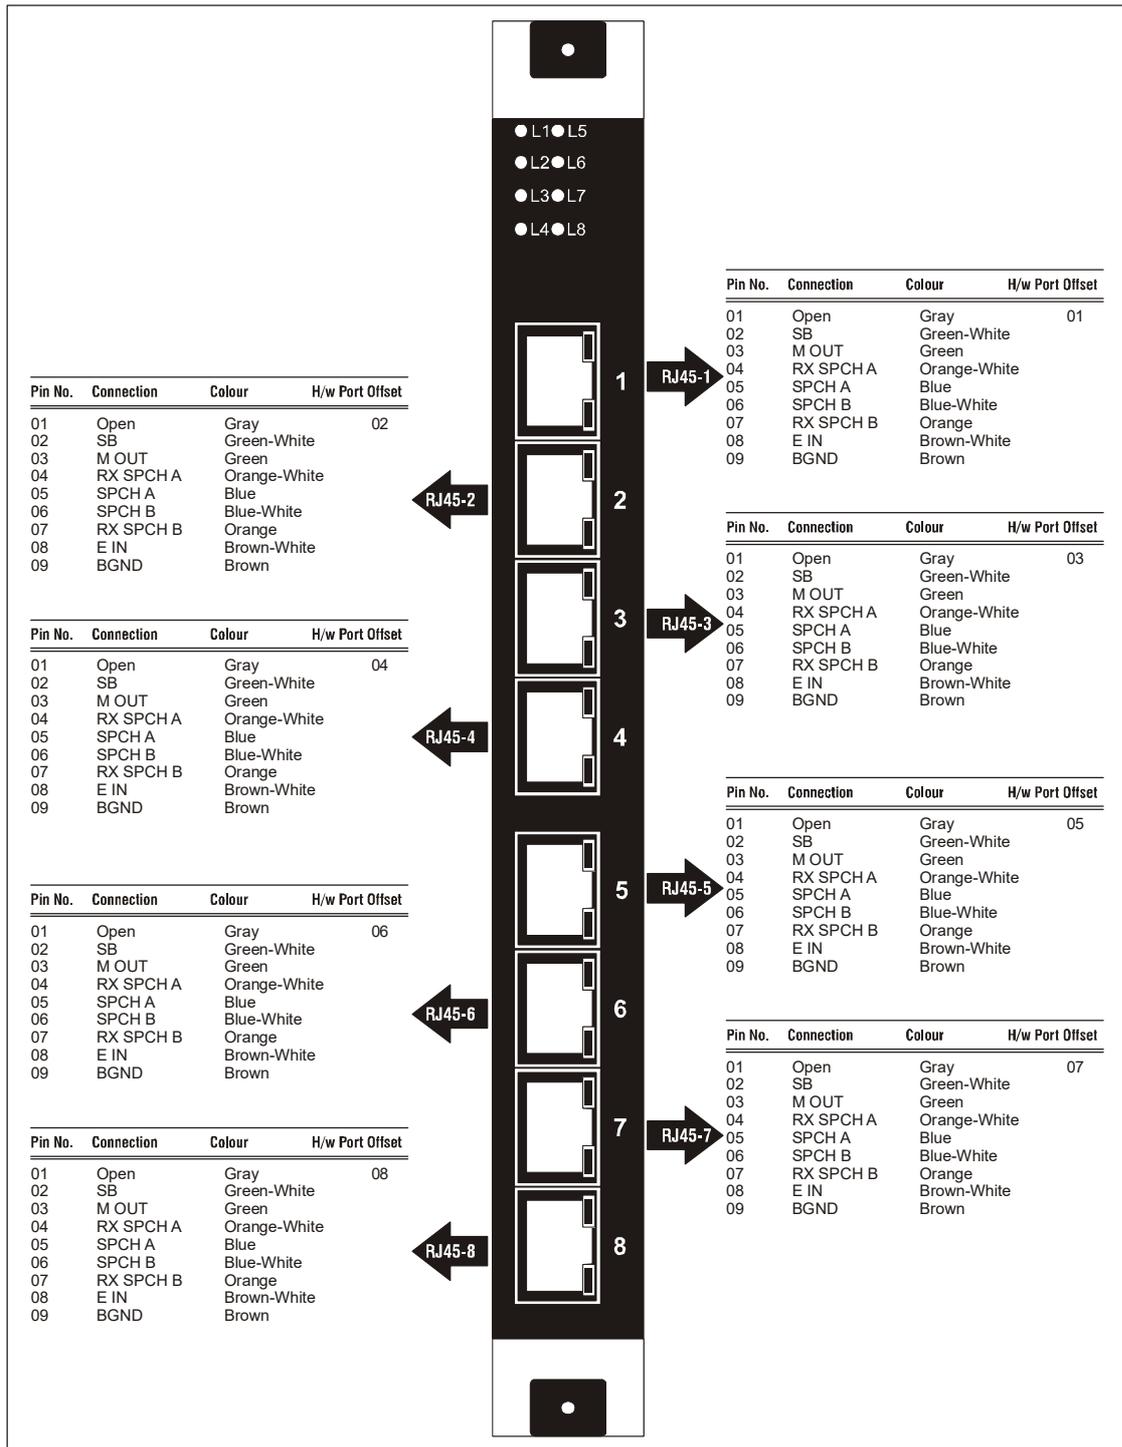

Keep Jumper number J5 in BC position and Jumper number J6 in BC/Open position.

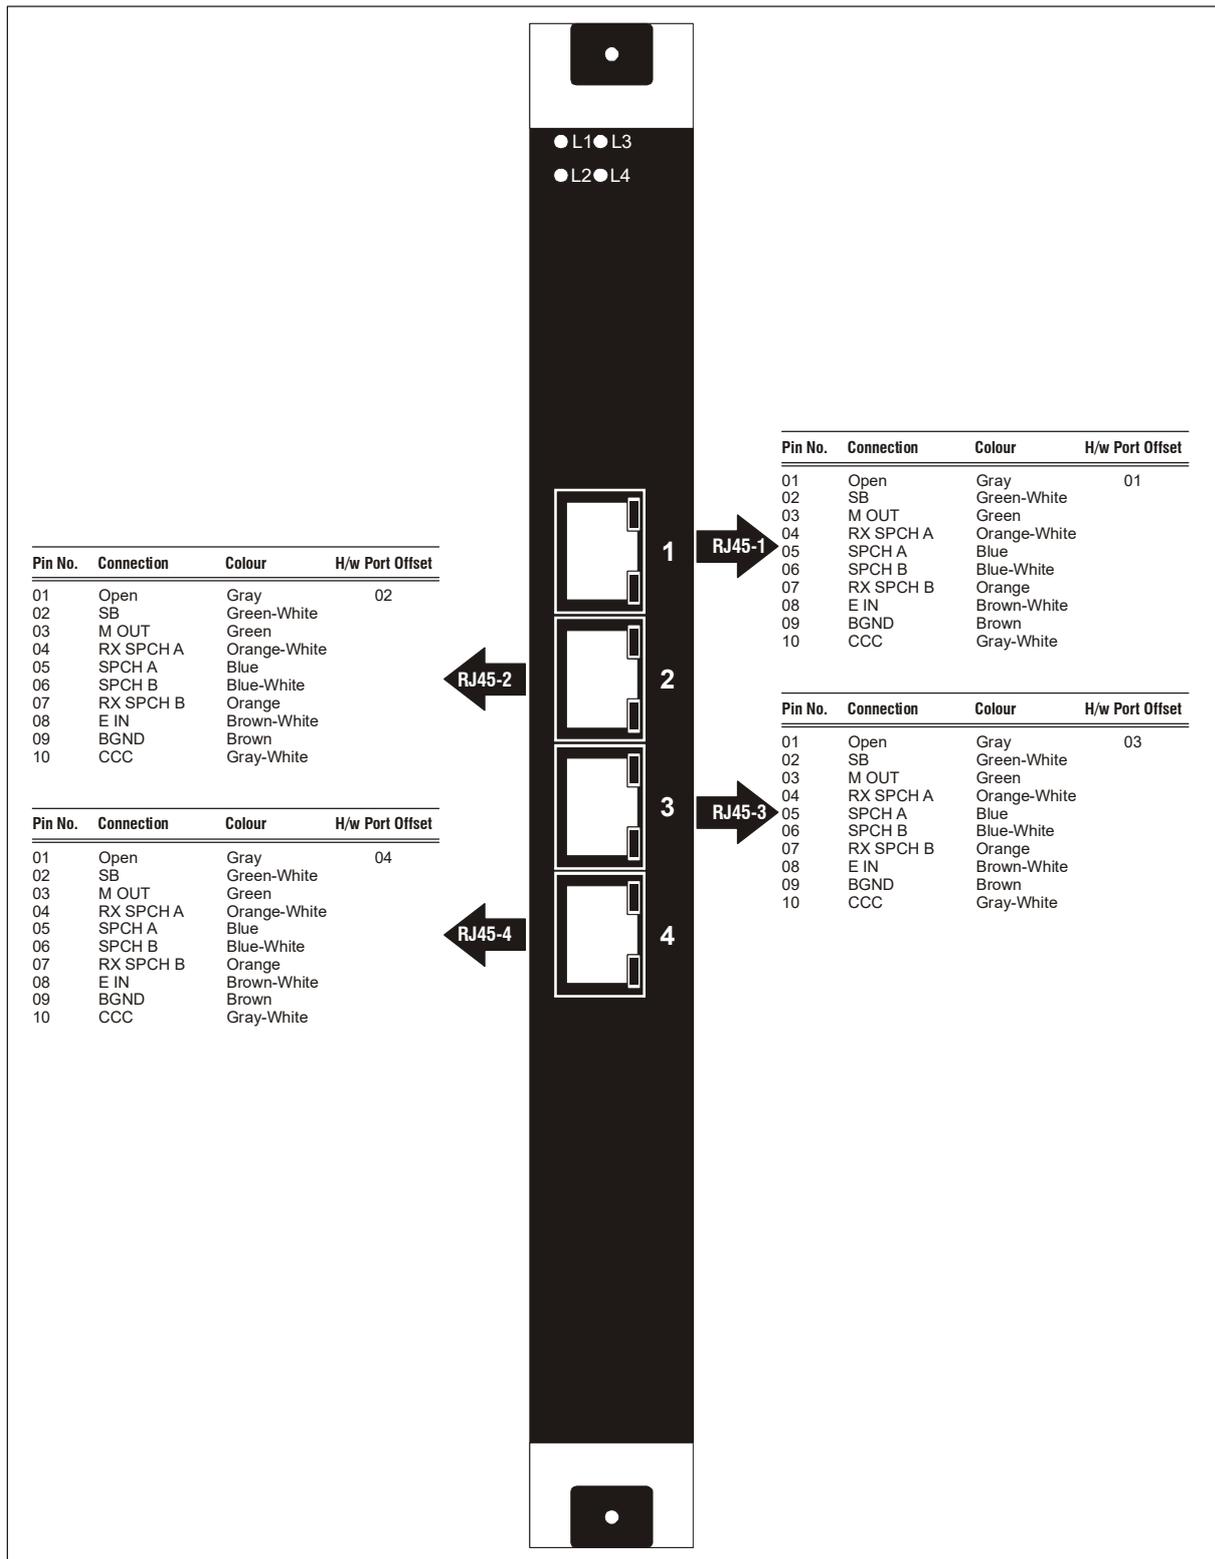

5. Now, select a free slot for the E&M Card. Unscrew and remove the filler bracket by pushing up the levers on the bracket. Preserve the filler bracket for future use.
6. Insert the E&M Card into guide rails of the empty slot. Make sure the connectors on the card make perfect contact with those on the backplane motherboard. Secure the card by pressing down the levers and fix the bracket with the screws provided with the card.
7. Connect the cables supplied with the E&M Card into the RJ45 connectors on the E&M Card.
8. Connect the free ends of the cables into the E&M Ports of the other System/PBX/Router/Tie Line equipment by appropriate crossing of the wires.

Refer the following pin-out details for the E&M Card and for each Interface and Speech Interface Type.

Pinout details of ETERNITY ME Card E&M8 - RJ45 Connectors

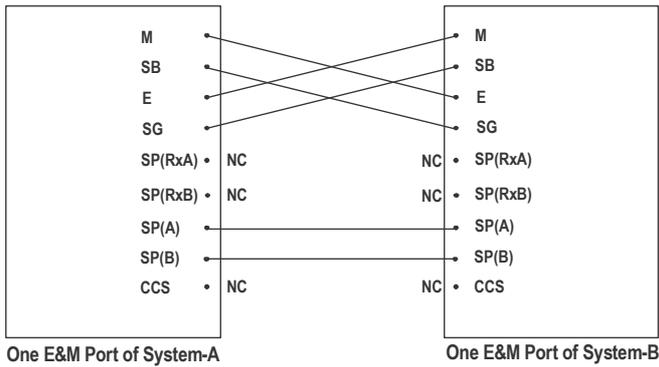

Pinout details of ETERNITY ME Card E&M4 - RJ45 Connectors

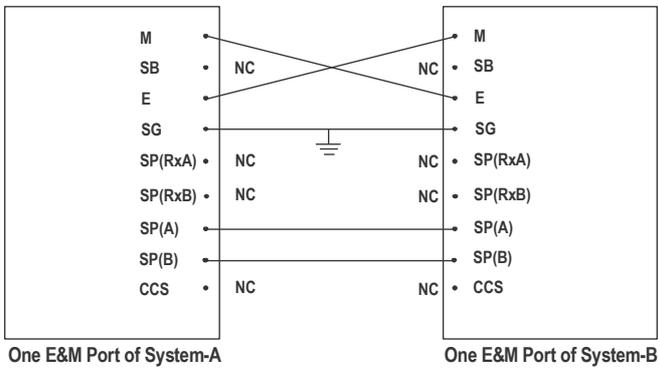

2 Wire, Type IV E&M Connection

2 Wire / Type IV E&M Connection

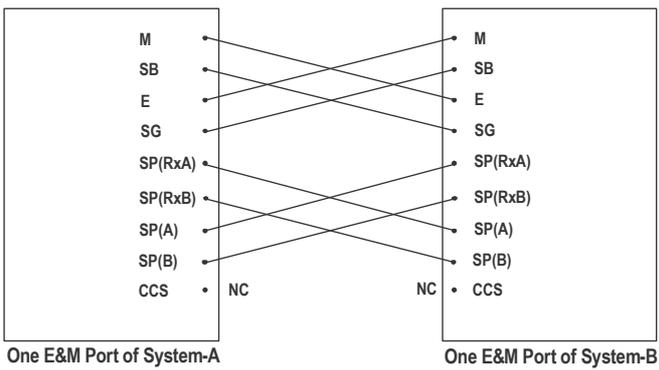

2 Wire, Type V E&M Connection

2 Wire / Type V E&M Connection

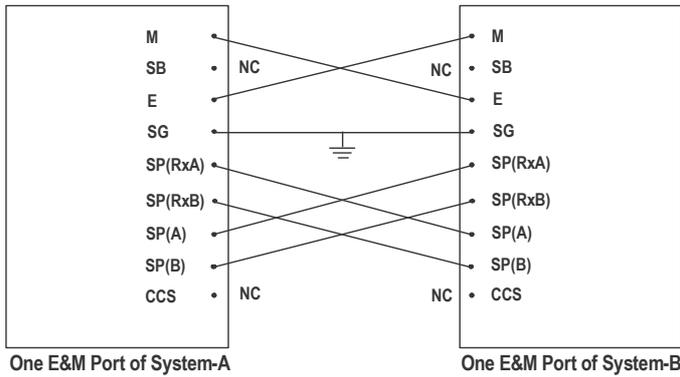

4 Wire, Type IV E&M Connection

4 Wire / Type IV E&M Connection

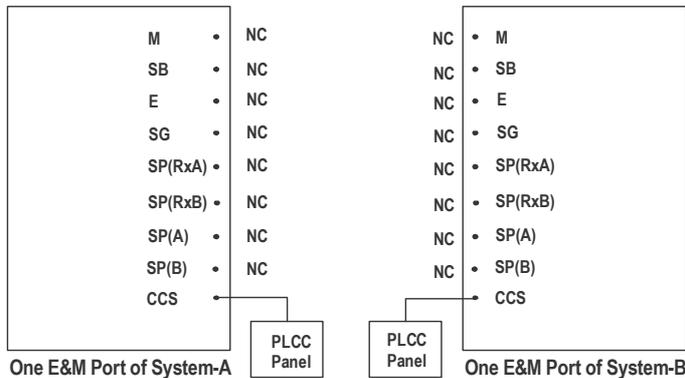

4 Wire, Type V E&M Connection

4 Wire / Type V E&M Connection

- If you are connecting two PLCC EPAX in a Power Line Carrier Communication Network Componder Control Signal (CCS) Connection should be made as illustrated in the block diagram below for any of the four combinations of E&M and Speech Interfaces illustrated in the previous step.

Componder Control Signal (CCS) is a special type of signal used by Power Line Carrier Communication Networks to improve quality of speech transmission. The PLCC network expects this signal from the system when speech is established and the E&M Card supports this facility. The system sends CCS signal to the PLCC panel.

- *When the E&M port is used as an Endpoint; the system sends a CCS to the PLCC panel while making an outgoing call through the E&M port or when a call is received at the E&M port.*
 - *When the E&M port is used for Transit Exchange; the system sends a CCS to the PLCC panel while there is a Transit call through the E&M port.*
- If you have completed all installation tasks, power ON the system, observe the Reset Cycle and the LED pattern of the E&M Card.

LED Pattern of the E&M Card

Stage	LED Color	LED Cadence
Initialization		
At Power ON	RED	L1 to L8 glow one after the other in a sequence, ON 100ms -OFF. L1 ON 100ms-OFF, L2 100ms ON-OFF, L3 100ms ON-OFF, L4 100ms ON-OFF.....L8 100ms ON-OFF
	GREEN	L1 to L8 glow one after the other in a sequence, ON 100ms -OFF. L1 ON 100ms-OFF, L2 100ms ON-OFF, L3 100ms ON-OFF, L4 100ms ON-OFF.....L8 100ms ON-OFF
Stand-By ^a	GREEN, ORANGE	L1 toggles GREEN ON 1 sec, ORANGE ON 1 sec
Normal (Port Event)		
M-Wire High	GREEN	LED of the Port continuously ON
M-Wire Low		LED of the Port continuously OFF
E-Wire High	RED	LED of the Port continuously ON
M-Wire Low		LED of the Port continuously OFF
E-Wire and M-Wire High	ORANGE	LED of the Port continuously ON
Errors		
Controller RAM failure	ORANGE	All LEDs Toggle at 1 sec
External RAM failure	ORANGE	All LEDs Toggle at 2 sec
Eprom failure	ORANGE	All LEDs Toggle at 3 sec
Invalid Slot detected	ORANGE	All LEDs Toggle at 6 sec

a. Waiting to be detected by Master Card.

Jumpers on the Main Board

Jumper Number	Position	Function
J1	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J4 & J5	AB (default)	Normal Operation
	BC	For uploading software using COM Port

The Mobile Card

The Mobile Card interfaces the system with 2G/3G/CDMA/4G networks. It routes calls made and received over mobile networks, like a mobile handset.

The Mobile Cards are available in CDMA, 2G, 3G and 4G variants.

The Mobile Card does not support GPRS features, Fax and Data services, network supported services, except CLIR and USSD.

For compatibility and use of Matrix GSM products (2G/3G/4G) in Russia and Iran Province connect with Matrix Sales or Technical Support Team.

The Mobile Card for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card GSM8	<p>8-port card to connect to 8 GSM networks (8 SIM Cards can be installed). To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G without SIM Hot-swap”.</p> <p>For Hardware Design V3R2, CPLD V3R2 and PCB Version Revision V3R1 This version onwards SIM Hot Swap is supported, that is the SIM card can be removed and inserted in the SIM Slots without turning off the system. To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap”.</p>
ETERNITY ME Card GSM8 3G	<p>8-port card to connect to 8 GSM networks with 3G support (8 SIM Cards can be installed). “ETERNITY ME Card GSM8/GSM8 3G without SIM Hot-swap”.</p> <p>For Hardware Design V3R2, CPLD V3R2 and PCB Version Revision V3R1 This version onwards SIM Hot Swap is supported, that is the SIM card can be removed and inserted in the SIM Slots without turning off the system. To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap”.</p>
ETERNITY ME CARD GSM8 4G	<p>8-port card to connect to 8 GSM networks with 4G support (8 SIM Cards can be installed) with SIM Hot Swap. To know more, refer to “ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap”.</p>
ETERNITY ME CARD CDMA2	<p>2-port card to connect to 2 CDMA networks (2 RUIM Cards can be installed)</p> <p>Cards with Version V4R1 cannot be downgraded to earlier versions.</p>

If you are installing CDMA Mobile Card in your system, it is recommended to avoid using features that support DTMF Detection.

The features where the caller is asked to dial digits and the system has to detect it, for example, DID, Voice Mail Auto Attendant etc might not work efficiently.

Just like mobile handsets, each Mobile Port has a unique IMEI (International Mobile Equipment Identity) number, pasted on the mobile engine.

The maximum Mobile ports supported are 64.
SIM cards from different service providers can be used.

Antenna

There is a single rooftop (RT) antenna for four GSM ports. A splitter connects all the four ports on the card into a single antenna. An antenna cable is also provided, giving you the flexibility to move the antenna to another position (in case of weak signal).

Personal Identification Number (PIN)⁶⁶

The SIM cards can be protected from unauthorized use by programming a Personal Identification Number (PIN) on the SIM. If the wrong SIM PIN is entered thrice in a row, by a user, the SIM card suspects the user and asks for the Personal Unlock Keyword (PUK).

LEDs

There is a tri-color LED for each mobile port on the card to indicate the functioning of the card and the status of the ports.

Installing the Mobile Card

To be able to connect the system to 2G/3G/CDMA/4G networks, you must have one of the above mobile cards installed in the system.

1. To install the Mobile Card,
 - If using a 2G/3G/CDMA/4G card, get the SIM Card from the 2G/3G/CDMA/4G service provider of your choice ready. Use SIM PIN protection⁶⁷, if required.

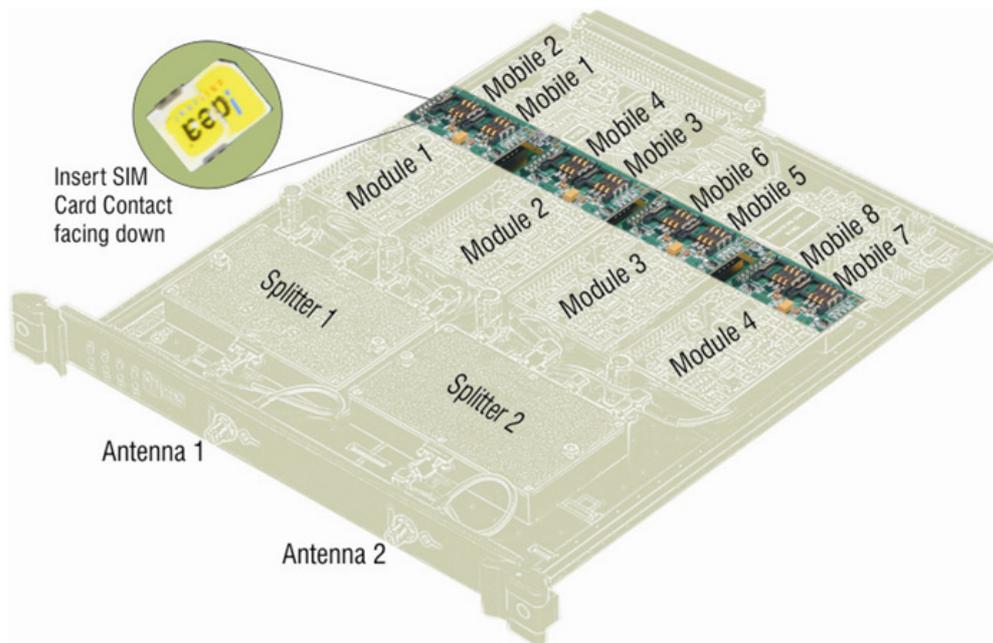

Disable Call Waiting in the SIM, else it may result in call disconnection.

2. Make sure that the system is installed at a location where sufficient network coverage is available. The power supply should be turned off, and you must be wearing an electrostatic discharge preventive wrist strap and must have a grounding mat, before you begin handling the card.
3. Unpack the Mobile Card and verify the package contents.

^{66.} Not applicable if you are installing CDMA Mobile Card in your system.

^{67.} SIM PIN Protection is not applicable if you are installing CDMA Mobile Card.

ETERNITY ME Card GSM8/GSM8 3G without SIM Hot-swap

Enabling PIN Protection on SIM⁶⁸

4. For the 2G/3G/CDMA Card, enable SIM PIN before installing the SIM card in the system.
 - insert the SIM into a mobile handset first.
 - enable PIN Protection from the mobile handset.
 - change the SIM PIN to 1234 (this is the default PIN for all SIM cards used in the system). Changing the SIM PIN to '1234' enables you to change the SIM PIN from the Jeeves later (Refer SIM PIN under ["Configuring Mobile Trunks"](#) for instructions).
 - remove the SIM from the mobile handset.

If you do not want to use PIN protection, insert the SIM in the mobile handset and disable PIN protection. Remove the SIM Card from the mobile handset.

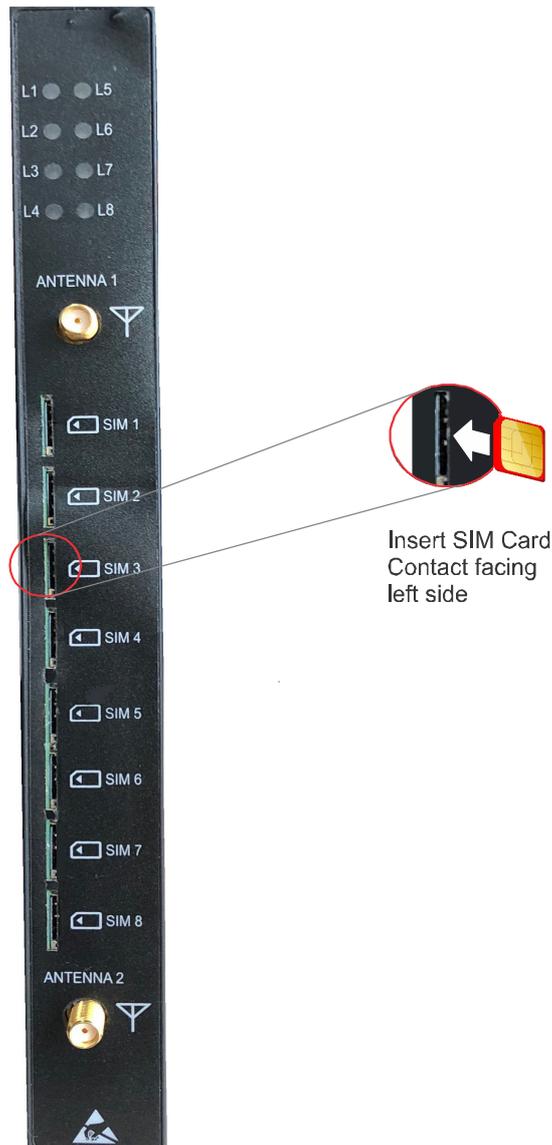

5. Insert the SIM card (PIN changed to 1234), with its connector side down into the SIM holder on the Mobile card. You can insert multiple SIM cards of the same GSM service provider or of different service providers.
6. Insert the Mobile Card into the guide rails of the Universal Slot you have selected for this card. Make sure that the card is inserted deep enough to make perfect contact with the connectors in the backplane. Now, press down the levers on the card mount bracket to secure the card in its slot.
7. Connect the antenna provided with the card on the splitter connector on the front panel of the card. You may also use the antenna cable to place the antenna at another position.
8. Repeat Steps 1-7 to insert another Mobile Card.
9. If you have completed all installations tasks, power the system.
10. Wait for the system to register with the Mobile network. By default, the Mobile ports are set to select and register with the Mobile networks automatically. Now, observe the LED Patterns of the Mobile Ports.

⁶⁸. Disable PIN Protection on RUIM if you are installing CDMA Mobile Card in your system.

- At every power up of the system, it takes about 3 minutes for the Mobile ports to get registered with the network. Once registration with the GSM network is completed, the mobile port can be used.
- Each time the Mobile Port sends a request, such as Registration Request, the system waits for the duration of the Network Response Timer. This Timer signifies the time for which the Mobile Port waits for a response from the Mobile network. It is fixed for 150 seconds for all Mobile ports.

ETERNITY ME Card GSM8/GSM8 3G/GSM8 4G with SIM Hot-swap

Enabling PIN Protection on SIM

4. For the 2G/3G/4G Card, enable SIM PIN before installing the SIM card in the system.
 - insert the SIM into a mobile handset first.
 - enable PIN Protection from the mobile handset.
 - change the SIM PIN to 1234 (this is the default PIN for all SIM cards used in the system). Changing the SIM PIN to '1234' enables you to change the SIM PIN from the Jeeves later (Refer SIM PIN under [“Configuring Mobile Trunks”](#) for instructions).
 - remove the SIM from the mobile handset.

If you do not want to use PIN protection, insert the SIM in the mobile handset and disable PIN protection. Remove the SIM Card from the mobile handset.

5. Insert the SIM with its contact side facing left into the SIM slot located on the fascia of ETERNITY ME Card.
6. Push the SIM backwards into the slot until you hear a click and the SIM is locked in place.
7. To unlock the SIM, push the protruded portion of the SIM backwards again and release it.

The Mobile cards with SIM Hot - swap are designed keeping in mind the Standard Nano SIM size. In case, you face any issues due to the SIM size, contact your respective Service Provider for assistance.

8. Repeat the same steps to insert another SIM Card. You can insert multiple SIM cards of the same GSM service provider or of different service providers.
9. Insert the Mobile Card into the guide rails of the Universal Slot you have selected for this card. Make sure that the card is inserted deep enough to make perfect contact with the connectors in the backplane. Now, press down the levers on the card mount bracket to secure the card in its slot.
10. Connect the antenna provided with the card on the splitter connector on the front panel of the card. You may also use the antenna cable to place the antenna at another position.
11. Repeat Steps 1-7 to insert another Mobile Card.
12. If you have completed all installations tasks, power the system.
13. Wait for the system to register with the Mobile network. By default, the Mobile ports are set to select and register with the Mobile networks automatically. Now, observe the LED Patterns of the Mobile Ports.

- *At every power up of the system, it takes about 3 minutes for the Mobile ports to get registered with the network. Once registration with the GSM network is completed, the mobile port can be used.*
- *Each time the Mobile Port sends a request, such as Registration Request, the system waits for the duration of the Network Response Timer. This Timer signifies the time for which the Mobile Port waits for a response from the Mobile network. It is fixed for 150 seconds for all Mobile ports.*

LED Pattern of Mobile Ports

The number of tri-color LEDs on the Mobile card corresponds with the number of mobile ports on the card.

At Power On: All LEDs will blink 1 second ON and 1 second OFF in the color sequence: Red-Green-Orange until the Reset cycle is complete.

In the Stand-by state: All LEDs will glow Orange for a second and turn Green for a second, repeatedly.

During normal functioning: The LEDs will various events on the Mobile port in the color and cadence described in the table below:

Event	Color	Cadence in msec (1 cadence is of 3000 msec)
Port disabled	-	LED OFF

Event	Color	Cadence in msec (1 cadence is of 3000 msec)
Port idle	-	LED OFF
Port Active (All States other than Ring and Speech)	Red	Continuous ON
Ring Event	Green	400ms ON-200ms OFF400ms ON-200ms OFF
Speech	Green	Continuous ON
GSM initialization	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-1200ms OFF (5 blinks)
PUK required	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-1600ms OFF-
SIM PIN faulty	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-2000ms OFF (3 blinks)
SIM Absent	Orange	200ms ON-200ms OFF-200ms ON-2400ms OFF (2 blinks)
Network Link Down (Absence of GSM Network)	Orange	200ms ON-2800ms OFF

The Magneto Card

The Magneto Card is used for connecting the system to Magneto Telephones⁶⁹, which are widely used by the defense establishments as field phones in front lines, and by other establishments such as railroad companies (signaling emergencies, crossings, etc.), electric utilities, pipeline companies, who need to have their networks at places that are too remote to be serviced by public telephone networks.

The Magneto Card lands calls from magneto field telephones on the extensions of the system and places calls from the extensions of the system on magneto telephones.

Magneto Card for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card Magneto8	8-port card to connect 8 Magneto Phones

The maximum number of magneto ports supported are 16.

Connectors

The Magneto Card has RJ45 connectors. A multi-pair cable is provided for each connector.

LED

The ETERNITY Magneto8 has 8 LEDs for each magneto port supported by the card.

The LEDs indicate the health of the cards during the Reset Cycle and the status of the ports during the normal functioning of the system.

Installing the Magneto Card

1. Have the necessary wiring for the Magneto Ports in place.

You may install an MDF to connect the Magneto Ports with the Field Telephone wires.

OR

You may connect the wires from the Magneto Field Telephones directly to the Magneto Port.

You are advised to use a separate set of Krone Modules for connecting the Magneto phones to the Magneto ports of the system

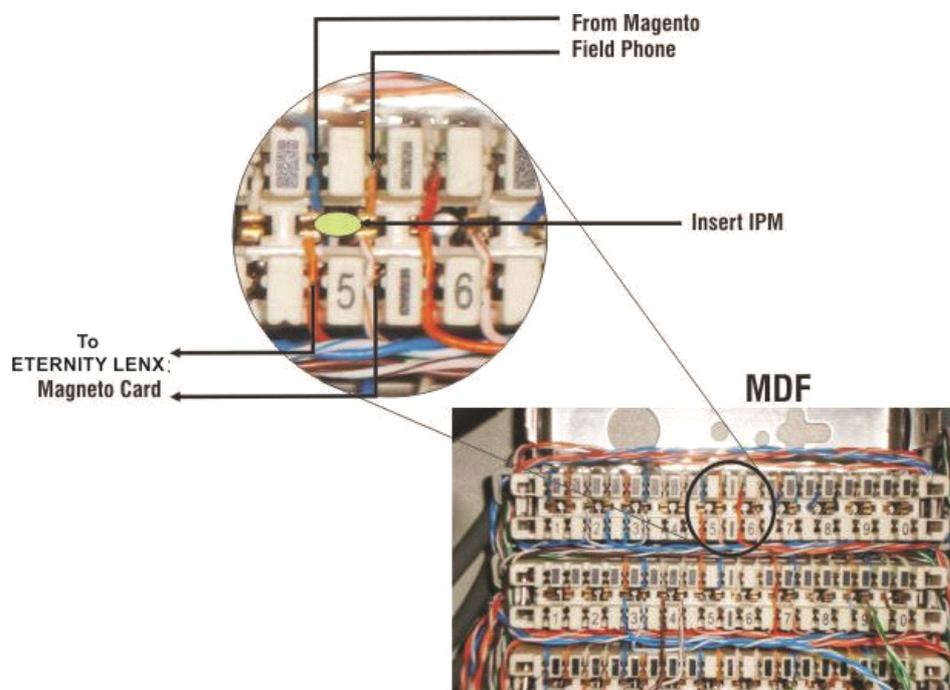

2. Prepare for the card installation by switching off power supply and wearing an electrostatic discharge preventive wrist strap and use a grounding mat.
3. Unpack the Magneto Card and check the package contents.

69. A magneto telephone is a local battery telephone set, in which signaling current is provided by a magneto hand generator, usually a magneto. The hand generator, commonly referred to as 'crank', is located on the right hand side of the telephone set and is turned to produce energy to ring other phones or to signal the CO. The magneto, also called the generator, is used to convert the mechanical motion via the crank to produce sufficient energy to ring other phones or to signal the CO.

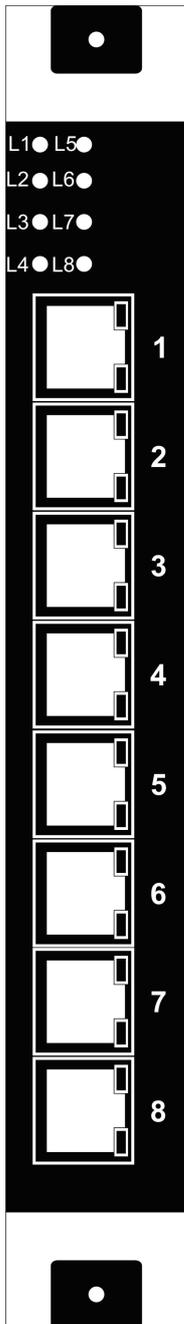

4. Select any universal slot to insert the card. Unscrew the filler bracket and remove it by pushing up the levers on the bracket.
5. Insert the Magneto card into the guide rails of the free slot. The card's connectors must make perfect contact with the connectors on the backplane motherboard. Press down the levers of the mounting bracket to secure the card in its slot and fix the two screws provided with the card on the mounting bracket.
6. Now, plug in the cables supplied with the Magneto Card into the connectors on the card. Terminate the free ends of the cables into the MDF, if applicable.

Refer to the following block diagram for terminating the cables from the Magneto Card and the wires from the Magneto Field Telephones.

Connecting Magneto Telephones to the Magneto Card

- Connect the pairs of wires from the Magneto Field Phones to the appropriate pairs emerging from the Magneto Card on the MDF. Refer the cable diagram below.

Connector	Color	Connection	H/w Port Offset
RJ45-1 (Blue)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-2 (Orange)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-3 (Green)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-4 (Brown)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-5 (Blue)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-6 (Orange)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-7 (Green)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —
RJ45-8 (Brown)	Blue - (Blue & White) Orange - (Orange & White) Green - (Green & White) Brown - (Brown & White)	Magneto — — —	01 — — —

- Repeat the same steps to install the other Magneto Cards.
- If you do not have any other Card to insert and have completed the installation procedures, power on the system and observe the Reset Cycle and the LED Pattern of the Magneto Card.

LED Pattern of the Magneto Card

Stage	LED Color	LED Cadence
Auto Upgradation / Auto Downgradation		
Card waiting for application	RED	L1 turned ON for 200ms, turned OFF simultaneously.
Card is up, loaded with new application	GREEN	L1 turned ON for 200ms, turned OFF simultaneously.
Initialization		
	RED	L1 to L8 turned ON 500ms-OFF 500ms
	GREEN	L1 to L8 turned ON 500ms-OFF 500ms
	ORANGE	L1 to L8 turned ON 500ms-OFF 500ms
Stand-By ^a	ORANGE, GREEN,	L1 toggles 1 sec Orange and RED
Normal (Port Event)		
Ring (incoming/outgoing call)	RED	LED of the Port continuously ON
Port Disabled		LED of the Port continuously OFF
OFF-Hook (in Speech) For Outgoing call from Magneto: When called extension answers the call For Incoming call to Magneto: When stopping Ring on Magneto using MRE key or #	GREEN	LED of the Port continuously ON
Port Idle		LED of the Port continuously OFF
Errors		
Invalid Card Configuration Jumper	ORANGE	All LEDs Flash (250ms ON-250ms OFF) twice, OFF 3 sec.
Invalid Slot detection ^b	ORANGE	LEDs Flash (250ms ON-250ms OFF) 6 times, OFF 3 sec.

a. Waiting to be detected by CPU Card.

b. Waiting to be detected by CPU Card.

Jumpers on the Main Board

Jumper Number	Position	Function
J1 & J2	AB	NA
	BC (default)	Normal Operation
J3, J5 & J6	AB (default)	Normal Operation
	BC	For uploading software using COM Port

The Radio Card

The Radio Interface Card (RIC) adds the Two-way Radio functionality in the system. In Two-way radio, the speech can be transmitted as well as received by the radio devices such as Radio Phone, Radio Repeater. Such devices are called Radio Transceivers. The Two-way radio works on High Frequency (HF), Very High Frequency (VHF) or Ultra High Frequency (UHF).

Radio Cards for ETERNITY MENX

Card Name	Configuration and Application
ETERNITY ME Card Radio8	8-port card to connect 8 Radio devices.
ETERNITY ME Card Radio4	4-port card to connect 8 Radio devices.

The maximum number of radio ported supported are 16.

Connectors

The Radio Card has RJ45 connectors. A multi-pair cable is provided for each connector.

LED

The Radio Card has one tri color LED.

Installing the Radio Card

1. Have the necessary wiring for the Radio Ports in place.

You may install an MDF to connect the Radio Ports with the Radio device wires.

OR

You may connect the wires from the Radio device directly to the Radio Port.

You are advised to use a separate set of Krone Modules for connecting the Radio devices to the Radio ports of the system.

2. Prepare for the card installation by switching off power supply and wearing an electrostatic discharge preventive wrist strap and use a grounding mat.
3. Unpack the Radio Card and check the package contents.
4. Select any universal slot to insert the card. Unscrew the filler bracket and remove it by pushing up the levers on the bracket.
5. Insert the Radio Card into the guide rails of the free slot. The card's connectors must make perfect contact with the connectors on the backplane motherboard. Press down the levers of the mounting bracket to secure the card in its slot and fix the two screws provided with the card on the mounting bracket.

6. Now, plug in the cables supplied with the Radio Card into the connectors on the card. Terminate the free ends of the cables into the MDF, if applicable.
7. Connect the pairs of wires from the Radio devices to the appropriate pairs emerging from the Radio Card of the system on the MDF. For more details, see [“The Main Distribution Frame \(MDF\)”](#).

Refer to the Pin-out details given below.

ETERNITY ME Card Radio8

Connector	Color	Pin Number	Signaling	H/w Port Offset
RJ45-1 to RJ45-8	Orange & White	1	PTT	01 to 08
	Orange	2	PTT_RTN	
	Green & White	3	Rx-	
	Blue	4	Tx+	
	Blue & White	5	Tx-	
	Green	6	Rx+	
	Brown & White	7	Unused	
	Brown	8	Unused	

ETERNITY ME Card Radio4

Connector	Color	Pin Number	Signaling	H/w Port Offset
RJ45-1 to RJ45-4	Orange & White	1	PTT	01 to 04
	Orange	2	PTT_RTN	
	Green & White	3	Rx-	
	Blue	4	Tx+	
	Blue & White	5	Tx-	
	Green	6	Rx+	
	Brown & White	7	Unused	
	Brown	8	Unused	

8. Repeat the same steps to install the other Radio Cards.
9. If you do not have any other Card to insert and have completed the installation procedures, power on the system. Observe the Reset Cycle and the LED Pattern of the Radio Card.

LED Pattern

Stage	LED Color	LED Cadence
Auto Upgradation / Auto Downgradation		
Card waiting for application	RED	200ms ON - 200ms OFF

Stage	LED Color	LED Cadence
Card is up, loaded with new application	GREEN	200ms ON - 200ms OFF
Initialization		
	RED	500ms ON - 500ms OFF
	GREEN	500ms ON - 500ms OFF
	ORANGE	500ms ON - 500ms OFF
Stand-By	ORANGE, GREEN	Toggles 1 sec Orange 1 sec Green
Port Status		
Selected Port's data are transmitted to master card	RED	Toggle on each event
Selected Port's data are received from master card	GREEN	Toggle on each event from master

Jumpers on the Main Board

Jumper Number	Position	Function
J3	AB (default)	Normal Operation
	BC	For uploading software using COM Port
J4 and J5	AB (default)	Normal Operation
	BC	For uploading software using COM Port

In PCB-P-200-80-01-01, for 4-wire speech the Jumpers J1 and J2 on the modules must always be set in AB position.

In PCB-P-200-80-01-02 onwards only 4-wire speech is possible therefore there are no Jumpers on the modules.

The Data Card

The Data Card supports four Ethernet 10/100Mbps interfaces. Ethernet data coming to ports can be mapped to 2Mb streams. Each data port can be mapped to one 2Mb - E1 stream, that is 30 channels. The remaining channels of E1 can be used for voice applications. The Data Card has a 4-port Ethernet switch on board, which can aggregate multiple data streams to PCM streams of the system.

The Data Card can be installed in any of the Universal Slots of the system.

Ports and Connectors

The Data Card has an RJ45 Connector for each port. Use the cables supplied with the card for connectivity.

You can connect the cables from the LAN switch to these connectors.

LEDs

The Data Card has one dual color LED.

Installing the Data Card

1. Unpack the Data Card and check the package contents. It is recommended that you switch off the power supply, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
2. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket! Preserve it for future use!
3. Insert the Data Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.

Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

4. Use the cable supplied with the card to connect the Data Ports to the Ethernet Network (Switch/PC).
5. If you have completed all other installation tasks, you may turn ON the system and observe the Reset Cycle and the LED pattern of the Data Card.

LED Pattern of the Data Card

Status	Color	Cadence
Waiting for Master to start Up-gradation procedure (waits for 10 seconds)	Red	Blinking 200ms ON - 200ms OFF
Up-gradation in progress	Green	Blinking 200ms ON - 200ms OFF
Application run error after up-gradation procedure	Red	Continuous ON
Auto upgradation completed successfully and in process to start new application	Green	Continuous ON

Status	Color	Cadence
Main application is being executed	Red	Blinking 1 sec ON - 1 sec OFF

Jumpers

Jumper Number	Position	Function
J9	AB (default)	External Boot - Normal
	BC	Internal Boot

SIP Extensions

SARVAM UCS supports up to 2000 SIP/UC Users. The SIP/UC Users function in the same way as DKP/SLT extensions of the system. SIP/UC Users can make and receive calls to any extension user of the system and to external numbers over various telecom networks like CO, Mobile, ISDN PRI, BRI, and VoIP⁷⁰.

You may register any SIP-enabled device — a Matrix UC Client, an IP-phone, a Soft phone, Analog Phone Adapter — as the SIP User of the system.

The Matrix UC Clients also offer UC functionalities in addition to the SIP functionalities.

The SIP Users register with the CPU Card of the system. Five free SIP Users are provided by default. You may register any of the SIP-enabled devices except the Matrix UC Clients with these free SIP Users. For registering the Matrix UC Clients, you must purchase the Matrix VARTA User License. If you require additional SIP Extensions you must purchase the IP Subscribers License.

The system supports two NX DBM VOCODER64 Modules. You must purchase the module separately. Each NX DBM VOCODER64 module supports a maximum of 64 VOCODER channels. The Vocoder channels are required for — VoIP to Non-VoIP calls, VoIP to VMS calls and VoIP to VoIP calls — where transcoding is required.

The system provides 4 pre-activated VOCODER channels by default. To use these channels make sure you have installed atleast one NX DBM VOCODER64 module. If you require more channels, you can purchase the channel licenses according to your requirement.

For more information on Licenses — Matrix VARTA User License, IP Subscribers License and VOCODER Channel License, see [“License Management”](#).

You may connect any Standard Phone or Extended IP Phones of Matrix as SIP Users.

Matrix VARTA WIN200, VARTA ADR100 and VARTA AMP100 can be registered as SIP Users, also offering the support for UC functionalities.

You may also connect/register the following as SIP Extensions of the system:

- Connect SPARSH VP248, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP248 as Extended SIP Extension”](#).
- Connect SPARSH VP310, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP310 as Extended SIP Extension”](#).
- Connect SPARSH VP330, the Touch Screen Extended IP Phone. For instruction, [“Connecting SPARSH VP330 as Extended SIP Extension”](#).
- Connect SPARSH VP510, the Premium IP Phone. For instruction, [“Connecting SPARSH VP510 as Extended SIP Extension”](#).
- Connect SPARSH VP210, the Entry Level IP Phone. For instruction, [“Connecting SPARSH VP210 as Extended SIP Extension”](#).
- Connect Extended SPARSH VP710, the Smart Video IP Phone. For instruction, [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#).

You can register following UC Clients as SIP Users of the system:

70. *Calls between VoIP, Public and Private Networks may be subject to Regulation in your country. You may have to configure your system to allow or restrict call traffic between networks to comply with the telecom regulations of your country. To know more, read [“Logical Partition”](#).*

- Matrix VARTA WIN200, Unified Communication Client for Windows. For instruction, refer to the *MATRIX VARTA WIN200* User Guide.
- Matrix Mobile UC Clients, as given below:
 - Matrix VARTA AMP100, the Mobile UC Client for iPhones. For instruction, refer to the *Matrix VARTA AMP100* User Guide.
 - Matrix VARTA ADR100, the Mobile UC Client for Android Smartphones/Tablets. For instruction, refer to the *Matrix VARTA ADR100* User Guide.

Refer to “[SARVAM UCS Features Supported in Terminals](#)” to know the features supported in each client.

The SIP Users may be registered over **WAN** or over **LAN** according to your preference and your IP network installation scenario. Extended SIP Phones and UC Clients can be registered with SARVAM UCS using IPv4 Addresses only.

You can register the same SIP User from three different locations.

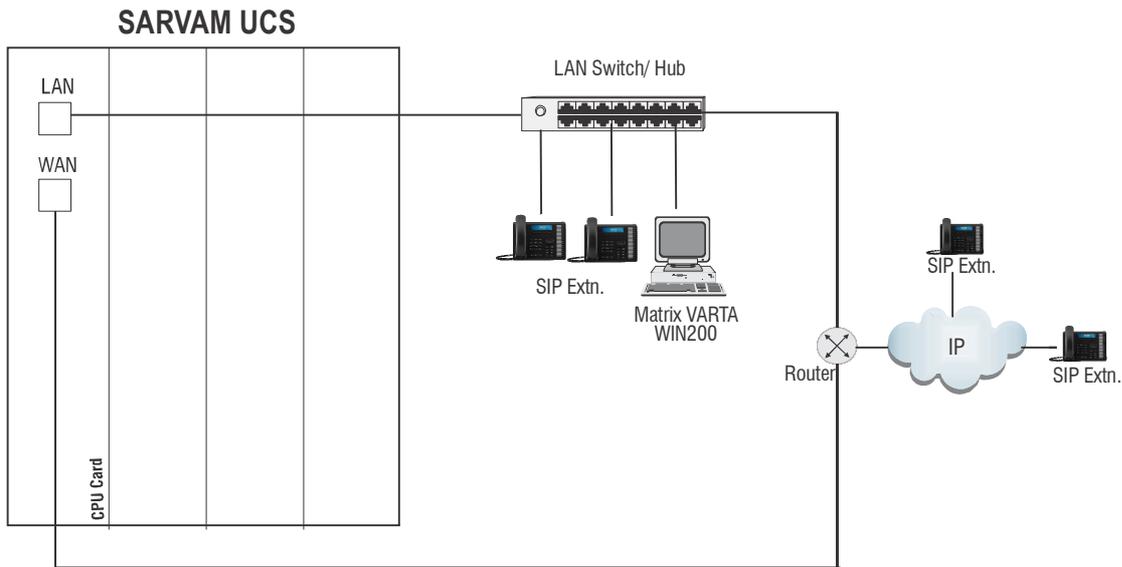

If you register the Extended IP Phone outside the Region/Country selected for SARVAM UCS, the time and Time Zone dependant features, such as Alarms, Reminders, Time Zone Display, of the phone at each location will operate according to the Real Time Clock of SARVAM UCS. Also, Access Codes and Emergency Numbers will work according to the Region/Country selected for SARVAM UCS.

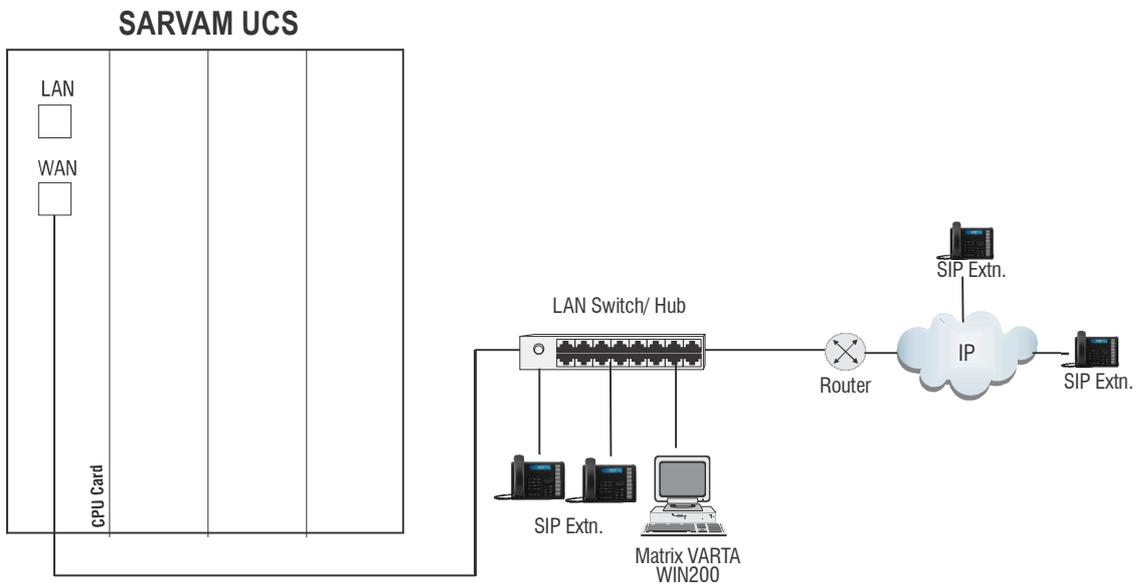

- Connect the Extended IP Phone, or any Standard IP Phone to the LAN Switch.
- Register any SIP device (Extended IP phone/ Soft clients or Standard IP phone) on the public network as SIP Extension.
- When you register the Matrix Extended IP Phone with the system, the WAN/LAN port is used for Auto Configuration as well for Registration of the Extended IP Phones.
- When you register a SIP device other than the Matrix Extended IP Phone on the public network as SIP Extension, do the following:
 - In this SIP device configure the following:
 - the Registrar Server Address of SARVAM UCS
 - the Registrar Server Port
 - the SIP ID
 - Authentication ID and Password.
 - Configure Port Forwarding for the WAN Port of SARVAM UCS on the Router.

If the SARVAM UCS is connected to a **Public Network**,

- Connect the Matrix VARTA WIN200, Extended IP Phone, or any Standard SIP device to the LAN Switch.
- Register any SIP device (Matrix VARTA UC Clients, Extended IP phone or Standard SIP phone) on the public network as SIP extension.

If the SARVAM UCS is connected to a **Private Network (Behind the NAT)**,

- Connect Matrix VARTA WIN200, Extended IP Phones or Standard SIP Phones to the LAN Switch
- You may also register any SIP device (Matrix VARTA UC Clients, Extended IP Phone or Standard SIP phone) on the public network as SIP Extension.

When you register the Matrix Extended IP Phone with SARVAM UCS, configure **Port Forwarding** for the **WAN port of the CPU Card** on the Router. The WAN Port is used for Auto Configuration of the Extended IP Phones.

Connecting SPARSH VP248 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

*If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as **'String'** and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format **"IP_Address:Port"** in your DHCP Server as per your installation scenario.*

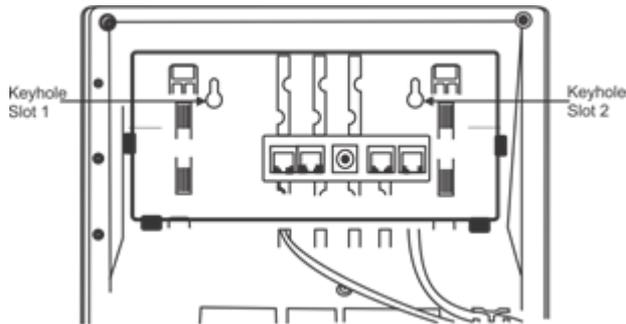

- Log in to Jeeves. For instructions, read the topic ["Configuring SARVAM UCS"](#).
- Assign SIP User ID (will work as an extension number) to the Extended IP Phone. For instructions on assigning SIP ID, see ["Configuring SIP Extensions"](#).

For the SIP User ID you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic ["Configuring SIP Extension Settings as per the Extended Phone Type"](#) under *Configuring SIP Extensions*.

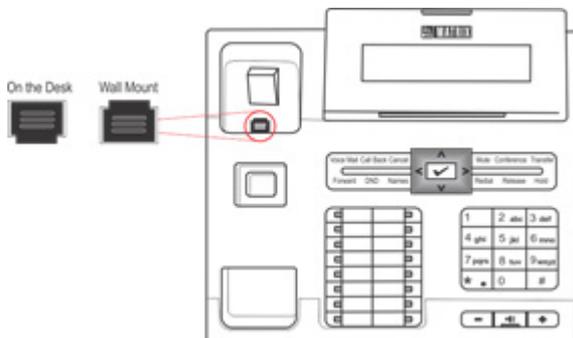

Now, follow the steps described below to install the Extended IP Phone. The instructions are common for all models of the SPARSH VP248. For the purpose of illustration, the premium model, SPARSH VP248P, has been used.

1. Unpack the SPARSH VP248 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.

- Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

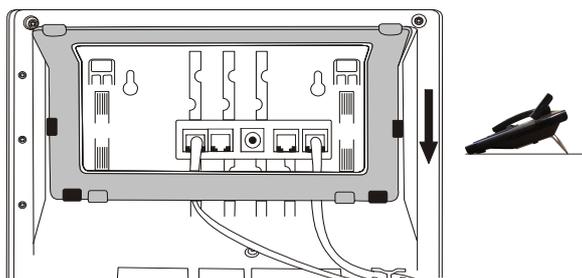

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

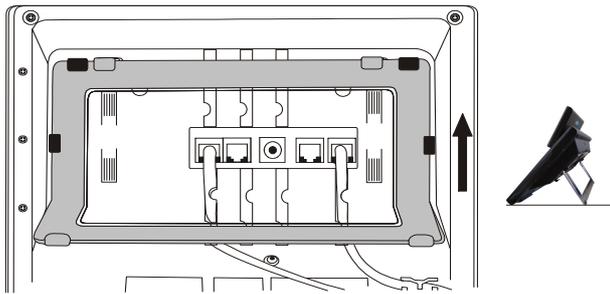

- When you mount the phone on a desk,
- You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 30° Angle

Foot Stand attached at 50° Angle

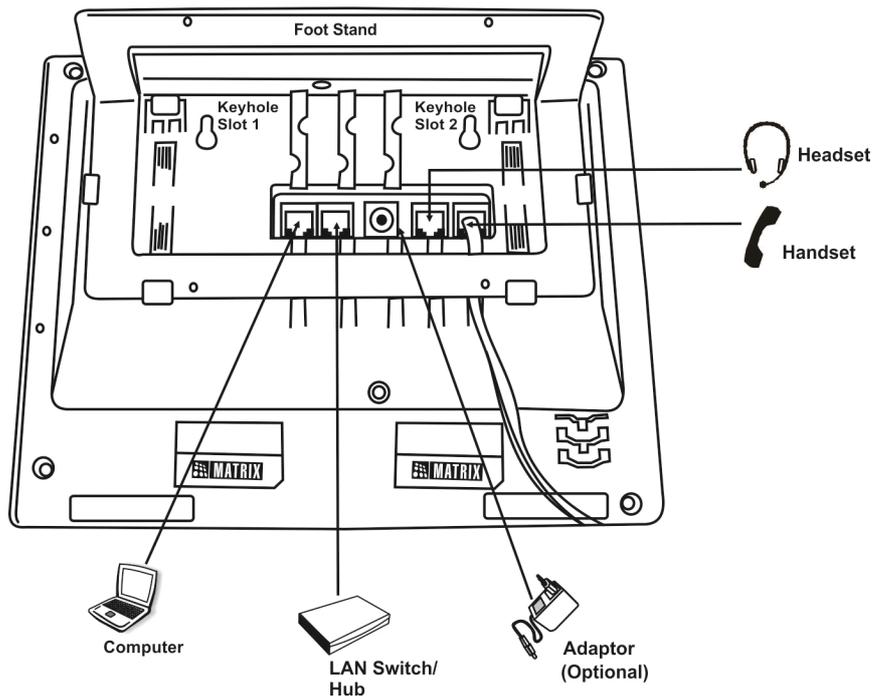

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

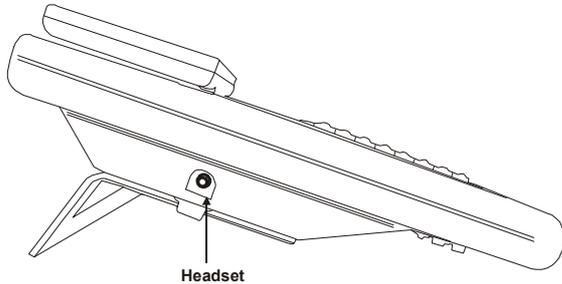

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

3. Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack at the bottom of the phone marked with the handset symbol.
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

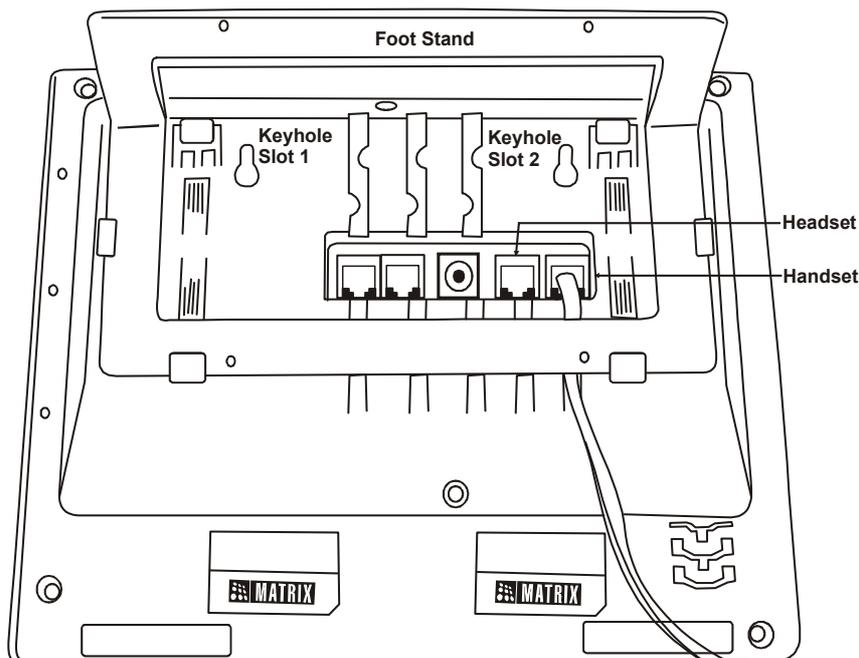

4. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 2.5 mm single connector into the headset jack headset jack with the symbol  on the left side panel of the phone, as illustrated in the figure below.

OR

- You may plug a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol , as illustrated in the figure below.

5. Connect the LAN Port of SPARSH VP248 to the LAN Switch/Hub or a Router, according to your installation scenario.
6. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.
7. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone. Plug in the Power Adapter into a power outlet.

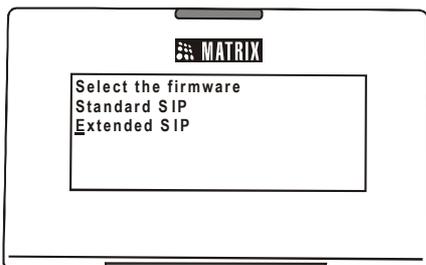

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

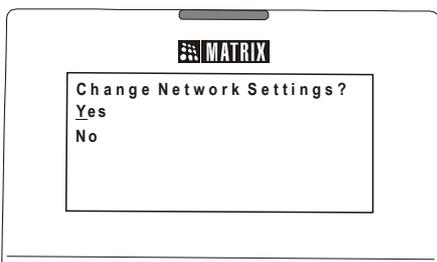

8. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- As soon as the 'Loading...' message appears on the phone display, press # key.
- Select the firmware **Extended - IP Phone**. Move the cursor by pressing the DOWN navigation key **V**.
- When the cursor is placed under the Extended IP Phone, press Enter key.

- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See ["Network Settings"](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone by accessing the Local Menu of the phone. To move the cursor and scroll through the menu and submenu options, use the following touch sense navigation keys on your phone.

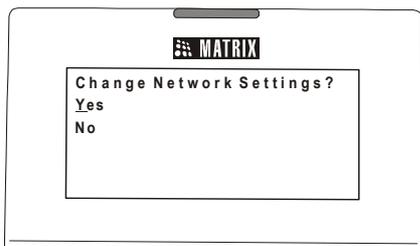

- The Enter key **✓** to make a selection or to complete an action.
- The Up key **▲** to move up the Menu.
- The Down key **▼** move down the Menu.
- The Forward key **➤** move the cursor one character.
- The Back key **◀** to move the cursor one character and to return from the submenu to the main menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

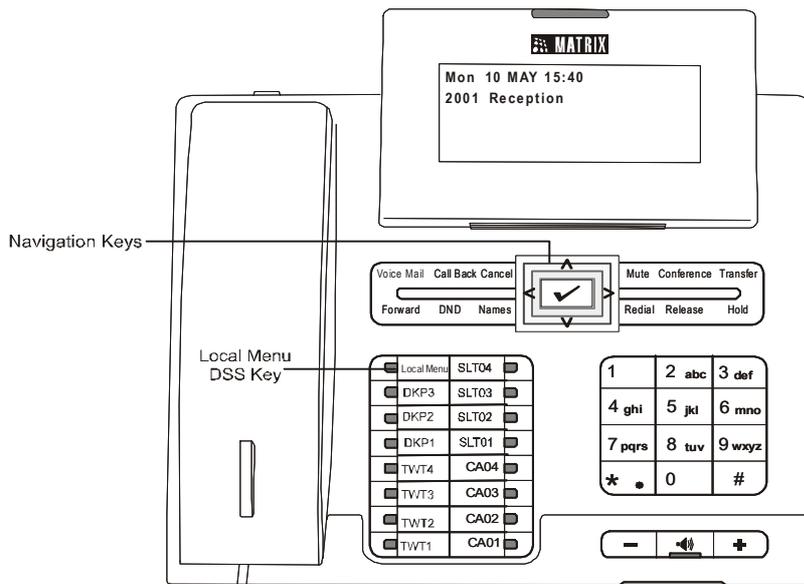

You must press the Enter Key to select Yes and access network settings.

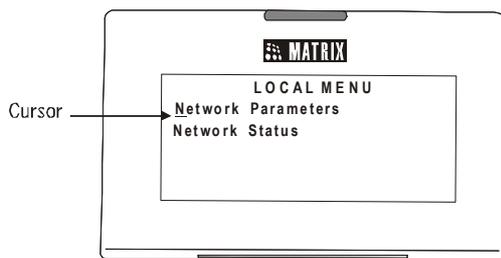

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Enter Key **✓** to access network settings,

- When the phone is in idle state. You must press the DSS key assigned to 'Local Menu'.

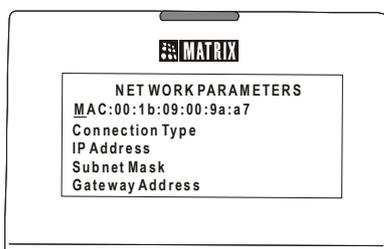

- When you press the Local Menu DSS Key (in idle state) or when you press the Enter key during any process, the Local Menu appears on your phone display.

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.
- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.
- If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁷¹.

⁷¹ The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see ["Using PCAP Trace for Matrix SPARSH VP248 Extended IP Phone"](#), under *PCAP Trace*.

When you change the Network Settings, the phone will restart.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?**.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

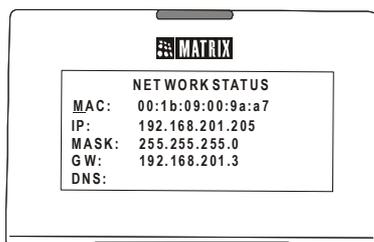

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?**.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

Viewing Network Status

- In the Local Menu of the phone, place the cursor on Network Status and press the Enter key.
- The Network Status submenu appears.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **S. ADD:** The LAN or WAN IP Address / Domain Name of the SARVAM UCS.
- **S. PORT:** The SPARSH Port SARVAM UCS.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.

- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Connecting SPARSH VP310 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

*If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.*

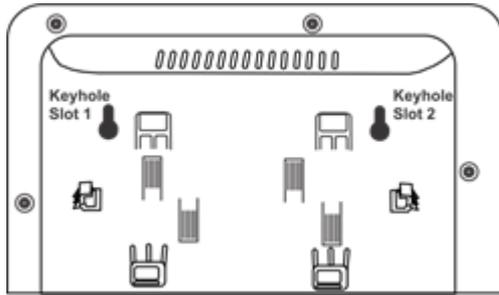

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see "[Configuring SIP Extensions](#)".

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic "[Configuring SIP Extension Settings as per the Extended Phone Type](#)" under *Configuring SIP Extensions*.

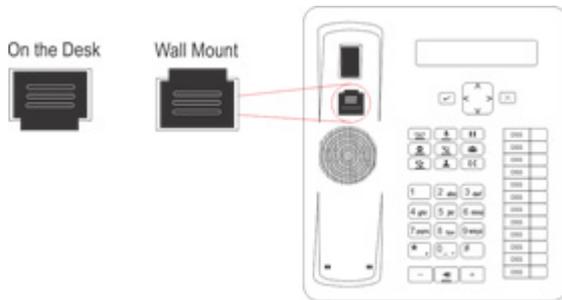

Now, follow the steps described below to install the Extended IP Phone.

1. Unpack the SPARSH VP310 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP310 on a wall,
 - Use the mounting template to drill holes of appropriate size and distance.
 - Fix the screw grips in the holes you drilled.

- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP310. The screws should protrude from the wall to fit into the Keyhole Slots.

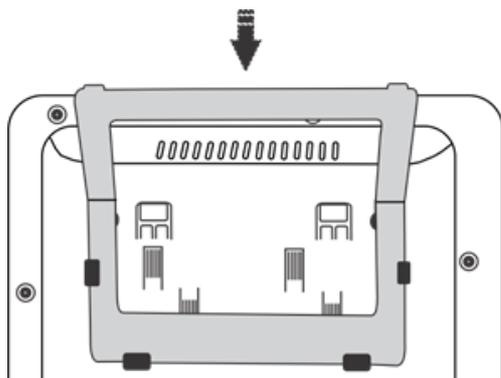

- Now, mount the phone with the screws fitting into the Keyhole Slot.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

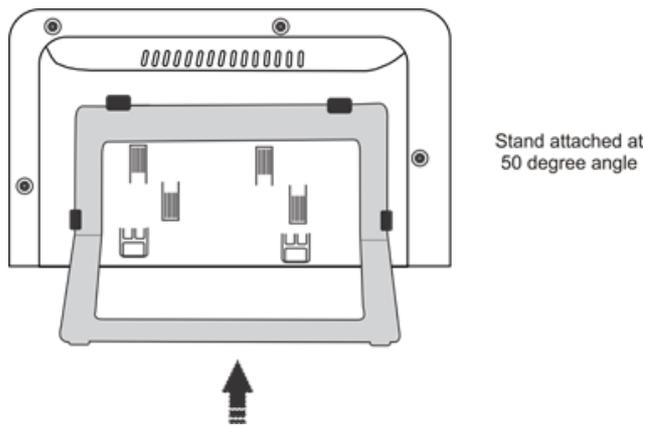

- When you mount the phone on a desk,
- You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 35° Angle

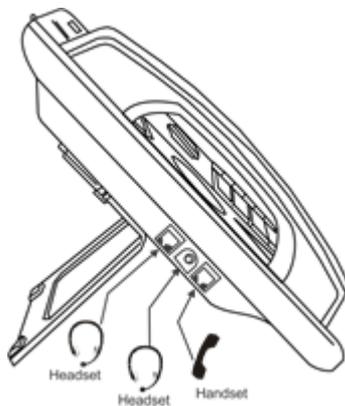

Stand attached at 35 degree angle

Foot Stand attached at 50° Angle

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

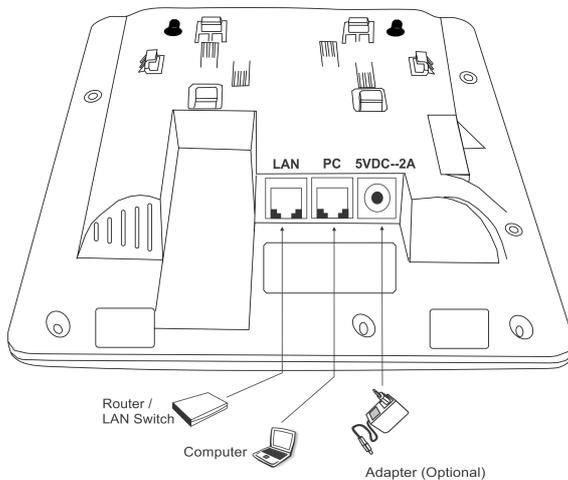

4. Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol .
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

5. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack headset jack with the symbol on the left side panel of the phone, as illustrated in the figure above.

OR

You may also plug in a headset with RJ9 connector into the headset port on the left side panel of the phone, marked with the symbol .

6. Connect the LAN Port of SPARSH VP310 to the LAN Switch/Hub or a Router, according to your installation scenario.
7. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.
8. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

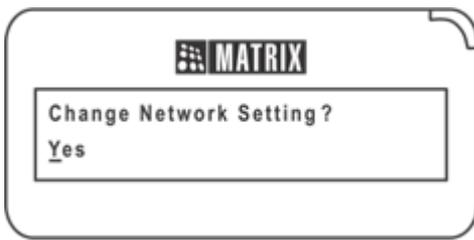

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

9. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the 'Loading...' message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.

- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See “[Network Settings](#)” at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key ▼ when the phone is in idle state. To move the cursor and scroll through the menu and submenu options, use the following navigation keys on your phone.

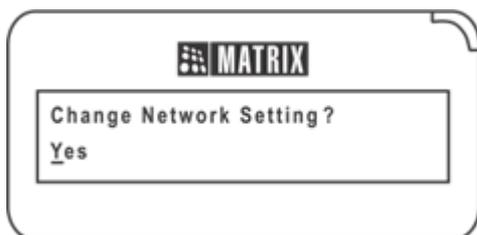

- The Enter key ✓ to make a selection or to complete an action.
- The Up key ▲ to move up the Menu.
- The Down key ▼ move down the Menu.
- The Forward key > move the cursor one character.
- The Back key < to move the cursor one character and to return from the submenu to the main menu.
- The Cancel key ✕ to exit a menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press the Enter key ✓ to select Yes and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Down key ▼ to access network settings.

3. When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.

Configuring Network Parameters

- When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.
- Press Enter key to select Network Parameters.
- The Network Parameters submenu appears.
- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- *To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.*
- *If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.*

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.
To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Server Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁷².

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

⁷² The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see [“Using PCAP Trace for Matrix SPARSH VP310 Matrix Extended IP Phone”](#), under *PCAP Trace*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.
- Again press Down key **▼** to select Network Status and press the Enter key **✓**.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Connecting SPARSH VP330 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix SPARSH VP330 to SARVAM UCS:

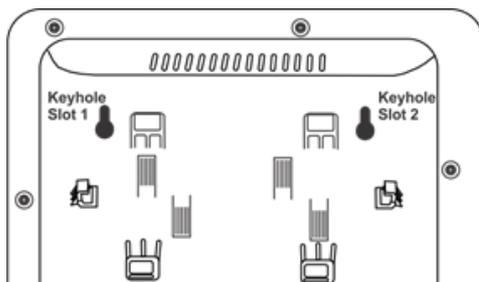

- Decide the location where you want to place SPARSH VP330 within your LAN.
- By Default, in SPARSH VP330, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of

SARVAM UCS and SPARSH Port in the format “**IP_Address:Port**” in your LAN DHCP Server as per your installation scenario.

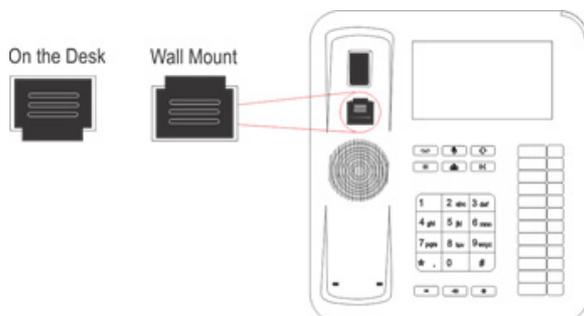

- Log in to *Jeeves*. For instructions, read the topic “[Configuring SARVAM UCS](#)”.
- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP330 can register as a SIP Extension. For instructions, see “[Configuring Matrix SPARSH VP330](#)”.

Now, follow the steps described below to install SPARSH VP330.

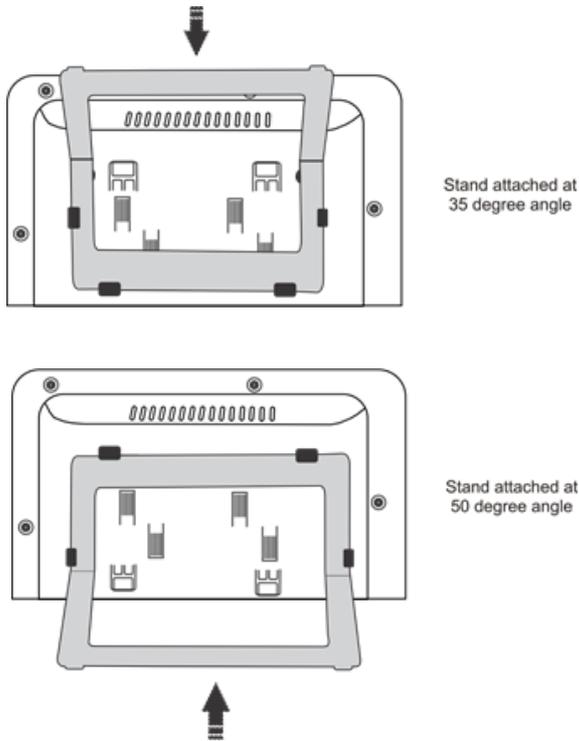

1. Unpack the SPARSH VP330 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.
 - Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

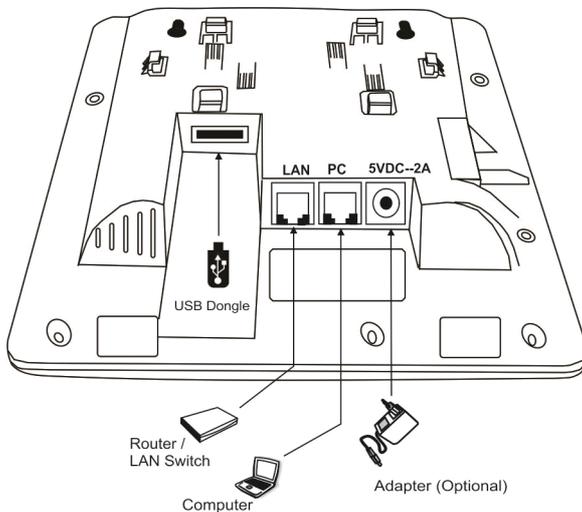

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

- When you mount the phone on a desk, you can attach the Foot Stand in two ways at **35° Angle** or at **50° Angle**.

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.
- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

- Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol.
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

5. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack with the symbol  on the left side panel of the phone.

OR

You may plug a headset with an RJ9 connector into the headset port on the side panel of the phone, marked with the symbol .

6. Connect the LAN Port of SPARSH VP330 to the IP Network — A Router or LAN Switch — using the Ethernet Cable.

OR

Connect the Wi-Fi USB Adapter into the USB port of the phone.

You can purchase the Wi-Fi USB Adapter from Matrix as an optional peripheral device to support wireless network.

7. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port at the bottom of the phone to the LAN Port of the computer.
8. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

9. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display.
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Network Settings/Server Settings or want to use Wi-Fi for connectivity, press

Settings  .

Refer to the *SPARSH VP330 User Guide*, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the *SPARSH VP330 User Guide* to know more.

Connecting SPARSH VP510 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to the system when used with SARVAM UCS application:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN Port IP Address /Domain Name and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.

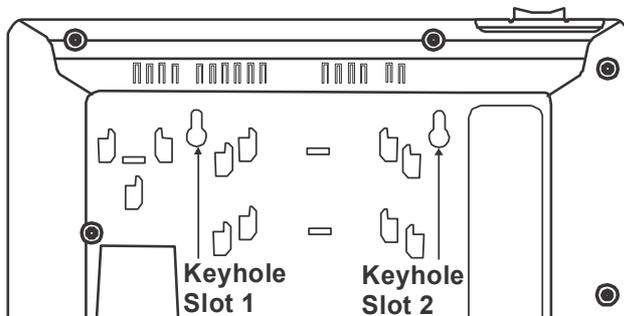

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see "[Configuring SIP Extensions](#)".

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic "[Configuring SIP Extension Settings as per the Extended Phone Type](#)" under *Configuring SIP Extensions*.

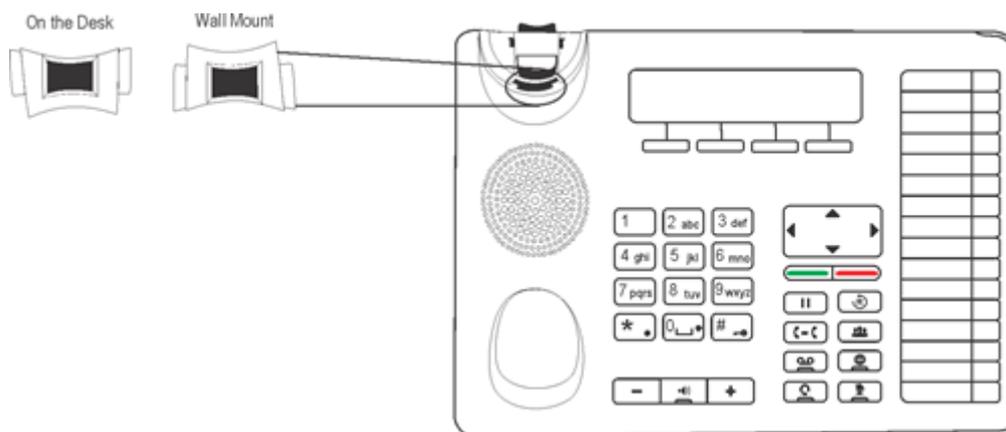

Now, follow the steps described below to install the Extended IP Phone:

1. Unpack the SPARSH VP510 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP510 on a wall,

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP510. The screws should protrude from the wall to fit into the Keyhole Slots.

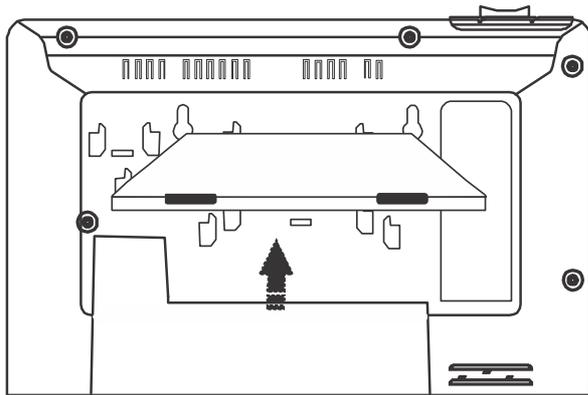

- Now, mount the phone with the screws into the Keyhole Slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

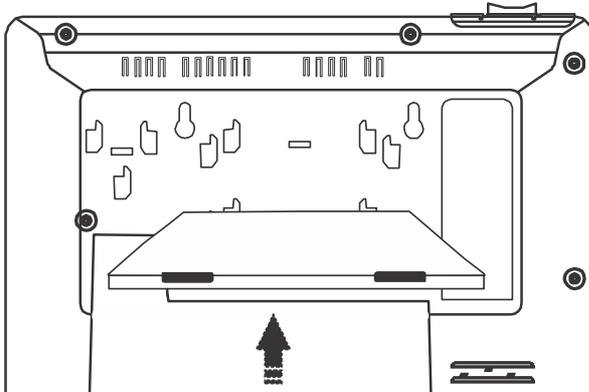

If you are unable to remove the wall mount tab, you may use a tool like a minus screw-driver to remove it.

- When you mount the phone on a desk,

- You can attach the Foot Stand in the following ways — at an angle of 45 degrees or 55 degrees

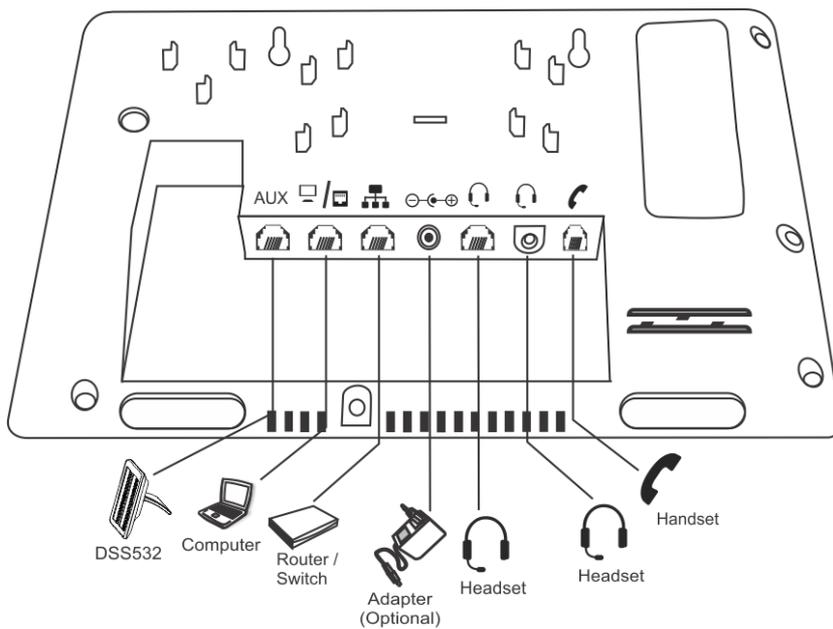

Stand attached at 45 degree angle

Stand attached at 55 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

4. Connect the Handset.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
- Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.

5. Connect the Headset (not supplied by Matrix).

- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset audio jack at the bottom of the phone, marked with the symbol .
- OR**
You may also plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

6. Connect to the IP Network.

- Plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone, marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.

7. Connect a PC to the Phone.

- Plug one end of the Ethernet Cable into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.

8. Connect DSS532 with the Phone.

- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with SPARSH VP510”](#).

9. Connect the Power Supply.

- It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant).

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

10. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the 'Loading...' message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.
- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press Yes key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See ["Network Settings"](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key  when the phone is in idle state.

To navigate the menu,

- Press the Menu Key when the phone is idle.
- Scroll by pressing the Up/Down Navigation Key to reach the desired Menu option.
- Press the Select / OK  Key to select the desired Menu option.
- Scroll by pressing the Up/Down Navigation Key to reach the desired sub-menu option.
- Press the Select / OK  Key to select the desired sub-menu option.

To exit menu,

- Press Cancel  Key.
or
Go ON-Hook.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

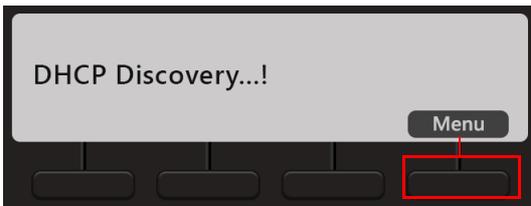

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press **Yes** key and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

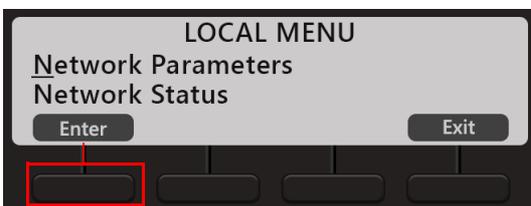

You must press the **Menu** key to access network settings.

3. When the phone is in idle state, press the Down key **▼**.

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.

- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select. Change the settings as per your requirements.
- Press **Save** key, to save the changes you make.
- You can configure all network parameters described below, except the MAC Address.

- *To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.*
- *If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Delete key. The digit to the left of the cursor will be deleted.*

Before you start configuring the Network Parameters, get acquainted with following context keys:

Context Keys	Description
Enter/OK	To select a particular parameter
Save	To save the changes
Back	To move a step backwards without saving the changes
Delete	To delete previous characters from the cursor position
2Ab/123	2Ab - Alphanumeric Mode 123 - Numeric Mode

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Sever Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁷³.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.

⁷³ The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
- Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
- Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and instructions on how to use PCAP Trace on the phone, refer to the *EON510_SPARSH VP510 User Guide*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.
- Again press Down key **▼** to select Network Status and press the Enter key.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Refer to the *EON510_SPARSH VP510 User Guide* to know more.

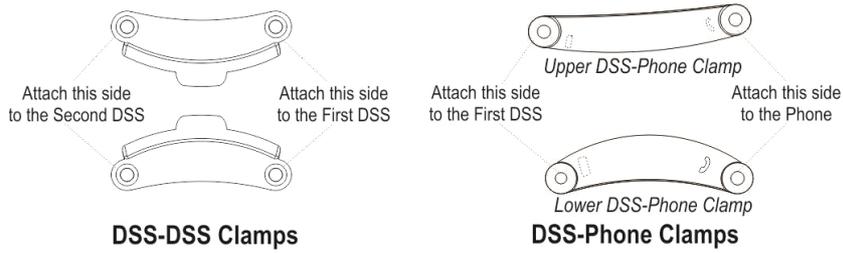

Installing DSS532 with SPARSH VP510

Once you have installed SPARSH VP510 with SARVAM UCS, you can install the DSS532 by following the steps given below:

1. Unpack the box and verify the package contents⁷⁴.

74. See [“Packing List”](#) of Appendix topic.

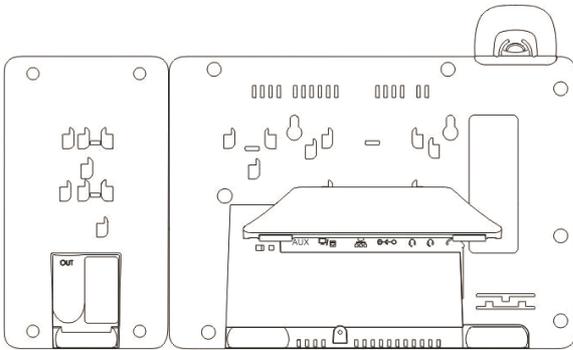

- Four clamps are provided with the phone — 2 DSS-Phone Clamps and 2 DSS-DSS Clamp.

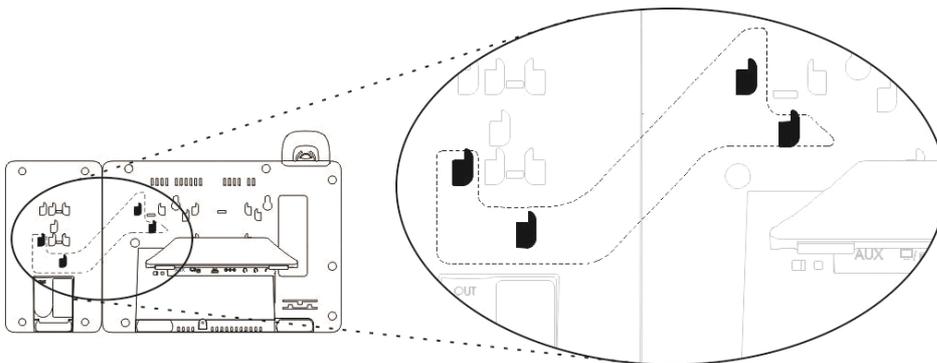

Connecting the First DSS532

Connecting the Extender

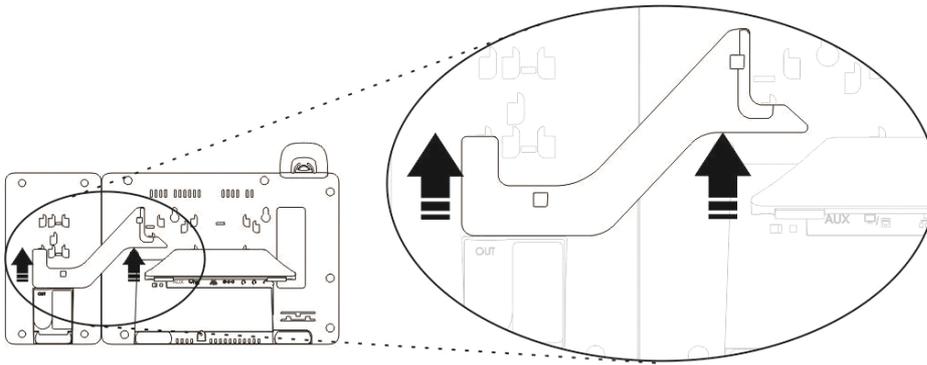

- Turn the phone upside down on the table and place the inverted DSS532 adjacent to it.

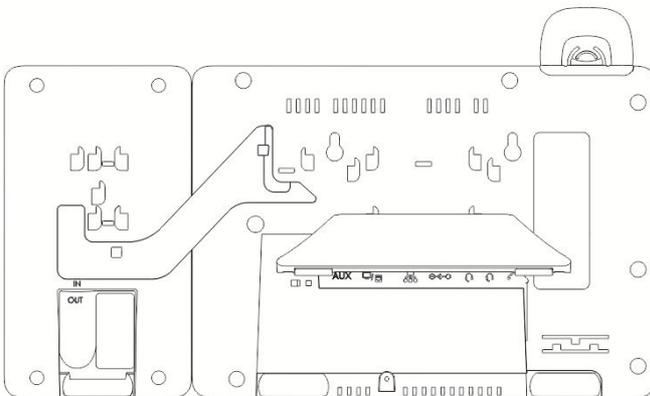

- To attach the DSS532 with the phone, place the DSS Extender as illustrated below.

5. Insert the hooks on the Extender into the slots provided on the phone and the DSS532.

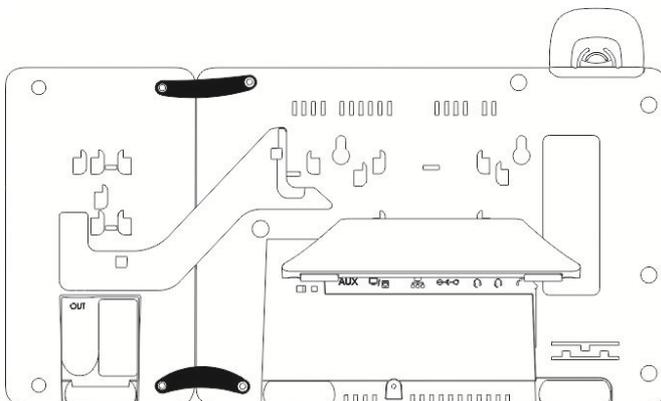

6. Firmly slide the DSS Extender upwards to lock them in place.

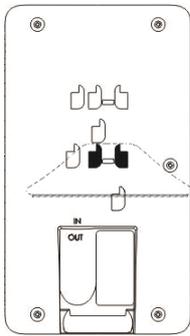

Attaching the Clamps

7. Now attach the clamps. To do so,
 - Remove the screws to attach the clamps.
 - Place the DSS-Phone Clamps between the DSS532 and the phone.
 - Insert the screws back to fix the clamps.

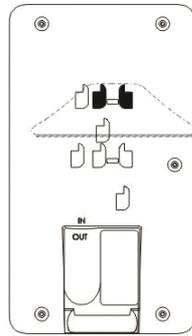

Attaching the Footstand

8. You can mount the DSS532 with the phone on the desk at two angles — **45 degrees** or **55 degrees** by attaching the Foot Stand.

Stand attached at 45 degree angle

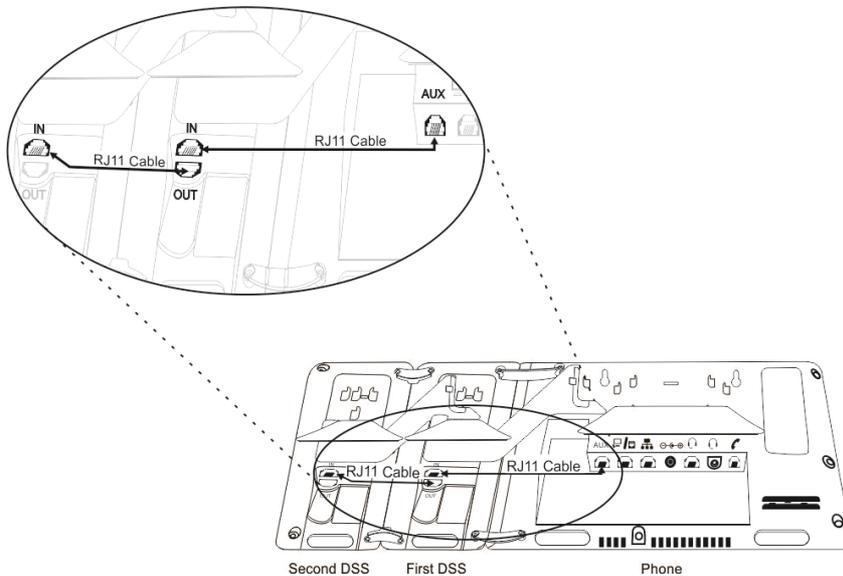

Stand attached at 55 degree angle

Make sure both, the DSS532 and phone are mounted at the same angle.

Connecting the Cables

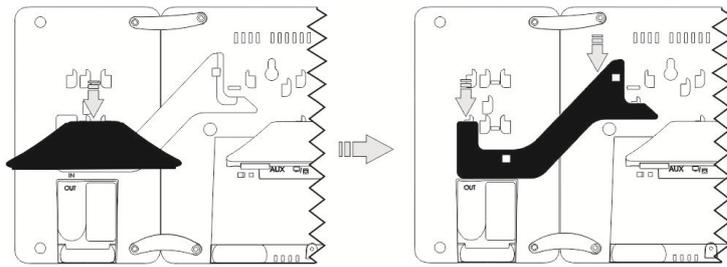

9. To connect the DSS532 with phone, plug one end of RJ11 Cable into **Auxiliary(AUX) Port** of the phone and the other end into the **IN Port** of the DSS532.

Connecting Multiple DSS532

Remove the Foot Stand

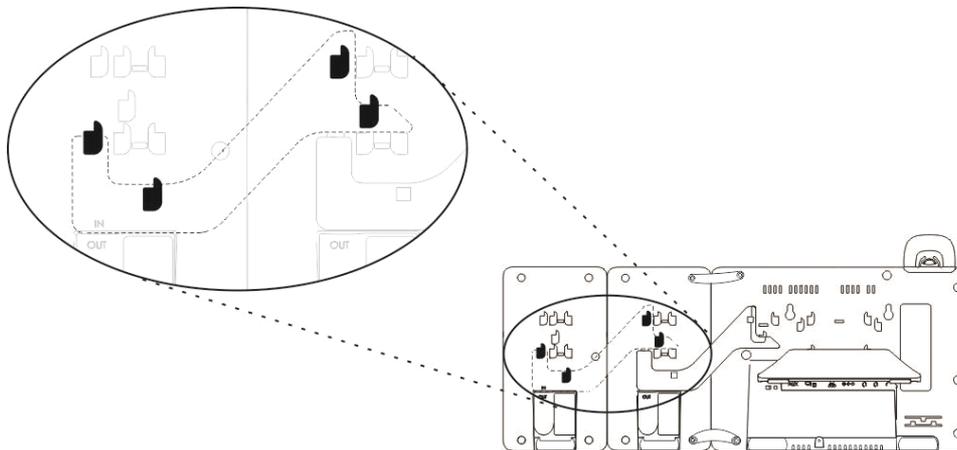

10. Remove the Foot Stand of attached DSS532. To do so,
 - Firmly slide the Foot Stand of the attached DSS532 downward to unlock.
 - Now, slide down the attached DSS Extender in downward direction.

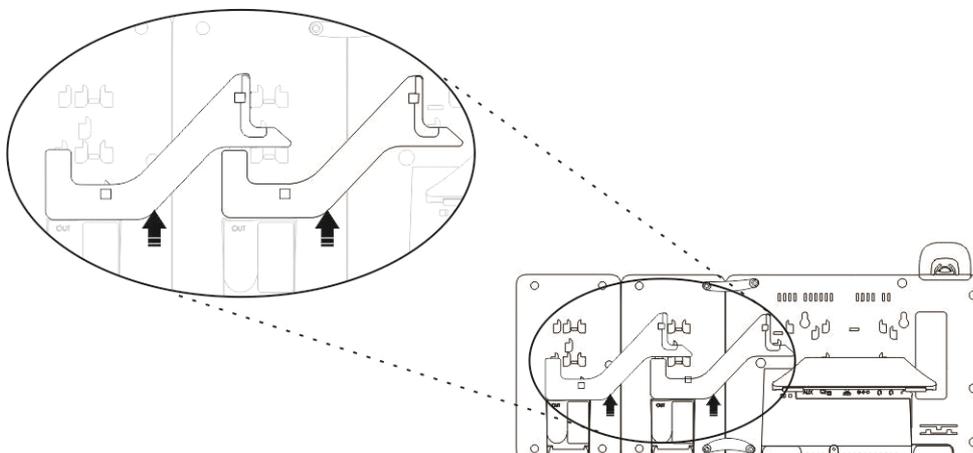

Attach the second DSS Extender

11. To attach the second DSS Extender,

- Place another inverted DSS532 adjacent to the existing assembly.
- Place the DSS Extender as illustrated in the diagram below.
- Insert the hooks on the Extender into the slots provided on both the DSS532.

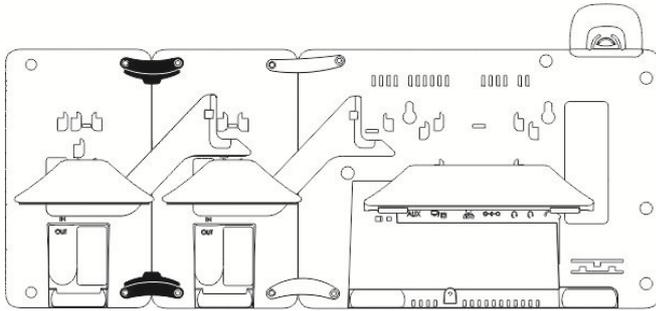

12. Firmly slide both the DSS Extenders upward consecutively (attach the second extender first followed by the existing one attached to the phone) and lock them in place.

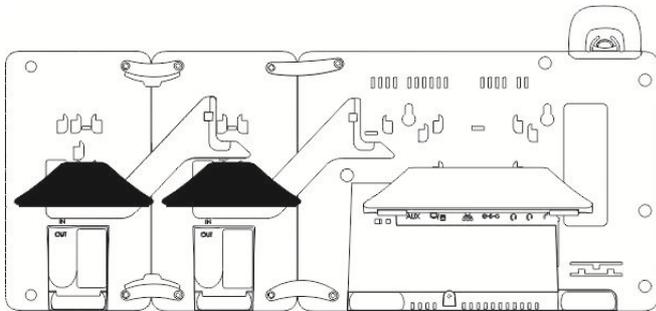

Attach the Clamps

13. Attach the DSS-DSS Clamps between both the DSS532.

Attach the Foot Stand

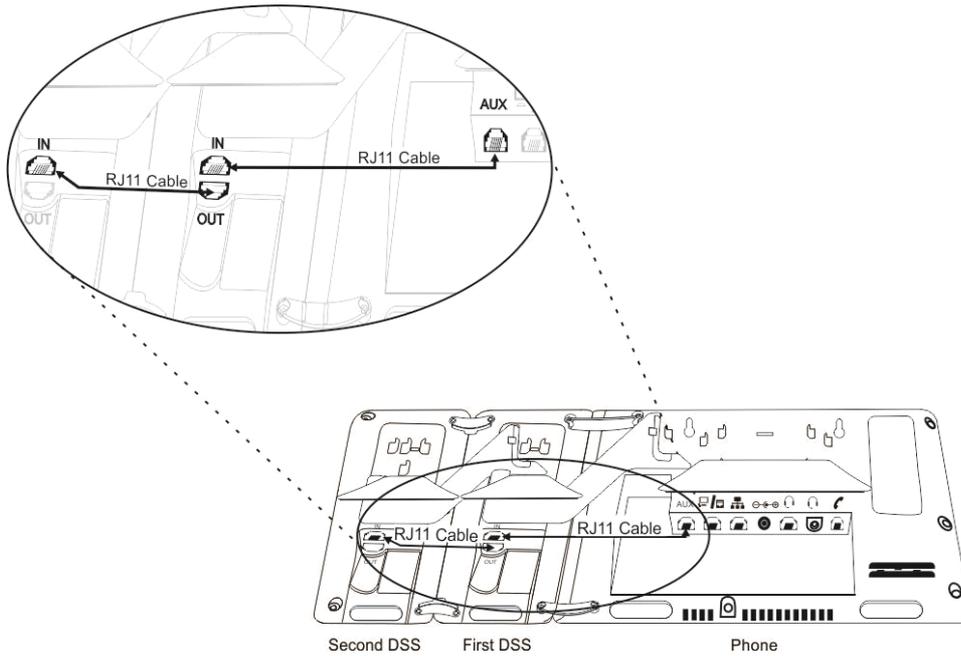

14. Attach the Foot Stand of both the DSS532.

Make sure both, the DSS532 and the phone are mounted at the same angle.

Connect the second DSS532 to the existing assembly

15. Plug one end of the RJ11 Cable into the OUT Port of the existing DSS532 (already connected with the phone) and the other end into the IN Port of the second DSS532.

You can install a maximum of four DSS532 with a phone.

16. After you have connected the DSS532 with the phone, you can configure the DSS Keys. For instructions, see [“Programming DSS Console Keys”](#).

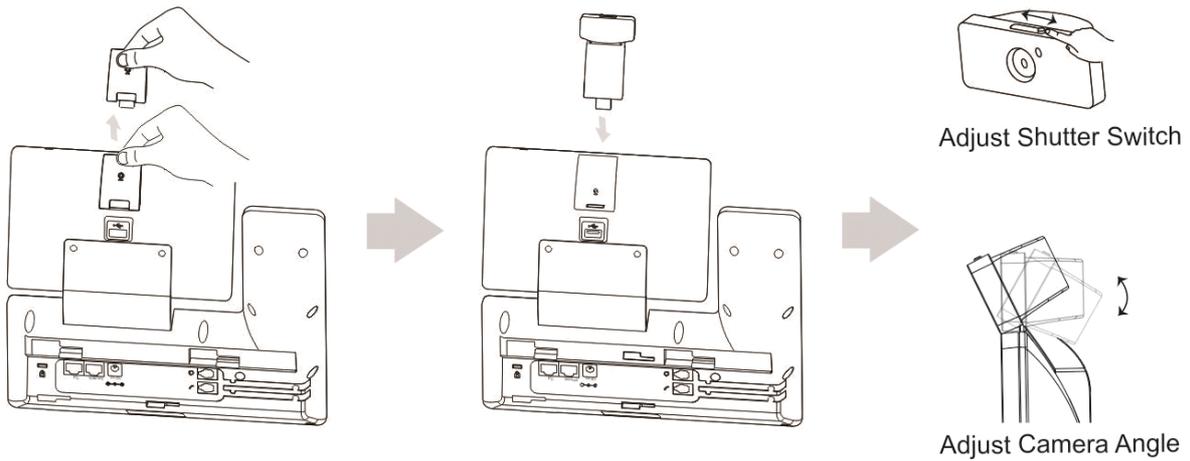

Connecting Extended SPARSH VP710 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended SPARSH VP710 to SARVAM UCS:

- Decide the location where you want to place Matrix Extended SPARSH VP710 within your LAN.
- Log in to *Jeeves*. For instructions, read the topic [“Configuring SARVAM UCS”](#).
- You must configure the necessary parameters in SARVAM UCS so that Extended SPARSH VP710 can register as a SIP Extension. For instructions, see [“Configuring Matrix Extended SPARSH VP710”](#).

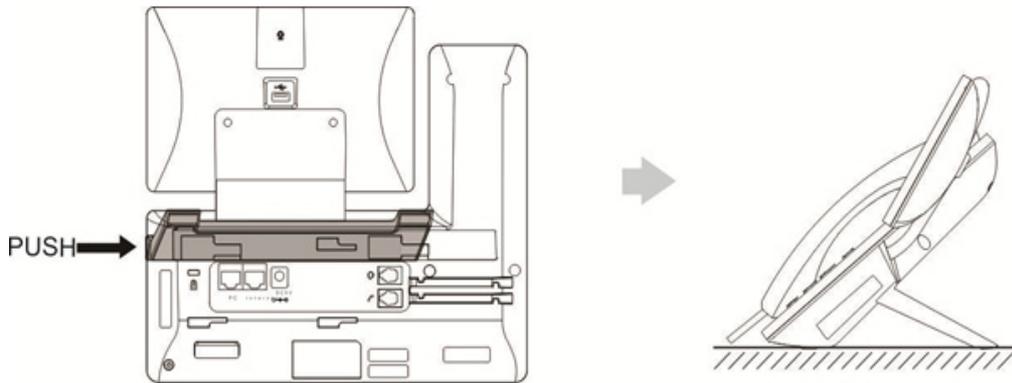

Now, follow the steps described below to install Extended SPARSH VP710.

1. Inserting the camera

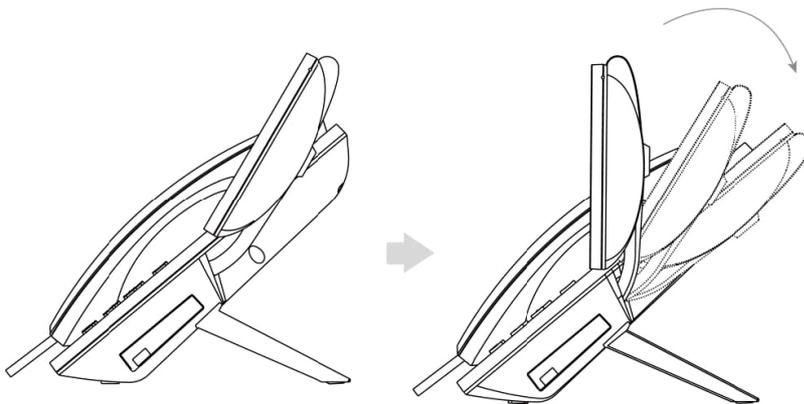

It is recommended to use only the Matrix original Camera, supplied with the IP Phone for video calling. The use of any third-party camera may cause damage to the phone. Damages to the phone caused by using third-party camera is not covered by Matrix warranty.

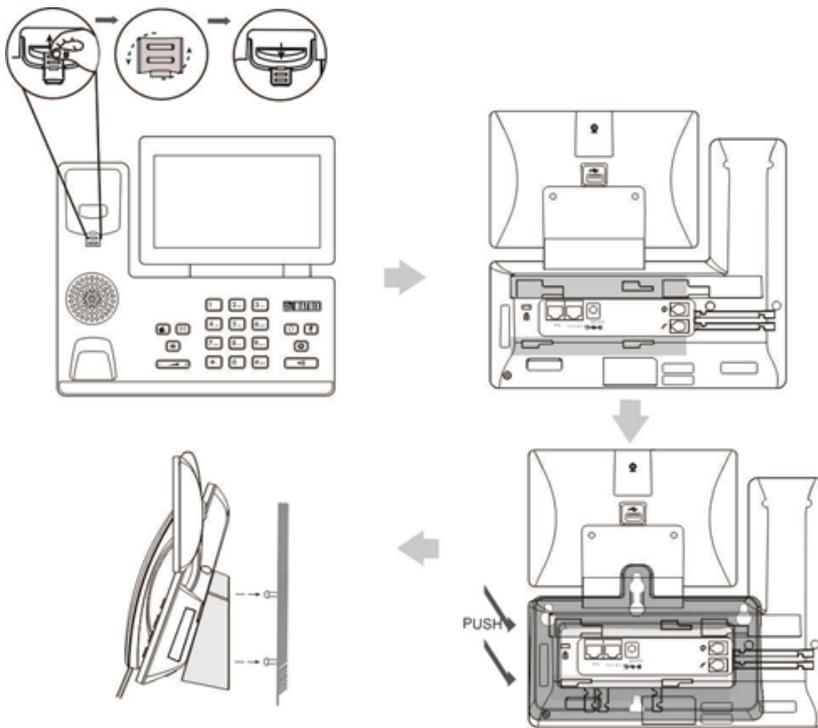

2. Attaching the stand

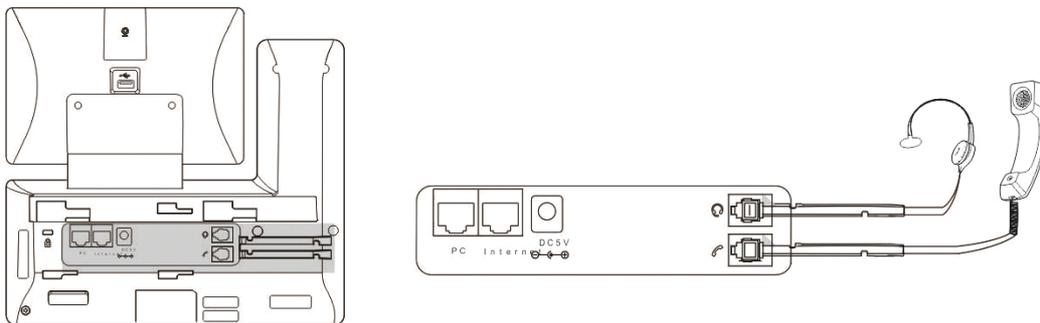

3. Adjusting the angle of the touch screen.

4. Attaching the optional wall mounting bracket

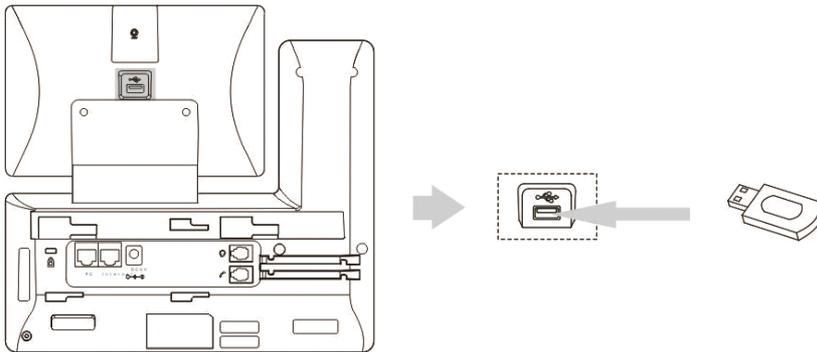

5. Connect the handset and optional headset.

A headset is not included in the packaging contents. Contact your dealer/reseller for more information.

6. Connect the optional USB Flash drive.

7. Connect the network and power.

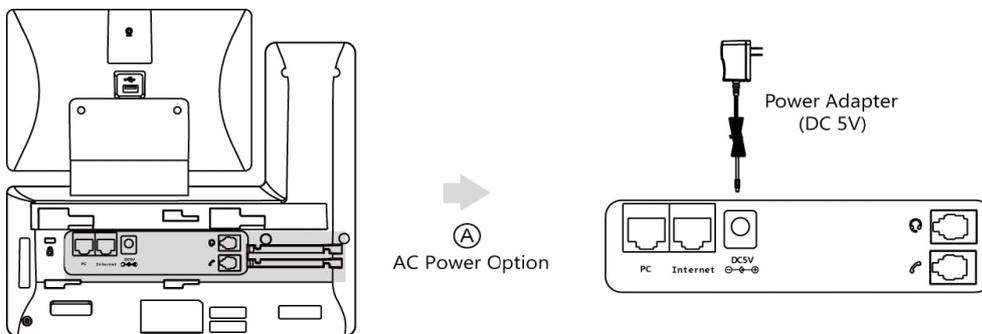

There are two options to connect the power and the network.

- AC power
- Power over Ethernet (PoE)

AC Power

To connect the AC power:

- Connect the DC plug on the power adapter to the DC5V port on the phone and connect the other end of the power adapter into an electrical power outlet.

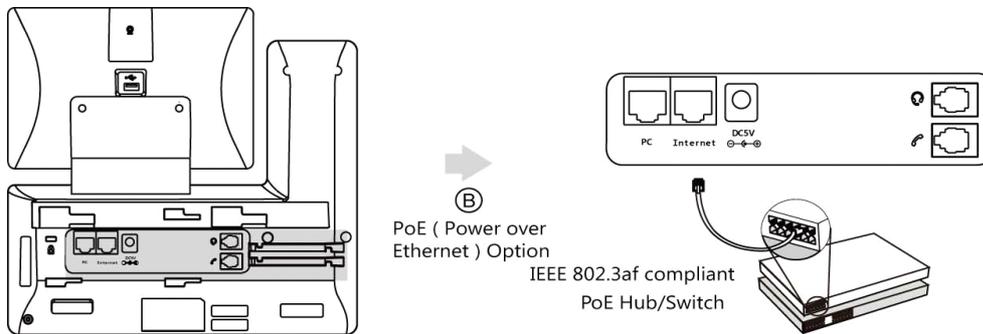

Power over Ethernet (PoE)

With the included or a regular Ethernet cable, the IP Phone can be powered from a PoE-compliant switch or hub.

To connect the PoE:

- Connect the Ethernet cable between the Internet port on the phone and an available port on the in-line power switch/hub.

 *If in-line power switch/hub is provided, you don't need to connect the phone to the power adapter. Make sure the switch/hub is PoE-compliant.*

 *Do not unplug or remove power while the phone is updating firmware.*

After the IP Phone is assembled and connected to the power supply, it automatically begins the initialization process.

During this process, the IP Phone displays the start up screen "Welcome Initializing...please wait".

Once the IP Phone is initialized, it displays two different phone modes:

- Standard SIP
 - Extended SIP
- Select Extended SIP, to operate the IP Phone in the extended mode. As soon as you select this mode, the booting process initiates again and the start up screen displays "Welcome Initializing...please wait". After the IP Phone is initialized, it attempts to contact a DHCP Server in your network to obtain valid IPv4 network settings (example: IP address, Subnet Mask, Gateway address, DNS address). You need to configure the basic network parameters of the IP Phone manually, if these are not provided by the DHCP Server or if your network does not support DHCP.

Refer to the *EXTENDED SPARSH VP710 User Guide*, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration (when DHCP is selected) to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

 *The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.*

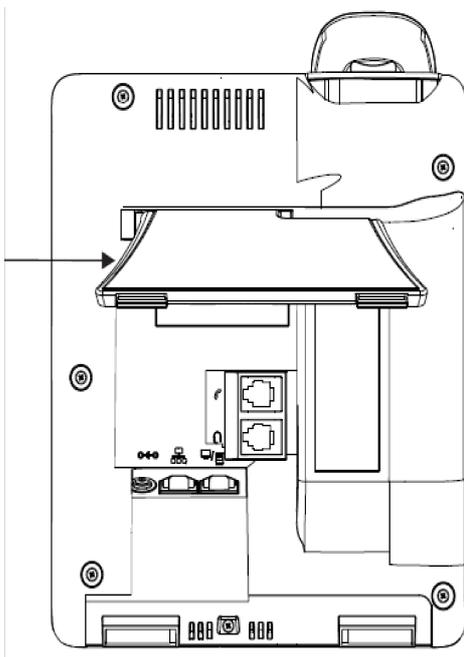

Connecting SPARSH VP210 as Extended SIP Extension

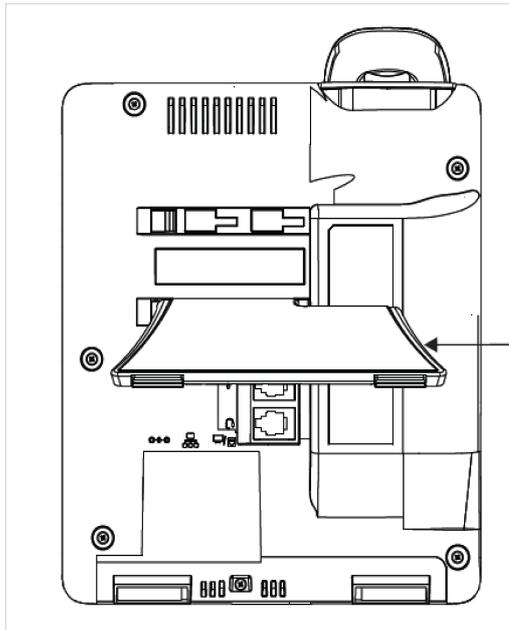

You are recommended to complete the following steps before connecting the Matrix SPARSH VP210 to SARVAM UCS:

- Decide the location where you want to place SPARSH VP210 within your LAN.
- By Default, in SPARSH VP210, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your LAN DHCP Server as per your installation scenario.
- Log in to *Jeeves*. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP210 can register as a SIP Extension. For instructions, see "[Configuring Matrix SPARSH VP210](#)".

Now, follow the steps described below to install SPARSH VP210.

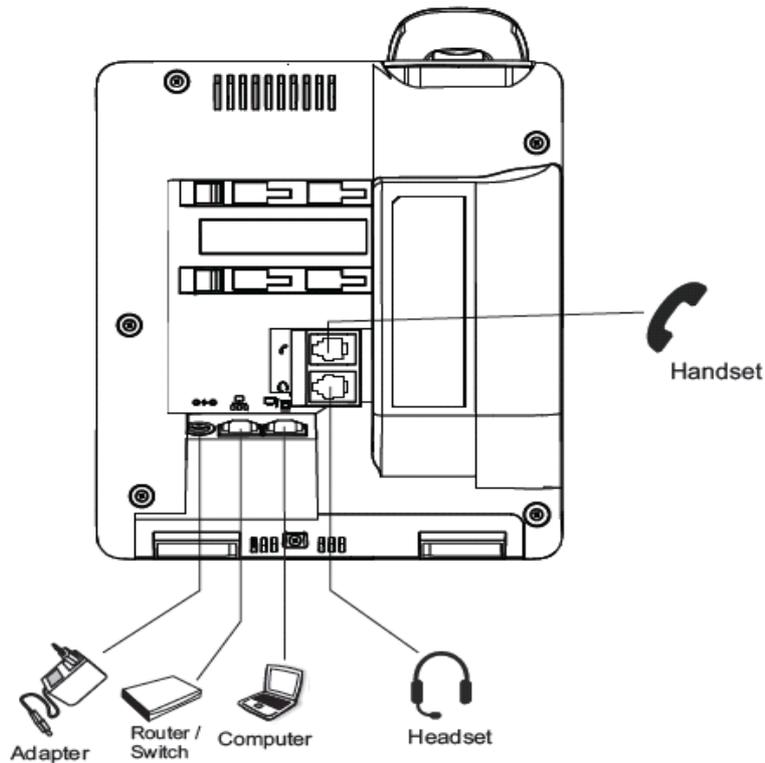

1. Unpack the SPARSH VP210 box and verify package contents.
2. When you mount the phone on a desk, you can attach the Foot Stand in two ways at **45° Angle** or at **55° Angle**.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

3. Connect the Handset to the Phone body.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
 - Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.
4. If you want to use a Headset (not supplied) with your phone, You may plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .
 5. To connect the LAN, Port , plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.
 6. To connect your phone to a computer on your desk, plug one end of the Ethernet Cable (not supplied with this phone) into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.
 7. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/0.6A) only. The use of any third-party power adapter may cause damage to the phone.

8. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display.
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Server Settings, press Settings.

Refer to the SPARSH VP210 (Extended) User Guide, for detailed instructions, to change the Network Settings of the phone and configure the network parameters.

- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the **SPARSH VP210 (Extended) User Guide** to know more.

Starting Up ETERNITY MENX

Power ON

- If you have completed all the installation tasks, switch on power supply. Keep the MCB Switch ON of your PS48V card installed in the system and power the FCBC.
- Observe the Reset Cycle.

Reset Cycle

- Reset Cycle (Power-ON Self Test) takes about 2 minutes to finish.
- All the LEDs of the system, the cards and the keys of the DKP/SIP devices attached to the System are turned on.

Interpreting LEDs

The functioning of the LEDs of the system and the various cards and their meaning are summarized at the end of the installation instructions for each Card Type.

Refer to the LED Patterns described for each Card Type to verify if the system is operating properly and locate faults, where they occur.

When the reset cycle is successful, the default Extension "[Access Codes](#)" loaded by the system and the date and time of the "[Real Time Clock \(RTC\)](#)" of the system will appear on the LCD display of the DKPs/ IP Phones you have connected with the system.

- *The Matrix ETERNITY GENX is to be installed by persons trained and experienced in telecom wiring.*
- *The person installing the ETERNITY GENX must be familiar with trunks, physical wiring of the MDF on both the exchange (System) side and the line side (CO).*
- *When installing any equipment, make sure that you take all the necessary precautions for handling electronic and electrical appliances. Follow proper procedures for static electricity, while handling the system and its cards to prevent damage to the system and harm to yourself.*
- *Use a grounding mat and wear an anti-static strap/belt. Read the do's and don'ts listed in [“Protecting the System and Yourself”](#).*
- *If you have complied with the requirements and instructions described in [“Before You Start”](#), you may now begin the installation of your ETERNITY GENX.*

Firmware Version V1R2 and earlier

The Matrix ETERNITY GENX is shipped factory fitted with the Power Supply Card, the CPU Card in their respective fixed slots (refer the section [“Know Your SARVAM UCS”](#)). VoIP and VMS are in-skin to the CPU Card. Hence, separate VMS and VoIP Cards are not required.

ETERNITY GENX has a total of 12 Universal slots. The Slave Cards - BRI, T1E1PRI, GSM/CDMA, DKP, CO, SLT, E&M, Radio, Data, Magneto, E1FO - are shipped separately as per the order placed by individual customers. These Cards are installed in any of the Universal slots.

If you upgrade the system firmware to V1R3 and later, the Expansion Slots license will be applicable for the universal slots. No universal slots will be functional by default. You must purchase the SARVAM EXP4 SME license to activate the universal slots as required.

For details, see [“Expansion Slots”](#) under [“License Management”](#).

Firmware Version V1R3 and later

The Matrix ETERNITY GENX is shipped factory fitted with the Power Supply Card, the CPU Card in their respective fixed slots (refer the section [“Know Your SARVAM UCS”](#)). VoIP and VMS are in-skin to the CPU Card. Hence, separate VMS and VoIP Cards are not required.

ETERNITY GENX has a total of 12 Universal slots. The Slave Cards - BRI, T1E1PRI, GSM/CDMA, DKP, CO, SLT, E&M, Radio, Data, Magneto, E1FO - are shipped separately as per the order placed by individual customers. These Cards are installed in any of the Universal slots.

If you have upgraded the system firmware to V1R3 and later in the old ETERNITY GENX system, the Expansion Slots license will be applicable for the universal slots. No universal slots will be functional by default. You must purchase the SARVAM EXP4 SME license to activate the universal slots as required.

If you have purchased the new ETERNITY GENX system with the firmware V1R3, the Expansion Slots license will be applicable for the universal slots. The first four universal slots after the power supply card will be functional by default. If you require more functional universal slots, you must purchase the SARVAM EXP4 SME license.

Each SARVAM EXP4 SME license will provide the activation for next four universal slots in sequence.

For details, see [“Expansion Slots”](#) under [“License Management”](#).

Illustrated below is the position of the fixed and universal slots in ETERNITY GENX.

ETERNITY GENX

The extreme left slot is reserved for the Power Supply Card and the extreme right slot is reserved for the CPU Card.

Follow the installation instructions for Cards described here also when you expand the system (add more Cards) or remove or swap Cards for maintenance and repair.

1. Unpack the box. Check the package contents (see [“Packing List”](#)). Contact your Dealer/Distributor if any of the items is missing, faulty or damaged. Do not discard the packaging material.

Mounting the System

2. Decide where to mount the ETERNITY GENX - on a table or wall - taking into consideration the mechanical dimensions and the weight. If mounting the system on a wall, you may refer the mechanical dimensions and the Mounting Template for drilling holes at appropriate places on the wall. Make sure the system orientation is horizontal.
3. When installing the system in a rack, allow adequate space between the system and other units for air circulation. Make sure the system orientation is horizontal.
4. Mount the system at the selected site. Make sure that the system is placed such that you have full access to the front and back panels. The holes in the panels are provided for ventilation; Make sure that these are not blocked, to prevent overheating.

Connecting Input Power Supply

5. Ensure that a proper electrical earth and telecom earth are in place.
6. Check the voltage at the power point from where the supply is to be given to the system. It should be as per the specifications. Earth the system properly. (Refer [“How to Make the Telecom Earth”](#)).

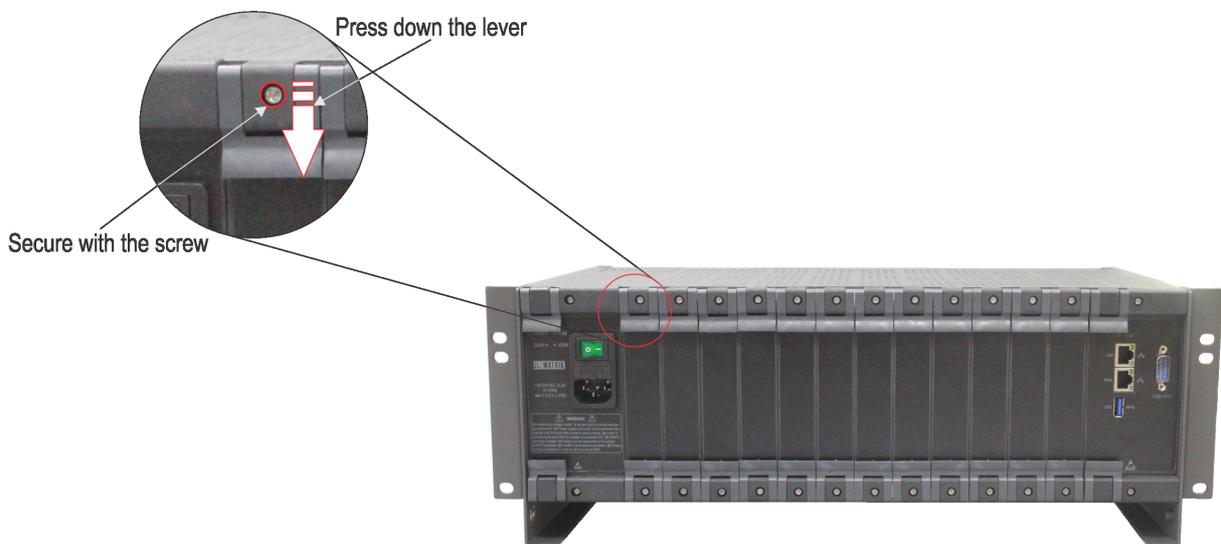

Inserting Cards

7. Make sure that the ETERNITY GENX power is off and the power cord is unplugged.
8. Select a free slot from the universal slots.
9. Unscrew and remove the filler bracket that covers the card-slot opening of the slot you intend to use.
10. Hold the card with the connectors facing you. Do not grab the card from both ends.
11. Slide the card into the slot, along the guide rails provided for each slot at the top and bottom planes.
12. Ensure that the cards are inserted deep enough for all the connector pins on the cards make complete contact with those of the motherboard on the backplane.

Do not force the card into the slot. Doing so can damage the card or the slot connector.

13. When the card is firmly seated in the connector, push down the levers on the card mounting bracket and secure the card with the screw provided.

14. Tighten the screws on either side of the bracket.
15. Following the above steps, install each card into the universal slots.

Detailed installing instructions are provided for each card - DKP, SLT, CO, ISDN BRI, ISDN T1E1PRI, GSM/CDMA, E&M, E1FO, Magneto, Radio - later in this section. Refer to them when installing each card type.

16. To remove a card:

- Switch off power supply, unplug the power cord.
- Disconnect any cables connected to the card.
- Remove the screws from the card-mounting bracket.
- Lift the levers on the mounting bracket to release the card.
- The card will emerge out of the slot.
- Grasp the card by its mounting bracket, and ease it out of its slot.

- *If you are removing the card permanently or for a certain period of time, install a filler bracket over the empty card opening in the chassis.*
- *Installing filler brackets over empty card-slot openings is necessary to protect the system from dust, dirt, insects and damage.*

17. Using the cables supplied with each card, and terminate the cables in the Main Distribution Frame (SLT, DKP, CO, and E&M lines), the NT1 device (ISDN BRI lines), ISDN Modem (ISDN PRI Lines), as applicable.

Lead the cables neatly and tangle-free into the MDF.

18. After you have completed inserting and connecting the cards, power ON the system and observe the Reset cycle and the LED pattern of each card, where applicable.

The Power Supply Card

Three types of Power Supply Cards are supported by the system: ETERNITY GE CARD PSUNI (250 W) and ETERNITY GE CARD PS48VDC (250W) and ETERNITY GE CARD PSBB.

- **ETERNITY GE CARD PSUNI (250W)** with 100-240VAC, 47-63Hz Mains as Input AC Voltage Power Supply and output 250W.

This card is designed on the SMPS scheme. As this card does not have any provision for battery backup, it is recommended that a UPS be connected to keep the system powered during outages.

This card has four Green LEDs, a Mains Switch, and a Socket assembly for connecting the mains cord.

- **ETERNITY GE CARD PS48VDC (250W)** with 48VDC as Input DC Power Supply Voltage and output as 250W. A Float cum Boost Charger (FCBC) is required to feed 48VDC power to the card. The FCBC works on input AC mains.

The card has four Green LEDs (for four different voltages), one Red LED (for input reverse indication, an MCB Switch, a power ON/OFF Switch, and a 3-way termination block for connecting the power cord.

Both, the PSUNI card and the PS48V Card provide DC output voltages as: +3.5V, +5.0V, -30V and -85V. These are indicated by LEDs.

- **ETERNITY GE CARD PS Battery Backup (PSBB)** with 100-240VAC, 47-63Hz Mains as Input AC Voltage Power Supply.

This card is designed on the SMPS scheme and has a provision for Battery Backup. The card is supplied with a Battery cable to connect a 24VDC external battery. When the system is functioning using the AC power supply the battery will also be charged by the card. This card has no LEDs.

Installing the Power Supply Card

The Power Supply Card is located in a fixed slot. No other card can be inserted in this slot.

The Power Supply Card is delivered factory fitted, when you buy the system. However, if you want to remove the card for the purpose of maintenance or replace it with a new one, please follow the instructions below:

1. Unpack the Power Supply Card and verify the package contents.

If already installed, switch OFF power supply, unplug the power cord. Remove the screws securing the card. Lift the levers on the mounting bracket to release the card. As the card emerges from the slot, ease it out of the slot.

AC Power Supply Card must be removed from the platform three minutes after the power supply is switched off.

Make sure you do not place the Power Supply Card on any conductive surface.

2. Insert the Power Supply card into the guide rails of the first slot on the extreme left, designated for the Power Supply Card. Make sure that the card is inserted deep enough to make perfect contact with the connectors on the motherboard at the backplane.

3. Now, press down the levers on the card mounting bracket to secure the card in its slot.
4. Secure the card in the slot by screwing the bracket on both ends.
5. If installing the PSUNI card, connect the three-pin power cord into the socket of the PSUNI card and plug in the cord into the mains supply.

You may connect the PSUNI Card to a UPS to keep the system live during power outages.

Select a UPS considering the typical power consumption of the system. See "[Power Consumption Table](#)".

6. If installing the **Eternity GE CARD PS48VDC (250W)**, connect the Float cum Boost Charger (FCBC) or AC-DC Power Supply with 48VDC Output. Terminate the power cord from the FCBC output into the 3-way termination block on the PS48V card.

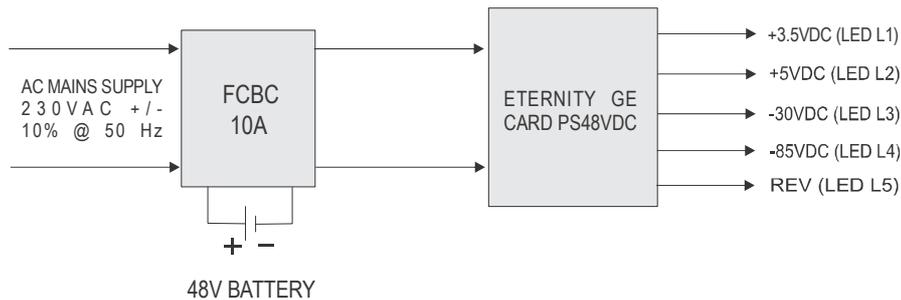

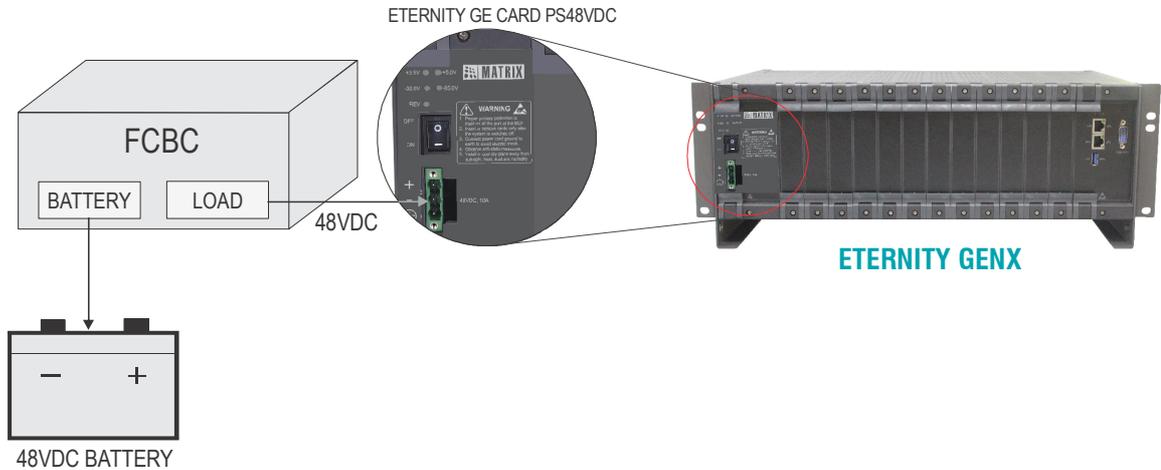

Polarity is critical. Ensure that the wires are connected with the correct polarity. Follow the standard color codes used by FCBC manufacturers:

Color	Signal	Symbol
Red	+48VDC	+
Black	GND	-
Green	Earth	

It is recommended that you measure the voltage before connecting the power cable to the power supply card. Ensure that the earth is connected.

Connecting an FCBC to the System

As PS48VDC Card works with FCBC, the input voltage working range has hysteresis. The power supply turns ON at Voltage greater than 45VDC and it remains ON till 40VDC during battery discharge condition. Moreover, the input voltage for the card must be from 40VDC to 60VDC.

7. Connect the Battery Backup⁷⁵. Battery backup time depends upon the total load. The total load is the sum of system's load and load of active extensions.
8. If installing **Eternity GE CARD PSBB**, connect the Battery Backup. Terminate the power cord from the Battery Backup output into the 3-way termination block on the PS Battery Backup card. The Battery cable supplied with the card has a connector on one end and the other end is free. Insert the cable connector into the connector on the card as shown below. At the other free end connect the Battery.

Polarity is critical. Ensure that the wires are connected with the correct polarity. Follow the standard color codes used by Battery manufacturers:

Color	Signal
Red	+24VDC
Black	GND

⁷⁵ When the batteries are drained, the FCBC goes into the charge mode and begins to charge the batteries at higher current. When the batteries reach a preset voltage level (typically set to 56.0 volts), the FCBC goes to float mode. In the float mode the FCBC keeps charging the battery but at lower current. The FCBC monitors the voltage level of the batteries. As soon as the battery voltage goes below preset voltage (typically set to 50.4 volts), FCBC goes from float mode to charge mode. The change over from mains to battery and vice-versa is automatic. The advantage of using an FCBC is that batteries get charged faster, since the batteries are charged with higher current initially.

Color	Signal
Green	Earth

It is recommended that you measure the voltage before connecting the power cable to the power supply card. Ensure that the earth is connected

The following table displays the charging time of the external battery

Type of Battery	Charging Time (Hours)
14Ah	13
27Ah	25

The following table displays the maximum number of off-hook ports supported

Condition	Number of off-hook ports
Continuous run condition	55 off-hook ports
Temporary overload	85 off-hook ports

9. Switch on power supply, after completing all other installation tasks.

Power Consumption Table

Platform	Number of Ports	Power Consumption ^a	Battery Backup ^b
		Off - Hook 30%	30%
ETERNITY GENX (System)	240	227 W (AC)	5.5hr(b)
		183 W (DC)	

a. Power Consumption is in Watts, if you want it in BTU per Hour then use the following relation:

$$1\text{Watt}=3.412\text{ BTU/Hr}$$

b. This Backup detail shown is considered with respect to 48V | 25Ah Battery.

The Power Supply unit can prove hazardous due to high Voltage Power it carries. Make sure you get it serviced by a trained service person only.

The CPU Card

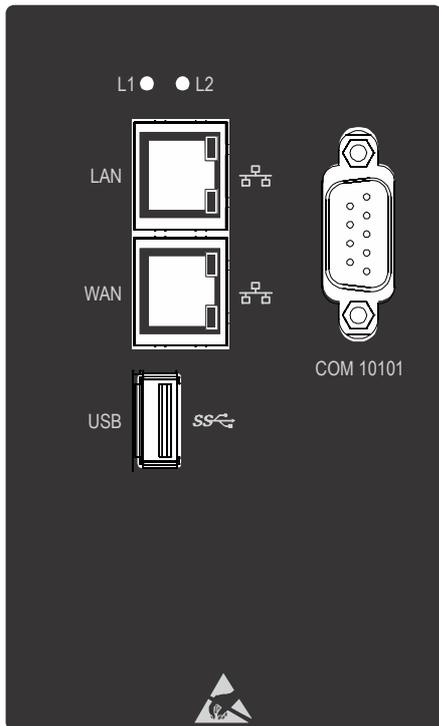

The ETERNITY GENX CPU Card hosts the SARVAM UCS Application. It supports two VOCODER modules and one VMS module. Both the modules — NX DBM VOCODER64 and NX DBM VMS64 are optional and can be purchased separately.

This card hosts Communication Manager, Feature Server, VoIP Server, VMS Server and other important servers and modules which controls all other slave cards (SLT, DKP, CO+SLT, DKP+SLT, E&M, BRI, T1E1, E1FO, GSM/CDMA etc.). All the configuration and programming information is stored on this card.

The CPU Card occupies a fixed slot, the first slot on the extreme right, with a unique arrangement of connectors. So no other card can be inserted in the slot of the CPU Card.

The CPU Card has a WAN Port, LAN Port, USB Port and COM Port on the front panel. It also has an Internal USB Port with a factory fitted pendrive.

Ports and Connectors:

Port	Connector	Description
LAN	RJ45	Used for connecting the Ethernet cable into LAN Port to connect to a PC or a LAN Switch.
WAN	RJ45	Used for connecting the Ethernet cable into WAN Port to connect to a Broadband Router/Modem.
USB	USB to COM Converter (Optional)	<p>The External USB can be used as COM Port by connecting the USB to COM Converter.</p> <p>The USB be COM Port can be used to:</p> <ul style="list-style-type: none"> • set up and run software applications — PMS and CAS. • capture System Activity Log, System Fault log and Hotel Motel Activity logs. • generate SMDR reports.
COM	DB-9	<p>Used to:</p> <ul style="list-style-type: none"> • set up and run software applications — PMS and CAS. • capture System Activity Log, System Fault log and Hotel Motel Activity logs. • generate SMDR reports.

If you buy a spare CPU Card separately, the default pendrive will not be provided along with it.

LAN Interface

The LAN Port is provided to connect:

- the system to a PC or a LAN. This port is used for operating the web-based programming software Jeeves.
- the CPU Card to the Local Area Network to register SIP extensions through the LAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “System Activity Log”, “System Fault Log” and Hotel Motel Activity Log.

WAN Interface

The WAN Port is provided to connect:

- a LAN Switch/Hub/Router/Modem.
- the CPU Card to the public network over a Router/Modem. Any user on the public network can be registered as SIP Extension through the WAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “System Activity Log”, “System Fault Log” and Hotel Motel Activity Log.

VoIP Interface

The CPU Card supports two NX DBM VOCODER64 modules. You must purchase the module separately for VoIP functionality.

VOCODER Channels

The system supports two NX DBM VOCODER64 Modules. Each module supports 64 VOCODER Channels⁷⁶. You must purchase the modules separately. The system provides 4 pre-activated VOCODER channels by default which can be used after installing NX DBM VOCODER64 module. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VOCODER CHNL4 and SARVAM VOCODER CHNL16.

If you require more than 64 VOCODER channels, you can install another NX DBM VOCODER64 Module.

A call made from a SIP Extension or SIP Trunk to another SIP Extension or SIP Trunk will consume two VOCODER channels, whereas a call made from a SLT or DKP extension to a SIP Extension or SIP Trunk will consume one VOCODER channel. Thus, the number of speech paths available to make simultaneous calls will depend not only on the number of VOCODER channels, but also on the number of channels consumed by such SIP-to-SIP and Analog/Digital extension to SIP Trunk/SIP Extension calls.

VMS Interface

The system supports a full-fledged, 'in-skin' Voice Mail System module to provide mailbox facility to all its extensions users. The Voice Mail System also forms the basis of other features like Conversation Recording and Call Taping.

Each Mailbox has the capacity of storing 15,000 voice messages. The maximum size of each Mailbox is 60,000 minutes. By default, the size of each Mailbox is set to 5 minutes. The maximum Message Length for each Mailbox is 9,999 seconds. By default, the Maximum Message Length for each Mailbox is set to 15 seconds.

⁷⁶. The number of VOCODER channels that will be supported would be as per the license you purchase.

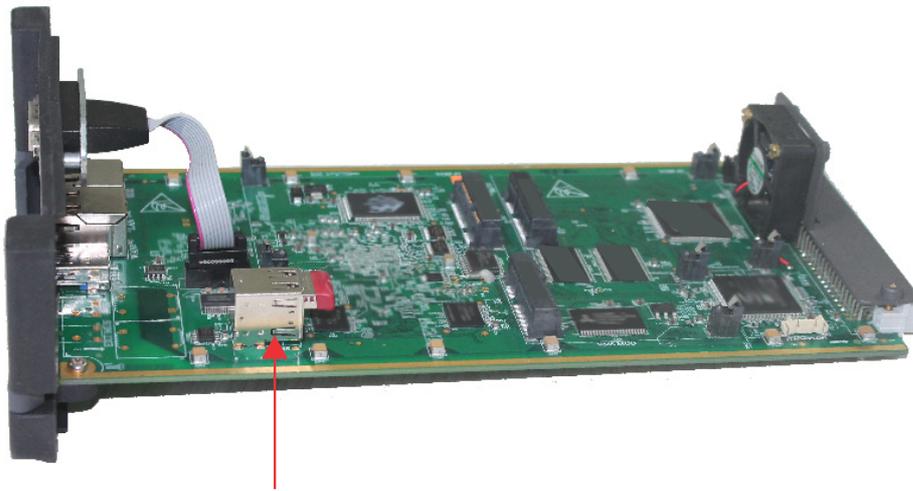

The NX DBM VMS64 Module is an optional module. It must be purchased separately. The factory fitted Pen Drive provided also contains the VMS configuration files, and voice messages for prompts and greetings along with the SARVAM UCS SME Application. The Pen Drive is also the storage device for mailbox messages.

If required, you may use a Pen Drive of upto 64GB by replacing the factory fitted pendrive with a new one.

The system supports a maximum of 64 channels out of which 4 channels are provided by default. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VMS CHNL4 and SARVAM VMS CHNL16.

Internal USB Port

The CPU Card has an Internal USB Port with a pendrive inserted into it.

Internal USB Port

The pendrive supports FAT32 file format. It contains the SARVAM UCS Application, VMS greetings, messages, mail boxes, Matrix Extended IP phone firmwares and SMS Server firmware.

 ***Do not remove the pendrive.***

When you select the SARVAM UCS SME Application, the system fetches the application from the pendrive.

External USB Port (Device Port) 3.0

The CPU Card has an External USB Port on the fascia. This can be used as a COM Port by connecting the USB to COM Converter.

 ***The USB to COM Converter will not be provided by Matrix.***

The following USB to COM Converters are supported:

- Prolific PL2303 by BAFO
- CH341 by Winchiphead

If you use any other USB to COM Converter, Matrix does not guarantee it's proper functioning.

The USB to COM Port has a DB-9 connector.

The port allows you to connect a PC to the system, so that you can install and operate the following features:

- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “System Activity Log” and “System Fault Log”, Hotel Motel Activity Log.

Communication Port (COM Port)

There is a asynchronous, serial, full-duplex RS-232C Communication (COM) Port, labeled as COM10101. The COM Port has a DB-9 connector.

The COM port allows you to connect a PC to the system, so that you can install and operate the following features:

- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “System Activity Log” and “System Fault Log”, Hotel Motel Activity Log.

LED

The CPU Card has two dual color (Green and Red) LEDs.

- LED 1 - L1 works as a Heart Bit of CPU Card. In Normal Condition, L1 will be turned ON Green for 1 sec and OFF for 1 sec.
- LED 2 - L2 indicates the Layer Application status. In Normal condition, L2 will be turned ON Orange and will blink very fast.
- Both L1 and L2 also indicate Application status.

Case 1: L1 is steady GREEN/OFF and LED2 is OFF. This means the Application is hung and there is some problem in the Application code.

Case 2: LED1 is steady GREEN/OFF and LED2 is GREEN/RED/ORANGE. This means the Layer is hung and there is some problem with the Layer code.

Jumpers

The position and function of the Jumpers on the CPU Card are:

Jumper Number	Position	Function
J1	AB	Default SE Password.
	BC (default)	Normal.

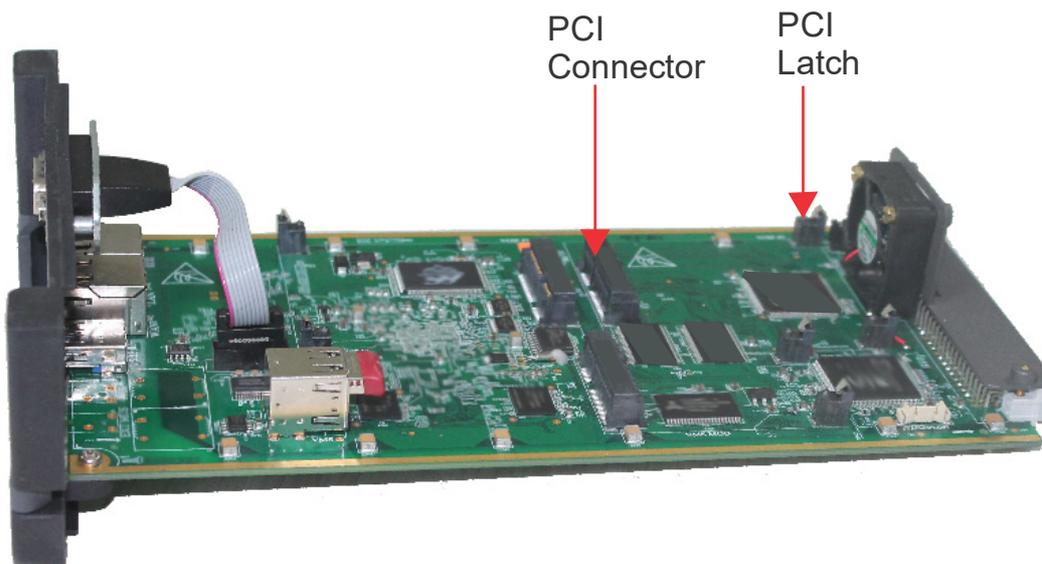

Installing the VOCODER Module

To install,

- Unpack the NX DBM VOCODER64 Module.

- If the CPU Card is already installed, switch off power supply, unplug the power cord. Remove the screws securing the card. Lift the levers on the mounting bracket to release the card. As the card emerges from the slot, ease it out of the slot.
- Place the card carefully on a table with some packing underneath it. Avoid any physical contact with the PCB part of the card as this could cause Electrostatic discharge (ESD) and may damage the hardware.
- The NX DBM VOCODER64 Module is to be mounted adjacent to the fan on the CPU board.

- Locate the PCI Connector and PCI Latch on the CPU board.

- Carefully hold the NX DBM VOCODER64 Module from the edges. Make sure you do not touch the PCB area.

- Insert the NX DBM VOCODER64 Module into the PCI Connector socket.

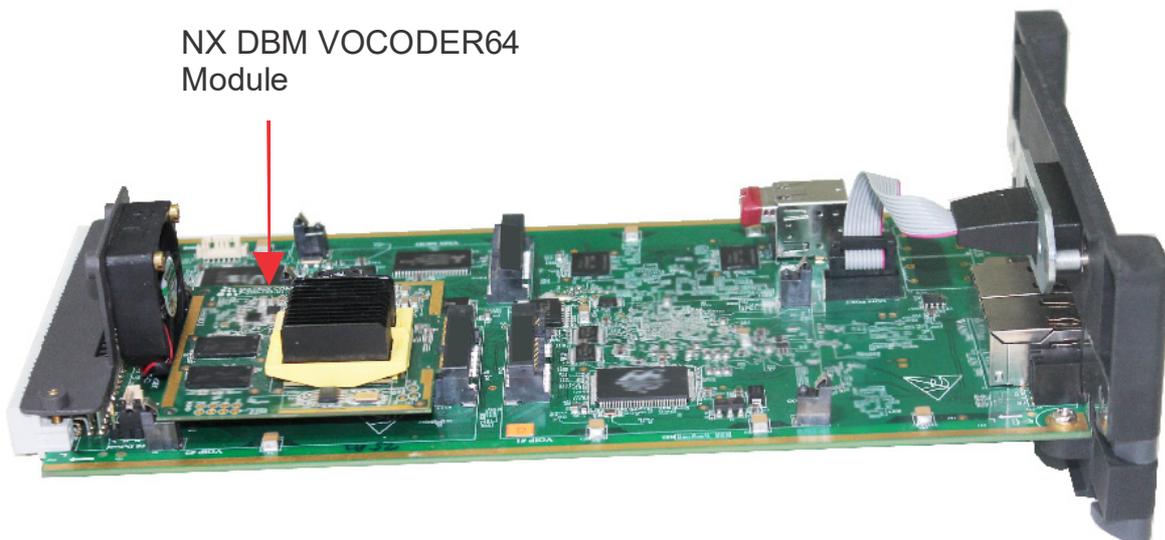

- Press the Module with a finger to fix the latches perfectly into the mounting holes. Make sure you do not touch the PCB area of the module except the yellow line provided for grounding at the front end of the module.

Do not apply excessive pressure. Follow the same steps if you wish to install another module.

Removing the VOCODER Module

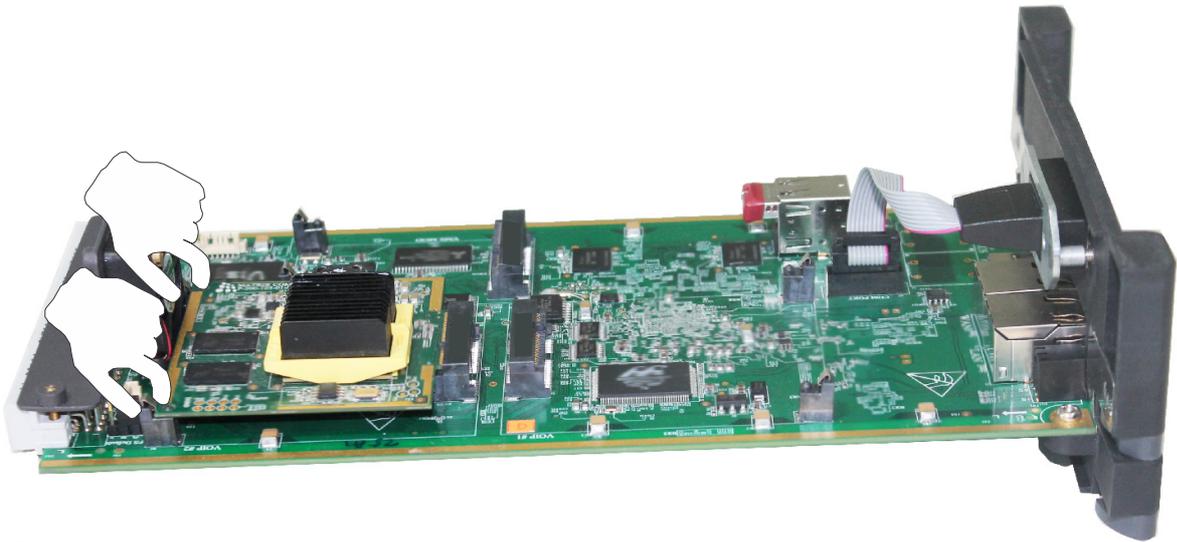

- Locate the VOCODER Module you want to remove from the CPU Card.

- Press both the latches together.

Make sure you support the base of the latches from behind with your forefinger.

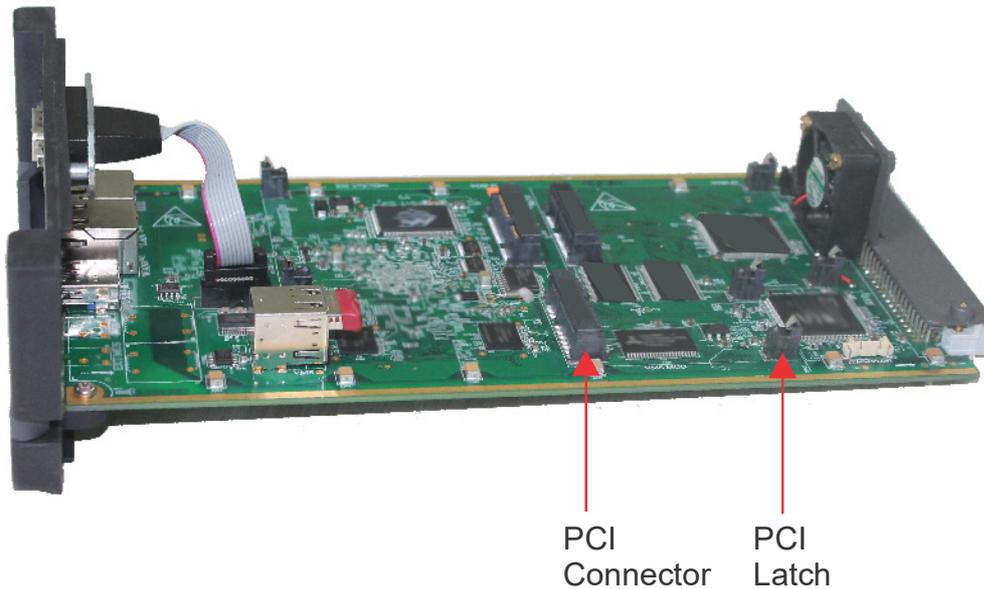

- Firmly hold the module and ease it out of the PCI connector carefully.

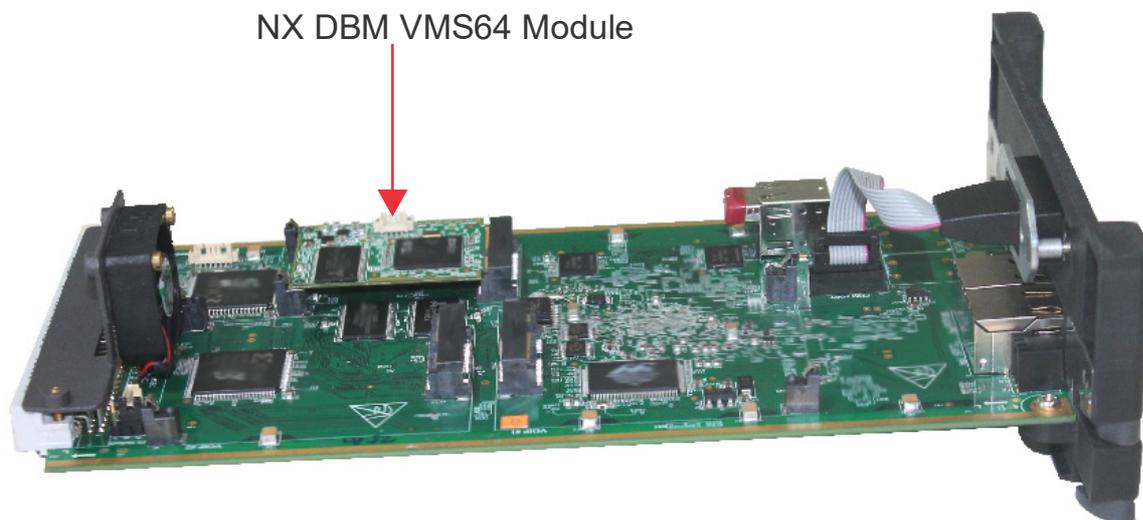

Installing the VMS Module

To install,

- Locate the PCI connector for NX DBM VMS64 Module on the CPU card.

- Follow the same steps as described in installing the NX DBM VOCODER64 Module. See [“Installing the VOCODER Module”](#).

- The pendrive which is provided to you by default contains VMS data and VMS firmware. You will be able to use the VMS features once you activate the VMS License.

If you want to store more voice mail messages or greetings then you will need more space to store the same. You can replace this default pendrive with a new one having more space.

To do so, you need to format your new pendrive with FAT32 file format and then copy all the contents of the factory fitted pendrive into the new pendrive.

Make sure you switch-off the system to replace the pendrive. The system will not detect the new pendrive if you do not restart the system after replacement.

- If you have no other modules to install, insert the card back into the ETERNITY GENX.
- Connect a computer to the LAN/WAN Port of the system with the ethernet cable supplied for the port.
- Open a Web browser on the computer to access the embedded Web server, Jeeves.
- Activate the VMS License Voucher. See [“License Management”](#) for instructions.
- Configure VMS. For detailed instructions, see [“Configuring Voice Mail System”](#).

For removing the VMS Module, follow the same steps as described for removing the VOCODER Module. See [“Removing the VOCODER Module”](#).

The Single Line Telephone Card

The Single Line Telephone (SLT) Card provides the interface to connect as extension phones, any standard, two-wire, analog single line telephone instrument - rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification.

The SLT Card is available in the following configurations. SLT interface also is available in combination with Two-wire trunk and digital key phone interfaces on a single card.

SLT Cards for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD SLT20	20-port card to connect 20 Single Line Telephones
ETERNITY GE CARD SLT16	16-port card to connect 16 Single Line Telephones
ETERNITY GE CARD SLT8	8-port card to connect 8 Single Line Telephones
ETERNITY GE CARD DKP4+SLT16	Combination card, with 4-ports to connect to 4 Digital Key Phones and 16 ports to connect 16 Single Line Telephones
ETERNITY GE CARD CO4+SLT16	Combination card with 4 ports to connect 4 Two-wire Trunk lines, and 16 ports to connect 16 Single Line Telephones
ETERNITY GE CARD CO4+DKP2+SLT12	Combination card, with 4 ports to connect 4 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones and 12 ports to connect 12 Single Line Telephones. This Card supports Power Fail Transfer. To know more, see “Power Fail Transfer” .
ETERNITY GE CARD CO4+DKP2+SLT8	Combination card, with 4 ports to connect 4 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones and 8 ports to connect 8 Single Line Telephones. This Card supports Power Fail Transfer. To know more, see “Power Fail Transfer” .
ETERNITY GE CARD CO2+DKP2+SLT16	Combination card, with 2 ports to connect 2 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones, and 16 ports to connect 16 Single Line Telephones

The maximum number of SLT ports supported are 240. However, the maximum number of simultaneous off-hook SLT ports supported are 120.

Connectors

The SLT Cards have RJ45 connectors, with each connector having 4 SLT ports. A multi-pair, MDF cable is supplied for each connector.

LEDs

The Cards SLT8 and SLT16 have 2 LEDs, while SLT20 has no LED:

- The LEDs indicate the health of the card during the Reset Cycle.

- the status of any one of the extension ports during normal functioning of the system. You can monitor any of the SLT Extension ports by assigning the LED to that port⁷⁷.

LED Pattern of SLT Card

LED 2 (L2)

PORT Status	LED Color	LED Cadence
Commands from Application to SLT Port.	GREEN	Toggle ^a at each command
Events to Application from SLT Port.	RED	Toggle ^b at each event

- The current LED state will remain the same until the next command is received from the application on the SLT Port. For example, if the current LED state is Green/Red ON, on the next command received, the LED will be turned OFF. It will remain OFF until the next command is received. When the next command is received it will be turned Green/Red ON again. This process continues.
- Same as above note.

Installing Single Line Telephones

To be able to connect Single Line Telephones as Extensions to your system, you must install at least one of the aforementioned SLT Cards in the System.

1. Decide the number of SLT extensions required and arrange for as many telephone instruments.

You may use any standard telephone instrument like a rotary phone, a pulse-tone switchable push-button phone, a feature phone or a cordless phone.

Use SLTs equipped with a 'Flash' key, as several of the features and facilities of the system require you to press Flash. If any of the SLTs you have selected does not have a Flash key, tap the Hook switch of the phone to dial Flash.

2. Unpack the SLT Card and check the package contents. Ensure that the power supply is switched off, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
3. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Do not discard the filler bracket! You may require it at a later stage.
4. Insert the SLT Card into the guide rails of the free slot you selected for the card.

Make sure that the connectors on the card make perfect contact with those on the motherboard on the backplane.

5. Press down the levers on the mounting bracket to secure the card in its slot. Now, secure the mounting bracket with the two screws provided.

⁷⁷. To do this, enter SE mode, enter the programming mode from any extension connected to the system, by dialing 1#91-SE Password. Dial the command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port. Exit programming mode by dialing '00'.

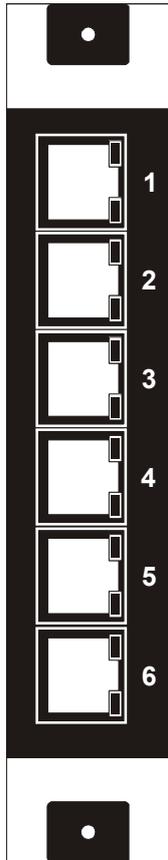

If you are installing more than one SLT Card, you can install the second card in any other free slot. It is not necessary to install the second/third card in the subsequent slots.

- Use the cables supplied with the SLT Card to connect the SLT wires with the Main Distribution Frame.

For each connector on the SLT Card, there is a separate 4-pair cable with an RJ45 jack on one end and free at the other end.

Refer the illustrations below for pin out details of each connector.

ETERNITY GE CARD SLT20

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	SLT	01

RJ45-'6	Blue - (Blue & White)	TWT	03
	Orange - (Orange & White)	TWT	04

- Plug in the RJ45 end of the MDF cables supplied with the card into the respective connectors. Refer to the pinout details of the connectors of each SLT Card type illustrated above.
- Terminate the open end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the ["The Main Distribution Frame \(MDF\)"](#).

Each wire-pair from the SLT Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic ["The Main Distribution Frame \(MDF\)"](#) for illustration.

- Repeat the same steps to install another SLT Card.

Connecting SLT instruments

- Connect the SLT instruments you have arranged for. Plug in the SLTs into the wall socket/outlets.

- For the purpose of testing, you may connect one or two Single Line Telephone instruments by plugging in the phone cables into the RJ45 connectors on the card.
- When you plug the RJ11 connector of SLT into an RJ45 connector on the SLT Card, the SLT will be connected on the first port on the connector.

The Intercom Line Card⁷⁸

For the Building Intercom application, the system supports the Intercom Line Card (ILC).

You can connect any standard, two-wire, analog single line telephone instrument - rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification to the Intercom Line Card.

ILC Cards for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD ILC20	20-port card to connect 20 Single Line Telephones

The maximum number of intercom ports supported are 240.

Connectors

The ILC Cards have RJ45 connectors, with each connector having 4 ports. A multi-pair, MDF cable is supplied for each connector.

LEDs

The Card ILC 20 has no LED:

- The LEDs indicate the health of the card during the Reset Cycle.
- the status of any one of the extension ports during normal functioning of the system.

Installing Single Line Telephones

To be able to connect intercom telephones to the system, you must install at least one of the aforementioned intercom line cards in the system.

1. Decide the number of intercom extensions required and arrange for as many telephone instruments.
2. Ensure that the extension wiring is completed according to your requirements. The extension cables from the wall jack are terminated in the Main Distribution Frame and the telephones are connected to the wall jacks.
3. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat to prevent damage to the components of the card.
4. Unpack the ILC Card and check the package contents. Switch off power supply before you install the card.
5. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Keep the filler bracket for future use.
6. Insert the ILC Card into the guide rails of the free slot you selected for the card.

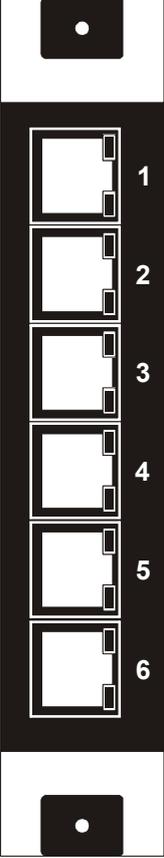

⁷⁸. This card has been phased-out. if required, only support will be provided for the same.

Make sure that the connectors on the card make perfect contact with those on the motherboard on the backplane.

7. Press down the levers on the mounting bracket to secure the card in its slot. Now, secure the mounting bracket with the two screws provided.
8. Repeat these steps to install another card.
9. Now, use the cables supplied with the ILC Card to connect the card to the Main Distribution Frame to which the intercom phones are connected.

For each connector on the card, there is a separate 4-pair cable with an RJ45 jack on one end and free at the other end. Refer the illustrations of the pinout of the intercom cards to connect the wires.

ETERNITY GE CARD ILC20

Connector	Color	Connection	H/w Port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04

	Orange - (Orange & White)	SLT	20
	Green - (Green & White)	-	-
	Brown - (Brown & White)	-	-

10. If you have completed all other installation tasks, power ON the system, observe the Reset Cycle.

The Digital Key Phone Card

The Digital Key Phone (DKP) Card provides the interface to connect the proprietary digital key phones of the EON series, the proprietary PC-based phone EONSOFT, the Direct Station Selection (DSS) Consoles, with the system.

The DKP Card is available in the following configurations:

DKP Cards for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD DKP16	16-port card to connect 16 DKP/DSS Consoles
ETERNITY GE CARD DKP8	8-port card to connect 8 DKP/DSS Consoles
ETERNITY GE CARD DKP4+SLT16	Combination card, with 4-ports to connect to 4 Digital Key Phones and 16 ports to connect 16 Single Line Telephones
ETERNITY GE CARD CO2+DKP2+SLT16	Combination card, with 2 ports to connect 2 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones, and 16 ports to connect 16 Single Line Telephones
ETERNITY GE CARD CO4+DKP2+SLT12	Combination card, with 4 ports to connect 4 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones and 12 ports to connect 12 Single Line Telephones. This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .
ETERNITY GE CARD CO4+DKP2+SLT8	Combination card, with 4 ports to connect 4 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones and 8 ports to connect 8 Single Line Telephones. This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .

To connect the proprietary digital key phones with the system, you must have at least one of the above mentioned DKP Cards installed in the system.

The maximum number of DKP Ports supported by the system are 96.

Connectors

The DKP Cards have RJ45 connectors, with each connector having 4 DKP ports. A multi-pair MDF cable is supplied for each connector on the card.

LEDs

The DKP16 and DKP8 Cards have two dual color LEDs:

- LED1 indicates the health of the card during the Reset Cycle.
- LED2 monitors the status of any one of the extension ports during normal functioning of the system.

LED2 can be assigned to any DKP port to monitor the status of that port⁷⁹.

Installing the Digital Key Phone Card

Decide the number of DKP extensions and DSS Consoles required and arrange for as many EON, EONSOFT and DSS Consoles.

Decide the locations of the DKP extensions and make sure that the necessary wiring for the DKP extensions, from the wall jack to the MDF, is done.

1. Unpack the DKP Card and check the package contents⁸⁰. Before handling the card, make sure that power supply is switched off and you are wearing an antistatic-wrist strap/belt and have a grounding mat.
2. Unscrew and remove the filler card mount bracket of any of the free (empty) Universal Slots. Do not discard the filler bracket, keep for future use to cover empty slots.
3. Insert the DKP Card into the guide rails of the free slot you have selected for the card. All the pins on the connector of the card should make perfect contact with those on the connector of the slot on the backplane motherboard.
4. Press down the levers on the mounting bracket to secure the card in its slot. Now, fix the card in its slot with the two screws provided.

If you are installing more than one DKP Card, it is not necessary to install the next card in the subsequent slot.

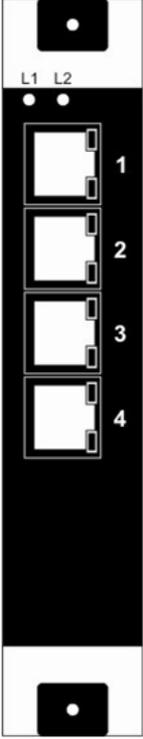

5. Using the MDF Cables supplied with the DKP Card connect the DKP ports to the Main Distribution Frame.

Refer the connector pin details for each DKP Card type given in the following.

79. You can do this from the SE mode, by dialing the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

80. See ["ETERNITY GENX Cards"](#) under 'Packing List' of Appendix topic.

ETERNITY GE CARD DKP16

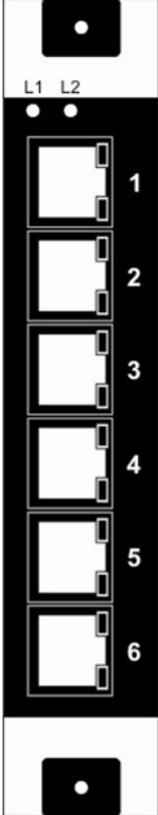

Connector	Color	Connection	H/w Port Offset

RJ45-6	Unused		

- Plug in the RJ45 end of the MDF cables provided with the DKP Card into the respective connectors.
- Terminate the free end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the Main Distribution Frame (MDF).

Each wire-pair from the DKP Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic [“The Main Distribution Frame \(MDF\)”](#) for illustration.

- Connect the Digital Key Phones to the wall jacks at their respective locations. Detailed installations instructions for EON and EONSOFT are provided separately.

If you have completed all installation tasks, power on the system and observe the Reset Cycle and the LED Pattern of the DKP Card.

LED Pattern DKP Card

LED 2 (L2)

PORT Status	LED Color	LED Cadence
Commands from Application to DKP Port.	GREEN	Toggle ^a
Events to Application from DKP Port.	RED	

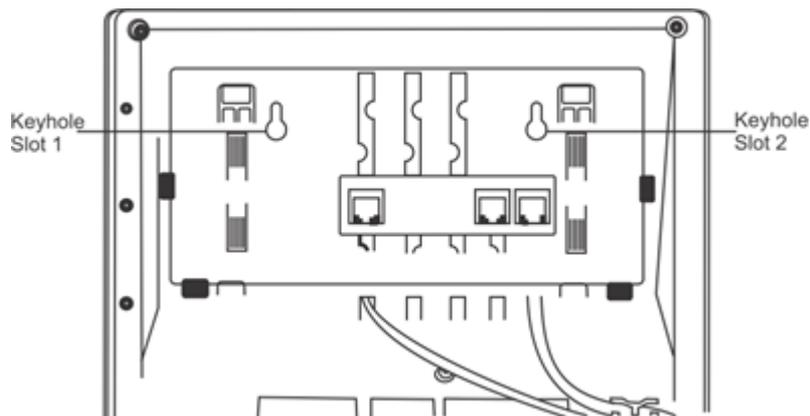

- a. The current LED state will remain the same until the next command is received from the application on the DKP Port. For example, if the current LED state is Green/Red ON, on the next command received, the LED will be turned OFF. It will remain OFF until the next command is received. When the next command is received it will be turned Green/Red ON again. This process continues.

Installing EON48

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

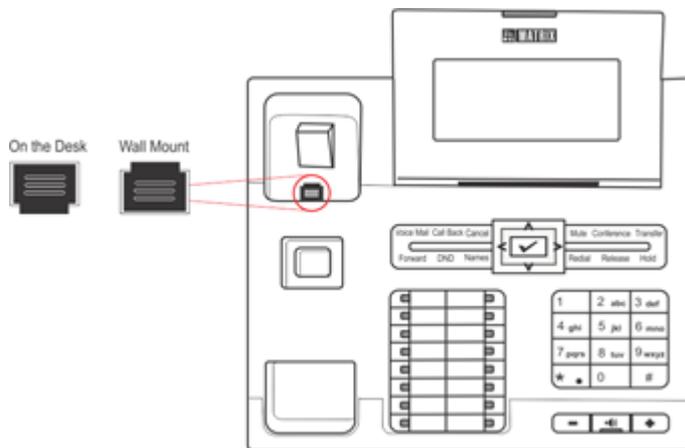

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

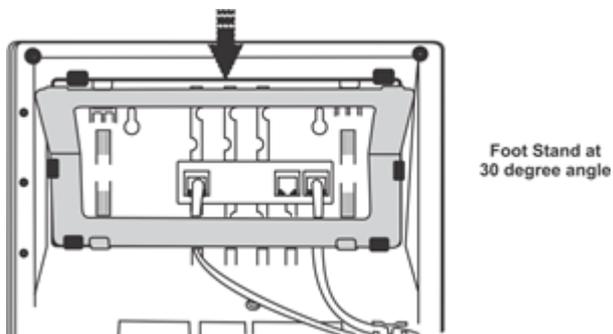

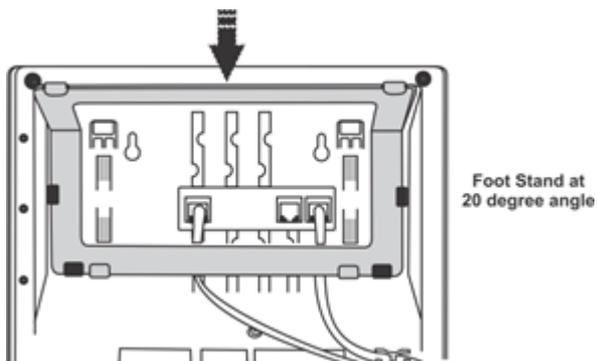

- Now, mount the phone with the screws fitting into the keyhole slots.

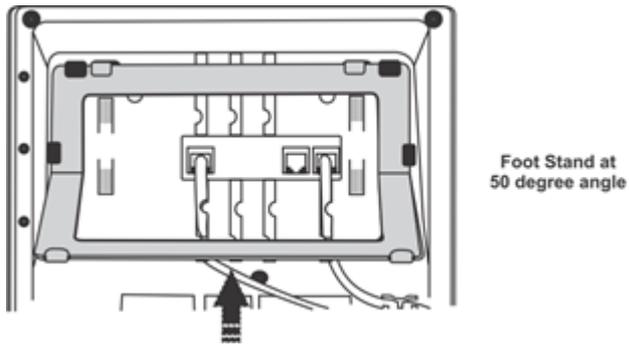

- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

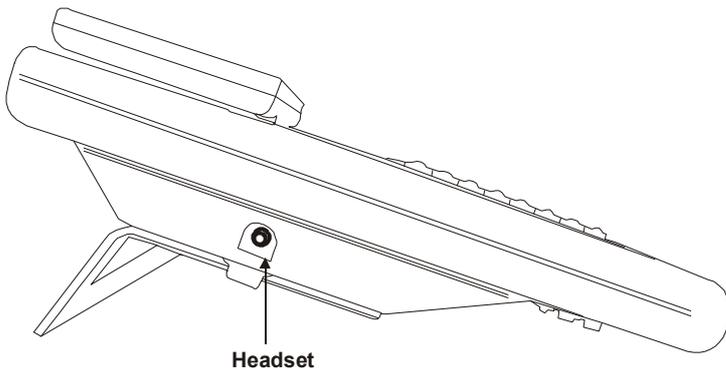

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **20° Angle** or at **30° Angle** or at **50° Angle**.

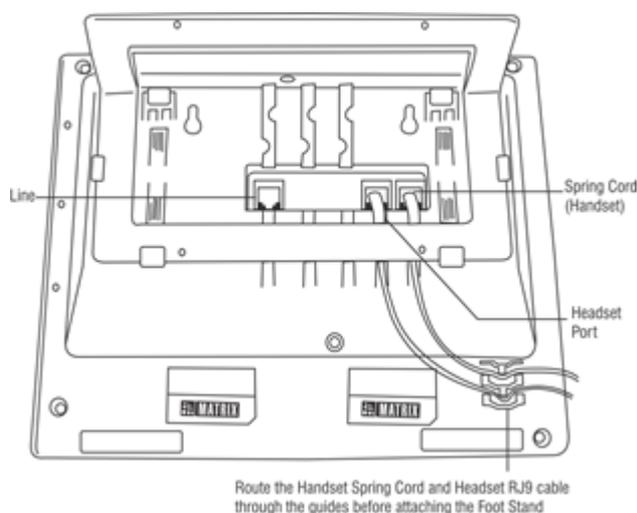

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.
- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
- Connect the handset of the EON48 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 2.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.

You may also plug in a stereo headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as '**LINE**' and the other end into the wall jack/DKP Port.

- When the system is powered ON, the EON will reset. The EON communicates with the system. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message 'Please wait'... appear on the LCD display.

- After successful handshaking and reset cycle, if the DKP Parameters have been configured, the LCD display of the EON will show the extension number and the extension name in one line and the day, date and time and the time zone in the other line.

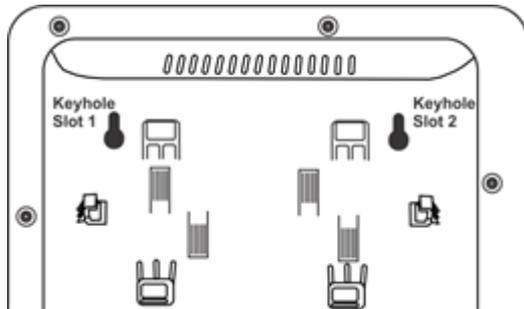

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#) for instructions.

Installing EON310

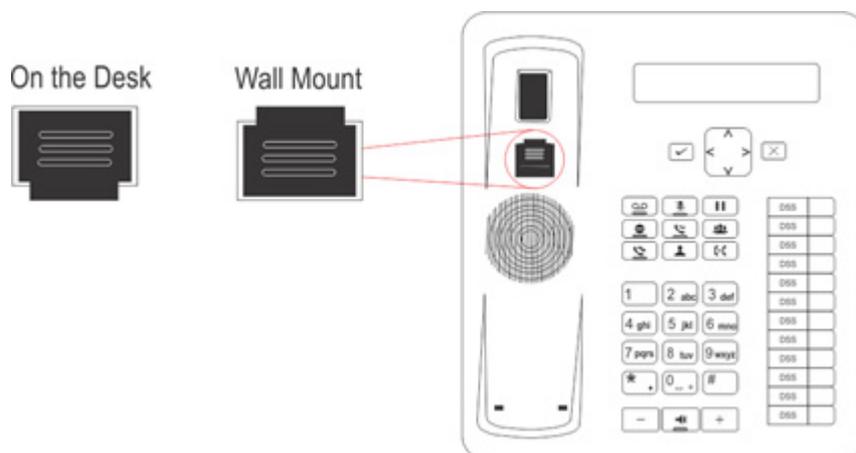

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

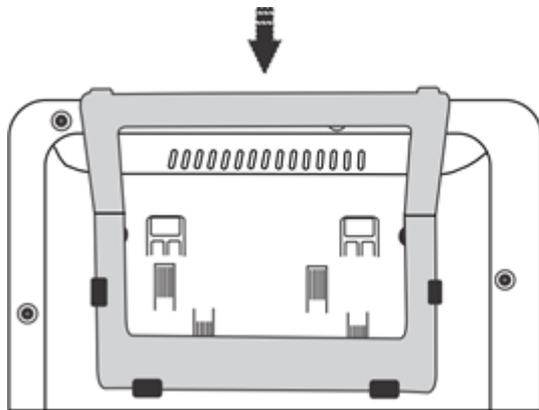

- Now, mount the phone with the screws fitting into the keyhole slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

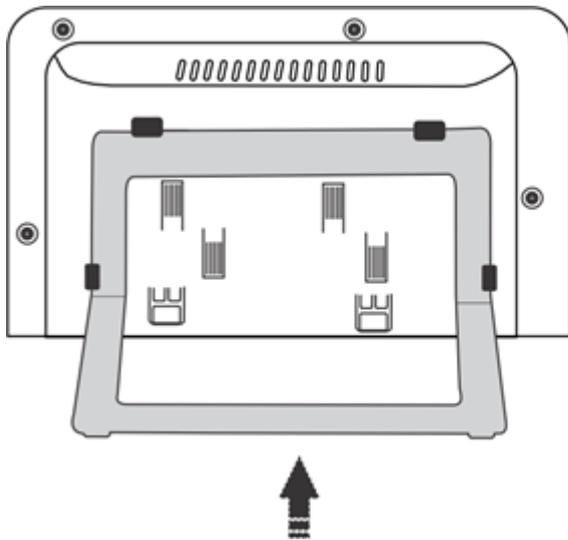

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **35° Angle** or at **50° Angle**.

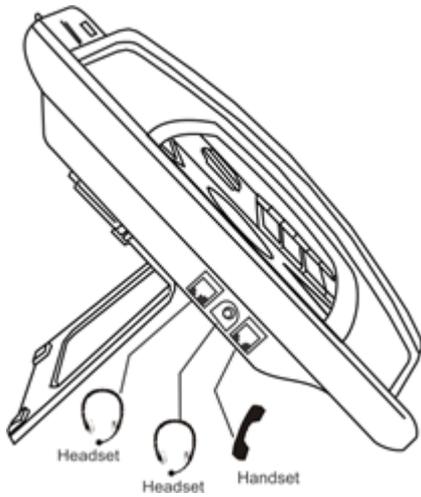

Stand attached at
35 degree angle

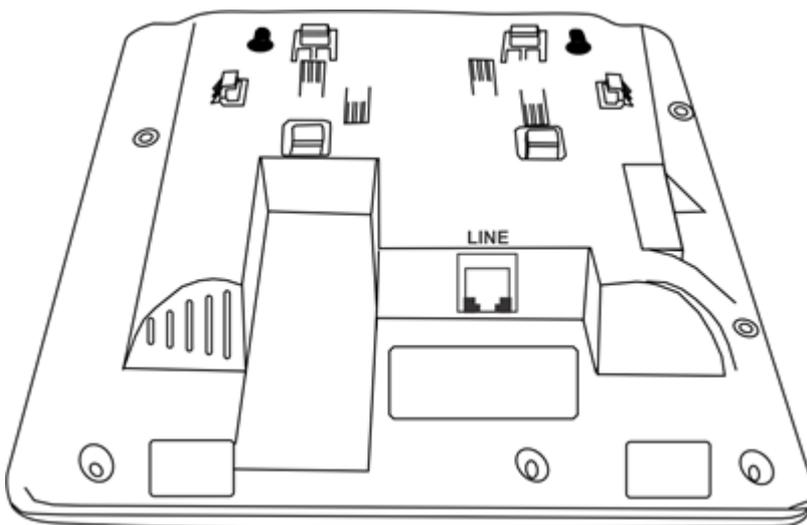

Stand attached at
50 degree angle

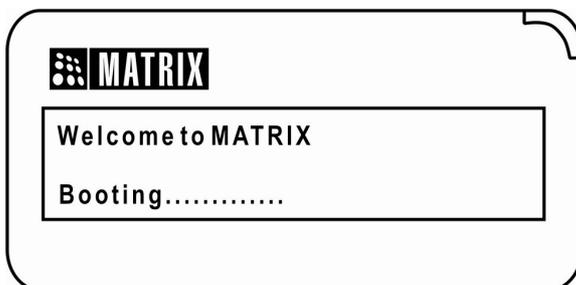

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
- Connect the handset of the EON310 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.
You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as '**LINE**' and the other end into the wall jack/DKP Port.

- When the system is powered ON, the EON will get reset and the message "Welcome to Matrix. Booting" ...appears on the LCD display.

- The EON communicates with the system. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message “Please Wait”...appears on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear on the LCD.

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#).

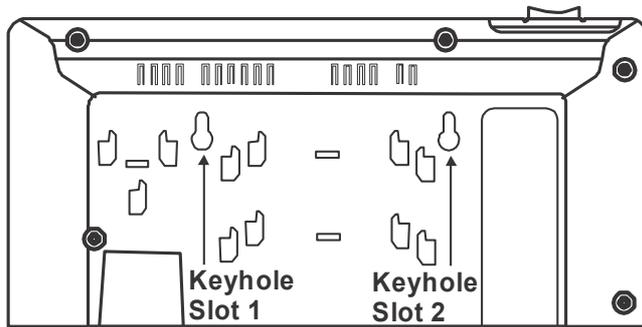

Installing EON510

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

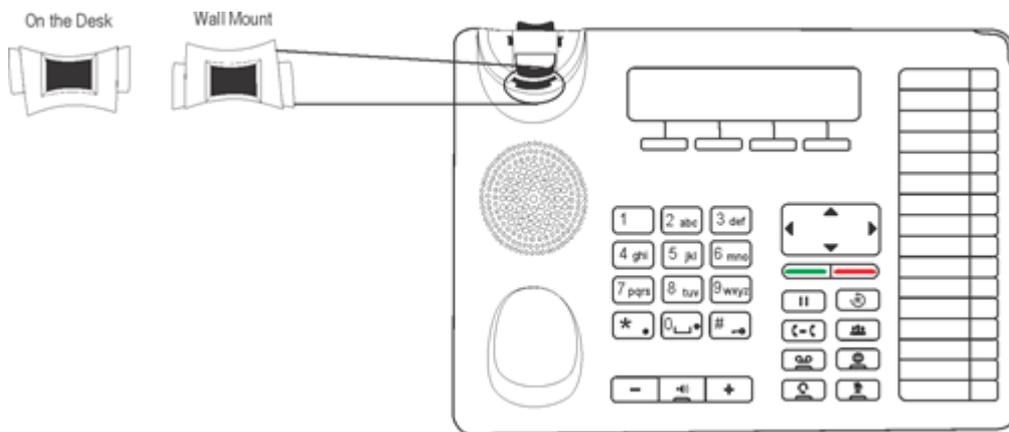

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.

- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

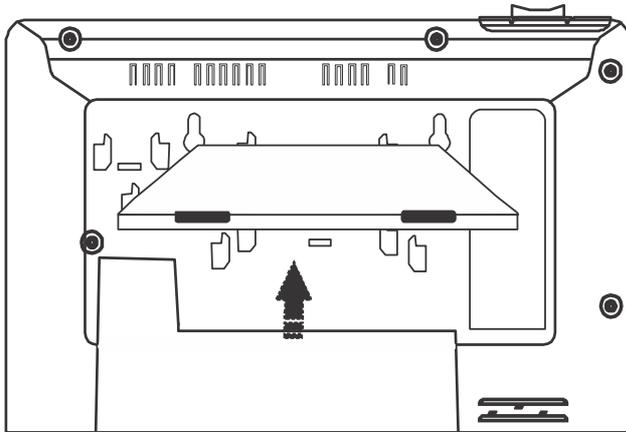

- Now, mount the phone with the screws fitting into the keyhole slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

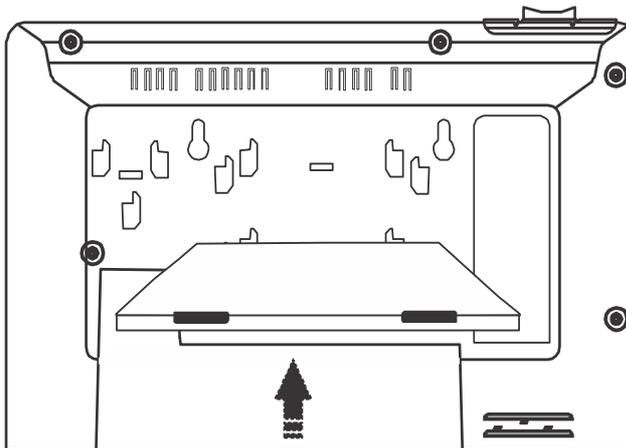

If you are unable to remove the wall mount tab, you may use a tool like a minus screw driver to remove it.

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **45° Angle** or at **55° Angle**.

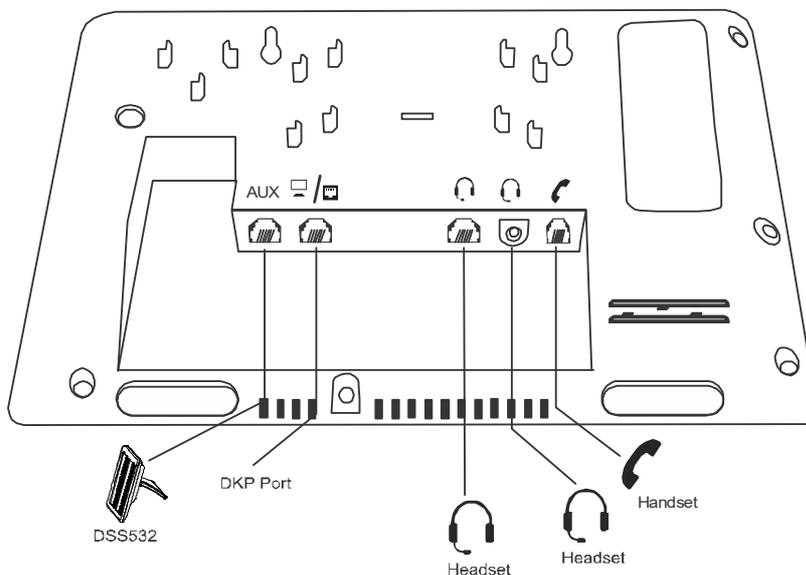

Stand attached at
45 degree angle

Stand attached at
55 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

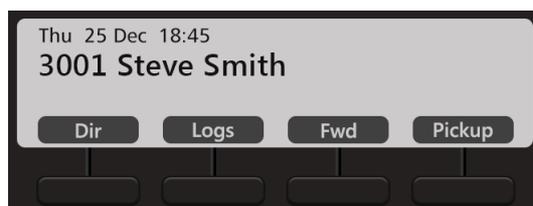

- Connect the handset of the EON510 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.
You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.
- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone marked with the symbol  and the other end into the wall jack/DKP Port.
- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with EON510”](#).
- When the system is powered ON, the EON will get reset.and the message 'Phone is Booting; Please wait...' appear on the LCD display.

- The EON communicates with the system. The handshaking lasts for 5-6 seconds. The message 'Loading Firmware Version-Revision; Please wait...' appear on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear, as illustrated below.

You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#).

Installing DSS Consoles

Installing DSS64

Once you have installed EON48/310 with SARVAM UCS, installing the DSS Consoles can be done in a few simple steps, very much similar to those involved in the installation of EON.

1. Unpack the box and verify the package contents⁸¹.
2. Place the DSS Console next to the DKP to which it is to be attached.
3. Decide which DKP Ports on the DKP Card are to be assigned to the DSS Consoles. You may select any free (unused) port on the card for DSS Consoles. It is not necessary for the DSS Console ports to be in a sequence with the DKP ports to which they are attached.

For example: you have connected DKP1 to Port 1 on the first RJ45 connector of the DKP8 card. You want to attach two DSS Consoles to DKP1. The two DSS Consoles may be connected to any port on the second connector of the card, not necessarily to Port 2 and Port 3 on the first connector.

4. The wire-pairs from the DKP Ports designated for DSS Consoles should be terminated on the bottom of the Krone Connector (of 'Station Lines' on the MDF).
5. The wire-pairs of the DSS Consoles should be terminated into the top of the Krone Connector (of 'Station Lines' on the MDF). Refer the topic "[The Main Distribution Frame \(MDF\)](#)" for illustration.

You can connect maximum two DSS64 with a single EON48/310.

6. The system automatically detects the DSS Console you connect and it will be will appear under **Unassigned DSS64** in "[DSS Status](#)". You must first assign these DSS Consoles to the respective DKP Ports and thereafter you will be able to configure the DSS Keys.
7. To assign the DSS Consoles, see "[DSS Status](#)" and to configure the DSS Keys, see "[Programming DSS Console Keys](#)".

Installing DSS532 with EON510

The instructions for installing DSS532 with EON510 or SPARSH VP510 are same. For detailed instructions, refer to "[Installing DSS532 with SPARSH VP510](#)".

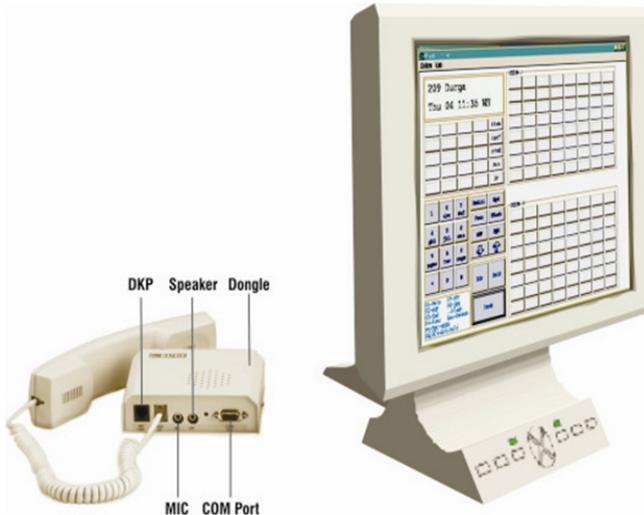

Installing EONSOFT

To install EONSOFT, you must have a computer with Windows as the operating system. The EONSOFT is compatible with the following Operating Systems of Windows:

- Windows 98
- Windows XP
- Windows NT
- Windows 2003
- Windows Vista
- Windows 2007

81. See "[Packing List](#)" of Appendix topic.

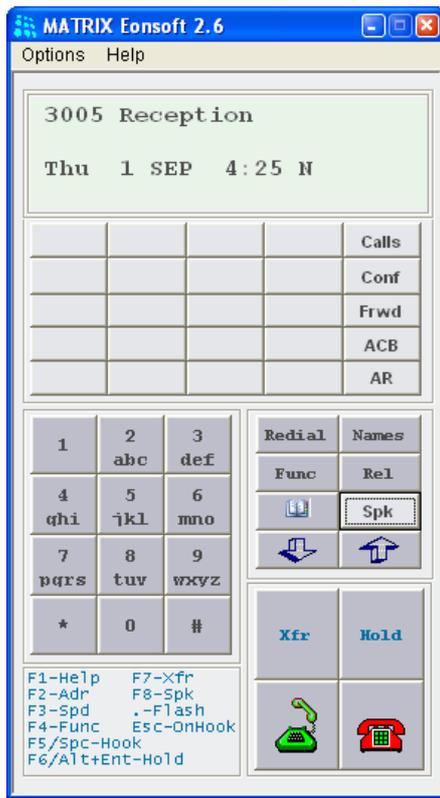

1. Unpack the box and verify the package contents⁸².
2. Connect the Handset to the dongle in the handset jack. If using a headset, connect the microphone and the speaker connectors into the dongle.

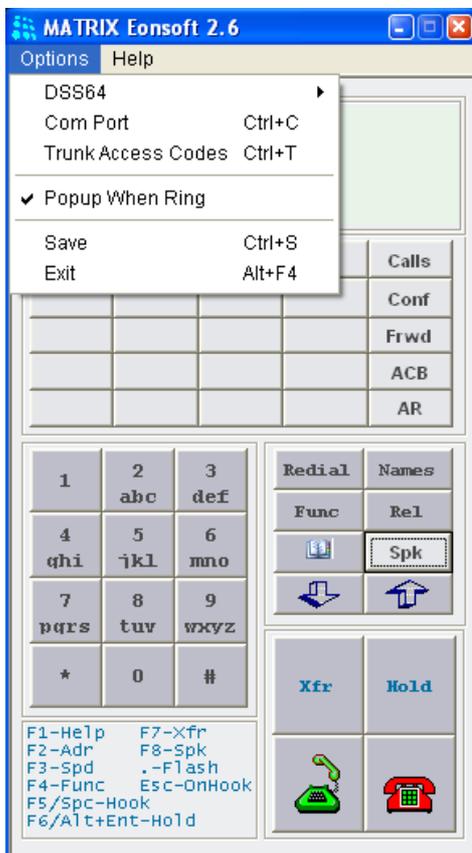

3. Connect one end of the Communication cable to the COM port of the dongle. Connect the other end of the communication cable into the COM port of the computer.
4. Connect a wire-pair of a DKP port to the RJ11 port marked 'DKP' on the dongle.
5. Switch ON the computer. The computer must have Windows Operating System installed on it.
6. Copy the EONSOFT Application Software provided by the Support Team onto your PC and install the application.
7. After the program has been installed and run, a shortcut will be automatically created and appear on your desktop.

82. See ["EONSOFT"](#) under 'Packing List' of Appendix topic.

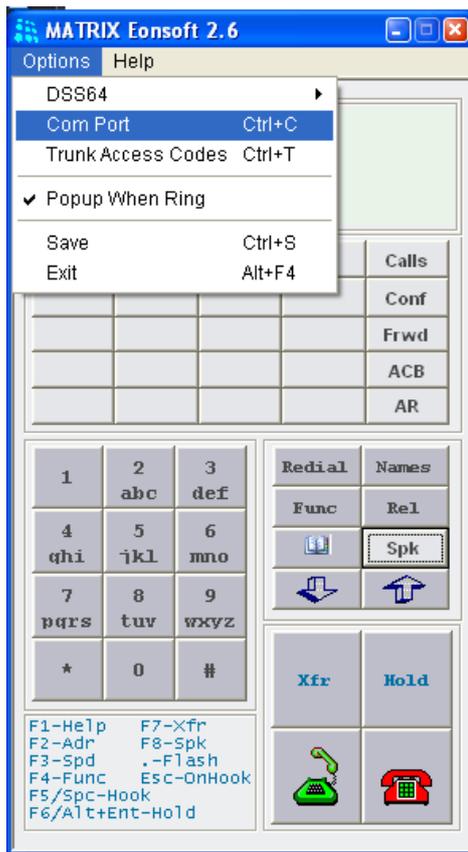

- Click the shortcut to open the program. The EONSOFT window will open:

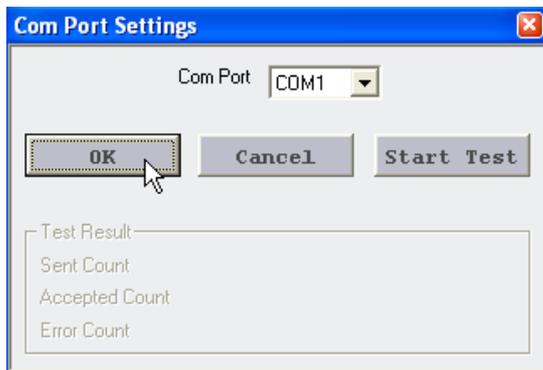

- Click **Options** at the top left of the window. A drop down menu will appear.

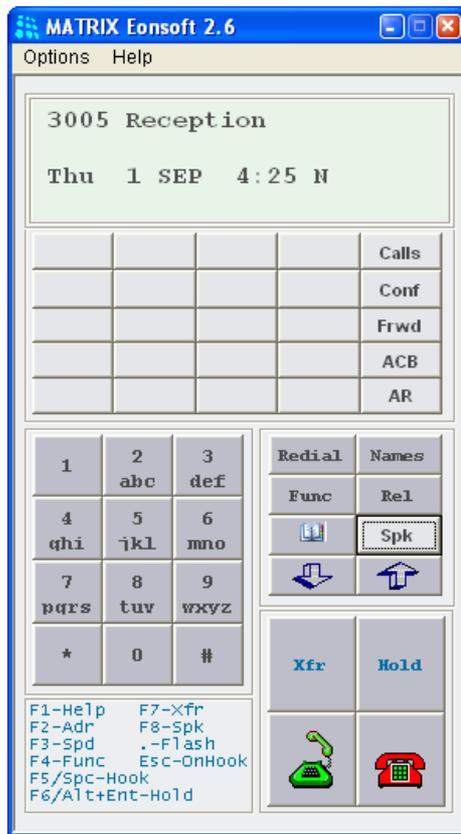

10. Click the option **COM Port**.

11. Select the COM Port to which the communication cable is connected.

12. EONSOFT is now connected. If you have already configured the DKP parameters like Access Code and Name for the port to which EONSOFT is connected, these will appear.

- If this window does not appear after you have selected the COM Port Option, test the COM Port for data transfer.
- If the wrong COM port has been selected, a dialog box will pop up on your screen with the message: "COMx is invalid or busy, please select another COM Port". Select the correct COM Port.

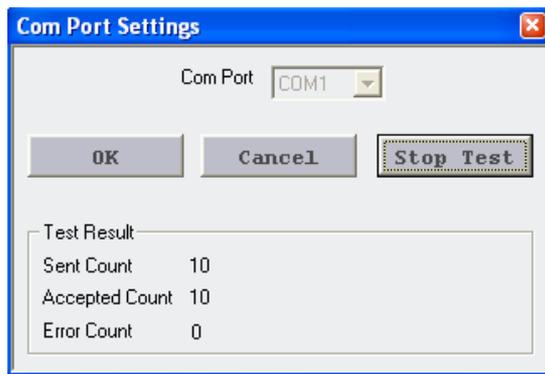

Test the functioning of the COM Port of the PC and the communication cable, before you install the EONSOFT.

Testing the COM Port

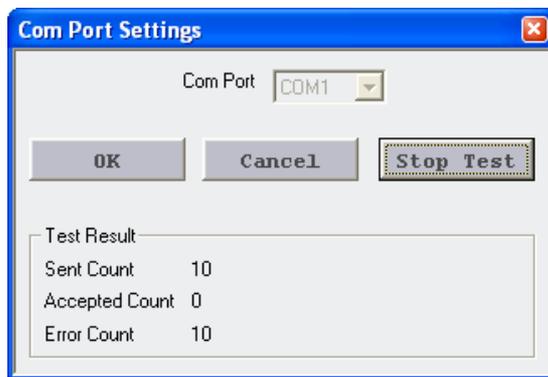

- From the drop down menu of **Options**, select the **COM Port** to which you have connected the communication cable.
- The COM Port Settings dialog box will open.
- Connect the communication cable to the COM Port of the PC.
- Short pin2 and pin3 of the DB-9 connector at the free end of the cable.
- Click the button labeled **Start Test** in the COM Port Settings dialog box.
- After clicking this button, observe the Test Result section on the dialog box.

- The **Error Count** value shows zero, if both the communication cable and the COM port are working.

The above screen shows that the COM Port/communication cable is working.

- If the **Error Count** shows a value other than zero, it means that either the communication cable or the COM port of the PC is faulty.

Above screen shows the faulty COM Port/Communication Cable.

- Remove the communication cable from the COM Port of the PC.
- Short pin2 and pin3 of the communication port of the computer and click 'Start Test' in the COM Port Settings dialog box.
- Now, if the error count is zero, please check the Communication Cable.
- If the error count is not a zero, the COM Port of the PC is faulty. Try another communication port.

The CO Card

The CO Card provides the interface to connect the system with the Two-Wire Analog Trunk lines from the CO Network. The CO Card supports the different standards and features of CO Networks across the world.

The CO Card is available in the following configurations. CO interface is also available in combination with SLT and DKP ports on a single card.

CO Cards for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD CO16	16-port card to connect 16 Two-wire Trunk lines from the CO network
ETERNITY GE CARD CO8	8-port card to connect 8 Two-wire Trunk lines from the CO network
ETERNITY GE CARD CO4+SLT16	Combination card, with 4 CO ports to connect 4 CO analog trunk lines and 16 SLT ports to connect 16 Single Line Telephones
ETERNITY GE CARD CO2+DKP2+SLT16	Combination card, with 2 CO ports to connect 2 Two-wire Trunk lines, 2 DKP ports to connect 2 Digital Key Phones, and 16 SLT ports to connect 16 Single Line Telephones
ETERNITY GE CARD CO4+DKP2+SLT12	Combination card, with 4 ports to connect 4 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones and 12 ports to connect 12 Single Line Telephones. This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .
ETERNITY GE CARD CO4+DKP2+SLT8	Combination card, with 4 ports to connect 4 Two-wire Trunk lines, 2 ports to connect 2 Digital Key Phones and 8 ports to connect 8 Single Line Telephones. This Card supports Power Fail Transfer. To know more, see "Power Fail Transfer" .

The maximum CO Trunk Ports supported are 64.

Connectors

The CO Card has RJ45 connectors, with 4 CO ports on each connector. A multi-pair, MDF cable is supplied for each connector on the card.

LED

The CO16 and CO8 Cards have two LEDs to indicate:

- the health of the card during the Reset Cycle
- the status of a selected Trunk port during normal functioning of the system

You can assign the LED to any CO port on the card which you want to monitor⁸³.

83. To assign the LED to a selected port for monitoring its functioning, you must enter SE mode and dial the SE Command 7902-Slot-LED Number-Port, where Slot is the number of the universal slot in which the card is installed and Port is the port on the card to which the LED is to be assigned to monitor its functioning. LED Number is the number of the LED on the card, which will monitor the port.

Among the combination cards CO2+DKP2+SLT16, CO2+DKP2+SLT8, CO4+CO16, CO4+DKP2+SLT8 have no LEDs. The combination card CO8+SLT8 has two LEDs.

LED Pattern of CO Card

LED 2 (L2)

PORT Status	LED Color	LED Cadence
Commands from Application to CO Port.	GREEN	Toggle ^a
Events to Application from CO Port.	RED	

- a. The current LED state will remain the same until the next command is received from the application on the CO Port. For example, if the current LED state is Green/Red ON, on the next command received, the LED will be turned OFF. It will remain OFF until the next command is received. When the next command is received it will be turned Green/Red ON again. This process continues.

Installing the CO Card

For CO connectivity, you must install at least one of the above mentioned CO Cards in the system.

1. Take all the necessary precautions prescribed for handling the cards and electronic equipment. Make sure that power supply is turned off before you begin the installation of the card. Put on an electrostatic-discharge preventive wrist strap/belt and use a grounding mat.
2. Unpack the CO card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Preserve the filler bracket for future use!
4. Insert the CO Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.
5. Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

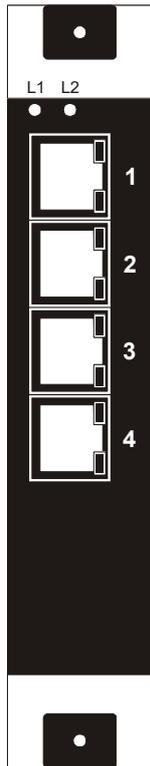

If installing more than one CO Card, it is not necessary to insert the other cards in subsequent slots. Any card can be inserted in any of the Universal Slots.

6. Use the cables supplied for each connector on the CO Card to connect the Trunk Lines with the Main Distribution Frame.

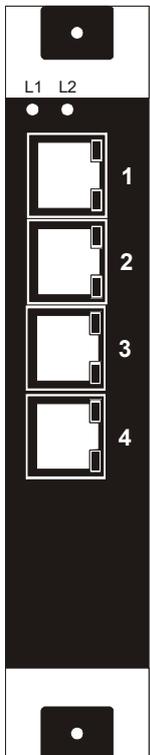

Refer the illustrations below for the pinout details of the connectors on each card.

ETERNITY GE CARD C016

- Plug in the RJ45 end of the Trunk Card cables into the respective connectors. Refer to the connector diagrams illustrated above for each CO Card type.
- Terminate the free end of the CO Card cable into the punch down blocks of the Krone modules designated for 'Trunk Lines' on [“The Main Distribution Frame \(MDF\)”](#).

Trunk cables from the system are to be connected with the Trunk Lines from the PSTN/CO terminated on the MDF. Each wire-pair from the CO Port must be terminated on the bottom of the Krone Connector, while the wire-pair of the trunk line from the CO Network to be connected to this port must be terminated on the top of the Krone Connector.

Refer the topics [“The Main Distribution Frame \(MDF\)”](#) and [“Terminating Trunk and Extension Cables on the MDF”](#).

- Repeat these steps to install other CO Cards, if applicable.

The BRI Card

The BRI Card provides the interface to connect system with ISDN BRI Lines. The BRI lines may be from a public ISDN exchange, a private ISDN exchange.

BRI Cards of ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD BRI4	4-Port card to connect 4 ISDN BRI Lines or ISDN Compatible Devices

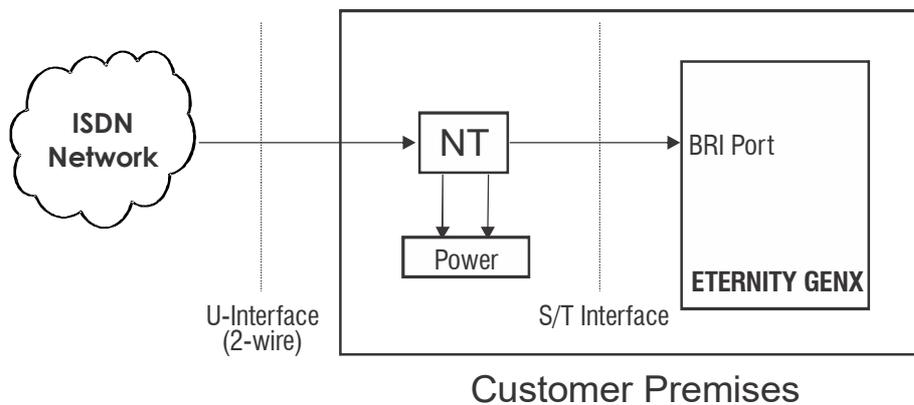

The maximum number of BRI lines supported are 32.

Connectors

The BRI Card has 4 RJ45 Connectors. A separate cable is supplied for each connector.

ISDN BRI - Installation Scenarios

Most ISDN Service Providers also provide the NT1 device along with the BRI line. The BRI Line from the ISDN central office is terminated on the NT1 on the Customer's Premises, as illustrated below.

Where,

- U Interface = between the NT1 equipment and the ISDN central office.
- S/T Interface = between the ISDN user equipment, in this case, ETERNITY GENX and the Network Interface Equipment (NT1).

The BRI line is terminated on the NT1. The S/T interface of the NT1 is connected to BRI port of the ETERNITY GENX.

TE and NT Modes

In this illustration, the BRI line from ISDN Service Provider is directly connected to BRI port of the ETERNITY GENX via the NT1 device. Here, the ETERNITY GENX is the Terminal Equipment, so the BRI Port must be programmed to work in the TE mode.

When an ISDN Phone is to be connected to the BRI port of ETERNITY GENX, the BRI port must be programmed to work in NT mode.

When a BRI port of another ISDN System is to be connected to the BRI port of the ETERNITY GENX, in such a configuration, you may configure

- the BRI port of the other ISDN System in the TE mode and the BRI Port of the ETERNITY GENX in the NT mode.

OR

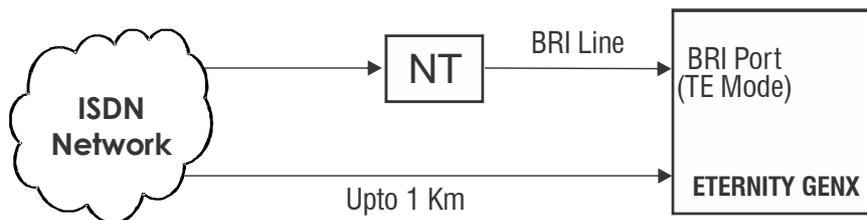

- the BRI port of the other ISDN System in the NT mode and the BRI Port of the ETERNITY GENX in the TE mode

Also refer the topic "[Configuring BRI Trunks](#)" to know more.

Types of BRI Configuration

There are two types of configurations in BRI: Point-to-Point Configuration and Point-to-Multipoint Configuration. Each of these is discussed below.

Point-to-Point Configuration

The maximum distance between the NT (Network Termination, NT1 or NT2) and a single Terminal Equipment, in this case ETERNITY GENX, can be up to 1 kilometer.

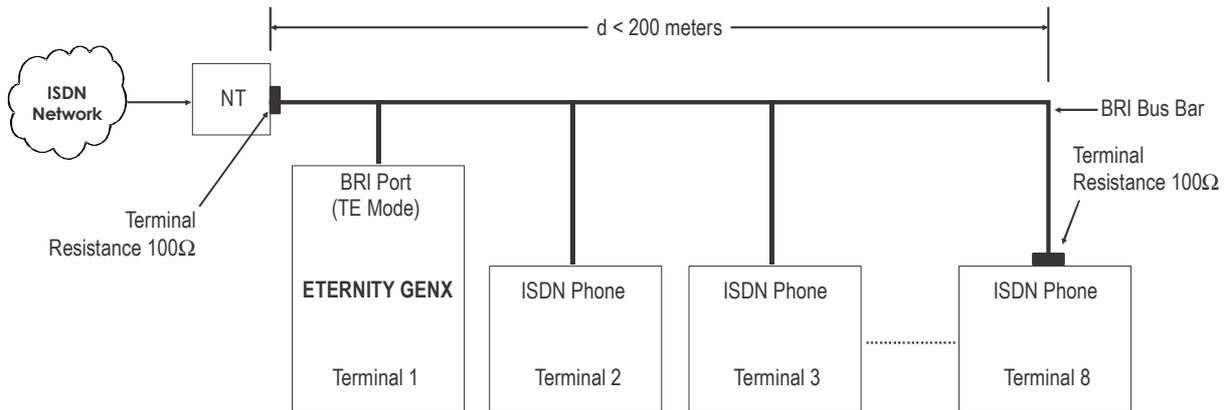

Point-to-Multipoint Configuration

A maximum of 8 ISDN equipment can be connected on a single BRI Bus line in a Point-to-Multipoint configuration.

Further, two configurations are possible in a Point-to-Multipoint configuration:

- a. Short Passive Bus Configuration
- b. Extended Passive Bus Configuration

Short Passive Bus Configuration

Where,

TE = Terminal Equipment or ISDN device (End user device)

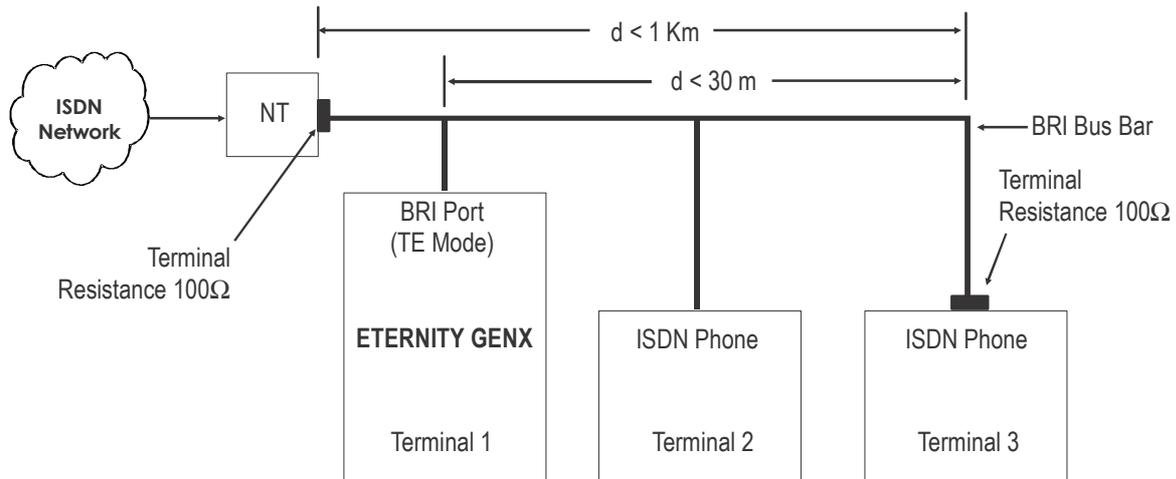

NT = Network Termination provided by the ISDN Service Provider

d = distance from NT to the last TE equipment.

In a Short Passive Bus Configuration,

- A maximum of 8 TEs or ISDN devices can be connected to a single NT on a bus up to 200 meters from the NT.
- 100Ω Terminal Resistance is required to be inserted at the NT side as well as the last TE Equipment as shown in the figure.
- Using this configuration, any subscriber from ETERNITY GENX can access a BRI line and can make outgoing calls. At the same time, another subscriber from ETERNITY GENX or any ISDN phone shown in the figure can make outgoing call from the same BRI. In the same way, incoming calls are possible on the same BRI.
- Only two simultaneous speech paths can be established, as BRI supports 2 voice channels only.
- This configuration is useful on the smaller premises, where a single BRI line and multiple ISDN devices are used.

Extended Passive Bus Configuration

Where,

TE = Terminal equipment of any ISDN Equipment

NT = Network Termination provided by Service Provider

TR Terminal Resistance 100Ω

d = distance from NT to the last TE Equipment

d1 = the total distance from first TE equipment and the last TE equipment.

In an Extended Passive Bus Configuration,

- You can connect only 3 Terminal Equipment or ISDN devices. These devices are grouped together at one end of the bus, with may extend to a distance of up to 1 kilometer from the NT.
- However, all the 3 Terminal Equipment/ISDN devices must be located within a range of 30 meters, as shown in the figure.
- Using this configuration, any subscriber from ETERNITY GENX can access the BRI line and make outgoing calls. At the same time, another subscriber from the ETERNITY GENX or any ISDN phone shown in the figure can make outgoing calls from the same BRI. In the same way, incoming calls are possible on the same BRI.
- Only two simultaneous speech paths can be established, as BRI supports 2 voice channels only.
- This configuration is useful on large premises where a limited number of ISDN devices (maximum 3) are to be used within a range of 30 meters.

Installing the BRI Card

1. Take all the necessary precautions prescribed for handling the cards and electronic equipment: turn off power supply, always wear an electrostatic-discharge preventive wrist strap/belt and use a grounding mat.
2. Unpack the BRI Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket! Preserve it for future use!

Setting Orientation Type of BRI Port

- The BRI Ports can be configured for different applications and can be interfaced directly with the BRI Network with Terminal Equipment like an ISDN Phone, with an ISDN-System.

To connect the BRI Port to the public network, BRI Port must configured in the TE mode.

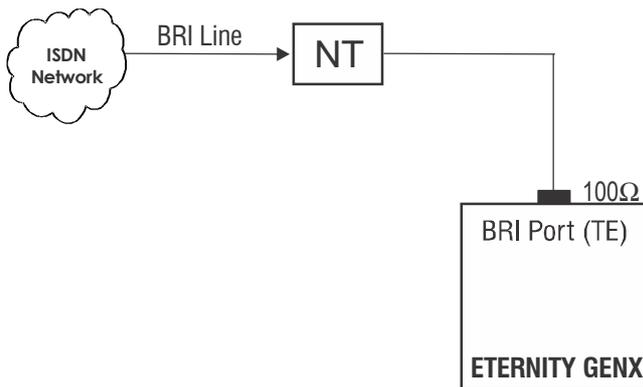

To connect ISDN phones, an ISDN System or any ISDN equipment, the BRI Port must be configured in the NT mode.

By default, BRI Ports are configured in the TE mode.

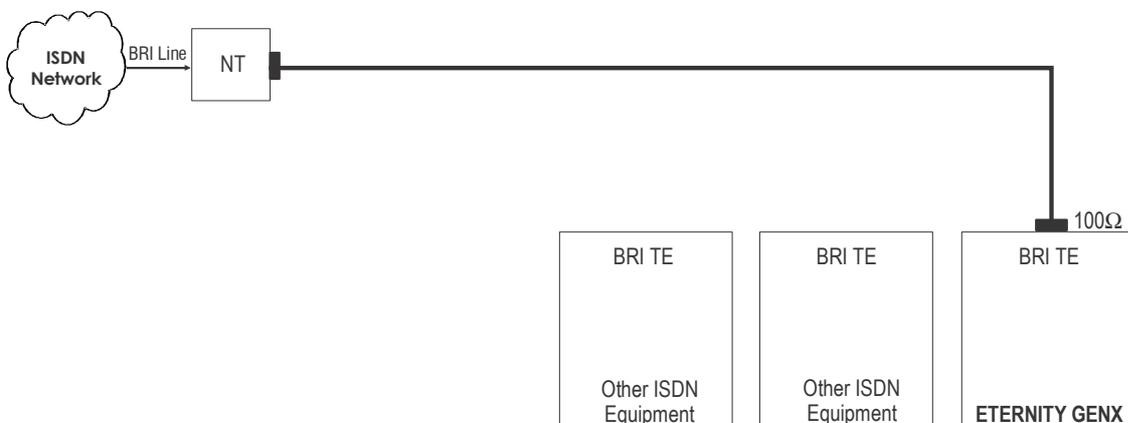

To set Orientation Type of the BRI Port, under **Configuration**, open the **BRI Configuration** link, and under **BRI Parameters**, set the **Orientation Type**.

Inserting Termination Resistance

- Termination of 100Ω should be inserted in the following cases:
 - When the BRI port is configured in the TE mode and connected in a Point-to-Point configuration as shown below.

- When the BRI port is configured in the TE mode in a Point-to-Multipoint configuration as shown below. 100Ω Termination is required on the last Terminal connected on the S0 bus to terminate calls properly.

In a Point-to-Multipoint configuration, 100Ω termination can be provided on either of the following:

- Last TE equipment
- Last point of the bus bar where the last TE equipment is connected.
- When BRI port is configured in the NT mode.
- If the S0 bus itself supports Terminating resistors, Termination Resistance need not be inserted when
 - BRI Port is configured as TE and connected in a Point-to-Point Configuration as illustrated above.
 - BRI Port is configured as NT.
- Termination need not be inserted if the BRI port of ETERNITY GENX (configured in TE mode) is connected as any terminal other than the last terminal on the S0 bus (in a Multi-point configuration).

Termination in TE Equipment (BRI Port)

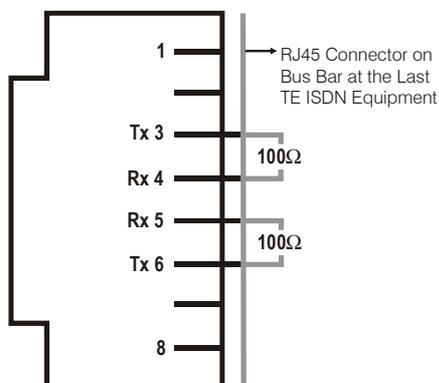

- To set the 100Ω termination on the BRI port set the Jumpers on the BRI module of each port as given in the table below.

Function	Module 1 (M1)				Module 2 (M2)			
	BRI Port 1		BRI Port 2		BRI Port 3		BRI Port 4	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J6	J8	J7	J9	J6	J8	J7	J9
To insert 100Ω termination	AB	AB	AB	AB	AB	AB	AB	AB
To remove 100Ω termination	BC	BC	BC	BC	BC	BC	BC	BC

 By default, Termination Resistance of 100Ω is set on the BRI port (the Jumpers are in AB position)

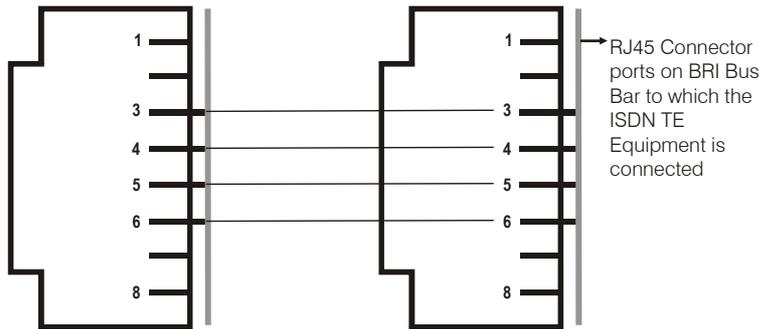

Termination in the Bus Bar

- 100Ω termination resistor can be connected between TX and RX, between pin number 3-4 and 5-6 in the RJ45 connector as illustrated below.

As shown in the application diagrams for Point-to-Multipoint connectivity, each ISDN TE device is connected in a Bus Bar, which may be Short Passive Bus Bar configuration or an Extended Passive Bus Bar configuration.

Illustrated below is the connection diagram of two ports connected with each other on the same BRI bus bar.

- The above figure shows the connection details of two ports on the BRI Bus Bar. Similarly, you can connect 8 ports on the Bus Bar, keeping in mind the Termination Resistor for the NT and the Last TE on the Bus bar.
- Pin number 3, 4, 5 and 6 of the RJ45 connector are used for connectivity.
- Pin number 3 and 6 are used for Transmit (Tx) and pin number 4 and 5 are used for Receive (Rx) from the ISDN TE side.
- Pin number 3 and 6 are used for Receive (Rx) and pin number 4 and 5 are used for Transmit (Tx) from the NT side.

Feeding Power to the Terminal

- When the BRI Port of the ETERNITY GENX is used as BRI-NT, you can feed power to the terminal equipment connected to the BRI-NT Port from the ETERNITY GENX.

To do this,

- Enable Feed Power on the BRI Port. For instructions see Power Feed under [“Configuring BRI Trunks”](#).
- By default, the Jumpers are set in AB position to feed power through Tx and Rx wires (Phantom Power). If you want to feed power through a separate pair of wires, you may change the position of the Jumpers on the BRI module as mentioned in the table below.

Function	Module 1 (M1)				Module 2 (M2)			
	BRI Port 1		BRI Port 2		BRI Port 3		BRI Port 4	
	Jumper Position		Jumper Position		Jumper Position		Jumper Position	
	J4	J5	J2	J3	J4	J5	J2	J3
To feed power on Tx and Rx wires (Phantom Power)	AB	AB	AB	AB	AB	AB	AB	AB
To feed power on separate pair of wires	BC	BC	BC	BC	BC	BC	BC	BC

- The maximum power that can be fed to a single BRI port is 50mA.
- From signaling point of view, a maximum of 8 terminal equipment can be connected on the BRI port configured in the NT mode.
- The number of ISDN Terminals that can be connected on the BRI port configured in the NT mode depends on the power consumed by the ISDN terminals.

9. Insert the BRI Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.

Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

If installing more than one BRI Card, it is not necessary to insert the other cards in subsequent slots. Any card can be inserted in any of the Universal Slots. Remember to set the Orientation Type, Termination Resistance and Power Feed, as required.

10. Use the straight cables supplied for each connector on the BRI card to connect the BRI Ports to the NT1 device supplied by your ISDN service provider. Refer the configuration and pinout details given below for guidance.

Configuration details of the U interface (RJ-45) at NT1

Pin Number	Pin Details
4	Tx
5	Rx

Configuration details of the S/T interface (RJ-45) on NT1

Pin Number	Pin Details
3	Rx1
4	Tx1
5	Tx2
6	Rx2

Pinout and Cable Details of BRI4 Port in TE Mode

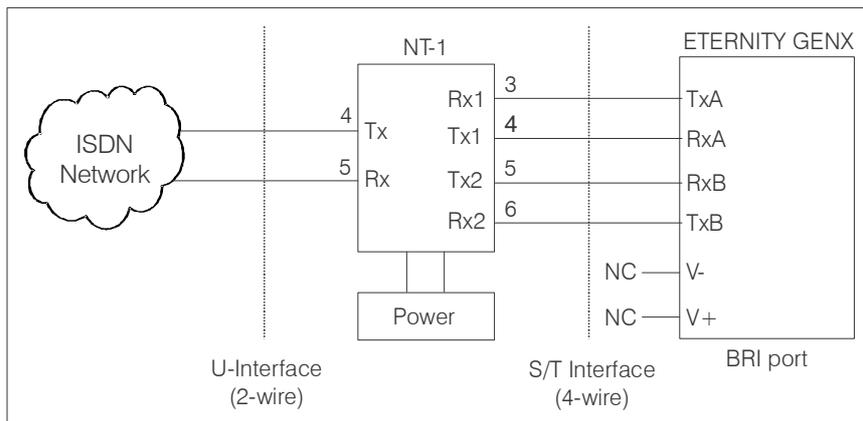

Pin	Color	Connection
1	Orange-White	Not connected
2	Orange	Not connected
3	Green-White	TxA
4	Blue	RxA
5	Blue-White	RxB
6	Green	TxB

Pin	Color	Connection
7	Brown-White	V-
8	Brown	V+

Pinout and Cable Details of BRI4 Port in NT Mode

Pin	Color	Connection
1	Orange-White	Not connected
2	Orange	Not connected
3	Green-White	RxA
4	Blue	TxA
5	Blue-White	TxB
6	Green	RxB
7	Brown-White	V-
8	Brown	V+

The following diagram shows how to connect a BRI Line to the BRI port in the TE mode.

- If you have completed all other installation tasks, you may turn ON the system and observe the Reset Cycle and the LED pattern of the BRI Card.

LED Pattern of the BRI Card

The BRI4 Card has an LED for each port: L1, L2, L3, L4.

The LEDs show the Status of the Ports as summarized in the table below:

Port Status	LED Color	LED Cadence
Port is not active	RED	Continuously ON
Port is active	GREEN	Continuously ON

The T1E1PRI Card

The ETERNITY GE CARD T1E1PRI Single provides the interface to connect the system to ISDN PRI Network.

When connected to T1 carrier lines, the Card supports the following signaling types:

- PRI
- Robbed Bit Signaling
- Q-Signaling (QSIG)
- E&M

When connected to E1 carrier lines, the Card supports the following signaling types:

- PRI
- Channel Associated Signaling (CAS)
- Q-Signaling (QSIG)
- E&M

T1E1PRI Card for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD T1E1PRI Single	1-Port card with QSIG support to connect 1 ISDN T1/E1 PRI Line or ISDN Compatible Device

The maximum number of PRI Lines supported are 8.

Connectors

The T1E1PRI Card has an RJ45 Connector. A cable with RJ45 plugs on both ends is supplied for the connector.

LEDs

The ETERNITY GE CARD T1E1PRI Single has 2 LEDs - L1 and L2 - for indicating the port states.

Installing the T1E1PRI Card

1. Before installing the card, take the necessary precautions prescribed for handling the cards. Always wear an electrostatic-discharge preventive wrist strap and use a grounding mat. Make sure the power supply is turned off.
2. Unpack the T1E1PRI Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket.

Setting Line Termination Resistor

- To set the Line Termination Resistor for the PRI Port for T1 or E1 Connectivity, you must change the position of the jumper J5. Refer the table below.

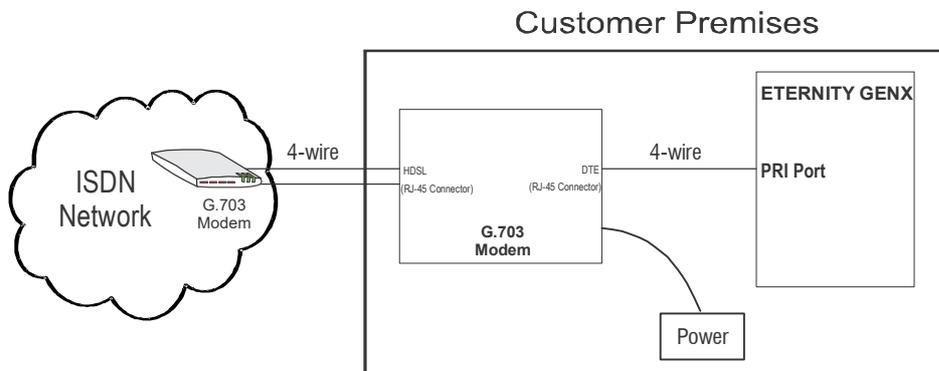

Jumper	Position	Meaning
J5	BC	To set termination resistance of 120Ω for E1 connectivity
J5	AB	To set termination resistance of 100Ω for T1 connectivity

- By default J5 is set to BC position to provide 120Ω termination resistance for E1 connectivity.
 - To set 100Ω termination resistance for T1 connectivity, set jumper J5 to AB position.
- Insert the T1E1PRI Card into the guide rails of the free slot you selected for the card. Make sure that the connectors on the card make perfect contact with those of the slot on the backplane motherboard.
 - Now, press down the levers on the card mounting brackets to secure the card in its slot. Fix the card in place with the two screws provided.

Connecting ISDN T1/E1 PRI Lines

- Use the cable supplied with the T1E1PRI Card to connect the system to the T1/E1 PRI network interface equipment (modem), which is usually supplied by your ISDN Service Provider along with the PRI line.

The diagram below illustrates this.

- Most Service Providers insist on connecting an ISDN modem at both the ends of the PRI line—one at the Local Exchange and other at the Customer's Premises.
 - At the Customer's Premises, the PRI line is terminated on the HDSL interface of the modem.
 - The DTE interface of the modem is to be connected to the PRI port (RJ-45 connector on the ETERNITY GE T1E1PRI Card).
- Plug in one end of the RJ45 cable supplied with the card into the card's connector. Plug the other end of the RJ45 cable into the Network Termination Unit.
 - Refer the following pin details for connecting the Network Termination Unit with the system.

Pin details of HDSL Interface of the G.703 Modem. (HDSL Network Termination Unit)

Pin Number	Pin Details
1	Line A
2	Line A
3	Not used
4	Line B
5	Line B
6	Not used
7	Not used
8	Not used

Pin details of DTE Interface of G.703 Modem. (HDSL Network Interface Unit)

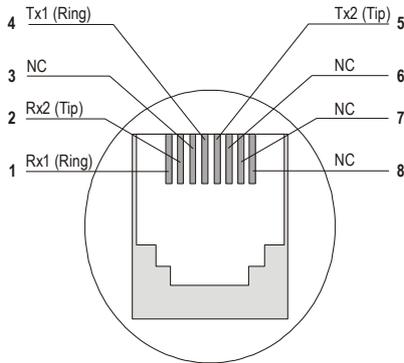

Pin Number	Pin Details
1	TX1 (Tip)
2	TX2 (Ring)
3	Not used
4	RX1 (Ring)
5	RX2 (Tip)
6	Not used
7	Not used
8	Not used

Most of the HDSL Network Termination Unit manufacturers use these connectors. But you are advised to read the installation guide of the HDSL Network Termination Unit being used by you.

Pin details of ETERNITY GENX T1E1PR1 Port

The T1E1PRI Port of the system terminates in an 8-pin RJ45, female connector and is wired according to the table below.

The cable wires may have to be crossed depending on the pinout of the DTE Interface of the modem.

10. Repeat the same steps to install another card. It is not necessary to install the other T1E1PRI Cards in a sequence. Any card can be installed in any of the slots.
11. If you have completed all other installation tasks. Power the system. After the Reset Cycle, observe the LED patterns of the T1E1PRI Card.

LED Patterns

The ETERNITY GE CARD T1E1PRI has 2 LEDs: L1 and L2. Given below are the LED Patterns defined for each port state in the different signaling types supported by the system.

1. Port Active Mode

Signaling Type: E1-PRI

LED1 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF
LOS Alarm	RED	Continuous ON

LED2 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: E1-CAS

LED1 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
MFA Alarm	RED	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF
LOS Alarm	RED	Continuous ON

LED2 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
Y-Bit Alarm	GREEN	100ms ON-100 ms OFF
AIS16 Alarm	RED	100ms ON-100 ms OFF
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: T1-RBS or T1-PRI

LED1 Pattern:

Port Status	Color	Cadence
No Alarm	GREEN	Continuous ON
TFA Alarm or MFA Alarm	RED	500ms ON-500 ms OFF
AIS Alarm	RED	100ms ON-100 ms OFF
LOS Alarm	RED	Continuous ON

LED2 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI or LOS Alarm	RED	Continuous ON

2. Port Maintenance Mode

LED1 Pattern:

Port Status	Color	Cadence
Maintenance Mode	RED -GREEN	500 ms RED-500 ms GREEN

LED2 Pattern:

Port Status	Color	Cadence
Near end loop back wait Before activate	RED	100ms ON-100 ms OFF
Near end loop active	RED	Continuous ON
Near end loop back wait Before deactivate	RED	500ms ON-500 ms OFF
Far end loop back wait after activate	GREEN	100ms ON-100 ms OFF
Far end loop active	GREEN	Continuous ON
Far end loop back wait after deactivate	GREEN	500ms ON-500 ms OFF

3. Port Disable Mode

LED1 Pattern:

Port Status	Color	Cadence
Port Disable	RED	Continuous ON

LED2 Pattern:

Port Status	Color	Cadence
Port Disabled	OFF	OFF

The E1FO Card

The ETERNITY GE CARD E1FO provides the interface to connect the system to the ISDN PRI Network. For E1 carrier lines the card supports the signaling types PRI, Q-Sig and CAS. For T1 carrier lines the card supports the signaling types PRI, Q-Sig and Robbed Bit Signaling. The T1/E1 ports can be set in Terminal or Network mode.

The E1FO Card supports Copper and Fiber Optic (FO) interfaces. At a time, either the Copper interface or the FO interface can be used. The FO interface supports only Single-mode (Mono mode) fiber connectivity and will work within a range of 30km.

E1 connectivity is supported over, the Copper interface as well as the Fiber Optic interface. The T1 connectivity is supported over the Copper interface only.

E1FO Card for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD E1FO Single	1-Port card to connect 1 ISDN T1/E1 Line on copper interface or E1 line on Fiber Optic (FO) interface.

Connectors

The E1FO Card has one RJ45 Connector and one Fiber Optic connector.

LEDs

The ETERNITY GE E1FO Card has 2 LEDs - L1 and L2 - for indicating the port states.

Installing the E1FO Card

1. Before installing the card, take the necessary precautions prescribed for handling the cards. Always wear an electrostatic-discharge preventive wrist strap and use a grounding mat. Make sure the power supply is turned off.
2. Unpack the E1FO Card and check the package contents.
3. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket.

Setting Line Termination Resistor

4. To set the Line Termination Resistor for the Port for T1 or E1 Connectivity, you must change the position of the jumper J5. Refer the table below.

Jumper	Position	Meaning
J5	BC	To set termination resistance of 120Ω for E1 connectivity
J5	AB	To set termination resistance of 100Ω for T1 connectivity

- By default J5 is set to BC position to provide 120Ω termination resistance for E1 connectivity.

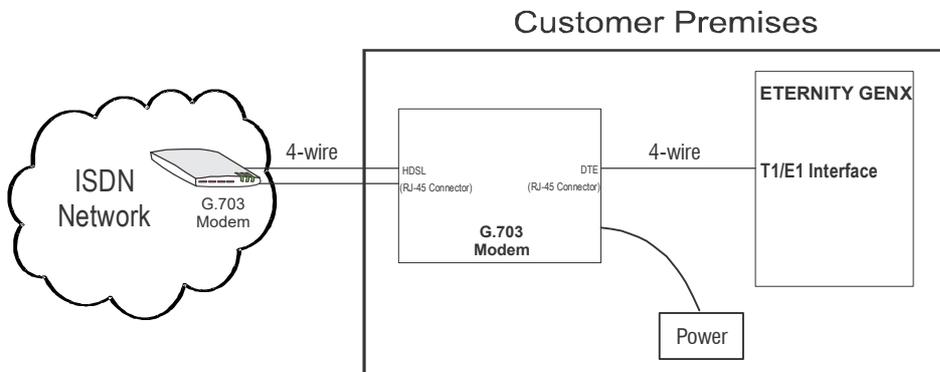

- To set 100Ω termination resistance for T1 connectivity, set jumper J5 to AB position.
5. Insert the E1FO Card into the guide rails of the free slot you selected for the card. Make sure that the connectors on the card make perfect contact with those of the slot on the backplane motherboard.
 6. Now, press down the levers on the card mounting brackets to secure the card in its slot. Fix the card in place with the two screws provided.

Connecting the T1/E1 Lines

Copper Interface Connectivity

7. Use the cable to connect the T1/E1 Port to the T1/E1 network interface equipment (modem), which is usually supplied by your ISDN Service Provider along with the PRI line.

The diagram below illustrates this.

- Most Service Providers insist on connecting an ISDN modem at both the ends of the PRI line—one at the Local Exchange and other at the Customer's Premises.
 - At the Customer's Premises, the PRI line is terminated on the HDSL interface of the modem.
 - The DTE interface of the modem is to be connected to the PRI port (RJ45 connector on the Matrix ETERNITY GE CARD E1FOPRI Single).
8. Plug in one end of the RJ45 cable into the card's connector. Plug the other end of the RJ45 cable into the Network Termination Unit.
 9. Refer the following pin details for connecting the Network Termination Unit with the system.

Pin details of HDSL Interface of the G.703 Modem. (HDSL Network Termination Unit)

Pin Number	Pin Details
1	Line A
2	Line A
3	Not used
4	Line B
5	Line B

Pin Number	Pin Details
6	Not used
7	Not used
8	Not used

Pin details of DTE Interface of G.703 Modem. (HDSL Network Interface Unit)

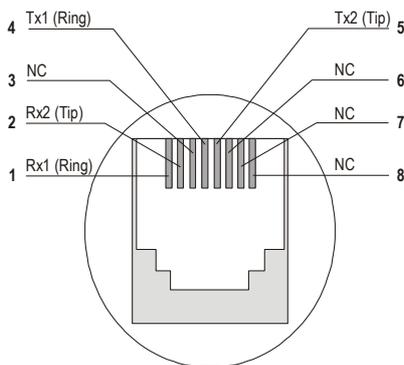

Pin Number	Pin Details
1	TX1 (Tip)
2	TX2 (Ring)
3	Not used
4	RX1 (Ring)
5	RX2 (Tip)
6	Not used
7	Not used
8	Not used

Most of the HDSL Network Termination Unit manufacturers use these connectors. But you are advised to read the installation guide of the HDSL Network Termination Unit being used by you.

Pin details of the T1/E1 PRI Interface

The T1/E1 Interface of the ETERNITY GE CARD E1FOPRI Single terminates in an 8-pin RJ45, female connector and is wired according to the table below.

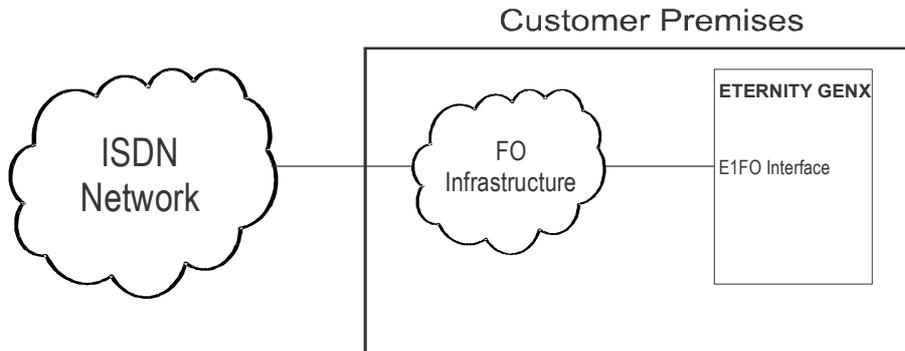

The cable wires may have to be crossed depending on the pinout of the DTE Interface of the modem.

Fiber Optic Interface Connectivity

- *Fiber Optic interface supports E1 connectivity only.*
- *The Fiber Option (FO) interface supports only Single-mode (Mono mode) fiber connectivity and will work within a range of 30km.*

10. If your service provider provides Fiber Optic connectivity or you have an existing Fiber Optic infrastructure, you can connect the FO line to the E1FO interface of the E1FO Card.

To use Fiber Optic interface, make sure you select **Line Coding Mechanism** as **NRZ (Fiber Optic)**. For details, see [“Configuring E1 Trunks”](#).

11. Repeat the same steps to install another card. It is not necessary to install the other E1FO Cards in a sequence. Any card can be installed in any of the slots.
12. If you have completed all other installation tasks. Power the system. After the Reset Cycle, observe the LED patterns of the E1FO Card.

LED Patterns

The ETERNITY GE E1FO Card has 2 LEDs: L1 and L2. Given below are the LED Patterns defined for each port state in the different signaling types supported.

1. Port Active Mode

Signaling Type: E1-PRI

LED1 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF
LOS Alarm	RED	Continuous ON

LED2 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
RAI Alarm	RED	500ms ON-500 ms OFF
AIS or LOS Alarm	RED	Continuous ON

Signaling Type: E1-CAS

LED1 Pattern:

Port Status	Color	Cadence
Layer 1 established successfully	GREEN	Continuous ON
CRC4 Alarm	GREEN	100ms ON-100 ms OFF
MFA Alarm	RED	100ms ON-100 ms OFF
BFA Alarm	RED	500ms ON-500 ms OFF

The E&M Card

The E&M Card of the system provides the interface for analog trunking to connect various communication equipment telephone switches, Routers, Leased Lines, etc. using Tie-Lines.

The E&M Card is required for the following applications:

- Power Line Carrier Communication (PLCC) Networks, where several systems are connected with each other through E&M tie lines. Refer [“PLCC-An Introduction”](#) to know more.
- [“Closed User Group \(CUG\)”](#), where several systems are connected with each other through E&M tie lines⁸⁴.
- System expansion, where two systems are connected with each other with E&M tie lines.
- Connecting remote systems over E&M tie lines.

Refer the topic [“E&M Connectivity”](#) to know more.

An E&M Port can be programmed to behave as a Trunk Interface, a Subscriber (Station) Interface or both, as a Tie Line with the dual personality of a Trunk and a Subscriber.

The E&M Card supports

- E&M Interface - Types IV and V
- Speech Interface - Two-wire and four-wire.
- E&M Trunk Seizure Type⁸⁵: Immediate, Immediate + Wink, Immediate with Ack, Immediate with Ack+Wink, Seizure Pulse, Seizure Pulse + Wink, Express, and Compander Control Signal.
- Address Signaling: Pulse dial (Pulse 10PPS, Pulse 20PPS) and Tone Dial (DTMF).

E&M Card for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD E&M4	4-port card to connect 4 E&M Tie Lines

The maximum number of E&M ports supported are 32.

Connectors

The E&M Card has RJ45 Connectors. A separate MDF cable is supplied for each connector.

LEDs

The ETERNITY GE E&M4 Card has 4 LEDs to indicate the functioning of the ports.

84. The Systems in a [“Closed User Group \(CUG\)”](#) can be connected over ISDN T1E1PRI Lines as well. Refer the topic [Closed User Groups to know more](#).

85. This is the line protocol that defines how the equipment seizes the E&M trunk. Also referred to as Start Dial Supervision Signaling Protocol.

Installing the E&M Card

An E&M port can be programmed to take on the function of:

- **a Station** - works like an extension interface, receiving incoming calls.

OR

- **a Trunk** - works like a trunk interface when any of the extensions of the system makes an outgoing call through it.

OR

- **a Tie Line** - takes on a dual personality: functioning as both as an extension and a trunk. The E&M port works like an extension interface for incoming calls. It works like a trunk interface when any extension makes an outgoing call through it.

This dual function is used in systems that are used as Transit Exchanges as in a PLCC Network. Read ["PLCC-An Introduction"](#) to know more.

You cannot connect a trunk line or an SLT / DKP to an E&M port.

1. Have the necessary wiring for the E&M Analog trunk in place. Take the necessary safety precautions before you begin handling the card; switch off power supply and always wear an antistatic wrist strap and use a grounding mat.
2. Unpack the E&M Card and check the package contents.
3. The E&M Card supports E&M Interface Type IV and Type V connection. To select the appropriate Interface Type out of the two, you need to change the Jumper Settings.

Refer the table below to select the desired Interface Type and Speech Interface.

Jumper Number	Position	Function
J1 and J2	AB	Type IV E&M Interface
	BC	Type V E&M Interface

- By default all the E&M Ports are set to support Type-IV.
 - To select the Type-V connection for the E&M Port, set Jumpers J1 and J2 (located on the E&M module) in BC Position.
4. Select the speech interface - 2-wire speech or 4-wire speech - as required, by changing the jumper settings. Refer the table below.

Jumper Number	Position	Function
J3 and J4	AB	4-wire speech interface
	BC	2-wire speech interface

- By default all the E&M Ports are set to support 2-wire Speech Interface.

- To select 2-wire speech interface for the E&M Port, set Jumpers J3 and J4 (given on E&M module) to BC Position.
- To select 4-wire speech interface for the E&M Port, set Jumpers J3 and J4 on E&M module to AB Position.

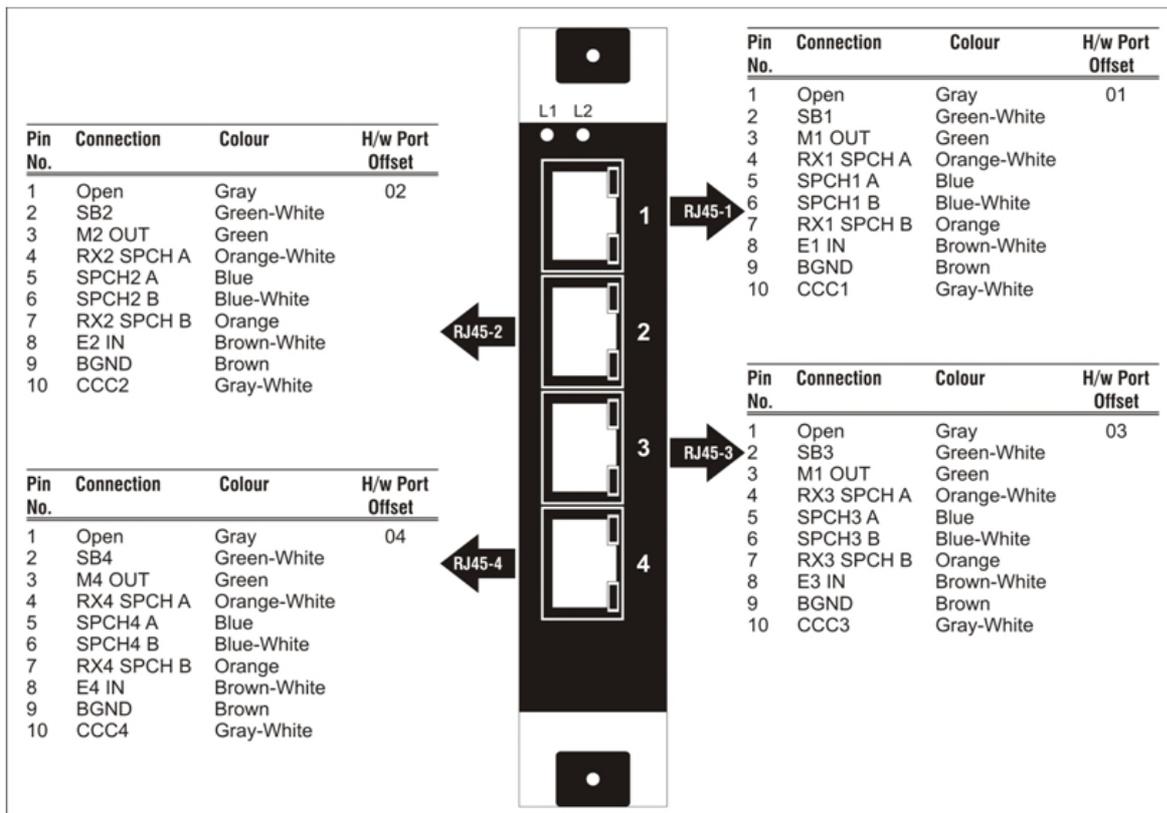

Keep Jumper number J5 in BC position and Jumper number J6 in BC/Open position.

- Now, select a free slot for the E&M Card. Unscrew and remove the filler bracket by pushing up the levers on the bracket. Preserve the filler bracket for future use.
- Insert the E&M Card into guide rails of the empty slot. Make sure the connectors on the card make perfect contact with those on the backplane motherboard. Secure the card by pressing down the levers and fix the bracket with the screws provided with the card.
- Connect the cables supplied with the E&M Card into the RJ45 connectors on the E&M Card.
- Connect the free ends of the cables into the E&M Ports of the other System/PBX/Router/Tie Line equipment by appropriate crossing of the wires.

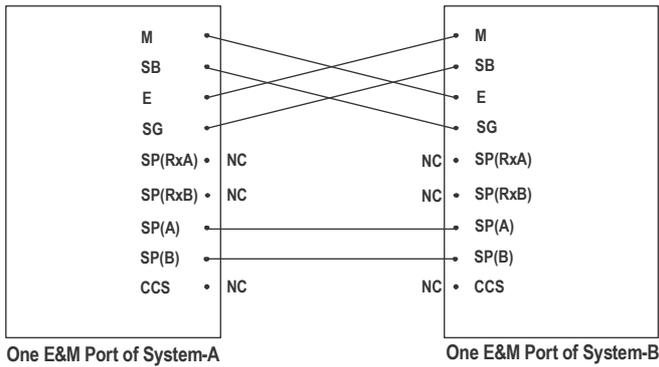

Refer the following pin-out details for the E&M Card and for each Interface and Speech Interface Type.

Pinout details of ETERNITY GE CARD E&M4

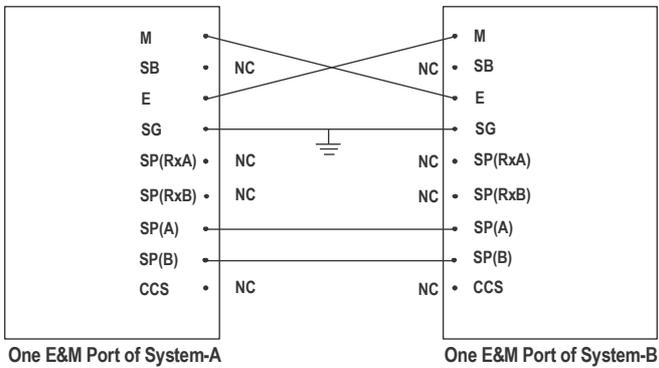

2 Wire, Type IV E&M Connection

2 Wire / Type IV E&M Connection

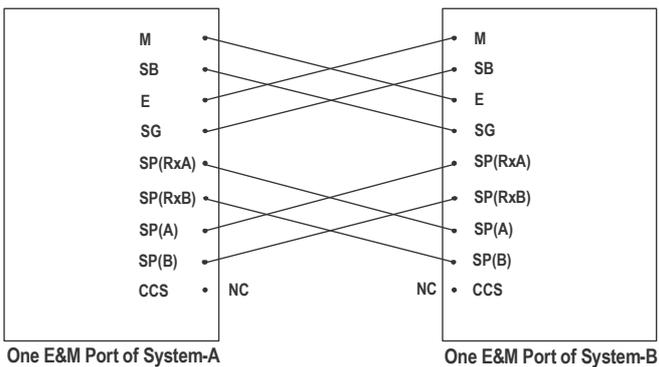

2 Wire, Type V E&M Connection

2 Wire / Type V E&M Connection

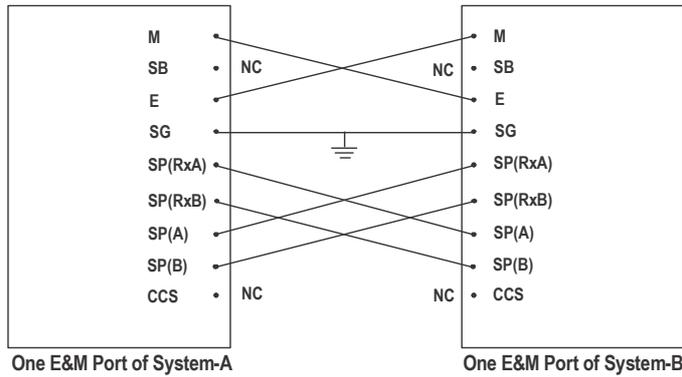

4 Wire, Type IV E&M Connection

4 Wire / Type IV E&M Connection

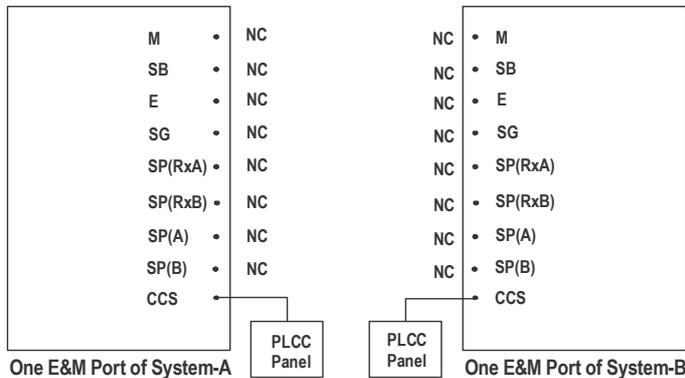

4 Wire, Type V E&M Connection

4 Wire / Type V E&M Connection

- If you are connecting two PLCC EPAX in a Power Line Carrier Communication Network Componder Control Signal (CCS) Connection should be made as illustrated in the block diagram below for any of the four combinations of E&M and Speech Interfaces illustrated in the previous step.

Componder Control Signal (CCS) is a special type of signal used by Power Line Carrier Communication Networks to improve quality of speech transmission. The PLCC network expects this signal from the system when speech is established and the E&M Card supports this facility. The system sends CCS signal to the PLCC panel.

- When the E&M port is used as an Endpoint; the system sends a CCS to the PLCC panel while making an outgoing call through the E&M port or when a call is received at the E&M port.
 - When the E&M port is used for Transit Exchange; the system sends a CCS to the PLCC panel while there is a Transit call through the E&M port.
- If you have completed all installation tasks, power ON the system, observe the Reset Cycle and the LED pattern of the E&M Card.

LED Pattern of E&M Card

Stage	LED Color	LED Cadence
At Power ON		LED OFF
After 30-60 seconds		LED OFF

Stage	LED Color	LED Cadence
After 60-90 seconds	RED	L1, L2, L3, L4 ON 500ms - L1, L2, L3, L4 OFF
	GREEN	L1, L2, L3, L4 ON 500ms - L1, L2, L3, L4 OFF
After 65-95 seconds	RED	L1, L2 L3, L4 ON 500ms - L1, L2, L3, L4 OFF
	GREEN	L1, L2 L3, L4 ON 500ms - L1, L2, L3, L4 OFF
Normal (Port Event)		
M-Wire High	Green	LED of the Port continuously ON
M-Wire Low		LED of the Port continuously OFF
E-Wire High	Red	LED of the Port continuously ON
E-Wire Low		LED of the Port continuously OFF
E-Wire and M-Wire High	Orange	LED of the Port continuously ON

The Mobile Card

The Mobile Card interfaces the system with GSM/3G/CDMA/LTE networks. It routes calls made and received over mobile networks, like a mobile handset.

The Mobile Cards are available in CDMA, 2G, 3G and 4G variants.

The Mobile Card does not support GPRS features, Fax and Data services, network supported services, except CLIR and USSD.

For compatibility and use of Matrix GSM products (2G/3G/4G) in Russia and Iran Province connect with Matrix Sales or Technical Support Team.

The Mobile Card for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD GSM4	<p>4-port card to connect to 4 GSM networks (4 SIM Cards can be installed). To know more, refer to “ETERNITY GE CARD GSM4/GSM4 3G/CDMA2 without SIM Hot-swap”.</p> <p>For Hardware Design V2R2, CPLD V2R2 and PCB V2R1 This version onwards SIM Hot Swap is supported, that is the SIM card can be removed and inserted in the SIM Slots without turning off the system. To know more, refer to “ETERNITY GE Card GSM4/GSM4 3G/GSM4 4G with SIM Hot-swap”.</p>
ETERNITY GE CARD GSM4 3G	<p>4-port card to connect to 4 GSM networks with 3G support (4 SIM Cards can be installed).</p> <p>For Hardware Design V2R2, CPLD V2R2 and PCB V2R1 This version onwards SIM Hot Swap is supported, that is the SIM card can be removed and inserted in the SIM Slots without turning off the system. To know more, refer to “ETERNITY GE Card GSM4/GSM4 3G/GSM4 4G with SIM Hot-swap”.</p>
ETERNITY GE CARD GSM4 4G	<p>4-port card to connect to 4 GSM networks with 4G support (4 SIM Cards can be installed). To know more, refer to “ETERNITY GE Card GSM4/GSM4 3G/GSM4 4G with SIM Hot-swap”.</p>
ETERNITY GE CARD CDMA2	<p>2-port card to connect to 2 CDMA networks (2 RUIM Cards can be installed).</p> <p>Cards with Version V4R1 cannot be downgraded to earlier versions.</p>

If you are installing CDMA Mobile Card in your system, it is recommended to avoid using features that support DTMF Detection.

The features where the caller is asked to dial digits and the system has to detect it, for example, DID, Voice Mail Auto Attendant etc might not work efficiently.

Just like mobile handsets, each Mobile Port has a unique IMEI (International Mobile Equipment Identity) number, pasted on the mobile engine.

The maximum Mobile ports supported are 40.
SIM cards from different service providers can be used.

Antenna

ETERNITY GE CARD GSM4 has a single antenna for the four ports. A splitter connects all the four ports on the card into a single antenna. An antenna cable is also provided, giving you the flexibility to move the antenna to another position (in case of weak signal).

Personal Identification Number (PIN)⁸⁶

The SIM cards can be protected from unauthorized use by programming a Personal Identification Number (PIN) on the SIM. If the wrong SIM PIN is entered thrice in a row, by a user, the SIM card suspects the user and asks for the Personal Unlock Keyword (PUK).

Installing the Mobile Card

To be able to connect the system to GSM/3G/4G/CDMA networks, you must have one of the above mobile cards installed in the system.

1. To install the Mobile Card,
 - If using a GSM/3G/4G/CDMA card, get the SIM Card from the GSM/3G/4G/CDMA service provider of your choice ready. Use SIM PIN protection⁸⁷, if required.

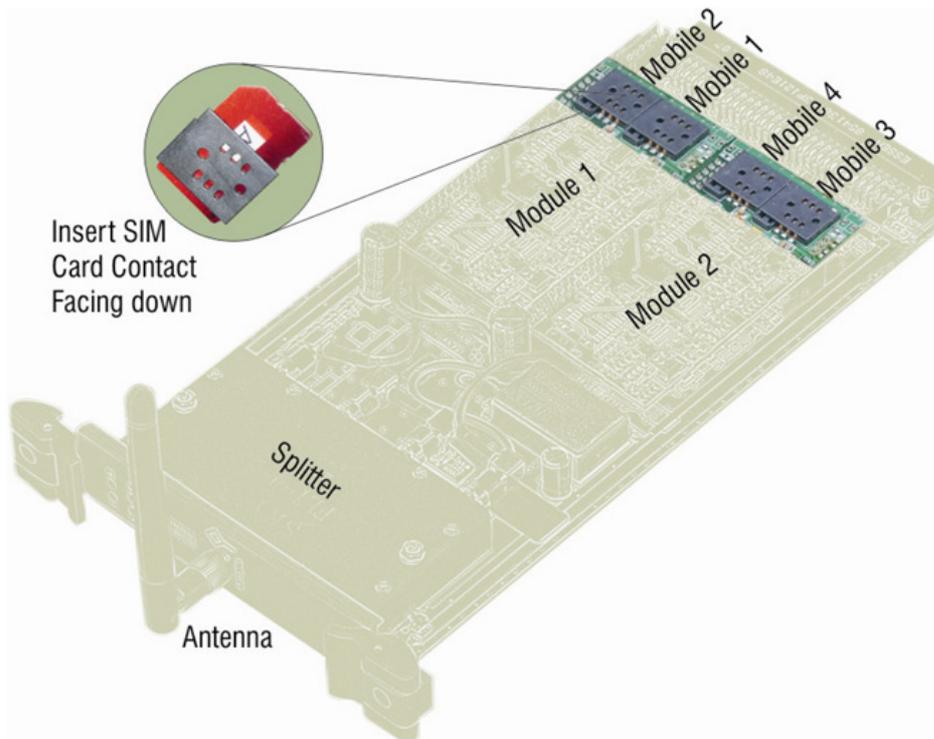

Disable Call Waiting in the SIM, else it may result in call disconnection.

2. Make sure that the system is installed at a location where sufficient network coverage is available. The power supply should be turned off, and you must be wearing an electrostatic discharge preventive wrist strap and must have a grounding mat, before you begin handling the card.
3. Unpack the Mobile Card and verify the package contents.

^{86.} Not applicable if you are installing CDMA Mobile Card in your system.

^{87.} SIM PIN Protection is not applicable if you are installing CDMA Mobile Card.

ETERNITY GE CARD GSM4/GSM4 3G/CDMA2⁸⁸ without SIM Hot-swap

Enabling PIN Protection on SIM⁸⁹

4. For the 2G/3G/CDMA Card, enable SIM PIN before installing the SIM card in the system.
 - insert the SIM into a mobile handset first.
 - enable PIN Protection from the mobile handset.
 - change the SIM PIN to 1234 (this is the default PIN for all SIM cards used in the system). Changing the SIM PIN to '1234' enables you to change the SIM PIN from the Jeeves later (Refer SIM PIN under [“Configuring Mobile Trunks”](#) for instructions).
 - remove the SIM from the mobile handset.

If you do not want to use PIN protection, insert the SIM in the mobile handset and disable PIN protection. Remove the SIM Card from the mobile handset.

5. Insert the SIM card (PIN changed to 1234), with its connector side down into the SIM holder on the Mobile card. You can insert multiple SIM cards of the same GSM service provider or of different service providers.
6. Insert the Mobile Card into the guide rails of the Universal Slot you have selected for this card. Make sure that the card is inserted deep enough to make perfect contact with the connectors in the backplane. Now, press down the levers on the card mount bracket to secure the card in its slot.
7. Connect the antenna provided with the card on the splitter connector on the front panel of the card. You may also use the antenna cable to place the antenna at another position.
8. Repeat Steps 1-7 to insert another Mobile Card.

88. Insert RUIM Card instead of SIM Card if you are installing CDMA Mobile Card. Insert the RUIM Cards in Mobile 1 and 2.

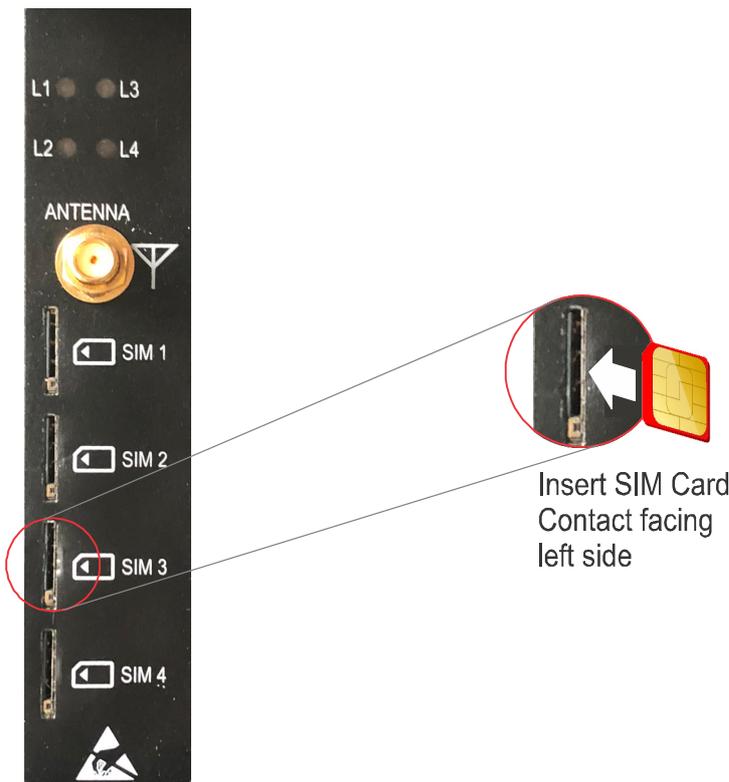

89. Disable PIN Protection on RUIM if you are installing CDMA Mobile Card in your system.

9. If you have completed all installations tasks, power the system.
10. Wait for the system to register with the Mobile network. By default, the Mobile ports are set to select and register with the Mobile networks automatically. Now, observe the LED Patterns of the Mobile Ports.

- *At every power up of the system, it takes about 3 minutes for the Mobile ports to get registered with the network. Once registration with the GSM network is completed, the mobile port can be used.*
- *Each time the Mobile Port sends a request, such as Registration Request, the system waits for the duration of the Network Response Timer. This Timer signifies the time for which the Mobile Port waits for a response from the Mobile network. It is fixed for 150 seconds for all Mobile ports.*

ETERNITY GE Card GSM4/GSM4 3G/GSM4 4G with SIM Hot-swap

Enabling PIN Protection on SIM

4. For the 2G/3G/4G Card, enable SIM PIN before installing the SIM card in the system.
 - insert the SIM into a mobile handset first.
 - enable PIN Protection from the mobile handset.
 - change the SIM PIN to 1234 (this is the default PIN for all SIM cards used in the system). Changing the SIM PIN to '1234' enables you to change the SIM PIN from the Jeeves later (Refer SIM PIN under [“Configuring Mobile Trunks”](#) for instructions).
 - remove the SIM from the mobile handset.

If you do not want to use PIN protection, insert the SIM in the mobile handset and disable PIN protection. Remove the SIM Card from the mobile handset.

5. Insert the SIM with its contact side facing left into the SIM slot located on the fascia of ETERNITY GE Card.

6. Push the SIM backwards into the slot until you hear a click and the SIM is locked in place.
7. To unlock the SIM, push the protruded portion of the SIM backwards again and release it.

The Mobile cards with SIM Hot - swap are designed keeping in mind the Standard Nano SIM size. In case, you face any issues due to the SIM size, contact your respective Service Provider for assistance.

8. Repeat the same steps to insert another SIM Card. You can insert multiple SIM cards of the same GSM service provider or of different service providers.
9. Insert the Mobile Card into the guide rails of the Universal Slot you have selected for this card. Make sure that the card is inserted deep enough to make perfect contact with the connectors in the backplane. Now, press down the levers on the card mount bracket to secure the card in its slot.
10. Connect the antenna provided with the card on the splitter connector on the front panel of the card. You may also use the antenna cable to place the antenna at another position.
11. Repeat Steps 1-7 to insert another Mobile Card.
12. If you have completed all installations tasks, power the system.
13. Wait for the system to register with the Mobile network. By default, the Mobile ports are set to select and register with the Mobile networks automatically. Now, observe the LED Patterns of the Mobile Ports.

- *At every power up of the system, it takes about 3 minutes for the Mobile ports to get registered with the network. Once registration with the GSM network is completed, the mobile port can be used.*
- *Each time the Mobile Port sends a request, such as Registration Request, the system waits for the duration of the Network Response Timer. This Timer signifies the time for which the Mobile Port waits for a response from the Mobile network. It is fixed for 150 seconds for all Mobile ports.*

LED Pattern of Mobile Ports

The number of LEDs on the Mobile Card corresponds with the number of mobile ports on the card.

After the Reset cycle is complete, during normal functioning, the LEDs color and cadence is described in the table below for various events on the Mobile port:

Event	Color	Cadence in msec (1 cadence is of 3000 msec)
Port idle	-	LED OFF
Port Active (All States other than Ring and Speech)	Red	Continuous ON
Ring Event	Green	400ms ON-200ms OFF400ms ON-200ms OFF
Speech	Green	Continuous ON
GSM initialization	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-1200ms OFF (5 blinks)
PUK required	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-1600ms OFF-

Event	Color	Cadence in msec (1 cadence is of 3000 msec)
SIM PIN faulty	Orange	200ms ON-200ms OFF-200ms ON-200ms OFF-200ms ON-2000ms OFF (3 blinks)
SIM Absent	Orange	200ms ON-200ms OFF-200ms ON-2400ms OFF (2 blinks)
Network Link Down (Absence of GSM Network)	Orange	200ms ON-2800ms OFF

The Magneto Card

The Magneto Card is used for connecting the system to Magneto Telephones⁹⁰, which are widely used by the defense establishments as field phones in front lines, and by other establishments such as railroad companies (signaling emergencies, crossings, etc.), electric utilities, pipeline companies, who need to have their networks at places that are too remote to be serviced by public telephone networks.

The Magneto Card lands calls from magneto field telephones on the extensions of the system and places calls from the extensions of the system on magneto telephones.

Magneto Card for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD MAGNETO4	4-port card to connect 4 Magneto Phones

The maximum number of magneto ports supported are 16.

Connectors

The Magneto Card has RJ45 connectors. A multi-pair cable is provided for each connector.

LED

The ETERNITY GE CARD MAGNETO4 does not support any LED.

Installing the Magneto Card

1. Have the necessary wiring for the Magneto Ports in place.

You may install an MDF to connect the Magneto Ports with the Field Telephone wires.

OR

You may connect the wires from the Magneto Field Telephones directly to the Magneto Port.

You are advised to use a separate set of Krone Modules for connecting the Magneto phones to the Magneto ports of the system

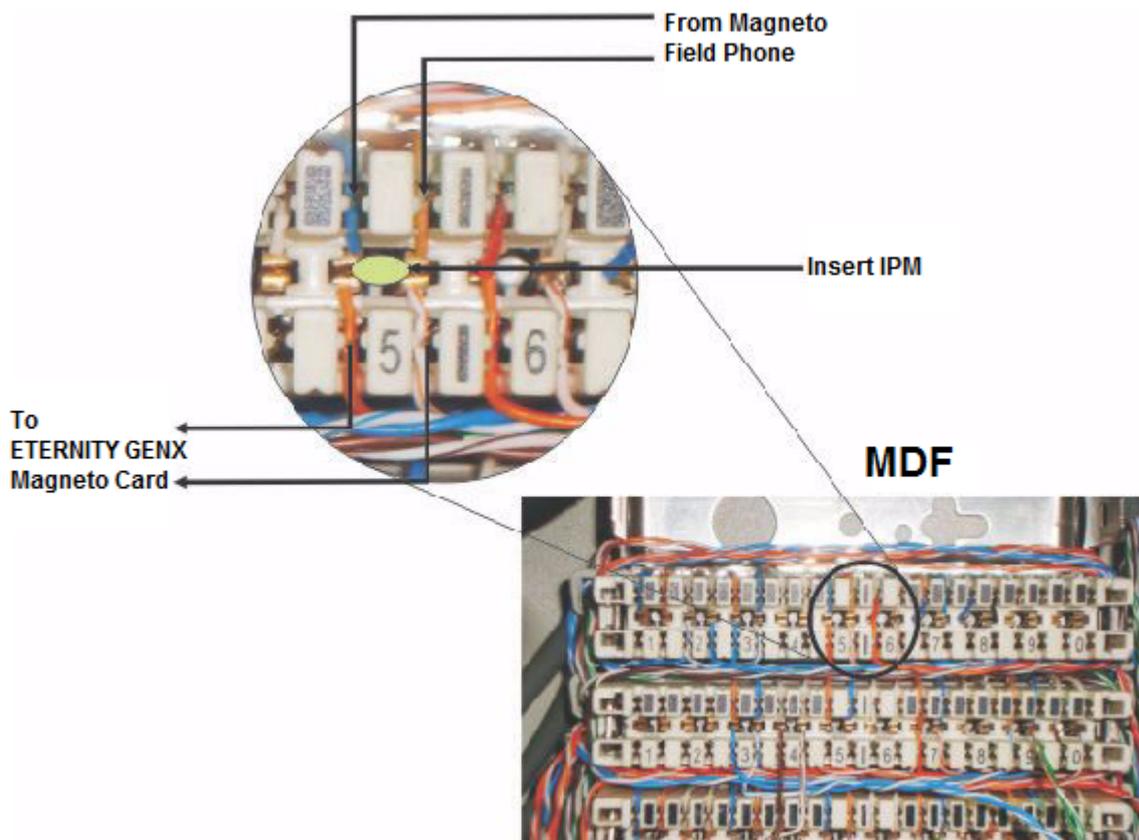

2. Prepare for the card installation by switching off power supply and wearing an electrostatic discharge preventive wrist strap and use a grounding mat.
3. Unpack the Magneto Card and check the package contents.
4. Select any universal slot to insert the card. Unscrew the filler bracket and remove it by pushing up the levers on the bracket.

90. A magneto telephone is a local battery telephone set, in which signaling current is provided by a magneto hand generator, usually a magneto. The hand generator, commonly referred to as 'crank', is located on the right hand side of the telephone set and is turned to produce energy to ring other phones or to signal the CO. The magneto, also called the generator, is used to convert the mechanical motion via the crank to produce sufficient energy to ring other phones or to signal the CO.

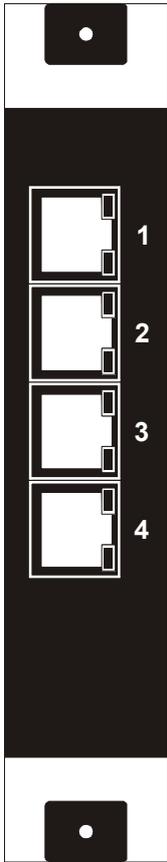

5. Insert the Magneto card into the guide rails of the free slot. The card's connectors must make perfect contact with the connectors on the backplane motherboard. Press down the levers of the mounting bracket to secure the card in its slot and fix the two screws provided with the card on the mounting bracket.
6. Now, plug in the cables supplied with the Magneto Card into the connectors on the card. Terminate the free ends of the cables into the MDF, if applicable.

Refer to the following block diagram for terminating the cables from the Magneto Card and the wires from the Magneto Field Telephones.

Connecting Magneto Telephones to the Magneto Card

- Connect the pairs of wires from the Magneto Field Phones to the appropriate pairs emerging from the ETERNITY GE CARD MAGNETO4 on the MDF. Refer the cable diagram below.

Connector	Color	Connection	H/w Port Offset
RJ45-1 (Blue)	Blue - (Blue & White)	Magneto	01
	Orange - (Orange & White)	-	-
	Green - (Green & White)	-	-
	Brown - (Brown & White)	-	-
RJ45-1 (Orange)	Blue - (Blue & White)	Magneto	02
	Orange - (Orange & White)	-	-
	Green - (Green & White)	-	-
	Brown - (Brown & White)	-	-
RJ45-1 (Green)	Blue - (Blue & White)	Magneto	03
	Orange - (Orange & White)	-	-
	Green - (Green & White)	-	-
	Brown - (Brown & White)	-	-
RJ45-1 (Brown)	Blue - (Blue & White)	Magneto	04
	Orange - (Orange & White)	-	-
	Green - (Green & White)	-	-
	Brown - (Brown & White)	-	-

- Repeat the same steps to install the other Magneto Cards.
- If you do not have any other Card to insert and have completed the installation procedures, power on the system.

The Radio Card

The Radio Interface Card (RIC) adds the Two-way Radio functionality in the system. In Two-way radio, the speech can be transmitted as well as received by the radio devices such as Radio Phone, Radio Repeater. Such devices are called Radio Transceivers. The Two-way radio works on High Frequency (HF), Very High Frequency (VHF) or Ultra High Frequency (UHF).

Radio Cards for ETERNITY GENX

Card Name	Configuration and Application
ETERNITY GE CARD RADIO4	4-port card to connect 4 Radio devices

The maximum number of radio ported supported are 16.

Connectors

The Radio Card has RJ45 connectors. A multi-pair cable is provided for each connector.

LED

The ETERNITY GE CARD RADIO4 does not support any LED.

Installing the Radio Card

1. Have the necessary wiring for the Radio Ports in place.

You may install an MDF to connect the Radio Ports with the Radio device wires.

OR

You may connect the wires from the Radio device directly to the Radio Port.

You are advised to use a separate set of Krone Modules for connecting the Radio devices to the Radio ports of the system.

2. Prepare for the card installation by switching off power supply and wearing an electrostatic discharge preventive wrist strap and use a grounding mat.
3. Unpack the Radio Card and check the package contents.
4. Select any universal slot to insert the card. Unscrew the filler bracket and remove it by pushing up the levers on the bracket.
5. Insert the Radio Card into the guide rails of the free slot. The card's connectors must make perfect contact with the connectors on the backplane motherboard. Press down the levers of the mounting bracket to secure the card in its slot and fix the two screws provided with the card on the mounting bracket.
6. Now, plug in the cables supplied with the Radio Card into the connectors on the card. Terminate the free ends of the cables into the MDF, if applicable.

7. Connect the pairs of wires from the Radio devices to the appropriate pairs emerging from the Radio Card of the system on the MDF. For more details, see [“The Main Distribution Frame \(MDF\)”](#).

Refer to the Pin-out details given below.

ETERNITY GENX Card Radio4

Connector	Color	Pin Number	Signaling	H/w Port Offset
RJ45-1 to RJ45-4	Orange & White	1	PTT	01 to 04
	Orange	2	PTT_RTN	
	Green & White	3	Rx-	
	Blue	4	Tx+	
	Blue & White	5	Tx-	
	Green	6	Rx+	
	Brown & White	7	Unused	
	Brown	8	Unused	

8. Repeat the same steps to install the other Radio Cards.
9. If you do not have any other Card to insert and have completed the installation procedures, power on the system.

The Data Card

The Data Card supports four Ethernet 10/100Mbps interfaces. Ethernet data coming to ports can be mapped to 2Mb streams. Each data port can be mapped to one 2Mb - E1 stream, that is 30 channels. The remaining channels of E1 can be used for voice applications. The Data Card has a 4-port Ethernet switch on board, which can aggregate multiple data streams to PCM streams of the system.

The Data Card can be installed in any of the Universal Slots of the system.

Ports and Connectors

The Data Card has an RJ45 Connector for each port. Use the cables supplied with the card for connectivity.

You can connect the cables from the LAN switch to these connectors.

LEDs

The Data Card does not have any LED.

Installing the Data Card

1. Unpack the Data Card and check the package contents. It is recommended that you switch off the power supply, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
2. Select any free (empty) slot from the Universal Slots. Unscrew and remove the filler bracket of the empty slot. Do not discard the filler bracket! Preserve it for future use!
3. Insert the Data Card into the guide rails of the free slot you selected for the card. The connectors on the card should make perfect contact with those of the slot on the backplane motherboard.

Press down the lever on the card mounting brackets to secure the card in its slot. Fix the mounting bracket in place with the two screws provided.

4. Use the cable supplied with the card to connect the Data Ports to the Ethernet Network (Switch/PC).
5. If you have completed all other installation tasks, you may turn ON the system.

Jumpers

Jumper Number	Position	Function
J7	AB (default)	External Boot - Normal
	BC	Internal Boot

SIP Extensions

SARVAM UCS supports up to 999 SIP/UC Users. The SIP/UC Users function in the same way as DKP/SLT extensions of the system. SIP/UC Users can make and receive calls to any extension user of the system and to external numbers over various telecom networks like CO, Mobile, ISDN PRI, BRI, and VoIP⁹¹.

You may register any SIP-enabled device — a Matrix UC Client, an IP-phone, a Soft phone, Analog Phone Adapter — as the SIP User of the system.

The Matrix UC Clients also offer UC functionalities in addition to the SIP functionalities.

The SIP Users register with the CPU Card of the system. Five free SIP Users are provided by default. You may register any of the SIP-enabled devices except the Matrix UC Clients with these free SIP Users. For registering the Matrix UC Clients, you must purchase the Matrix VARTA User License. If you require additional SIP Extensions you must purchase the IP Subscribers License.

The system supports two NX DBM VOCODER64 Modules. You must purchase the module separately. Each NX DBM VOCODER64 module supports a maximum of 64 VOCODER channels. The Vocoder channels are required for — VoIP to Non-VoIP calls, VoIP to VMS calls and VoIP to VoIP calls — where transcoding is required.

The system provides 4 pre-activated VOCODER channels by default. To use these channels make sure you have installed atleast one NX DBM VOCODER64 module. If you require more channels, you can purchase the channel licenses according to your requirement.

For more information on Licenses — Matrix VARTA User License, IP Subscribers License and VOCODER Channel License, see [“License Management”](#).

You may connect any Standard Phone or Extended IP Phones of Matrix as SIP Users.

Matrix VARTA WIN200, VARTA ADR100 and VARTA AMP100 can be registered as SIP Users, also offering the support for UC functionalities.

You may also connect/register the following as SIP Extensions of the system:

- Connect SPARSH VP248, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP248 as Extended SIP Extension”](#).
- Connect SPARSH VP310, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP310 as Extended SIP Extension”](#).
- Connect SPARSH VP330, the Touch Screen Extended IP Phone. For instruction, [“Connecting SPARSH VP330 as Extended SIP Extension”](#).
- Connect SPARSH VP510, the Premium IP Phone. For instruction, [“Connecting SPARSH VP510 as Extended SIP Extension”](#).
- Connect SPARSH VP210, the Entry Level IP Phone. For instruction, [“Connecting SPARSH VP210 as Extended SIP Extension”](#).
- Connect Extended SPARSH VP710, the Smart Video IP Phone. For instruction, [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#).

You can register following UC Clients as SIP Users of the system:

91. *Calls between VoIP, Public and Private Networks may be subject to Regulation in your country. You may have to configure your system to allow or restrict call traffic between networks to comply with the telecom regulations of your country. To know more, read [“Logical Partition”](#).*

- Matrix VARTA WIN200, Unified Communication Client for Windows. For instruction, refer to the *MATRIX VARTA WIN200* User Guide.
- Matrix Mobile UC Clients, as given below:
 - Matrix VARTA AMP100, the Mobile UC Client for iPhones. For instruction, refer to the *Matrix VARTA AMP100* User Guide.
 - Matrix VARTA ADR100, the Mobile UC Client for Android Smartphones/Tablets. For instruction, refer to the *Matrix VARTA ADR100* User Guide.

Refer to “[SARVAM UCS Features Supported in Terminals](#)” to know the features supported in each client.

The SIP Users may be registered over **WAN** or over **LAN** according to your preference and your IP network installation scenario. Extended SIP Phones and UC Clients can be registered with SARVAM UCS using IPv4 Addresses only.

You can register the same SIP User from three different locations.

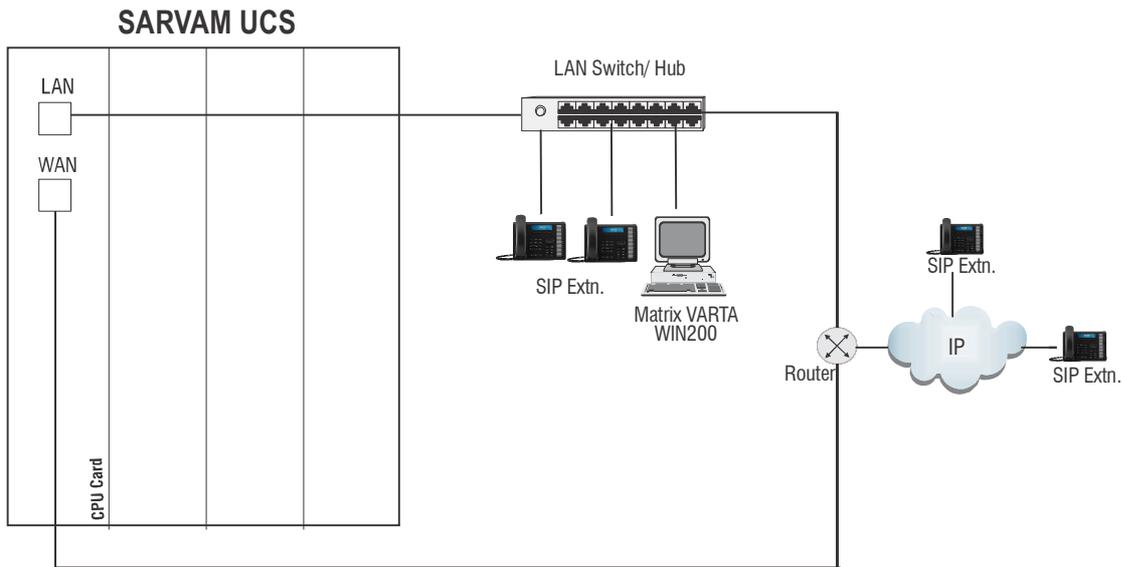

If you register the Extended IP Phone outside the Region/Country selected for SARVAM UCS, the time and Time Zone dependant features, such as Alarms, Reminders, Time Zone Display, of the phone at each location will operate according to the Real Time Clock of SARVAM UCS. Also, Access Codes and Emergency Numbers will work according to the Region/Country selected for SARVAM UCS.

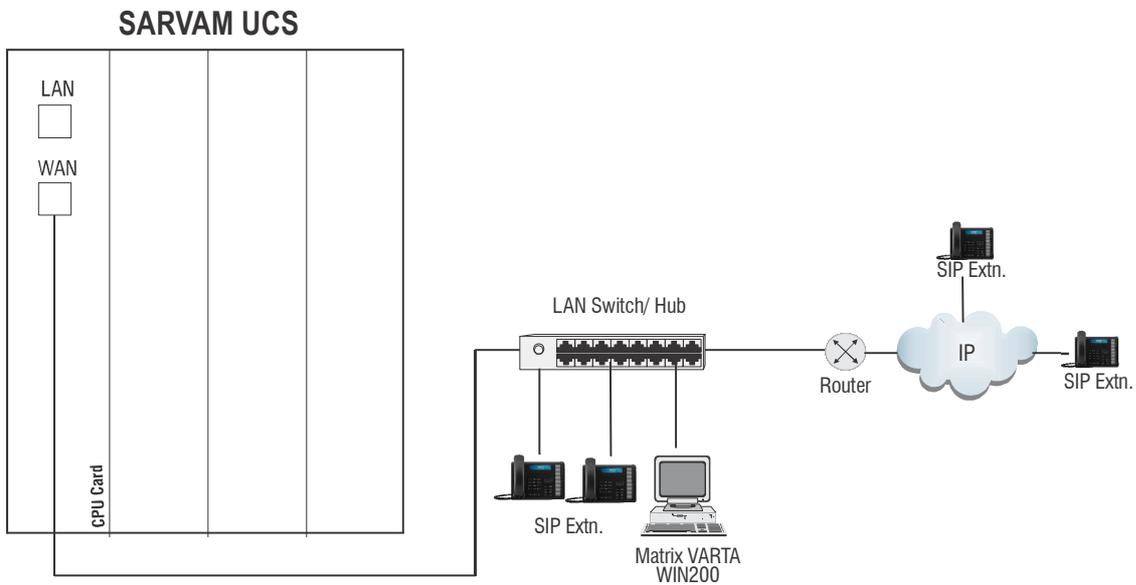

- Connect the Extended IP Phone, or any Standard IP Phone to the LAN Switch.
- Register any SIP device (Extended IP phone/ Soft clients or Standard IP phone) on the public network as SIP Extension.
- When you register the Matrix Extended IP Phone with the system, the WAN/LAN port is used for Auto Configuration as well for Registration of the Extended IP Phones.
- When you register a SIP device other than the Matrix Extended IP Phone on the public network as SIP Extension, do the following:
 - In this SIP device configure the following:
 - the Registrar Server Address of SARVAM UCS
 - the Registrar Server Port
 - the SIP ID
 - Authentication ID and Password.
 - Configure Port Forwarding for the WAN Port of SARVAM UCS on the Router.

If the SARVAM UCS is connected to a **Public Network**,

- Connect the Matrix VARTA WIN200, Extended IP Phone, or any Standard SIP device to the LAN Switch.
- Register any SIP device (Matrix VARTA UC Clients, Extended IP phone or Standard SIP phone) on the public network as SIP extension.

If the SARVAM UCS is connected to a **Private Network (Behind the NAT)**,

- Connect Matrix VARTA WIN200, Extended IP Phones or Standard SIP Phones to the LAN Switch
- You may also register any SIP device (Matrix VARTA UC Clients, Extended IP Phone or Standard SIP phone) on the public network as SIP Extension.

When you register the Matrix Extended IP Phone with SARVAM UCS, configure **Port Forwarding** for the **WAN port of the CPU Card** on the Router. The WAN Port is used for Auto Configuration of the Extended IP Phones.

Connecting SPARSH VP248 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

*If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.*

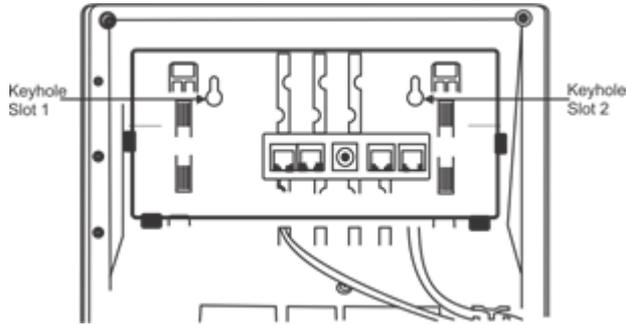

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- Assign SIP User ID (will work as an extension number) to the Extended IP Phone. For instructions on assigning SIP ID, see "[Configuring SIP Extensions](#)".

For the SIP User ID you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic "[Configuring SIP Extension Settings as per the Extended Phone Type](#)" under *Configuring SIP Extensions*.

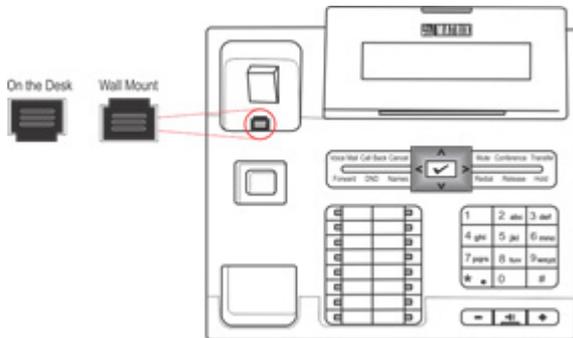

Now, follow the steps described below to install the Extended IP Phone. The instructions are common for all models of the SPARSH VP248. For the purpose of illustration, the premium model, SPARSH VP248P, has been used.

1. Unpack the SPARSH VP248 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.

- Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

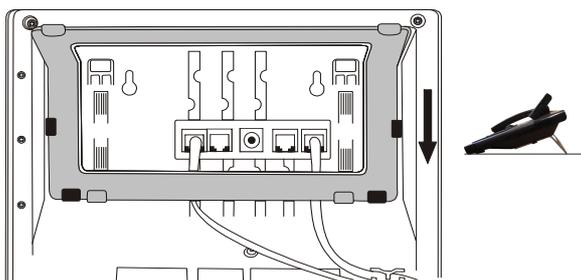

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

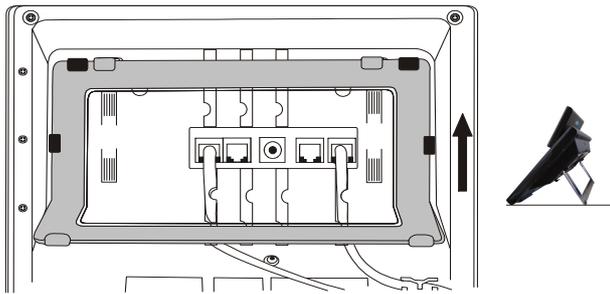

- When you mount the phone on a desk,
- You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 30° Angle

Foot Stand attached at 50° Angle

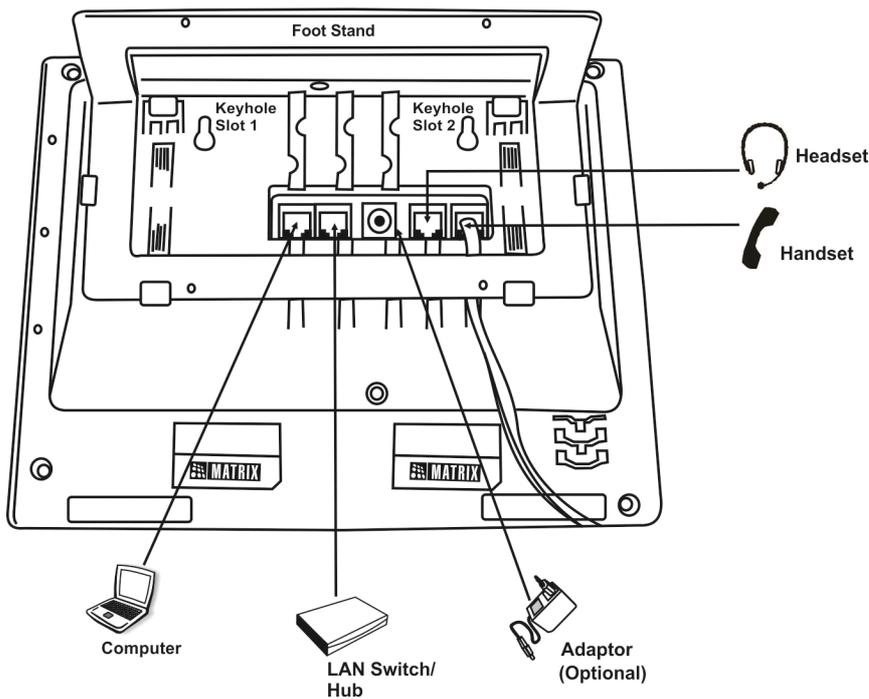

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

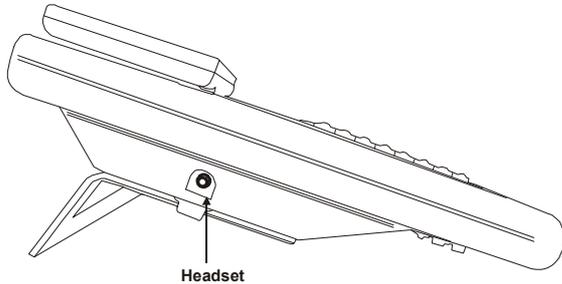

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

3. Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack at the bottom of the phone marked with the handset symbol.
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

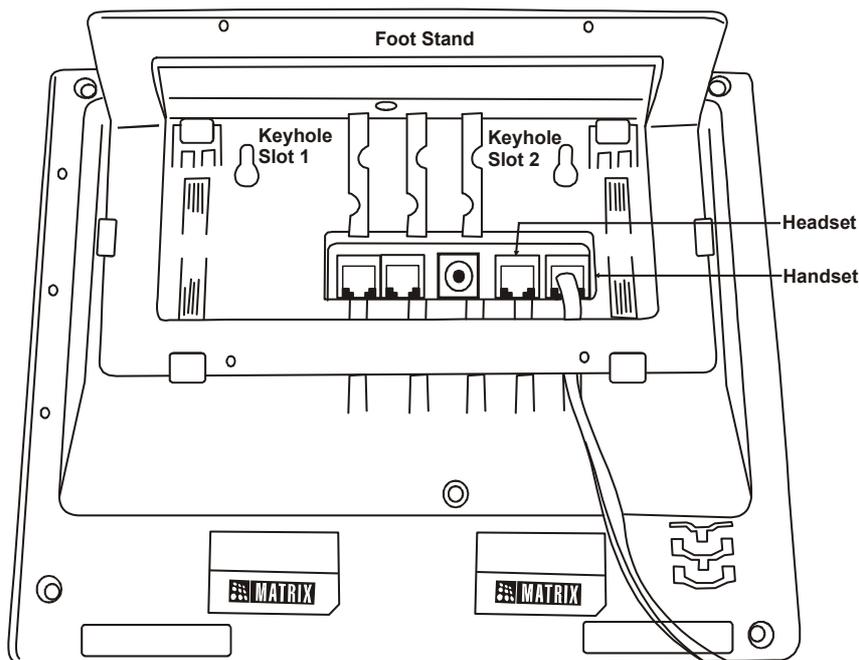

4. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 2.5 mm single connector into the headset jack headset jack with the symbol  on the left side panel of the phone, as illustrated in the figure below.

OR

- You may plug a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol , as illustrated in the figure below.

Connect the LAN Port of SPARSH VP248 to the LAN Switch/Hub or a Router, according to your installation scenario.

5. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.
6. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone. Plug in the Power Adapter into a power outlet.

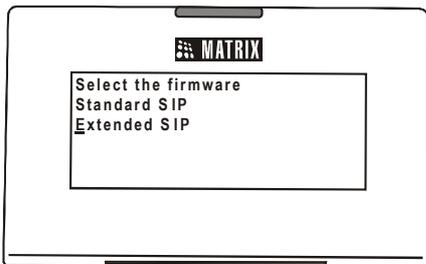

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

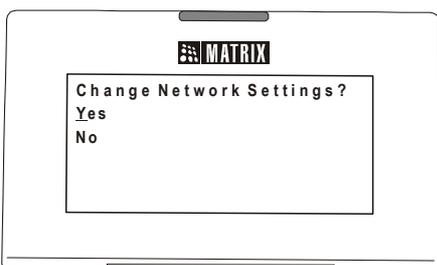

7. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- As soon as the 'Loading...' message appears on the phone display, press # key.
- Select the firmware **Extended - IP Phone**. Move the cursor by pressing the DOWN navigation key **V**.
- When the cursor is placed under the Extended IP Phone, press Enter key.

- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See [“Network Settings”](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone by accessing the Local Menu of the phone. To move the cursor and scroll through the menu and submenu options, use the following touch sense navigation keys on your phone.

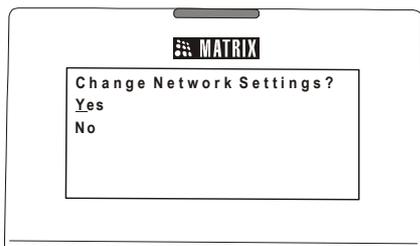

- The Enter key **✓** to make a selection or to complete an action.
- The Up key **▲** to move up the Menu.
- The Down key **▼** move down the Menu.
- The Forward key **➤** move the cursor one character.
- The Back key **◀** to move the cursor one character and to return from the submenu to the main menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

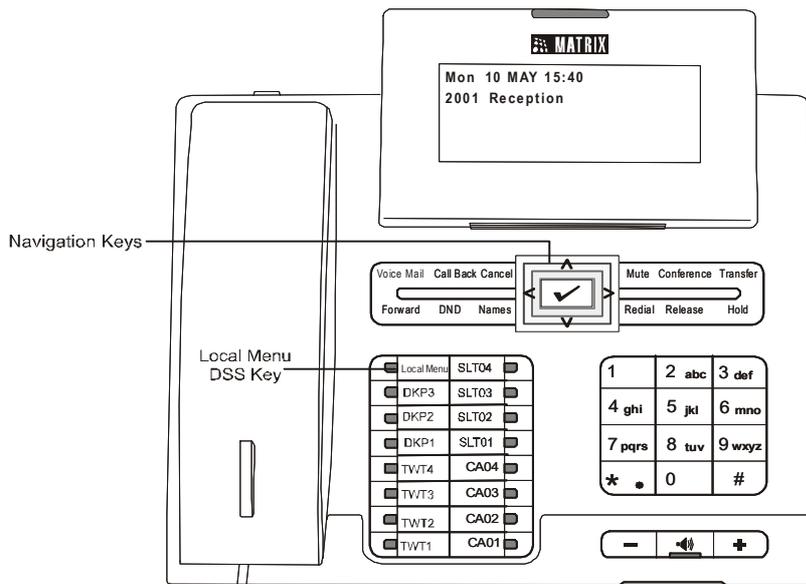

You must press the Enter Key to select Yes and access network settings.

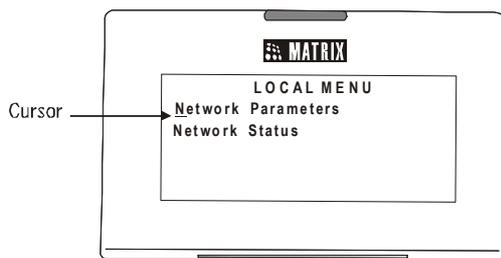

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Enter Key **✓** to access network settings,

- When the phone is in idle state. You must press the DSS key assigned to 'Local Menu'.

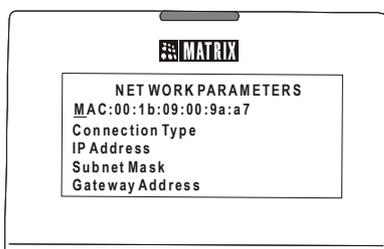

- When you press the Local Menu DSS Key (in idle state) or when you press the Enter key during any process, the Local Menu appears on your phone display.

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.
- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.
- If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star "*" key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star "*" key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star "*" key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁹².

⁹² The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see [“Using PCAP Trace for Matrix SPARSH VP248 Extended IP Phone”](#), under *PCAP Trace*.

When you change the Network Settings, the phone will restart.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?**.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

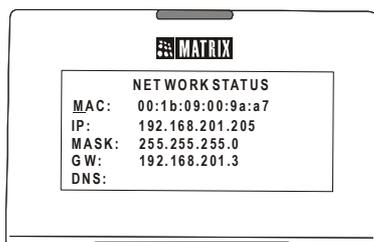

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?**.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

Viewing Network Status

- In the Local Menu of the phone, place the cursor on Network Status and press the Enter key.
- The Network Status submenu appears.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **S. ADD:** The LAN or WAN IP Address / Domain Name of the SARVAM UCS.
- **S. PORT:** The SPARSH Port SARVAM UCS.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.

- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Connecting SPARSH VP310 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

*If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.*

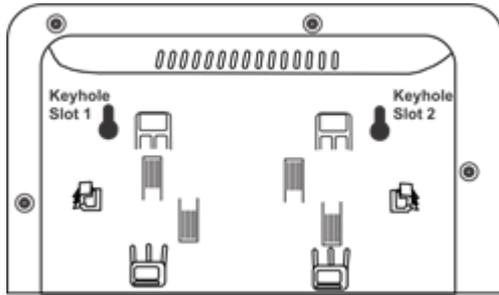

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see "[Configuring SIP Extensions](#)".

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic "[Configuring SIP Extension Settings as per the Extended Phone Type](#)" under *Configuring SIP Extensions*.

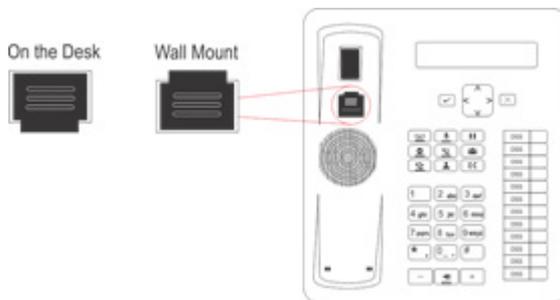

Now, follow the steps described below to install the Extended IP Phone.

1. Unpack the SPARSH VP310 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP310 on a wall,
 - Use the mounting template to drill holes of appropriate size and distance.
 - Fix the screw grips in the holes you drilled.

- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP310. The screws should protrude from the wall to fit into the Keyhole Slots.

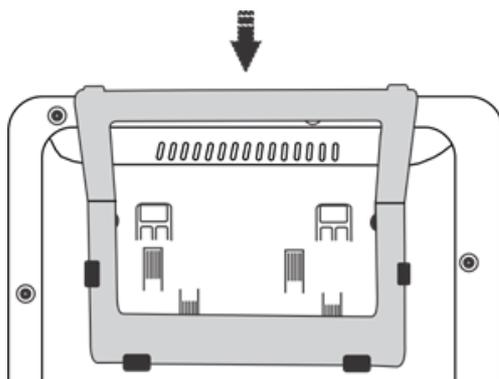

- Now, mount the phone with the screws fitting into the Keyhole Slot.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

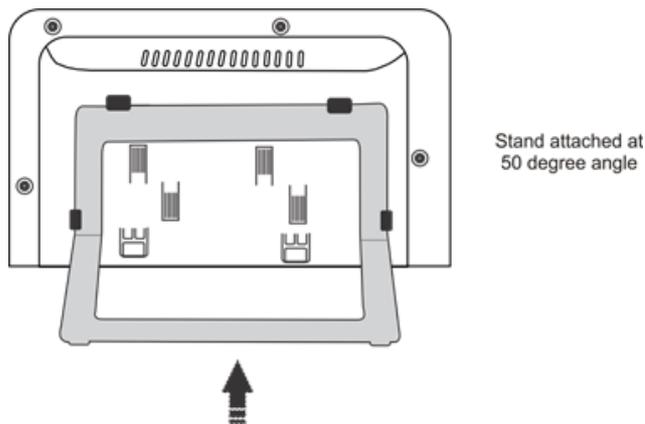

- When you mount the phone on a desk,
- You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 35° Angle

Stand attached at 35 degree angle

Foot Stand attached at 50° Angle

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

4. Connect the Handset to the Phone body.

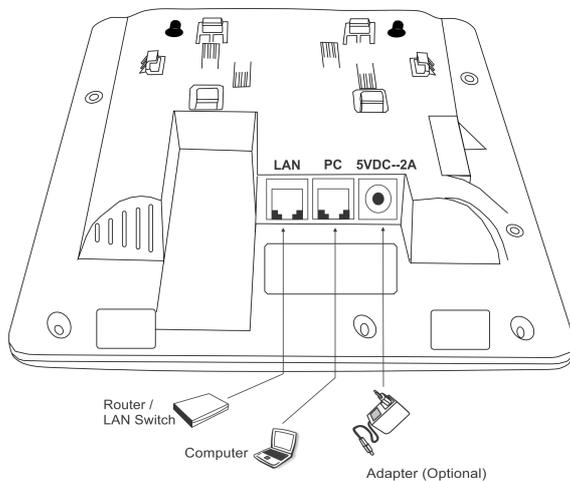

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol .

- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

5. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack headset jack with the symbol on the left side panel of the phone, as illustrated in the figure above.

OR

You may also plug in a headset with RJ9 connector into the headset port on the left side panel of the phone, marked with the symbol .

6. Connect the LAN Port of SPARSH VP310 to the LAN Switch/Hub or a Router, according to your installation scenario.
7. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.
8. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

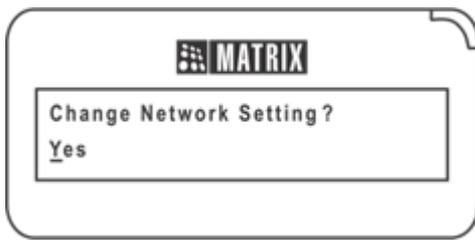

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

9. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the 'Loading...' message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.

- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See “[Network Settings](#)” at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key **▼** when the phone is in idle state. To move the cursor and scroll through the menu and submenu options, use the following navigation keys on your phone.

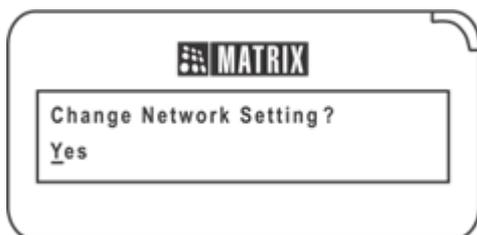

- The Enter key **✓** to make a selection or to complete an action.
- The Up key **▲** to move up the Menu.
- The Down key **▼** move down the Menu.
- The Forward key **➤** move the cursor one character.
- The Back key **◀** to move the cursor one character and to return from the submenu to the main menu.
- The Cancel key **✕** to exit a menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press the Enter key ✓ to select Yes and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Down key ▼ to access network settings.

3. When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.

Configuring Network Parameters

- When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.
- Press Enter key to select Network Parameters.
- The Network Parameters submenu appears.
- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- *To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.*
- *If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.*

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.
To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Server Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁹³.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

⁹³ The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see [“Using PCAP Trace for Matrix SPARSH VP310 Matrix Extended IP Phone”](#), under *PCAP Trace*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.
- Again press Down key **▼** to select Network Status and press the Enter key **✓**.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Connecting SPARSH VP330 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix SPARSH VP330 to SARVAM UCS:

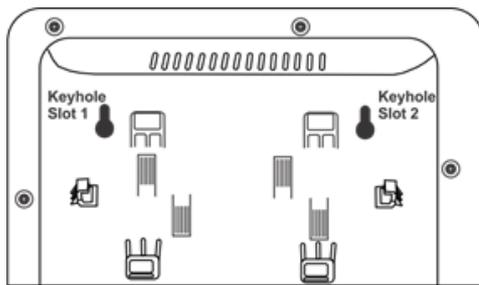

- Decide the location where you want to place SPARSH VP330 within your LAN.
- By Default, in SPARSH VP330, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of

SARVAM UCS and SPARSH Port in the format “**IP_Address:Port**” in your LAN DHCP Server as per your installation scenario.

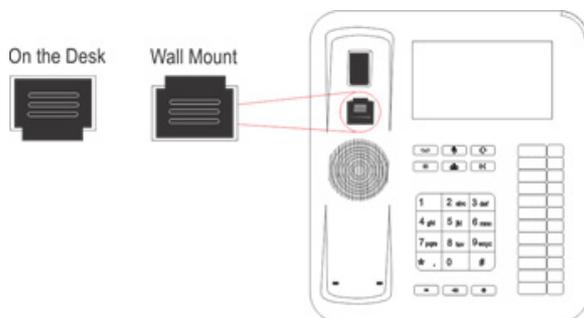

- Log in to *Jeeves*. For instructions, read the topic “[Configuring SARVAM UCS](#)”.
- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP330 can register as a SIP Extension. For instructions, see “[Configuring Matrix SPARSH VP330](#)”.

Now, follow the steps described below to install SPARSH VP330.

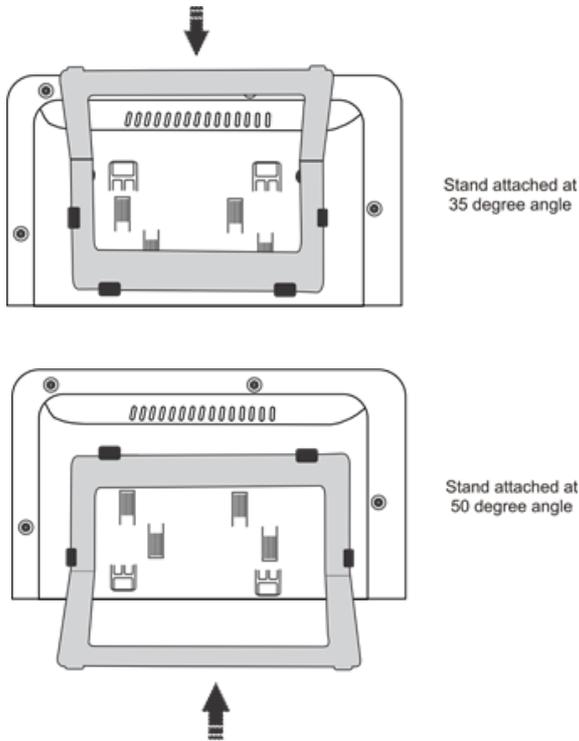

1. Unpack the SPARSH VP330 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.
 - Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

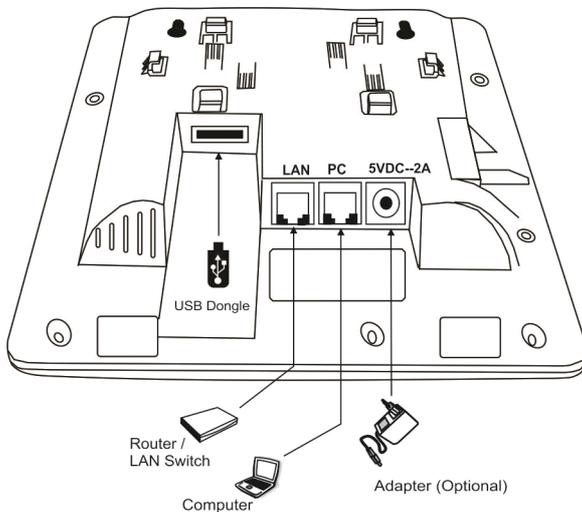

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

- When you mount the phone on a desk, you can attach the Foot Stand in two ways at **35° Angle** or at **50° Angle**.

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.
- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

- Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol.
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

5. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack with the symbol  on the left side panel of the phone.

OR

You may plug a headset with an RJ9 connector into the headset port on the side panel of the phone, marked with the symbol .

6. Connect the LAN Port of SPARSH VP330 to the IP Network — A Router or LAN Switch — using the Ethernet Cable.

OR

Connect the Wi-Fi USB Adapter into the USB port of the phone.

You can purchase the Wi-Fi USB Adapter from Matrix as an optional peripheral device to support wireless network.

7. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port at the bottom of the phone to the LAN Port of the computer.
8. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

9. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display,
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Network Settings/Server Settings or want to use Wi-Fi for connectivity, press

Settings  .

Refer to the *SPARSH VP330 User Guide*, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the *SPARSH VP330 User Guide* to know more.

Connecting SPARSH VP510 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to the system when used with SARVAM UCS application:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN Port IP Address /Domain Name and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.

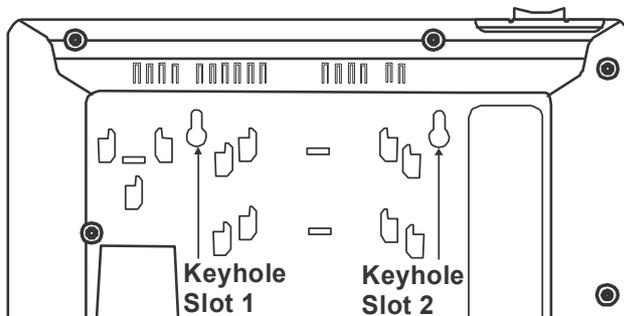

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see "[Configuring SIP Extensions](#)".

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic "[Configuring SIP Extension Settings as per the Extended Phone Type](#)" under *Configuring SIP Extensions*.

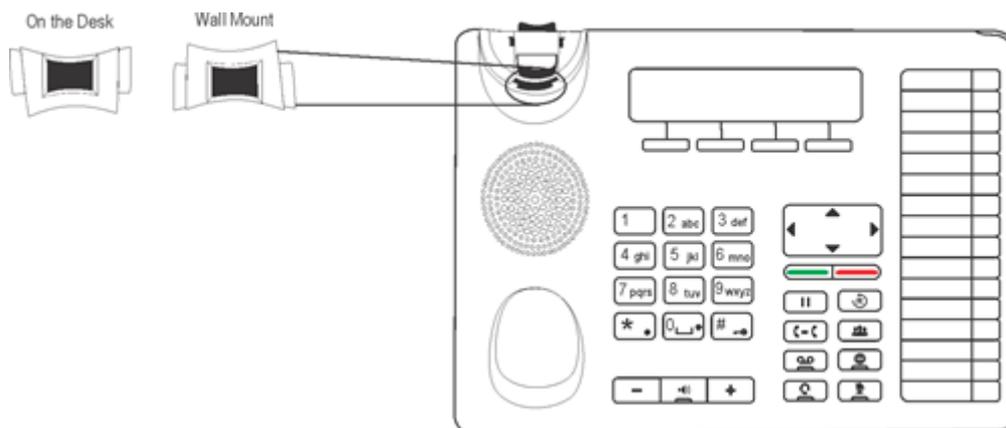

Now, follow the steps described below to install the Extended IP Phone:

1. Unpack the SPARSH VP510 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP510 on a wall,

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP510. The screws should protrude from the wall to fit into the Keyhole Slots.

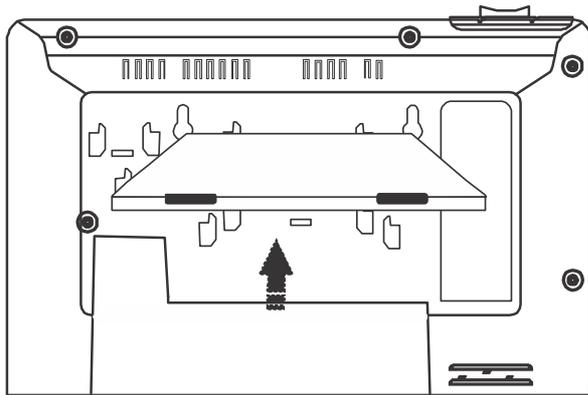

- Now, mount the phone with the screws into the Keyhole Slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

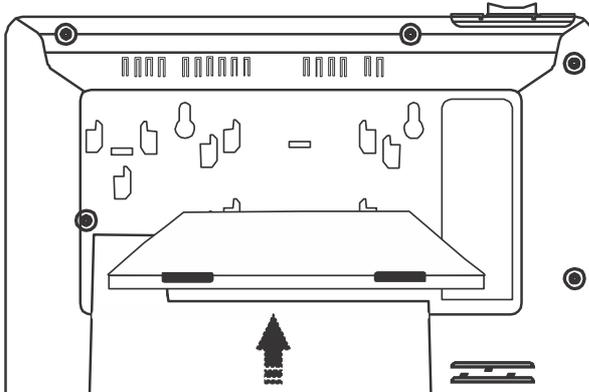

If you are unable to remove the wall mount tab, you may use a tool like a minus screw-driver to remove it.

- When you mount the phone on a desk,

- You can attach the Foot Stand in the following ways — at an angle of 45 degrees or 55 degrees

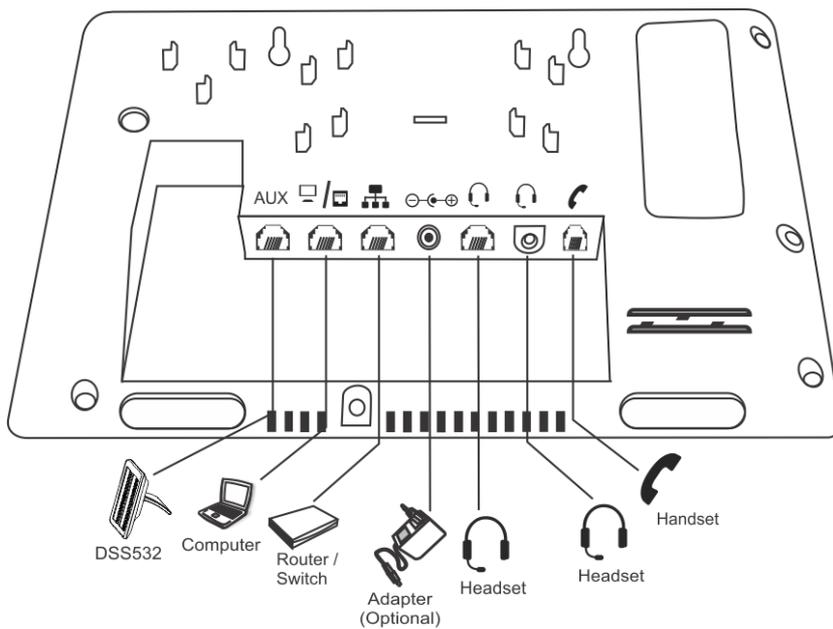

Stand attached at 45 degree angle

Stand attached at 55 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

4. Connect the Handset.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
- Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.

5. Connect the Headset (not supplied by Matrix).

- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset audio jack at the bottom of the phone, marked with the symbol .

OR

You may also plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

6. Connect to the IP Network.

- Plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone, marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.

7. Connect a PC to the Phone.

- Plug one end of the Ethernet Cable into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.

8. Connect DSS532 with the Phone.

- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with SPARSH VP510”](#).

9. Connect the Power Supply.

- It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant).

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

10. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the 'Loading...' message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.
- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press Yes key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See ["Network Settings"](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key  when the phone is in idle state.

To navigate the menu,

- Press the Menu Key when the phone is idle.
- Scroll by pressing the Up/Down Navigation Key to reach the desired Menu option.
- Press the Select / OK  Key to select the desired Menu option.
- Scroll by pressing the Up/Down Navigation Key to reach the desired sub-menu option.
- Press the Select / OK  Key to select the desired sub-menu option.

To exit menu,

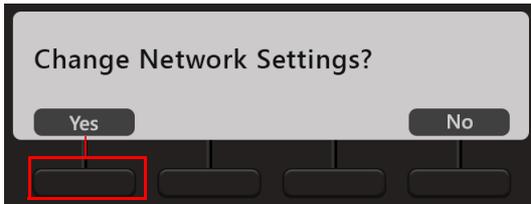

- Press Cancel  Key.
or
Go ON-Hook.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

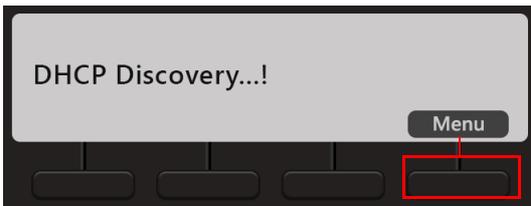

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press **Yes** key and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

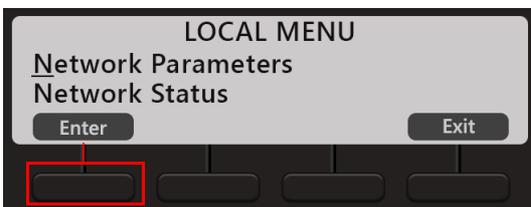

You must press the **Menu** key to access network settings.

3. When the phone is in idle state, press the Down key **▼**.

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.

- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select. Change the settings as per your requirements.
- Press **Save** key, to save the changes you make.
- You can configure all network parameters described below, except the MAC Address.

- *To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.*
- *If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Delete key. The digit to the left of the cursor will be deleted.*

Before you start configuring the Network Parameters, get acquainted with following context keys:

Context Keys	Description
Enter/OK	To select a particular parameter
Save	To save the changes
Back	To move a step backwards without saving the changes
Delete	To delete previous characters from the cursor position
2Ab/123	2Ab - Alphanumeric Mode 123 - Numeric Mode

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Sever Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic⁹⁴.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.

⁹⁴ The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
- Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
- Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and instructions on how to use PCAP Trace on the phone, refer to the *EON510_SPARSH VP510 User Guide*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.
- Again press Down key **▼** to select Network Status and press the Enter key.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Refer to the *EON510_SPARSH VP510 User Guide* to know more.

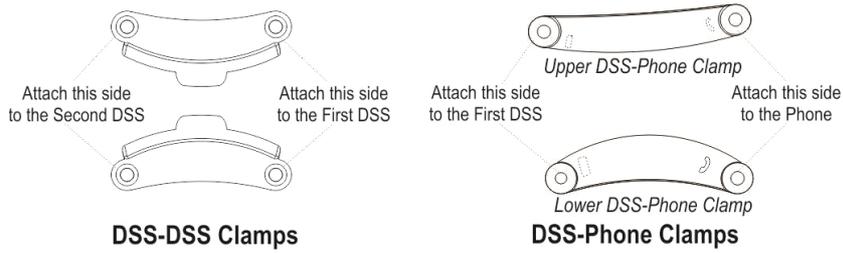

Installing DSS532 with SPARSH VP510

Once you have installed SPARSH VP510 with SARVAM UCS, you can install the DSS532 by following the steps given below:

1. Unpack the box and verify the package contents⁹⁵.

95. See *"Packing List"* of *Appendix topic*.

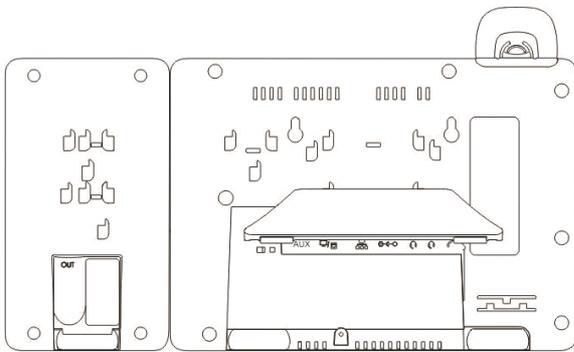

- Four clamps are provided with the phone — 2 DSS-Phone Clamps and 2 DSS-DSS Clamp.

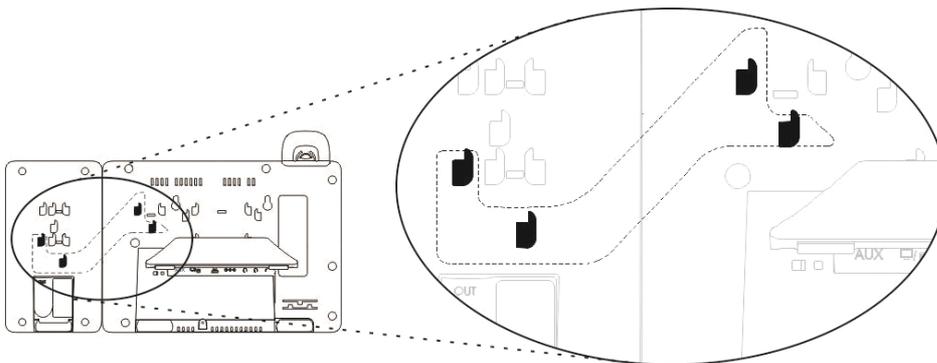

Connecting the First DSS532

Connecting the Extender

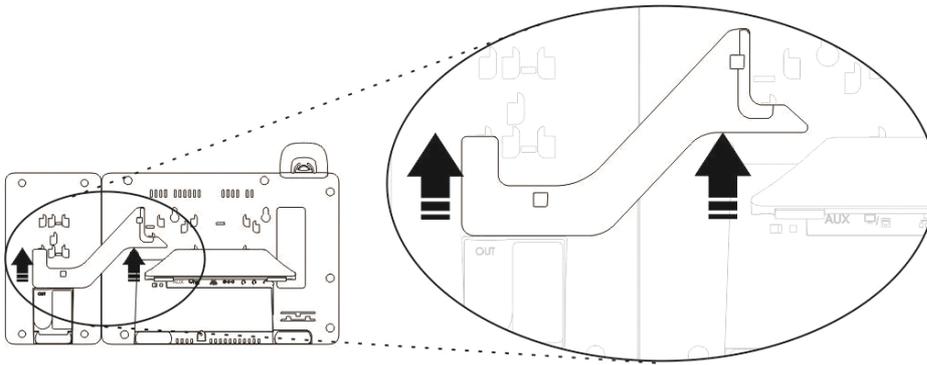

- Turn the phone upside down on the table and place the inverted DSS532 adjacent to it.

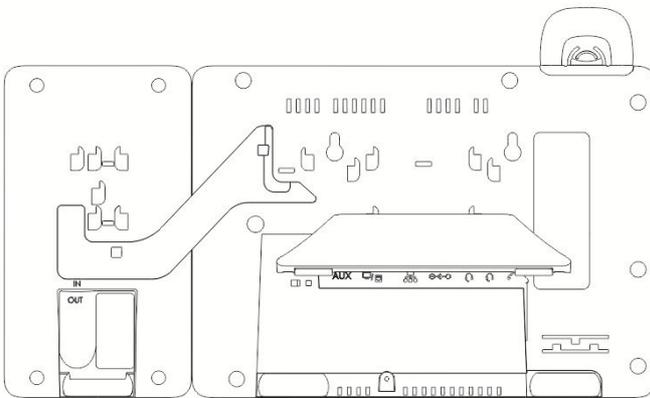

- To attach the DSS532 with the phone, place the DSS Extender as illustrated below.

5. Insert the hooks on the Extender into the slots provided on the phone and the DSS532.

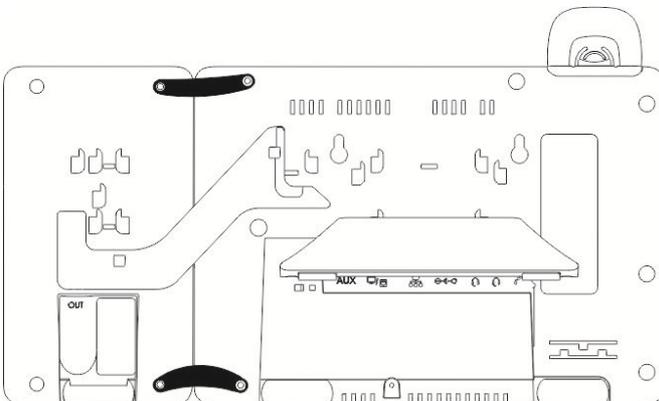

6. Firmly slide the DSS Extender upwards to lock them in place.

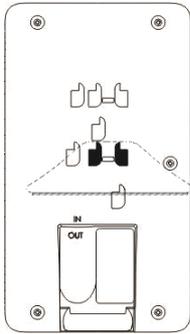

Attaching the Clamps

7. Now attach the clamps. To do so,
 - Remove the screws to attach the clamps.
 - Place the DSS-Phone Clamps between the DSS532 and the phone.
 - Insert the screws back to fix the clamps.

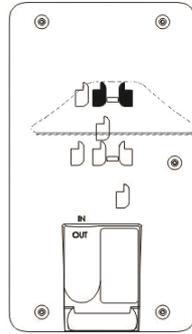

Attaching the Footstand

8. You can mount the DSS532 with the phone on the desk at two angles — **45 degrees** or **55 degrees** by attaching the Foot Stand.

Stand attached at 45 degree angle

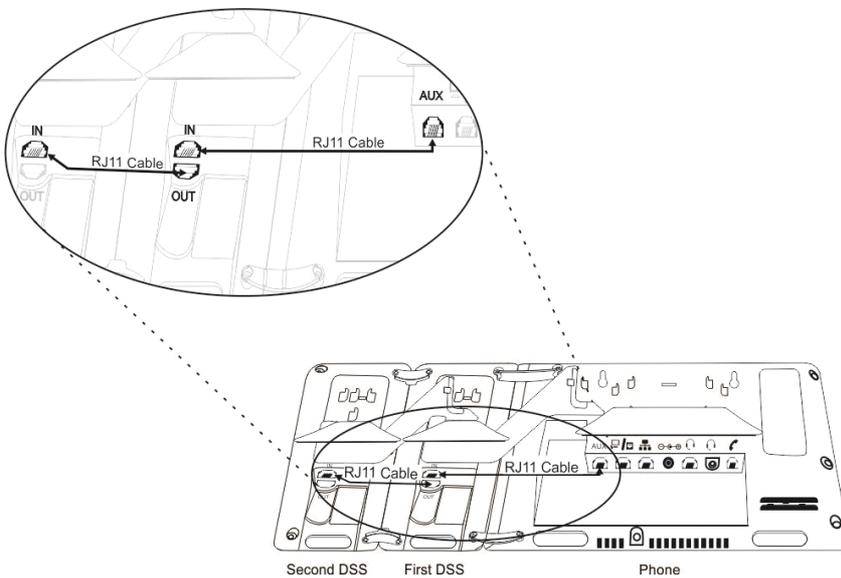

Stand attached at 55 degree angle

Make sure both, the DSS532 and phone are mounted at the same angle.

Connecting the Cables

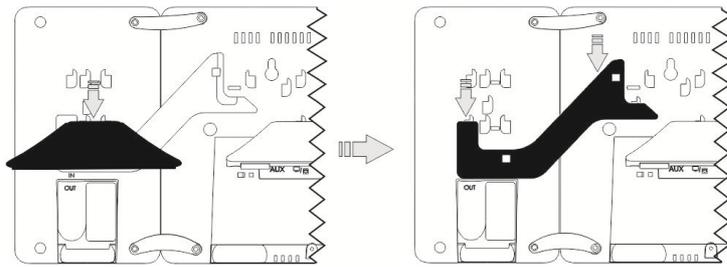

9. To connect the DSS532 with phone, plug one end of RJ11 Cable into **Auxiliary(AUX) Port** of the phone and the other end into the **IN Port** of the DSS532.

Connecting Multiple DSS532

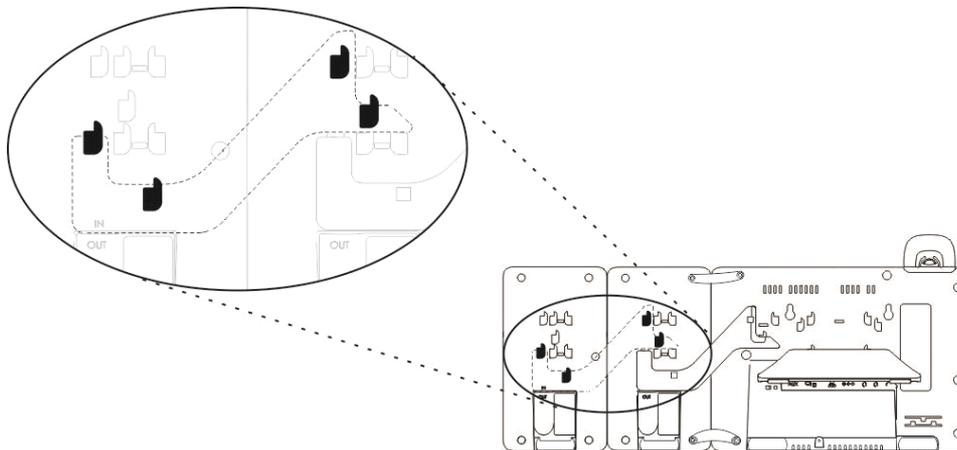

Remove the Foot Stand

10. Remove the Foot Stand of attached DSS532. To do so,
 - Firmly slide the Foot Stand of the attached DSS532 downward to unlock.
 - Now, slide down the attached DSS Extender in downward direction.

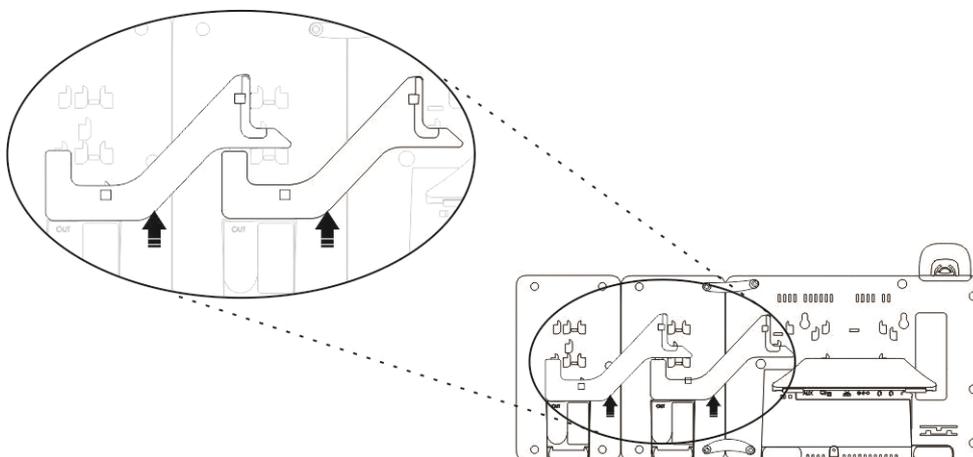

Attach the second DSS Extender

11. To attach the second DSS Extender,
 - Place another inverted DSS532 adjacent to the existing assembly.
 - Place the DSS Extender as illustrated in the diagram below.
 - Insert the hooks on the Extender into the slots provided on both the DSS532.

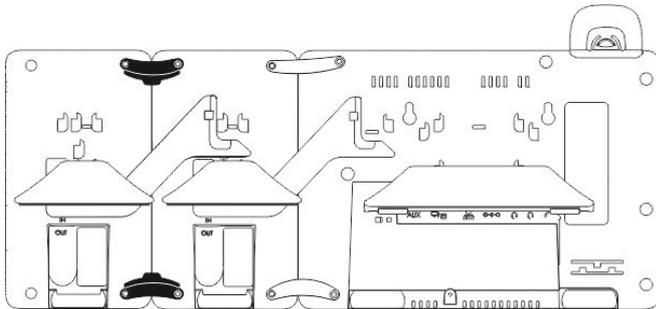

12. Firmly slide both the DSS Extenders upward consecutively (attach the second extender first followed by the existing one attached to the phone) and lock them in place.

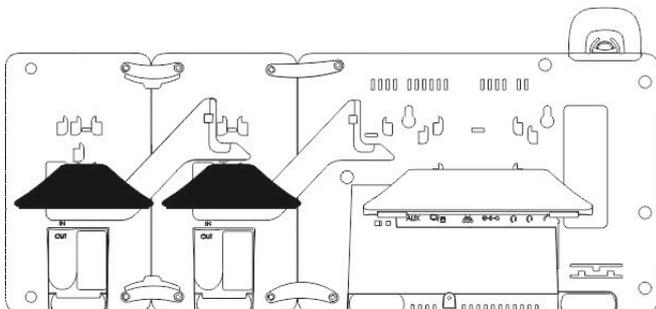

Attach the Clamps

13. Attach the DSS-DSS Clamps between both the DSS532.

Attach the Foot Stand

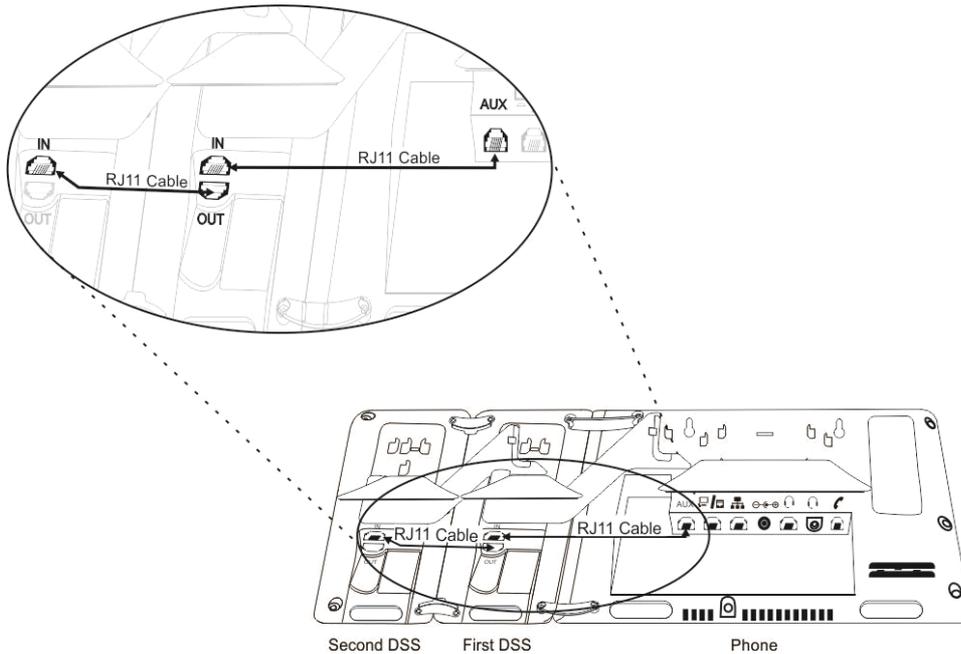

14. Attach the Foot Stand of both the DSS532.

Make sure both, the DSS532 and the phone are mounted at the same angle.

Connect the second DSS532 to the existing assembly

15. Plug one end of the RJ11 Cable into the OUT Port of the existing DSS532 (already connected with the phone) and the other end into the IN Port of the second DSS532.

You can install a maximum of four DSS532 with a phone.

16. After you have connected the DSS532 with the phone, you can configure the DSS Keys. For instructions, see ["Programming DSS Console Keys"](#).

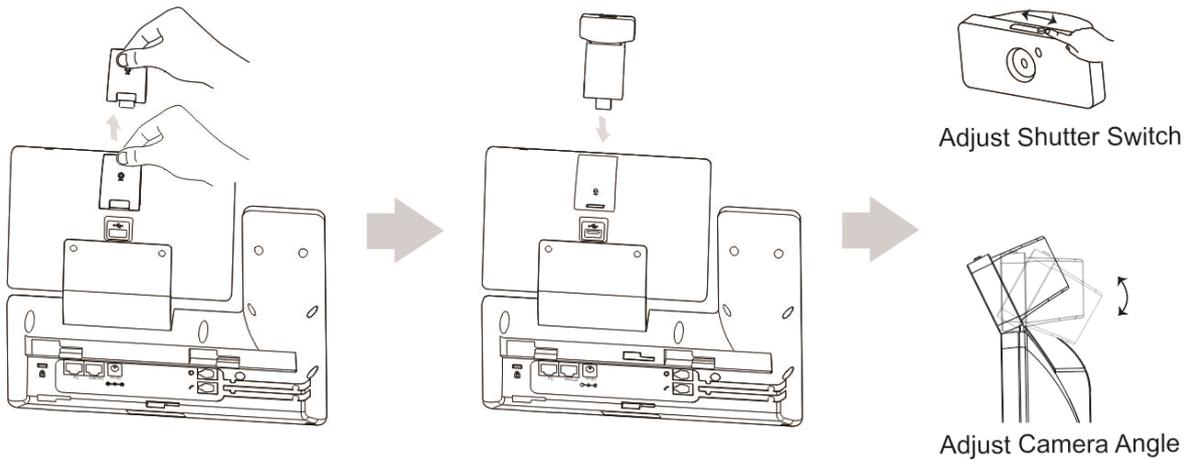

Connecting Extended SPARSH VP710 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended SPARSH VP710 to SARVAM UCS:

- Decide the location where you want to place Matrix Extended SPARSH VP710 within your LAN.
- Log in to *Jeeves*. For instructions, read the topic ["Configuring SARVAM UCS"](#).
- You must configure the necessary parameters in SARVAM UCS so that Extended SPARSH VP710 can register as a SIP Extension. For instructions, see ["Configuring Matrix Extended SPARSH VP710"](#).

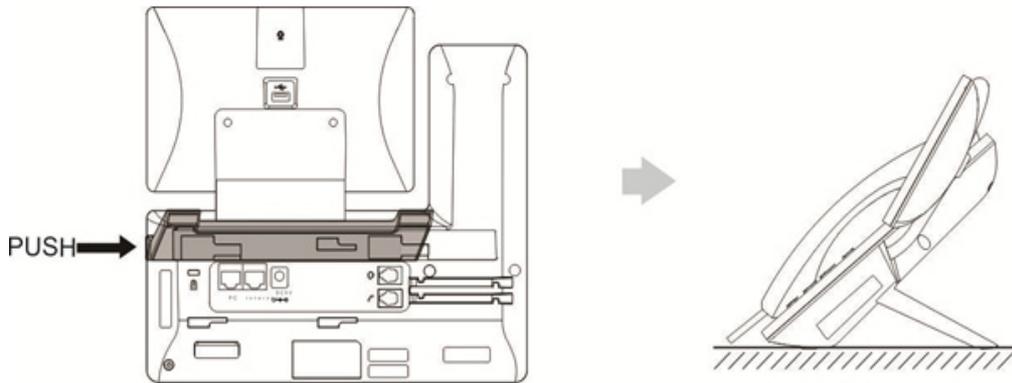

Now, follow the steps described below to install Extended SPARSH VP710.

1. Inserting the camera

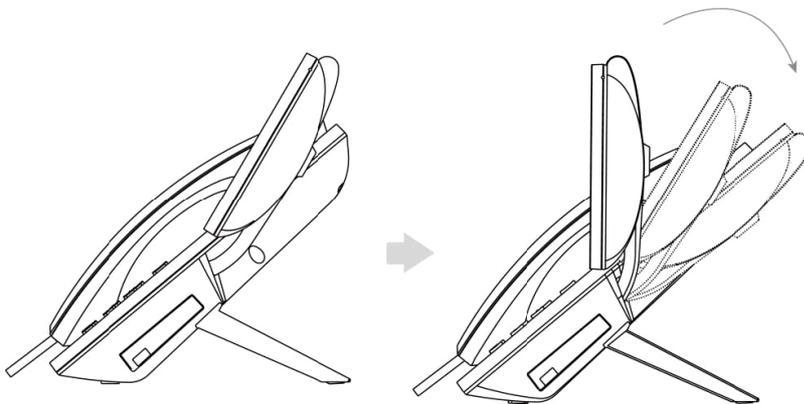

It is recommended to use only the Matrix original Camera, supplied with the IP Phone for video calling. The use of any third-party camera may cause damage to the phone. Damages to the phone caused by using third-party camera is not covered by Matrix warranty.

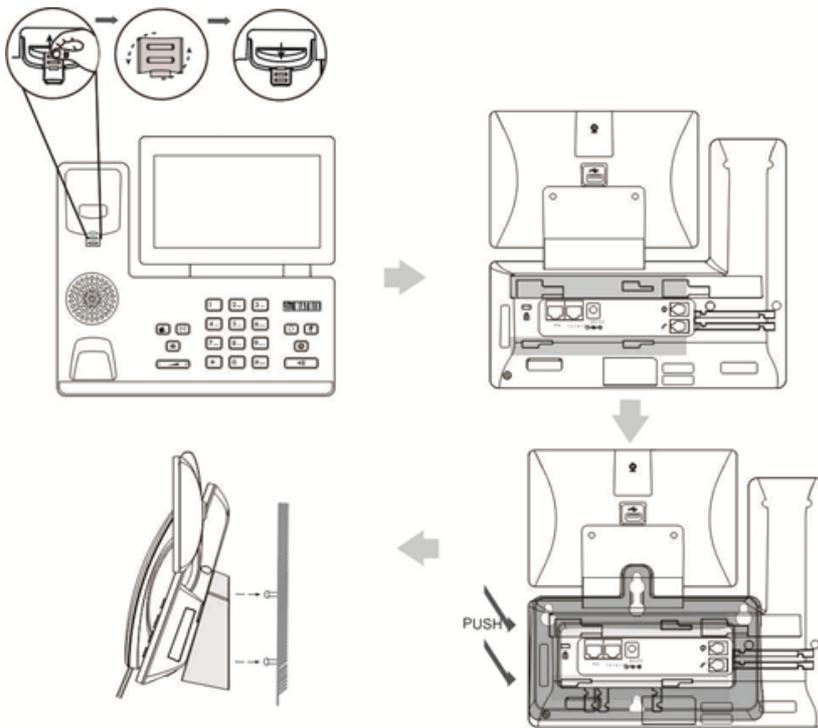

2. Attaching the stand

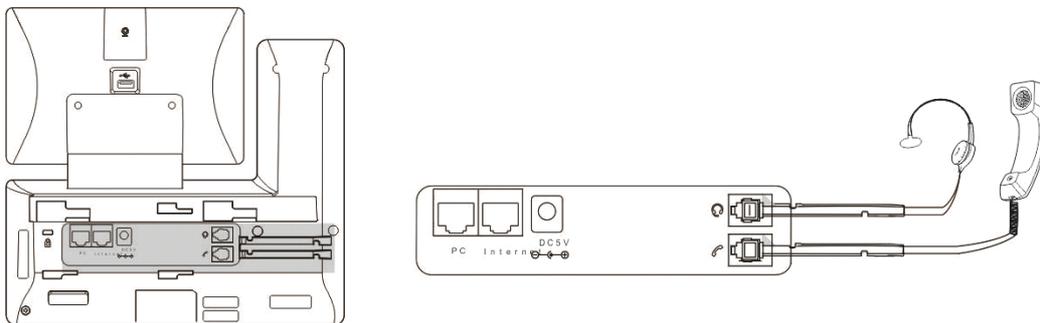

3. Adjusting the angle of the touch screen.

4. Attaching the optional wall mounting bracket

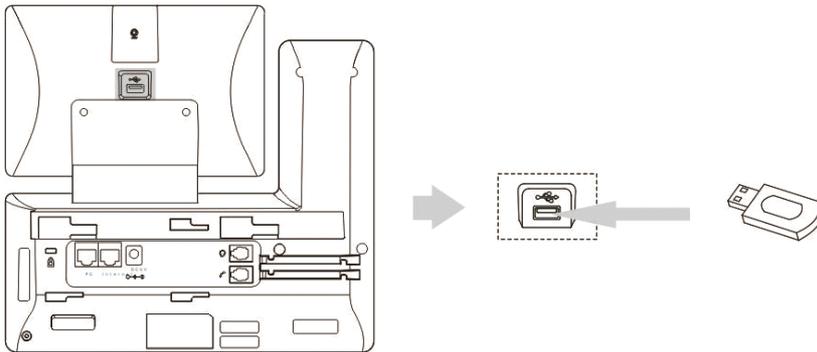

5. Connect the handset and optional headset.

A headset is not included in the packaging contents. Contact your dealer/reseller for more information.

6. Connect the optional USB Flash drive.

7. Connect the network and power.

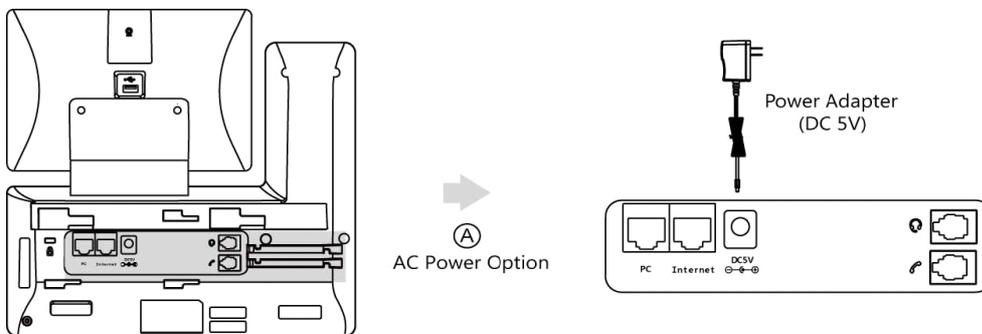

There are two options to connect the power and the network.

- AC power
- Power over Ethernet (PoE)

AC Power

To connect the AC power:

- Connect the DC plug on the power adapter to the DC5V port on the phone and connect the other end of the power adapter into an electrical power outlet.

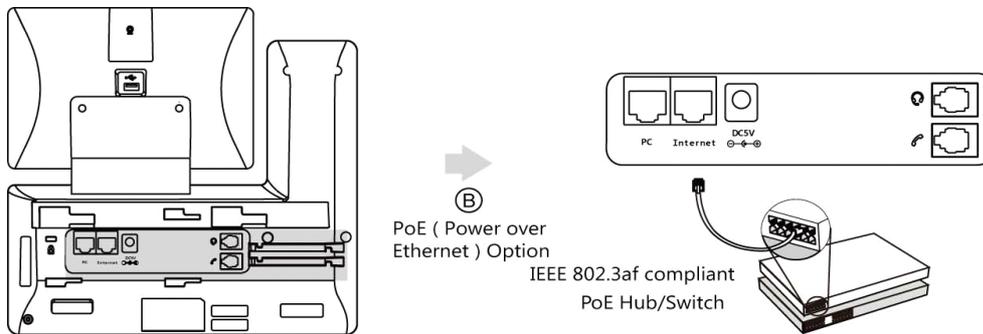

Power over Ethernet (PoE)

With the included or a regular Ethernet cable, the IP Phone can be powered from a PoE-compliant switch or hub.

To connect the PoE:

- Connect the Ethernet cable between the Internet port on the phone and an available port on the in-line power switch/hub.

 *If in-line power switch/hub is provided, you don't need to connect the phone to the power adapter. Make sure the switch/hub is PoE-compliant.*

 *Do not unplug or remove power while the phone is updating firmware.*

After the IP Phone is assembled and connected to the power supply, it automatically begins the initialization process.

During this process, the IP Phone displays the start up screen "Welcome Initializing...please wait".

Once the IP Phone is initialized, it displays two different phone modes:

- Standard SIP
 - Extended SIP
- Select Extended SIP, to operate the IP Phone in the extended mode. As soon as you select this mode, the booting process initiates again and the start up screen displays "Welcome Initializing...please wait". After the IP Phone is initialized, it attempts to contact a DHCP Server in your network to obtain valid IPv4 network settings (example: IP address, Subnet Mask, Gateway address, DNS address). You need to configure the basic network parameters of the IP Phone manually, if these are not provided by the DHCP Server or if your network does not support DHCP.

Refer to the *EXTENDED SPARSH VP710 User Guide*, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration (when DHCP is selected) to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

 *The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.*

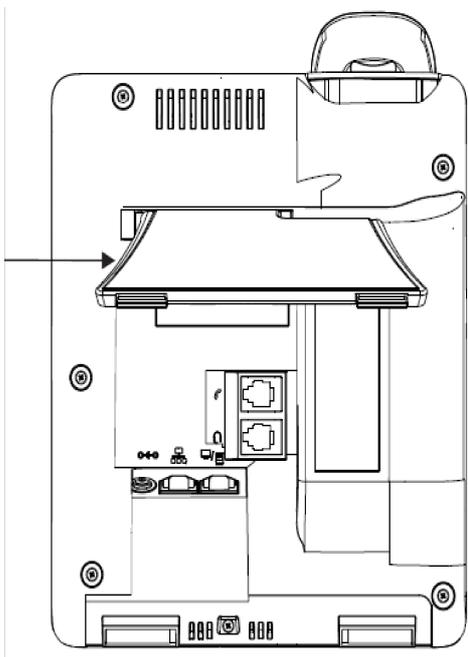

Connecting SPARSH VP210 as Extended SIP Extension

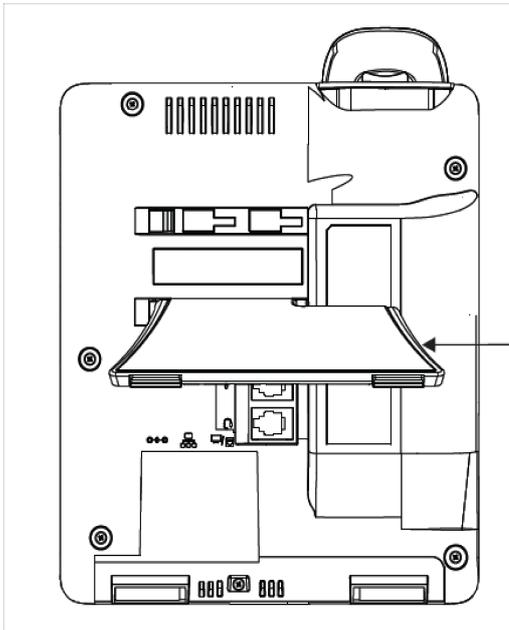

You are recommended to complete the following steps before connecting the Matrix SPARSH VP210 to SARVAM UCS:

- Decide the location where you want to place SPARSH VP210 within your LAN.
- By Default, in SPARSH VP210, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as **'String'** and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format **"IP_Address:Port"** in your LAN DHCP Server as per your installation scenario.
- Log in to *Jeeves*. For instructions, read the topic ["Configuring SARVAM UCS"](#).
- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP210 can register as a SIP Extension. For instructions, see ["Configuring Matrix SPARSH VP210"](#).

Now, follow the steps described below to install SPARSH VP210.

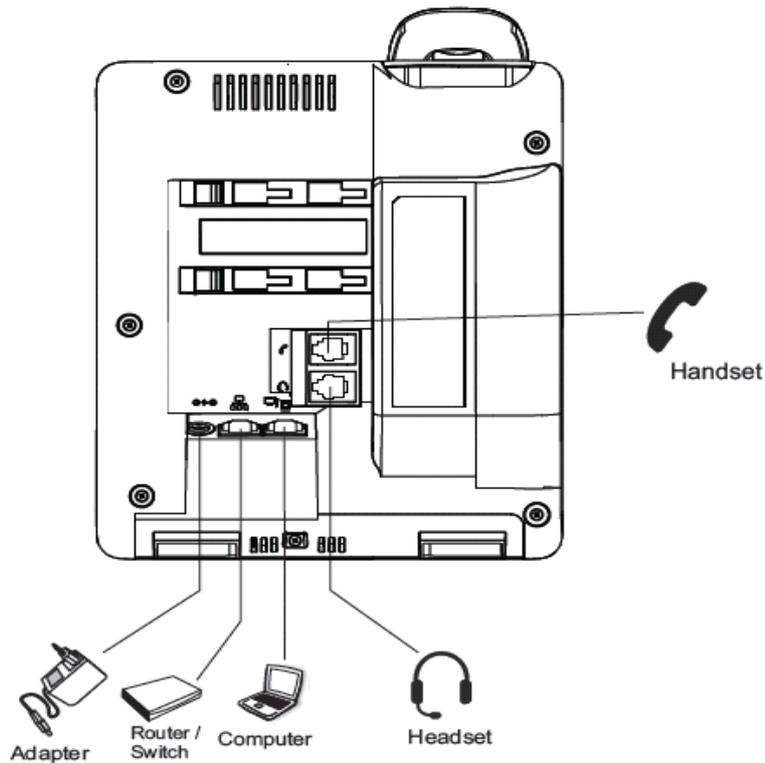

1. Unpack the SPARSH VP210 box and verify package contents.
2. When you mount the phone on a desk, you can attach the Foot Stand in two ways at **45° Angle** or at **55° Angle**.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

3. Connect the Handset to the Phone body.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
 - Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.
4. If you want to use a Headset (not supplied) with your phone, You may plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .
 5. To connect the LAN, Port , plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.
 6. To connect your phone to a computer on your desk, plug one end of the Ethernet Cable (not supplied with this phone) into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.
 7. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/0.6A) only. The use of any third-party power adapter may cause damage to the phone.

8. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display.
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Server Settings, press Settings.

Refer to the SPARSH VP210 (Extended) User Guide, for detailed instructions, to change the Network Settings of the phone and configure the network parameters.

- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the **SPARSH VP210 (Extended) User Guide** to know more.

Starting Up ETERNITY GENX

Power ON

1. If you have completed all the installation tasks, switch on power supply.
 - For PSUNI Card installed in the system, connect the three-prong plug of the power cord from the system into the AC outlet, and switch on power supply.
 - For PS48V Card installed in the system, keep the MCB Switch ON and power the FCBC.
2. Observe the Reset Cycle.

Reset Cycle

- Reset Cycle (Power-ON Self Test) takes about 2 minutes to finish.
- All the LEDs of the system, the cards and the keys of the DKP/SIP devices attached to the System are turned on.

Interpreting LEDs

The functioning of the LEDs of the system and the various cards and their meaning are summarized at the end of the installation instructions for each Card Type.

Refer to the LED Patterns described for each Card Type to verify if the system is operating properly and locate faults, where they occur.

When the reset cycle is successful, the default Extension "[Access Codes](#)" loaded by the system and the date and time of the "[Real Time Clock \(RTC\)](#)" of the system will appear on the LCD display of the DKPs/ IP Phones you have connected with the system.

- *The Matrix ETERNITY PENX is to be installed by persons trained and experienced in telecom wiring.*
- *The person installing the ETERNITY PENX must be familiar with trunks, physical wiring of the MDF on both the exchange (System) side and the line side (CO).*
- *When installing any equipment, make sure that you take all the necessary precautions for handling electronic and electrical appliances. Follow proper procedures for static electricity, while handling the system and its cards to prevent damage to the system and harm to yourself.*
- *Use a grounding mat and wear an anti-static strap/belt. Read the do's and don'ts listed in ["Protecting the System and Yourself"](#).*
- *If you have complied with the requirements and instructions described in ["Before You Start"](#), you may now begin the installation of your ETERNITY PENX.*

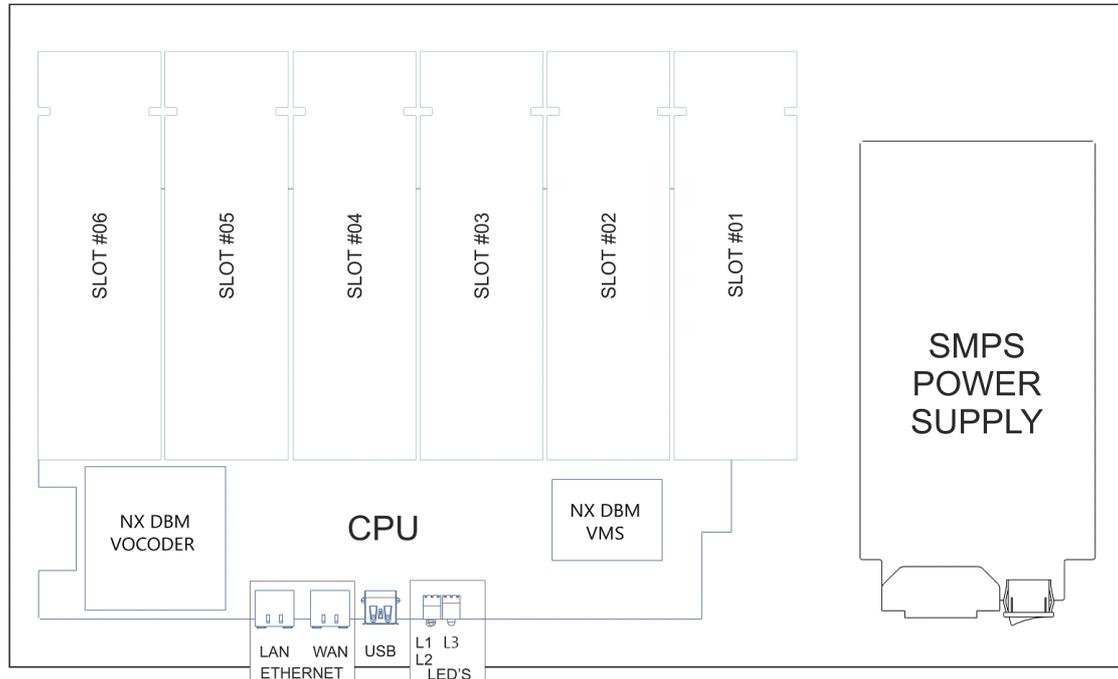

The Matrix ETERNITY PENX is shipped factory fitted with the Power supply unit and the CPU Card (refer the section ["Hardware Overview"](#)).

The cards – SLT, DKP, CO, T1E1PRI, GSM – and the modules – VoIP and VMS - are shipped separately as per the order placed by individual customers.

Illustrated below are the positions of the universal slots.

ETERNITY PENX

The Power Supply unit and the CPU are in-built, and fixed on the bottom plane of the ETERNITY PENX.

Six Universal slots are located on the CPU. The connectors of the slots are located on the CPU.

Cards are mounted on the CPU and secured on the three studs on the CPU, with the screws provided.

ETERNITY PENX has – LAN Port, WAN Port, External USB, Internal USB, 3-PIN Power Plug Connector and ON/OFF Switch along with three LEDs.

Instructions are provided in the following for installation of the cards. These instructions are to be followed also when you expand the system (add more cards) or remove cards for maintenance and repair.

1. Have all the necessary wiring ready. Read the topic *Main Distribution Frame* for guidance on how to set up the MDF and connect the system with the MDF, and install Primary Protection against heavy voltages.
2. Unpack the box. Check the package contents (see Packaging List). Contact your Dealer/Distributor if any of the items is missing, faulty or damaged. Do not discard the packaging material.

Mounting the System

3. You can mount the system on a table, a wall. or a rack.

If you have decided to mount the ETERNITY PENX on a wall, use the Mounting Template for drilling the holes at appropriate distances on the wall.

4. Mount the system at the selected site. Make sure that the system is placed such that you have full access to the front and back panels. The holes in the side panels are provided for ventilation; Make sure that these are not blocked, to prevent overheating.

When installing the system in a rack allow adequate space between the system and other units for air circulation.

Connecting Input Power Supply

5. Ensure that a proper electrical earth and telecom earth are in place.
6. Check the voltage at the power point from where the supply is to be given to the system. It should be as per the specifications. Earth the system properly.

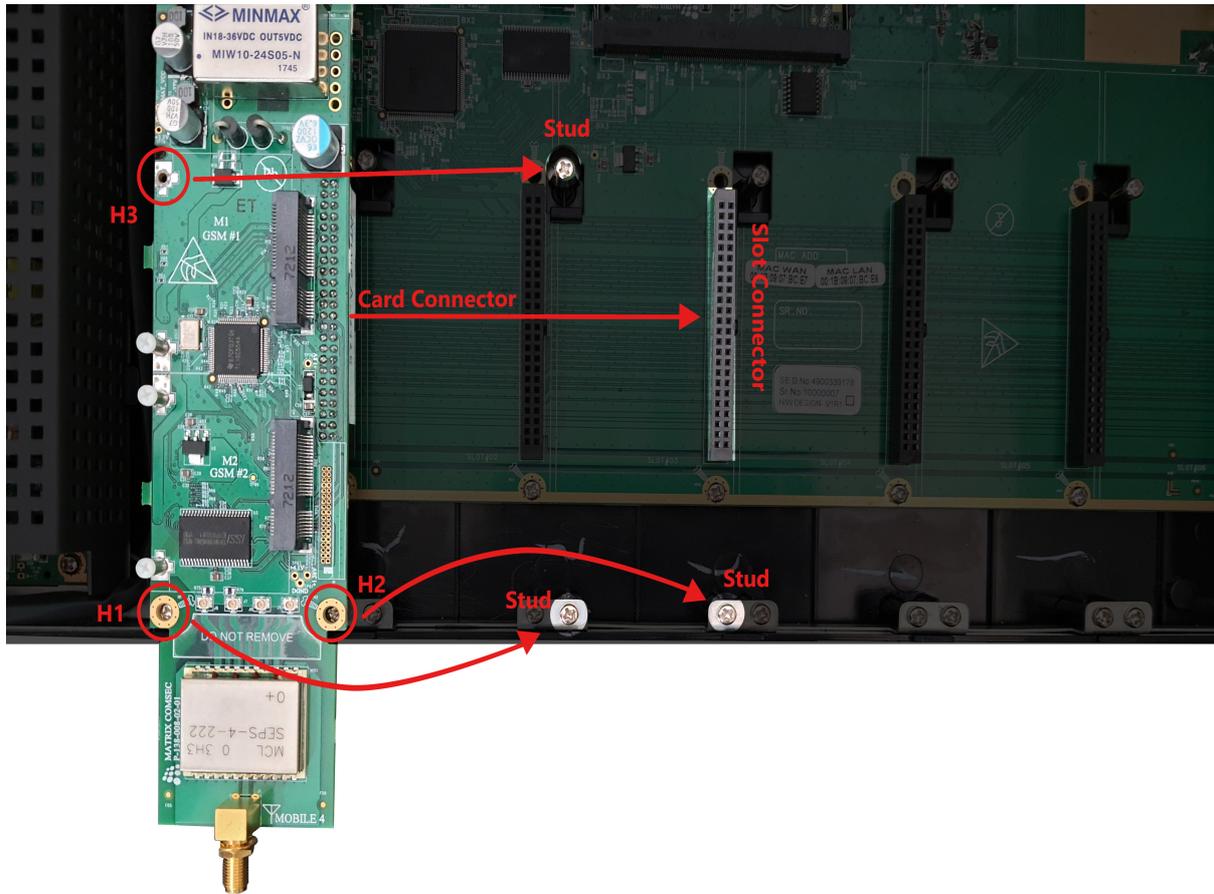

Inserting Cards

7. Make sure the power supply is turned off and the power cord is unplugged, before you begin inserting the cards.
8. Unpack the card and check the package contents.
9. Unscrew the top cover of the ETERNITY PENX and remove it by sliding it out. Keep the cover and the screws aside.

10. Select a free slot from the universal slots.

11. Grasp the card by its sides or corners. Fit the card into connectors of the selected slot. Ensure that the card is seated perfectly for all the connector pins on the cards make complete contact with those on the CPU (motherboard) on the bottom plane.

12. When the card is firmly seated in the connector, use the three screws provided with the card to secure it on the studs labeled as H1, H2 and H3.

13. Following the above steps, install each card into the universal slots.

Detailed installing instructions are provided for each card — DKP, SLT, CO, T1/E1/PRI, GSM and modules — VoIP and VMS — later in this section. Refer to them when installing each card type.

14. Using the cables supplied with the cards, connect the card interfaces with the MDF (for SLT, DKP and CO), the ISDN modem (for T1/E1 PRI lines), the IP network, a Computer as applicable for each card.

15. Lead the cables out of the enclosure through any of the two cable outlets on either side of the enclosure.

Lead the cables neatly and tangle-free into the MDF.

16. When you have completed inserting the cards and connecting the cables, replace the top cover by sliding it in place. Secure the cover with the two screws you removed.

Since the connectors of the cards will not be visible after the cover has been replaced, you are advised to label the cables appropriately to facilitate identification.

17. To remove a card:
 - Switch off power supply, unplug the power cord.

- Disconnect any cables connected to the card.
- Remove the screws from the studs H1, H2 and H3.
- Grasp the card by corners; gently rock the card to ease it out of its slot connectors.

The Power Supply Unit

The Power Supply in the ETERNITY PENX is an in-built universal SMPS, with 100-240VAC, 47-63Hz Mains as Input AC Voltage Power Supply.

There is no provision for battery backup. So, you are recommended to provide Battery Backup of 24 VDC, 7-10A.H. by connecting a UPS to keep the system powered during outages.

Typical power consumption⁹⁶ of ETERNITY PENX is 40 W.

The Power Supply Unit is factory-fitted. It must be removed and refitted by trained technicians only, and only for the purpose of fault repair or replacement.

The CPU

The CPU of ETERNITY PENX manages the entire system, controls all other cards (SLT, DKP, CO, DKP+SLT, CO+SLT, DKP+CO T1E1PRI Single, GSM, etc.). All configuration and programming information is stored on this card.

The CPU is factory-fitted on the bottom plane of the ETERNITY PENX.

The CPU may be removed and reinstalled solely for the purpose of fault repair or replacement, and by trained technicians only.

Ports and Connectors:

Port	Connector	Description
LAN	RJ45	Used for connecting the Ethernet cable into LAN Port to connect to a PC or a LAN Switch.
WAN	RJ45	Used for connecting the Ethernet cable into WAN Port to connect to a Broadband Router/Modem.
USB	USB to COM Converter	The External USB can be used as COM Port by connecting the USB to COM Converter. The USB to COM Port can be used to: <ul style="list-style-type: none"> • set up and run software applications — PMS and CAS. • capture System Activity Log, System Fault log and Hotel Motel Activity logs. • generate SMDR reports.
Power	3-PIN Power Cord	Used to connect Power Adapter
ON/OFF	Switch	Used to Switch ON/OFF Power.

96. Considering 30% SLT off-hook when 48 SLTs are connected.

Jumpers

Jumper J6 on the CPU card of ETERNITY PENX are used to Reset the SE Password. Refer the table below:

Jumper Number	Position	Function
J6	AB BC (default)	Reset SE Password. Normal.

ETERNITY PENX does not support Redundancy and Hot Swap.

Providing Battery Backup

Provide Battery Backup of 24 VDC, 7-10A.H. by connecting the system with a UPS.

Connecting ETERNITY PENX to the Local Area Network

Plug one end of the Ethernet cable supplied with the system into the LAN port of the ETERNITY PENX and plug the other end into the LAN switch.

With the ETERNITY PENX connected to a LAN, you can:

- access the web-based programming tool Jeeves from any PC on the LAN.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.

When you connect the ETERNITY PENX to a Ethernet PC, you need to make sure that

- *The IP Address of the LAN Port of the ETERNITY PENX and the Ethernet Port of the PC are not the same.*
- *The LAN Port of ETERNITY PENX and the Ethernet Port of the PC are in the same Subnet.*
- For instructions to change the IP address and Subnet Mask, refer [“Changing IP Address and Subnet Mask of the WAN Port Only”](#) at the end of this topic.

Connect the ETERNITY PENX to a Standalone PC

You can connect ETERNITY PENX to a standalone PC through the LAN/WAN Port, depending on the type of application you want to use.

1. Connect the LAN/WAN Port of ETERNITY with the Ethernet Port of the stand-alone PC using the Ethernet cable supplied with ETERNITY.

If you connect to the PC via the LAN/WAN port you can:

- Use the web-based programming Tool Jeeves
- Configure LAN/WAN using FTP
- Take debug/report on ETERNITY PENX Syslog
- Capture SMDR reports, SMDR Online and SMDR Posting

- Capture System Activity Log and System Fault Log, Hotel Motel Activity Log
- Run PMS Interface or CAS Interface in the Hotel Application⁹⁷

When you connect the ETERNITY PENX to a standalone PC, you need to make sure that

- The IP Address of the LAN/WAN Port of the ETERNITY PENX and the Ethernet Port of the PC are not the same.
- The LAN/WAN Port of ETERNITY PENX and the Ethernet Port of the PC are in the same Subnet.
- For instructions to change the IP address and Subnet Mask, refer "[Changing IP Address and Subnet Mask of the WAN Port Only](#)" at the end of this topic.

Changing IP Address and Subnet Mask of the WAN Port Only

The default IP Address of the LAN Port of the ETERNITY PENX is 192.168.2.100, WAN Port of the ETERNITY PENX is 192.168.1.100 and the Subnet Mask is 255.255.255.0.

- Ascertain the IP Address and Subnet of the standalone PC.

If the system is connected to a LAN PC, ask the LAN Administrator to assign an IP Address and a Subnet Mask to the ETERNITY PENX⁹⁸.

- Replace the cover of the ETERNITY PENX and switch ON the system.
- Change the IP Address and the Subnet Mask of the WAN Port by dialing the following commands from an extension of the ETERNITY PENX.

To change IP Address of the WAN Port:

- Dial **2110-IP Address**
For example: to change the IP Address to 192.168.50.10 dial **2110-192168050010**.
You get confirmation tone.
- Dial **2111-Subnet Mask**
For example: to change the Subnet Mask to 255.255.255.0 dial **2111-255255255000**.
You get confirmation tone.
- Dial **00** to exit from the programming mode.

- If there is a DHCP server on the LAN to which the LAN Port of the ETERNITY PENX is connected, there is no need to change the IP Address or Subnet Mask, as these will be provided automatically by the DHCP server.
- You must only enable the DHCP flag of the LAN/WAN Port of ETERNITY PENX.
- To enable DHCP flag
 - Dial **1#91-SE Password**

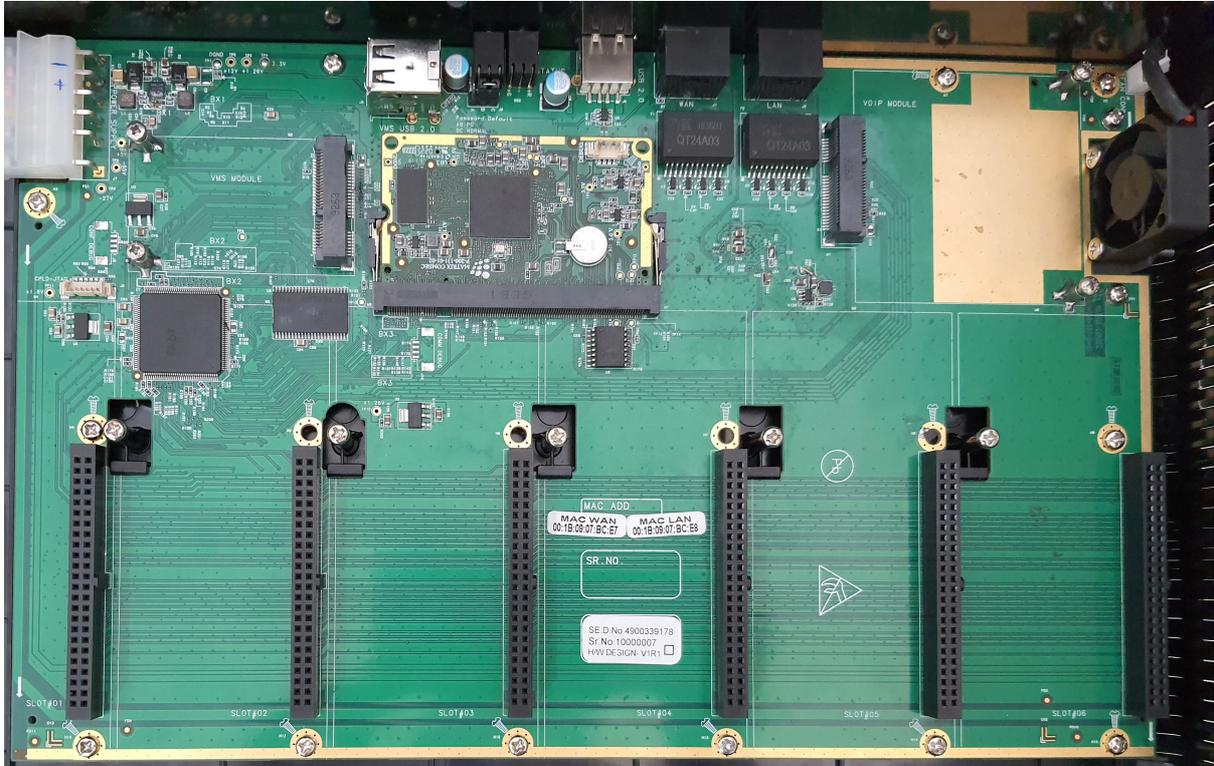

97. Refer the ETERNITY Hospitality System Manual to know more.

98. This will not be necessary, if there is a Dynamic Host Configuration Protocol (DHCP) server on the LAN.

- You get programming tone.
 - Dial **2117-1**
 - You get confirmation tone.
-
- Dial **00** to exit from the programming mode.

The CPU Card

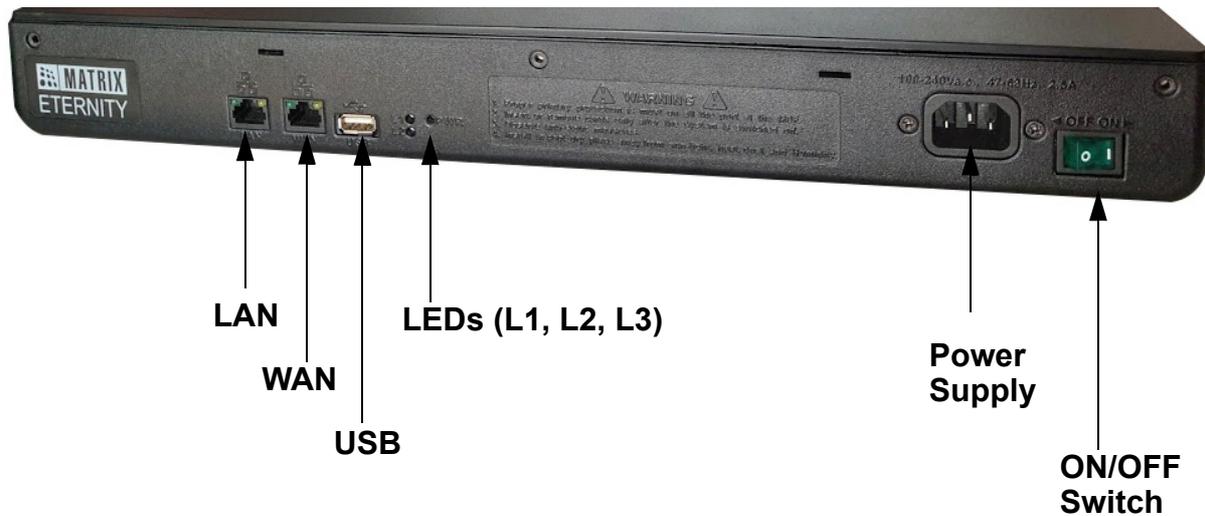

The ETERNITY PENX CPU Card hosts the SARVAM UCS SMB Application. It supports one VOCODER modules and one VMS module. Both the modules — NX DBM VOCODER64 and NX DBM VMS64 are optional and can be purchased separately.

This card hosts Communication Manager, Feature Server, VoIP Server, VMS Server and other important servers and modules which controls all other slave cards (SLT, DKP, CO+SLT, DKP+SLT, T1E1, GSM etc.). All the configuration and programming information is stored on this card.

The CPU Card has a WAN Port, LAN Port and USB Port on the front panel. It also has an Internal USB Port with a factory fitted pendrive.

Ports and Connectors:

Port	Connector	Description
LAN	RJ45	Used for connecting the Ethernet cable into LAN Port to connect to a PC or a LAN Switch.
WAN	RJ45	Used for connecting the Ethernet cable into WAN Port to connect to a Broadband Router/Modem.
USB	USB to COM Converter	<p>The External USB can be used as COM Port by connecting the USB to COM Converter.</p> <p>The USB be COM Port can be used to:</p> <ul style="list-style-type: none"> • set up and run software applications — PMS and CAS. • capture System Activity Log, System Fault log and Hotel Motel Activity logs. • generate SMDR reports.
Power	3-PIN Power Cord	Used to connect Power Adapter
ON/OFF	Switch	Used to Switch ON/OFF Power.

If you buy a spare CPU Card separately, the default pendrive will not be provided along with it.

LAN Interface

The LAN Port is provided to connect:

- the system to a PC or a LAN. This port is used for operating the web-based programming software Jeeves.
- the CPU Card to the Local Area Network to register SIP extensions through the LAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “*System Activity Log*”, “*System Fault Log*” and Hotel Motel Activity Log.

WAN Interface

The WAN Port is provided to connect:

- a LAN Switch/Hub/Router/Modem.
- the CPU Card to the public network over a Router/Modem. Any user on the public network can be registered as SIP Extension through the WAN Port.
- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.
- capture “*System Activity Log*”, “*System Fault Log*” and Hotel Motel Activity Log.

VoIP Interface

The CPU Card supports one NX DBM VOCODER64 modules. You must purchase the module separately for VoIP functionality.

VOCODER Channels

The system supports one NX DBM VOCODER64 Module. This module supports 64 VOCODER Channels⁹⁹. You must purchase the module separately. The system provides 4 pre-activated VOCODER channels by default which can be used after installing NX DBM VOCODER64 module. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VOCODER CHNL4 and SARVAM VOCODER CHNL16.

If you require more than 64 VOCODER channels, you can install another NX DBM VOCODER64 Module.

A call made from a SIP Extension or SIP Trunk to another SIP Extension or SIP Trunk will consume two VOCODER channels, whereas a call made from a SLT or DKP extension to a SIP Extension or SIP Trunk will consume one VOCODER channel. Thus, the number of speech paths available to make simultaneous calls will depend not only on the number of VOCODER channels, but also on the number of channels consumed by such SIP-to-SIP and Analog/Digital extension to SIP Trunk/SIP Extension calls.

VMS Interface

The system supports a full-fledged, 'in-skin' Voice Mail System module to provide mailbox facility to all its extensions users. The Voice Mail System also forms the basis of other features like Conversation Recording and Call Taping.

Each Mailbox has the capacity of storing 15,000 voice messages. The maximum size of each Mailbox is 60,000 minutes. By default, the size of each Mailbox is set to 5 minutes. The maximum Message Length for each Mailbox is 9,999 seconds. By default, the Maximum Message Length for each Mailbox is set to 15 seconds.

The NX DBM VMS64 Module is an optional module. It must be purchased separately. The factory fitted Pen Drive provided also contains the VMS configuration files, and voice messages for prompts and greetings along with the SARVAM UCS SMB Application. The Pen Drive is also the storage device for mailbox messages.

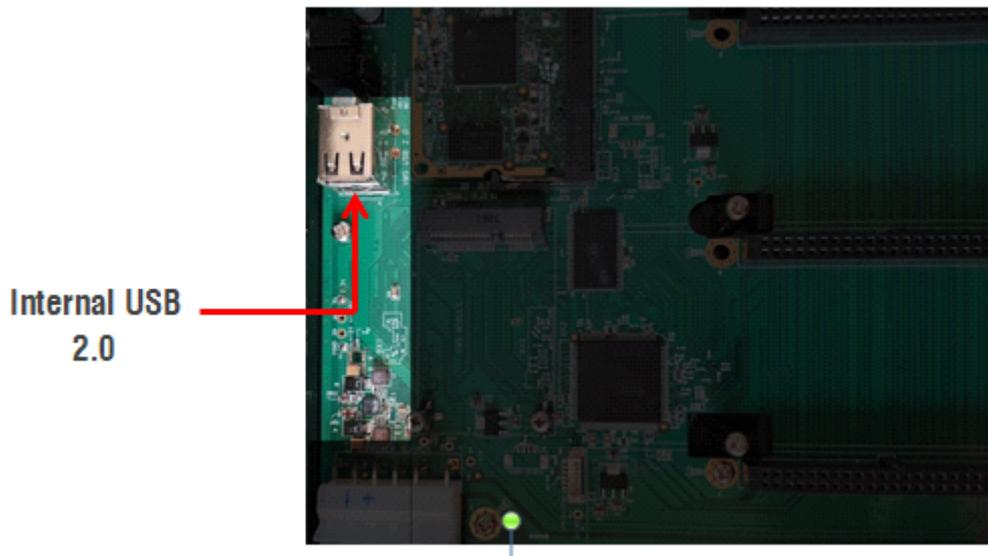

If required, you may use a Pen Drive of upto 64GB by replacing the factory fitted pendrive with a new one.

The system supports a maximum of 16 channels out of which 4 channels are provided by default. If you require more channels, you can purchase the licenses accordingly. Matrix provides two licenses — SARVAM VMS CHNL4 and SARVAM VMS CHNL16.

99. *The number of VOCODER channels that will be supported would be as per the license you purchase.*

Internal USB Port

The CPU Card has an Internal USB Port with a pendrive inserted into it.

The pendrive supports FAT32 file format. It contains the SARVAM UCS SMB Application, VMS greetings, messages, mail boxes, Matrix Extended IP phone firmwares and SMS Server firmware.

 **Do not remove the pendrive.**

When you select the SARVAM UCS SMB Application, the system fetches the application from the pendrive.

External USB Port (Device Port) 2.0

The CPU Card has an External USB Port on the fascia. This can be used as a COM Port by connecting the USB to COM Converter.

 **The USB to COM Converter will not be provided by Matrix.**

The following USB to COM Converters are supported:

- Prolific PL2303 by BAFO
- CH341 by Winchiphead

 **If you use any other USB to COM Converter, Matrix does not guarantee it's proper functioning.**

The USB to COM Port has a DB-9 connector.

The port allows you to connect a PC to the system, so that you can install and operate the following features:

- set up and run software applications such as PMS and CAS on any PC on the LAN.
- generate Station Message Detail Record (SMDR) Reports on any PC on the LAN.

- capture “System Activity Log” and “System Fault Log”, Hotel Motel Activity Log.

LED

The System has three dual color (Green and Red) LEDs.

LED 1 and 2 denote the health of the system and LED 3 is for Power Status.

- LED 1 - L1 works as a Heart Bit of CPU Card. In Normal Condition, L1 will be turned ON Green for 1 sec and OFF for 1 sec.
- LED 2 - L2 indicates the Layer Application status. In Normal condition, L2 will be turned ON Red and will blink very fast.
- Both L1 and L2 also indicate Application status.

Case 1: L1 is steady GREEN/OFF and LED2 is OFF. This means the Application is hung and there is some problem in the Application code.

Case 2: LED1 is steady GREEN/OFF and LED2 is GREEN/RED/ORANGE. This means the Layer is hung and there is some problem with the Layer code.

- LED 3 - L3 indicates Power ON/OFF Status.
 - At Power ON, Power LED will turn ON (Continuous Green).
 - System LED (STS) will display following error/events/status.

LED Status	Color	Comment
1sec On - 1sec Off (Continuous)	Green	ETERNITY PENX started successfully.
5sec On - 5sec Off (Continuous)	Green	Software Mismatch (uboot checksum did not match)
10sec On - 10sec Off (Continuous)	Green	Flash Lock due to License
100msec ON - 100msec OFF - 100msec ON - 100msec OFF - 100msec ON - 5000msec OFF	Green	Recovery Mode ^a

a.If you get Recovery Mode LED status, contact Matrix Support Team.

- Mobile Ports take about 3 minutes to get registered with the network.

Jumpers

The position and function of the Jumpers on the CPU Card are:

Jumper Number	Position	Function
J6	AB BC (default)	Reset SE Password. Normal.

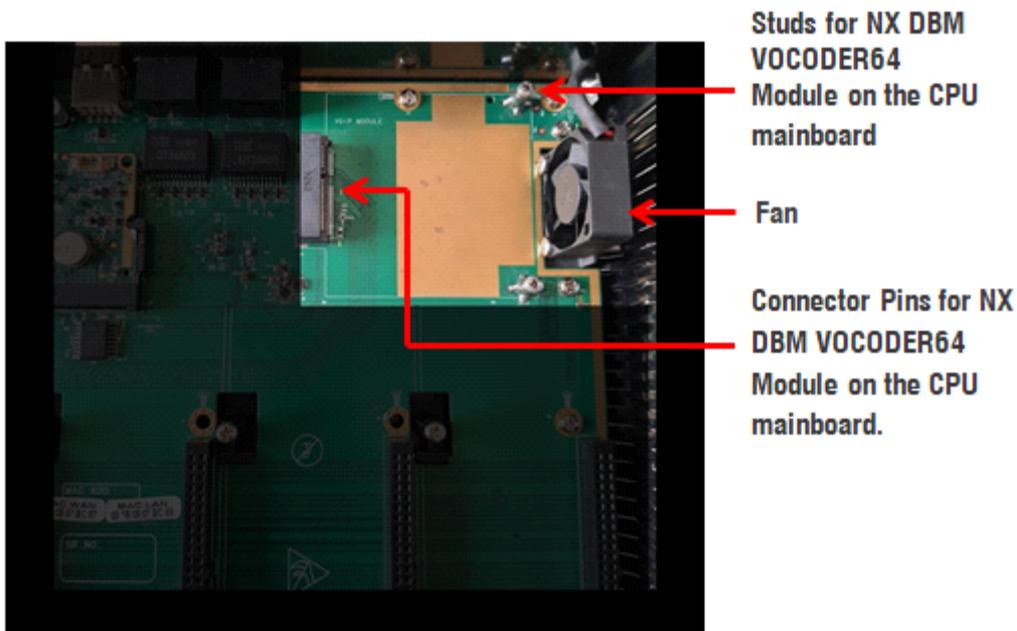

Installing the VOCODER Module

To install,

- Unpack the NX DBM VOCODER64 Module.

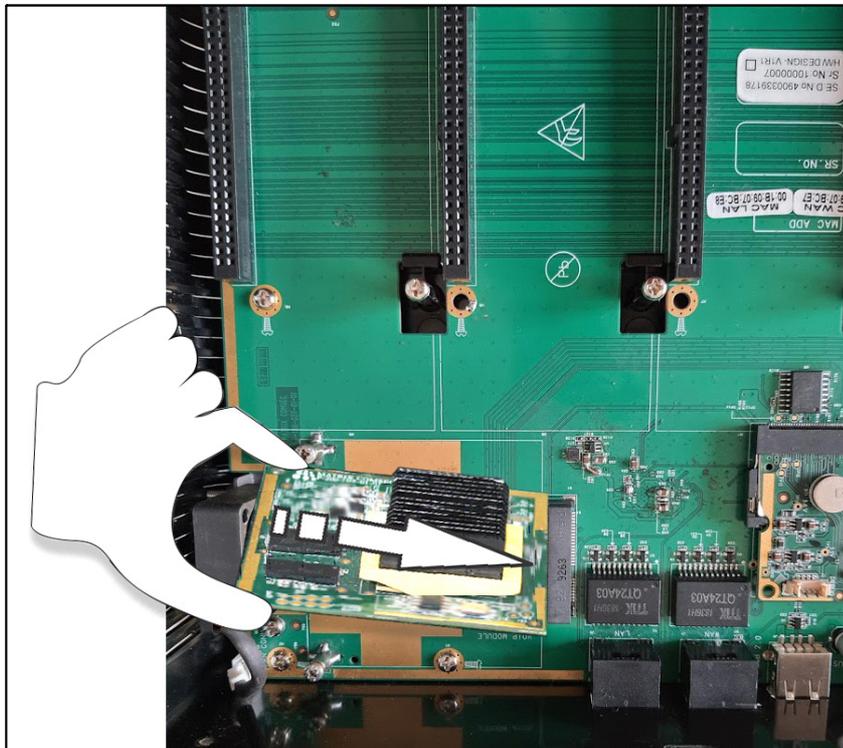

- Unscrew the top cover of the ETERNITY PENX and remove it by sliding it out. Keep the cover and the screws aside.
- The NX DBM VOCODER64 Module is to be mounted adjacent to the fan on the CPU board.
- Locate the studs on the CPU mainboard and unscrew them to install the NX DBM VOCODER64 Module.

- Carefully hold the NX DBM VOCODER64 Module from the edges. Make sure you do not touch the PCB area.

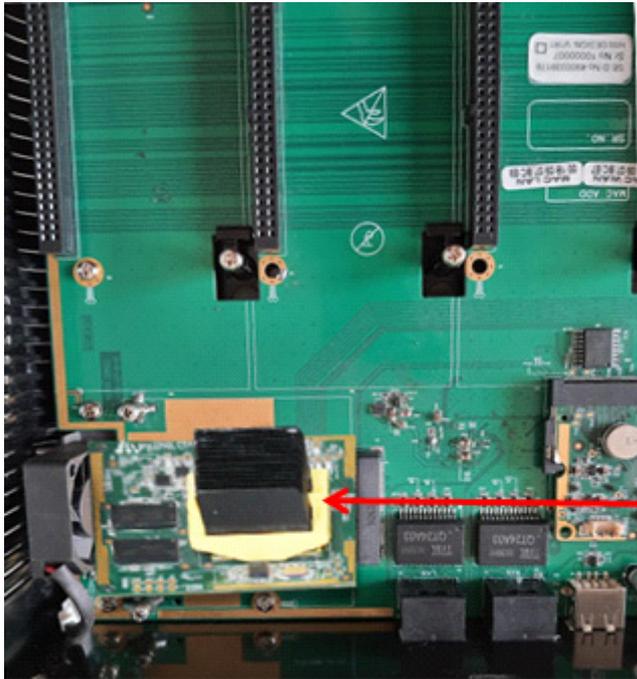

- Gently seat the NX DBM VOCODER64 Module on the studs on the CPU mainboard. The connector pins on the module must make complete contact with those on the CPU mainboard. Do not apply pressure.

- When the module is seated firmly on the studs on the CPU mainboard, secure the module with the screws on the studs.
- Do not apply excessive pressure. Follow the same steps if you wish to install VMS module, see [“Installing the VMS Module”](#).
- If you have no other modules to install, replace the top cover and secure the cover with the screws.

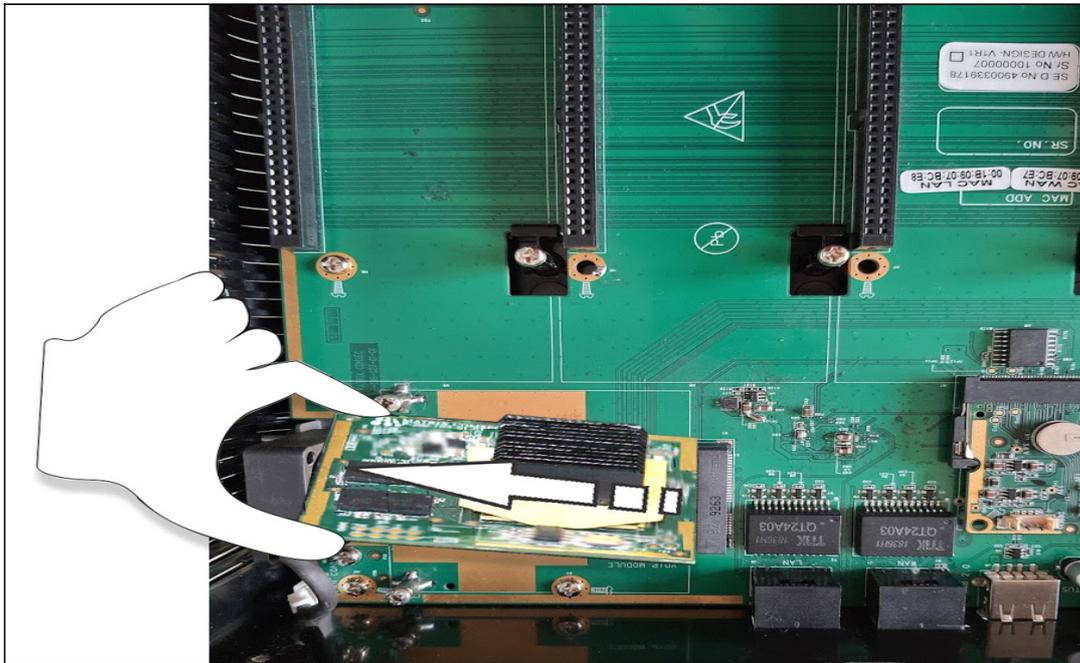

Removing the VOCODER Module

- Locate the VOCODER Module you want to remove from the CPU Card.

**NX DBM VOCODER64
Module**

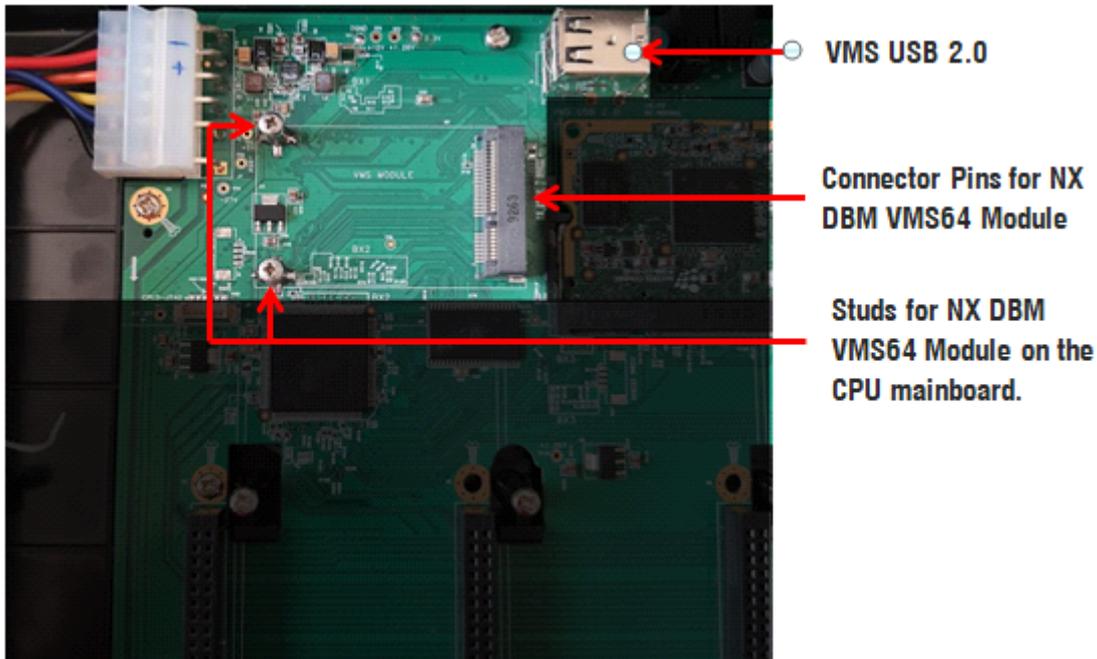

- Remove the screws, firmly hold the module and ease it out of the PCI connector carefully.

Installing the VMS Module

To install,

- Locate the PCI connector for NX DBM VMS64 Module on the CPU card.

- Follow the same steps as described in installing the NX DBM VOCODER64 Module. See [“Installing the VOCODER Module”](#).
- The pendrive which is provided to you by default contains VMS data and VMS firmware. You will be able to use the VMS features once you activate the VMS License.

If you want to store more voice mail messages or greetings then you will need more space to store the same. You can replace this default pendrive with a new one having more space.

To do so, you need to format your new pendrive with FAT32 file format and then copy all the contents of the factory fitted pendrive into the new pendrive.

Make sure you switch-off the system to replace the pendrive. The system will not detect the new pendrive if you do not restart the system after replacement.

- If you have no other modules to install, replace the top cover and secure the cover with the screws.
- Connect a computer to the LAN/WAN Port of the system with the Ethernet cable supplied for the port.
- Open a Web browser on the computer to access the embedded Web server, Jeeves.
- Activate the VMS License Voucher. See [“License Management”](#) for instructions.
- Configure VMS. For detailed instructions, see [“Configuring Voice Mail System”](#).

The Single Line Telephone Card

The Single Line Telephone (SLT) Card provides the interface to connect as extension phones, any standard, two-wire, analog single line telephone instrument-rotary, pulse-tone, cordless, feature phones with or without Calling Line Identification.

The SLT Card is available in the following configurations for ETERNITY PENX. The SLT interface is available in combination with Digital Key Phone ports and Two-wire Trunk ports on a single card.

SLT Cards for ETERNITY PENX

Card Name	Configuration and Application
ETERNITY PE Card SLT8	8-port card to connect 8 Single Line Telephones
ETERNITY PE Card SLT4	4-port card to connect 4 Single Line Telephones
ETERNITY PE Card DKP2+SLT6	Combination card, with 2 ports to connect to 2 Digital Key Phones and 6 Single Line Telephones
ETERNITY PE Card CO4+SLT4	Combination card, with 4 ports to connect to 4 Two-wire Analog trunk lines and 4 Single Line Telephones
ETERNITY PE Card CO2+DKP2+SLT4	Combination card, with 2 ports to connect to 2 Two-wire Analog trunk lines, 2 Digital Key Phones, and 4 Single Line Telephones
ETERNITY PE Card CO2+SLT6	Combination card with 2 ports to connect 2 Two-wire Analog trunk lines, and 6 ports to connect 6 Single Line Telephones

Choose an SLT Card with the configuration that meets your requirement for SLT ports. Also consider the maximum SLT Port capacity of the system you are installing.

The maximum number of SLT ports supported by ETERNITY PENX are 48 SLT Ports.

Connectors

The SLT Cards have RJ45 connectors. A multi-pair, cable is supplied for each connector on the card.

Installing Single Line Telephones

To be able to connect Single Line Telephones as Extensions to your ETERNITY PENX, you must install at least one of the aforementioned SLT cards in the System.

1. Decide the number of SLT extensions required and arrange for as many telephone instruments.

You may use any standard telephone instrument like a rotary phone, a pulse-tone switchable push-button phone, a feature phone or a cordless phone.

Use SLTs equipped with a 'Flash' key, as several of the features and facilities of the ETERNITY require you to press Flash. If any of the SLTs you have selected does not have a Flash key, tap the Hook switch of the phone to dial Flash.

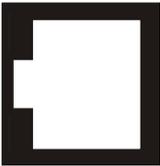

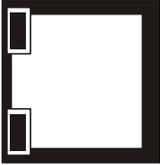

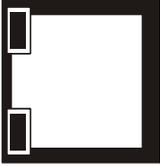

2. Unpack the SLT card and check the package contents.

3. Make sure that the power supply is switched off, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
4. Unscrew the top cover of the ETERNITY PENX and slide it out. Keep the cover and the screws aside.
5. Select any of the free slots from the universal slots.
6. Grasping the card by its sides or corners fit it onto the connectors of the selected slot. The card should be seated such that its connector pins make perfect contact with those on the CPU (motherboard) on the bottom plane.
7. Secure the card on the studs labeled H1, H2 and H3 with the three screws provided.
8. Repeat the same steps to install another SLT card. It is not necessary to install the other SLT cards in subsequent slots. You may install the other SLT cards in any of the universal slots.
9. Now, use the cables supplied with the SLT card to connect the SLT wires with the Main Distribution Frame.

For each connector on the SLT Card, there is a separate cable with an RJ45 plug on one end and free at the other end.

Refer to the pin-out details of the connectors on each card type to connect the wire-pairs.

ETERNITY PE Card SLT4

Connector	Color	Connection	H/w port Offset
	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
	RJ45-2		
	RJ45-3		

ETERNITY PE Card SLT8

Connector	Color	Connection	HW port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	SLT	05
	Orange - (Orange & White)	SLT	06
RJ45-3	Blue - (Blue & White)	SLT	07
	Orange - (Orange & White)	SLT	08

ETERNITY PE DKP2+SLT6

Connector	Color	Connection	HW port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	SLT	05
	Orange - (Orange & White)	SLT	06
RJ45-3	Blue - (Blue & White)	DKP	01
	Orange - (Orange & White)	DKP	02

ETERNITY PE Card CO4+SLT4

Connector	Color	Connection	HW port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
RJ45-3	Blue - (Blue & White)	CO	03
	Orange - (Orange & White)	CO	04

ETERNITY PE Card CO2+DKP2+SLT4

Connector	Color	Connection	HW port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
RJ45-3	Blue - (Blue & White)	DKP	01
	Orange - (Orange & White)	DKP	02

10. Plug in the RJ45 end of the SLT cables into the respective connectors.
11. Lead the cables out of the enclosure through any of the two cable outlets on either side of the enclosure.
12. Terminate the free end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the Main Distribution Frame (MDF).

Each wire-pair from the ETERNITY PENX SLT Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic [“The Main Distribution Frame \(MDF\)”](#) for illustration.

13. If you have completed installing all cards, replace the top cover by sliding it in place. Secure the cover with the two screws you removed.

Connecting SLT instruments

14. Connect the SLT instruments you have arranged for. Plug in the SLTs into the wall socket/outlets.

- *For the purpose of testing, you may connect one or two Single Line Telephone instruments by plugging in the phone cables into the RJ45 connectors on the card.*
- *When you plug the RJ11 connector of SLT into an RJ45 connector on the SLT card, the SLT will be connected to the first port on the connector.*

The Digital Key Phone Card

The Digital Key Phone (DKP) Card provides the interface to connect the proprietary digital key phones of the EON series, the proprietary PC-based phone EONSOFT, the Direct Station Selection (DSS) Consoles, with ETERNITY PENX.

The DKP Card is available in the following configurations for ETERNITY PENX. The DKP interface is available in combination with SLT ports and Two-wire Trunk ports on a single card.

DKP Cards for ETERNITY PENX

Card Name	Configuration and Application
ETERNITY PE Card DKP8	8-port card to connect 8 DKP/DSS Consoles
ETERNITY PE Card DKP2+SLT6	Combination card, with 2 ports to connect to 2 Digital Key Phones and 6 Single Line Telephones
ETERNITY PE Card CO2+DKP2+SLT4	Combination card, with 2 ports to connect to 2 Two-wire Analog trunk lines, 2 ports to connect 2 DKP/DSS Consoles, and 4 ports to connect 4 Single Line Telephones

To connect the proprietary digital key phones with ETERNITY PENX, you must have at least one of the above mentioned DKP Cards installed in the system.

Select a DKP Card with the configuration that meets your requirement for DKP Ports. Also consider the maximum DKP Port capacity of the system you are installing.

The maximum number of DKP ports supported by ETERNITY PENX are 16 DKP ports

Installing the Digital Key Phone Card

Decide the number of DKP extensions and DSS Consoles required and arrange for as many EON, EONSOFT and DSS Consoles.

Decide the locations of the DKP extensions and make sure that the necessary wiring for the DKP extensions, from the wall jack to the MDF, is done.

1. Unpack the DKP card and check the package contents.
2. Make sure that the power supply is switched off, before you begin the installation of the card. Always wear an electrostatic discharge prevention wrist strap/belt and use a grounding mat.
3. Unscrew the top cover of the ETERNITY PENX and slide it out. Keep the cover and the screws aside.
4. Select any of the free slots from the universal slots.
5. Grasping the card by its sides or corners fit it onto the connectors of the selected slot. The card should be seated such that its connector pins make perfect contact with those on the CPU (motherboard) on the bottom plane.
6. Secure the card on the studs labeled H1, H2 and H3 with the three screws provided.

7. Repeat the same steps to install another DKP card. It is not necessary to install the other DKP cards in subsequent slots. You may install the other DKP cards in any of the universal slots.
8. Now, use the cables supplied with the DKP card to connect the DKP wires with the Main Distribution Frame.

For each connector on the DKP Card, there is a separate cable with an RJ45 plug on one end and free at the other end.

Refer the connector pin details for each DKP Card type given in the following.

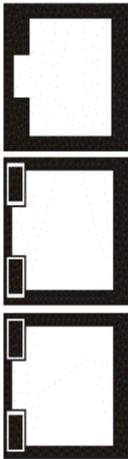

ETERNITY PE DKP8

	Connector	Color	Connection	HW port Offset
	RJ45-1	Blue - (Blue & White)	DKP	01
		Orange - (Orange & White)	DKP	02
		Green - (Green & White)	DKP	03
		Brown - (Brown & White)	DKP	04
	RJ45-2	Blue - (Blue & White)	DKP	05
		Orange - (Orange & White)	DKP	06
	RJ45-3	Blue - (Blue & White)	DKP	07
		Orange - (Orange & White)	DKP	08

ETERNITY PE Card DKP2+SLT6

	Connector	Color	Connection	HW port Offset
	RJ45-1	Blue - (Blue & White)	SLT	01
		Orange - (Orange & White)	SLT	02
		Green - (Green & White)	SLT	03
		Brown - (Brown & White)	SLT	04
	RJ45-2	Blue - (Blue & White)	SLT	05
		Orange - (Orange & White)	SLT	06
	RJ45-3	Blue - (Blue & White)	DKP	01
		Orange - (Orange & White)	DKP	02

ETERNITY PE Card CO2+DKP2+SLT4

Connector	Color	Connection	HW port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
RJ45-3	Blue - (Blue & White)	DKP	01
	Orange - (Orange & White)	DKP	02

- Plug in the RJ45 end of the MDF cables provided with the DKP card into the respective connectors.
- Terminate the free end of the cables into the punch down blocks of the Krone modules designated for 'Station Lines' in the Main Distribution Frame (MDF).

Each wire-pair from the ETERNITY PENX DKP Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the extension line to be connected to this port must be terminated on the top of the Krone connector. Refer the topic [“The Main Distribution Frame \(MDF\)”](#) for illustration.

9. Connect the Digital Key Phones to the wall jacks at their respective locations. Detailed installations instructions for EON and EONSOFT are provided separately.

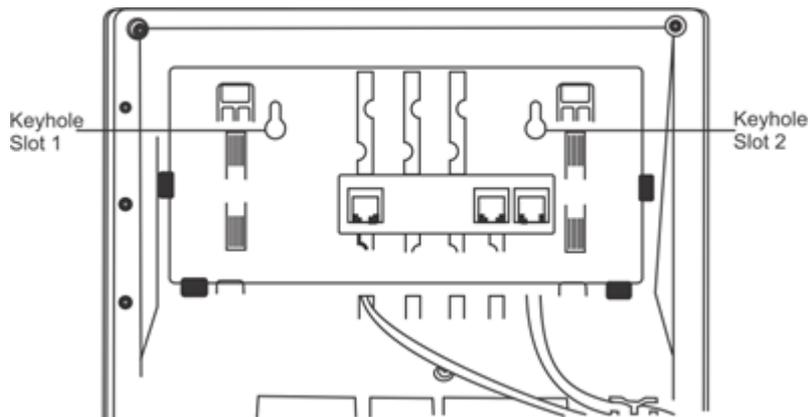

If you have completed all installation tasks, power on the system and observe the Reset Cycle and the LED Pattern of the DKP Card.

Installing EON48

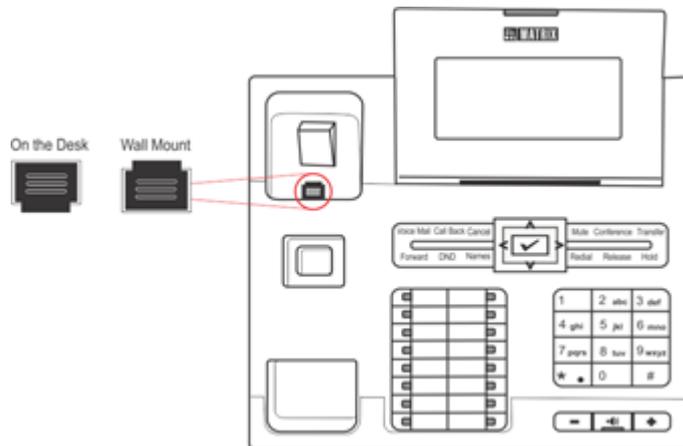

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2. The screws should protrude from the wall to fit into the keyhole slots.

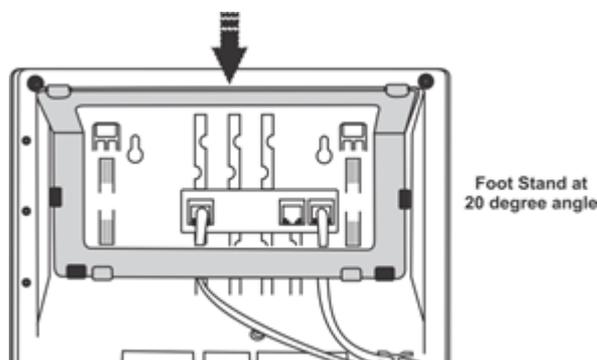

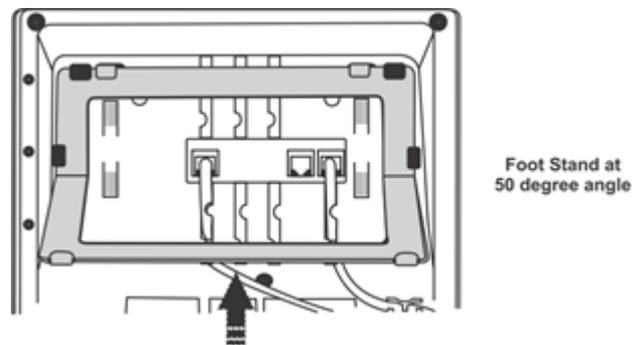

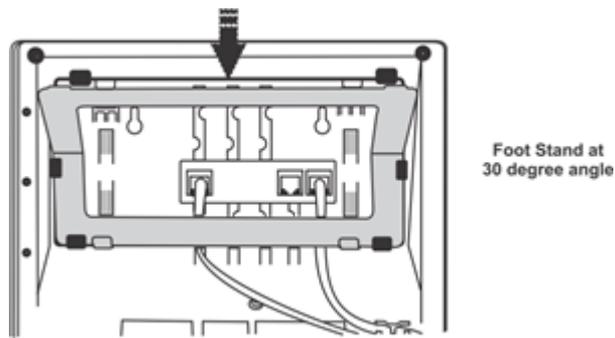

- Now, mount the phone with the screws fitting into the keyhole slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

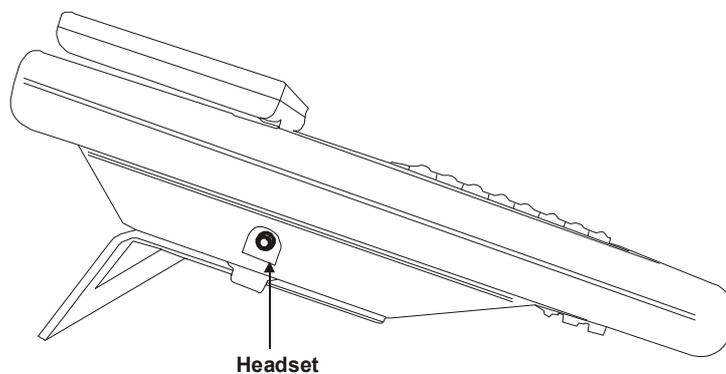

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **20° Angle** or at **30° Angle** or at **50° Angle**.

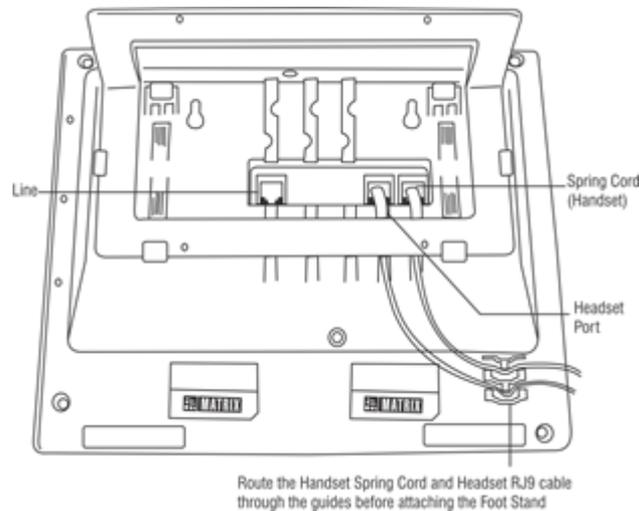

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.
- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
- Connect the handset of the EON48 to the phone body using the spring cord.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 2.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.

You may also plug in a stereo headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

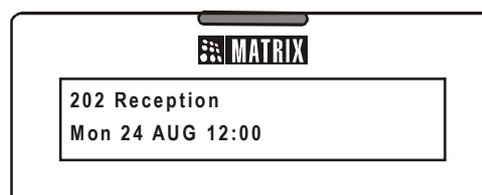

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as '**LINE**' and the other end into the wall jack/DKP Port.

- When the ETERNITY PENX is powered ON, the EON will reset. The EON communicates with the ETERNITY. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message '*Please wait*'... appear on the LCD display.

- After successful handshaking and reset cycle, if the DKP Parameters have been configured, the LCD display of the EON will show the extension number and the extension name in one line and the day, date and time and the time zone in the other line.

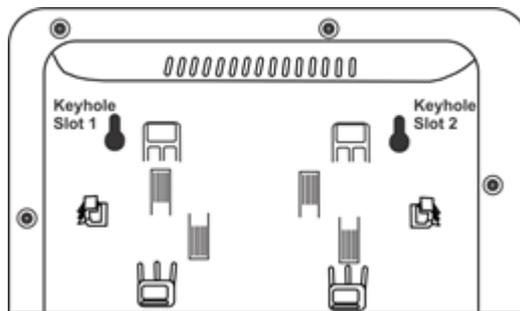

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, "[Digital Key Phone-Operation](#)" for instructions.

Installing EON310

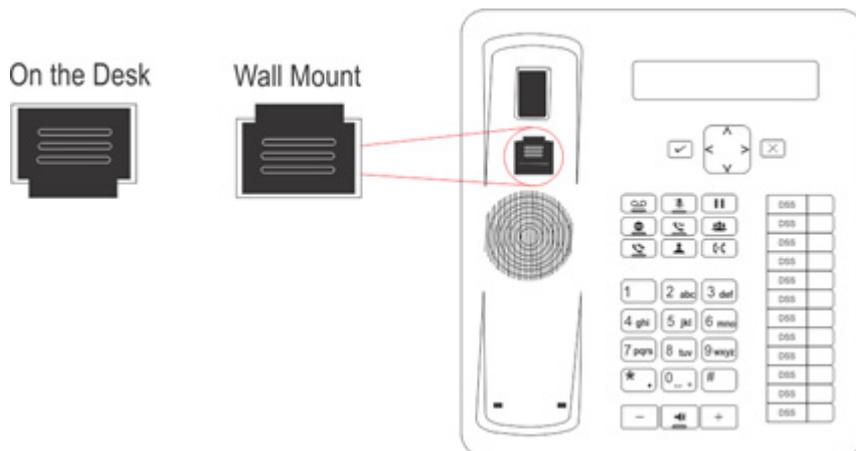

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 . The screws should protrude from the wall to fit into the keyhole slots.

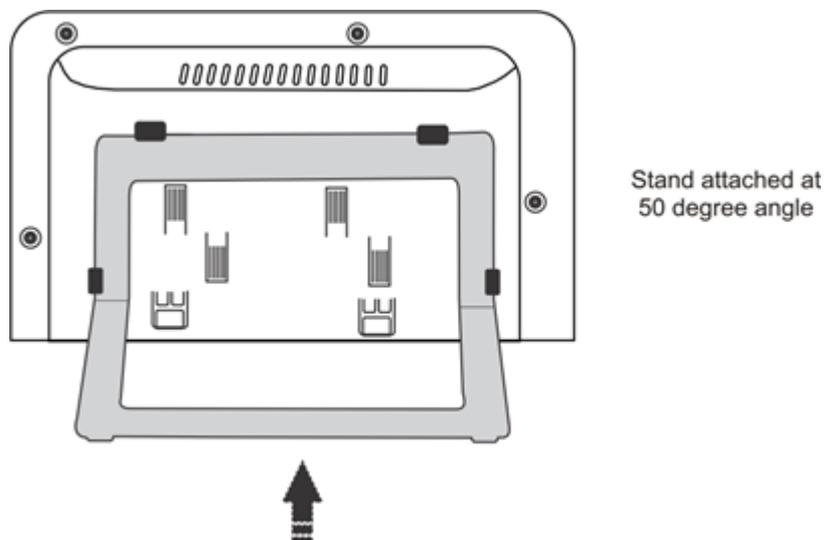

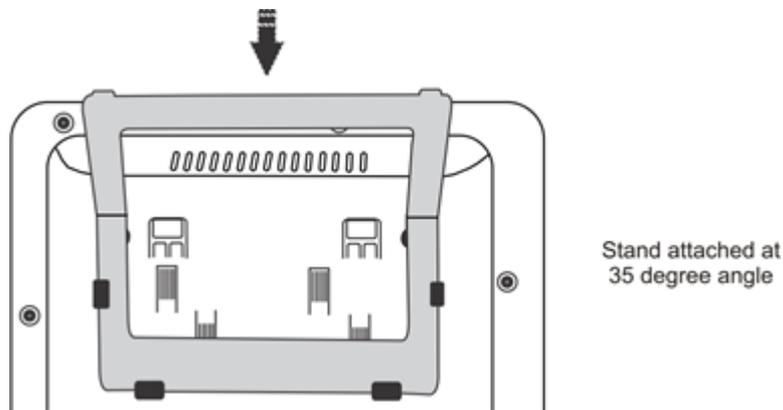

- Now, mount the phone with the screws fitting into the keyhole slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

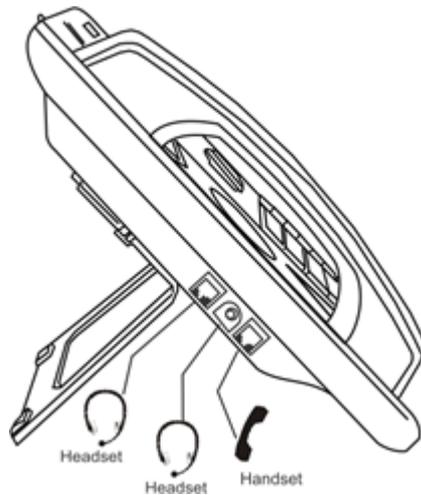

Mount the phone on the Desk

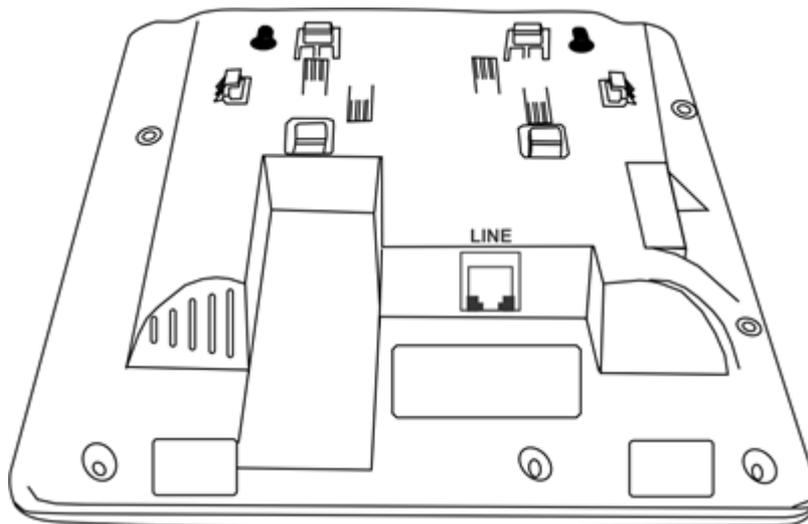

- You can attach the Foot Stand in the following ways—at an angle of **35° Angle** or at **50° Angle**.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
 - Connect the handset of the EON310 to the phone body using the spring cord.
 - To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone.
- You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.

- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone labeled as '**LINE**' and the other end into the wall jack/DKP Port.

- When the ETERNITY PENX is powered ON, the EON will get reset and the message "Welcome to Matrix. Booting" appears on the LCD display.

- The EON communicates with the ETERNITY PENX. The handshaking lasts for 5-6 seconds. The EON model, version and revision number, along with the message “Please Wait” appears on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear on the LCD.

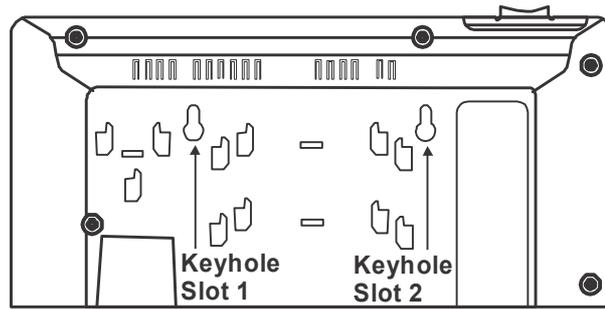

- You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“Digital Key Phone-Operation”](#).

Installing EON510

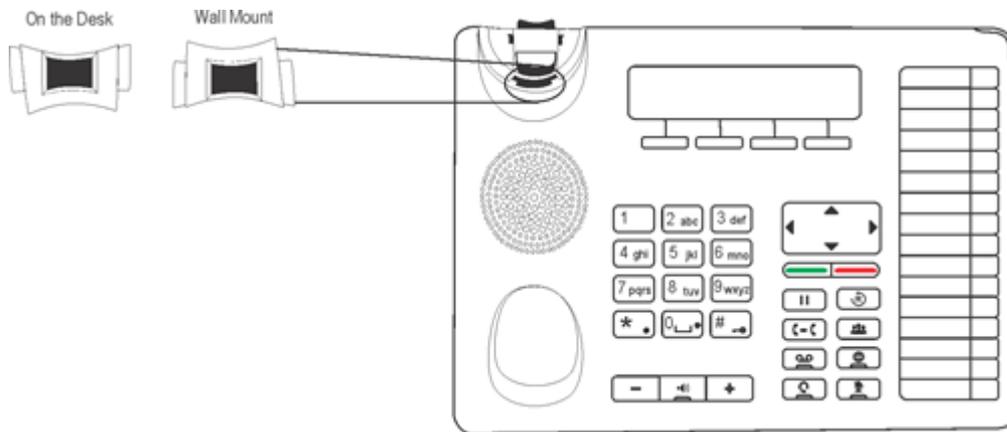

- Unpack the box and verify the package contents.
- You can mount the phone on a wall or on desk.

Mount the phone on a Wall

- Use the mounting template to drill holes of appropriate size and distance.
- Fix the screw grips in the holes you drilled.
- Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 . The screws should protrude from the wall to fit into the keyhole slots.

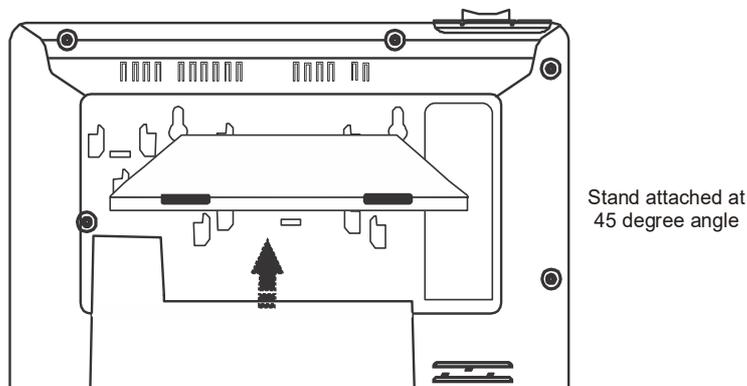

- Now, mount the phone with the screws fitting into the keyhole slots.
- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

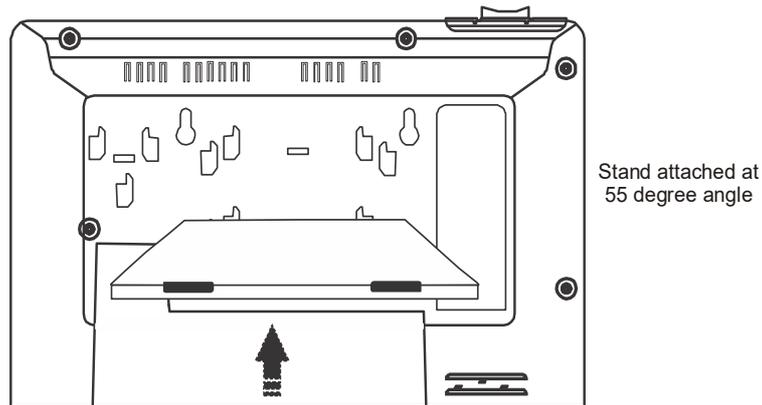

If you are unable to remove the wall mount tab, you may use a tool like a minus screw driver to remove it.

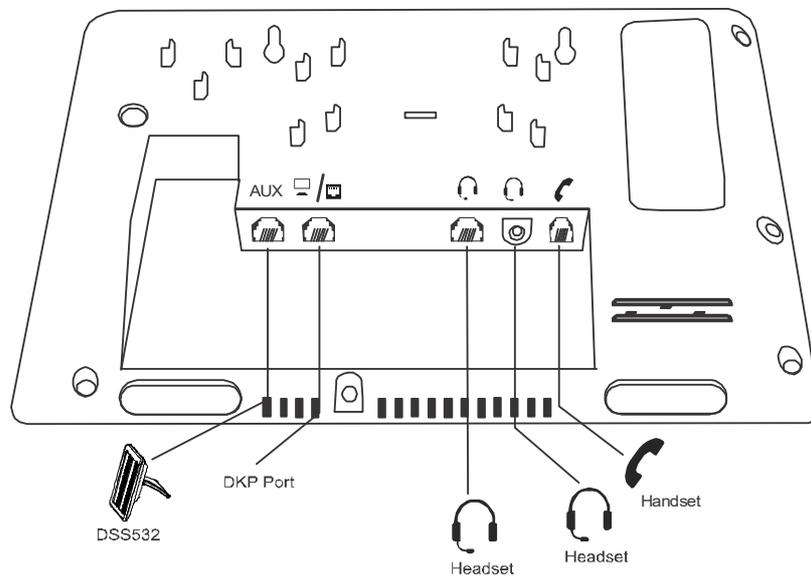

Mount the phone on the Desk

- You can attach the Foot Stand in the following ways—at an angle of **45° Angle** or at **55° Angle**.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

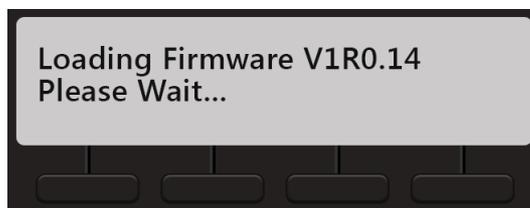

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
- Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.
- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset jack with the symbol  on the left side panel of the phone. You may also plug in a stereo headset with an RJ9 connector into the headset port marked with the symbol , on the left side panel of the phone.
- Plug one end of the RJ11 cable supplied with the phone into the RJ11 connector of the phone marked with the symbol  and the other end into the wall jack/DKP Port.

- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with EON510”](#).
- When the ETERNITY PENX is powered ON, the EON will get reset and the message 'Phone is Booting; Please wait...' appear on the LCD display.

- The EON communicates with the ETERNITY PENX. The handshaking lasts for 5-6 seconds. The message 'Loading Firmware Version-Revision; Please wait...' appear on the LCD display.

- After successful handshaking and reset cycle, the extension number, day, date and time will appear on the LCD of the phone. If you have already assigned extension number and name, in the DKP Parameters, these will appear, as illustrated below.

You may adjust the LCD for brightness, contrast and backlight. Refer the topic, [“The Digital Key Phone Card”](#).

Installing DSS Consoles

Installing DSS64

Once you have installed EON with ETERNITY PENX, installing DSS Consoles can be done in a few simple steps, very much similar to those involved in the installation of EON.

1. Unpack the box and verify the package contents¹⁰⁰.
2. Place the DSS Console next to the DKP, to which it is to be attached.

You can install two DSS consoles to a DKP. Refer [“Direct Station Selection Console”](#) for possible combinations for installing the models of DSS Consoles.

100. See [“Packing List”](#) under Appendix topic.

3. Decide which DKP Ports on the DKP Card are to be assigned to the DSS Consoles. You may select any free (unused) port on the card for DSS Consoles. It is not necessary for the DSS Console ports to be in a sequence with the DKP ports to which they are attached.

For example: you have connected DKP1 to Port 1 on the first RJ45 connector of the DKP8 card. You want to attach two DSS Consoles to DKP1. The two DSS Consoles may be connected to any port on the second connector of the card, not necessarily to Port 2 and Port 3 on the first connector.

4. The wire-pairs from the DKP Ports designated for DSS Consoles should be terminated on the bottom of the Krone Connector (of 'Station Lines' on the MDF).
5. The wire-pairs of the DSS Consoles should be terminated into the top of the Krone Connector (of 'Station Lines' on the MDF). Refer the topic "[The Main Distribution Frame \(MDF\)](#)" for illustration.

You can connect maximum two DSS64 with a single EON48/310.

6. The system automatically detects the DSS Console you connect and it will be will appear under **Unassigned DSS64** in "[DSS Status](#)". You must first assign these DSS Consoles to the respective DKP Ports and thereafter you will be able to configure the DSS Keys.
7. To assign the DSS Consoles, see "[DSS Status](#)" and to configure the DSS Keys, see "[Programming DSS Console Keys](#)".

Installing DSS532 with EON510

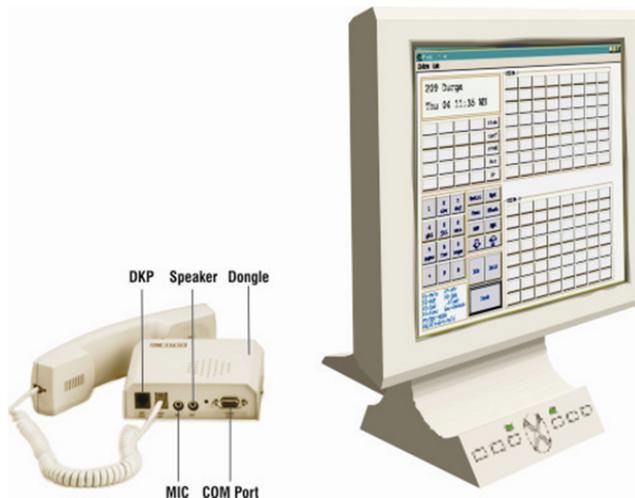

The instructions for installing DSS532 with EON510 or SPARSH VP510 are the same. For detailed instructions, refer to "[Installing DSS532 with SPARSH VP510](#)".

Installing EONSOFT

To install EONSOFT,

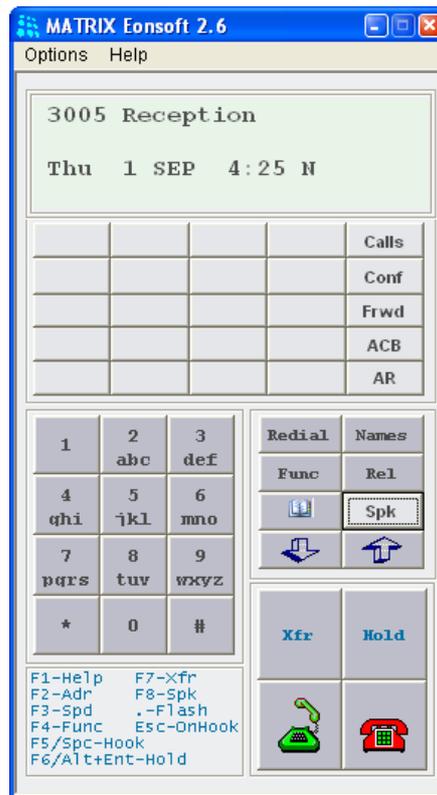

- Contact Matrix Support Team for the EONSOFT Installation Software Application.
 - You must have a computer with Windows as the operating system. The EONSOFT is compatible with the following Operating Systems of Windows:
 - Windows 98
 - Windows XP
 - Windows NT
 - Windows 2003
 - Windows Vista
 - Windows 2007
1. Unpack the box and verify the package contents¹⁰¹.
 2. Connect the Handset to the dongle in the handset jack. If using a headset, connect the microphone and the speaker connectors into the dongle.

101. See "[EONSOFT](#)" under 'Packing List' of Appendix topic.

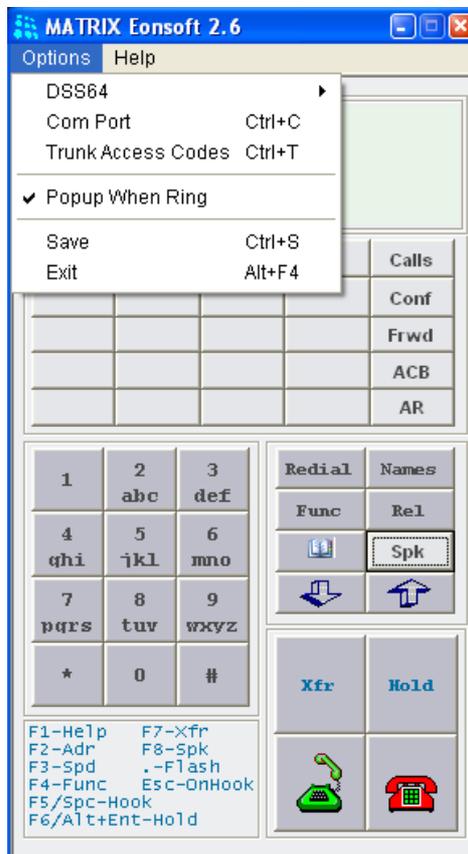

3. Connect one end of the Communication cable to the COM port of the dongle. Connect the other end of the communication cable into the COM port of the computer.
4. Connect a wire-pair of a DKP port of the ETERNITY PENX to the RJ11 port marked 'DKP' on the dongle.
5. Switch ON the computer. The computer must have Windows Operating System installed on it. If you do not have of the operating systems mentioned above, install any compatible Windows Operating System.
6. Copy the EONSOFT Application Software provided by the Support Team onto your PC and install the application.
7. After the program has been installed and run, a shortcut will be automatically created and appear on your desktop.

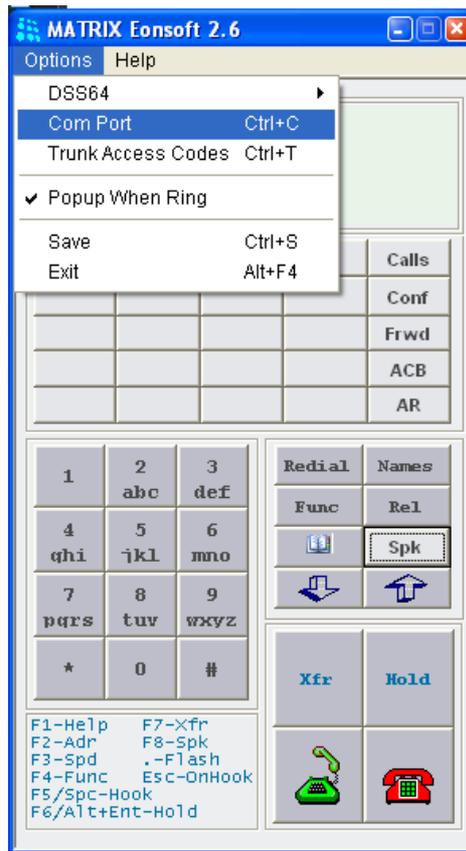

- Click the shortcut to open the program. The EONSOFT window will open:

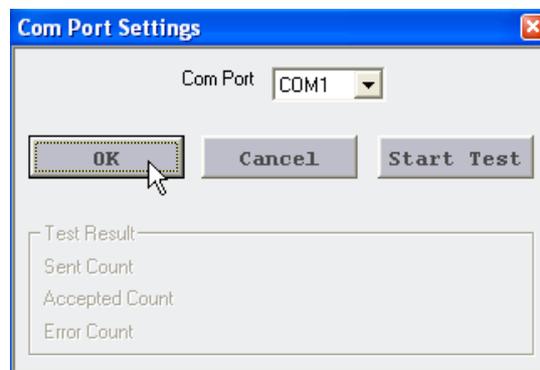

- Click **Options** at the top left of the window. A drop down menu will appear.

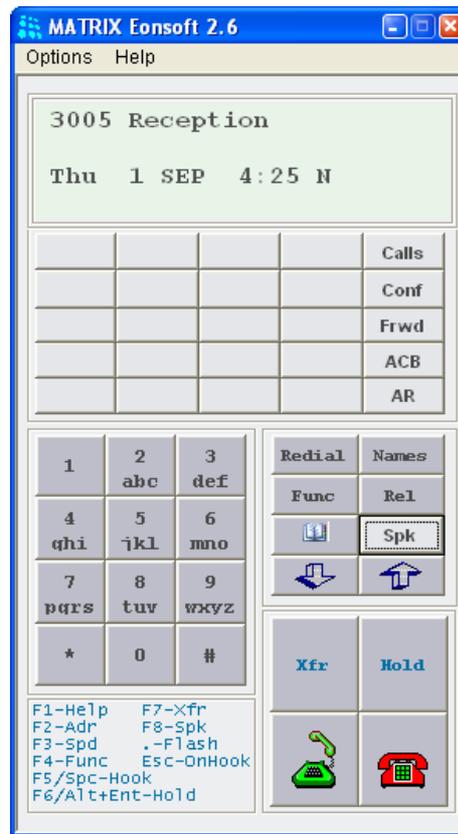

10. Click the option **COM Port**.

11. Select the COM Port to which the communication cable is connected.

12. EONSOFT is now connected. If you have already configured the DKP parameters like Access Code and Name for the port to which EONSOFT is connected, these will appear.

- If this window does not appear after you have selected the COM Port Option, test the COM Port for data transfer.
- If the wrong COM port has been selected, a dialog box will pop up on your screen with the message: “COMx is invalid or busy, please select another COM Port”. Select the correct COM Port.

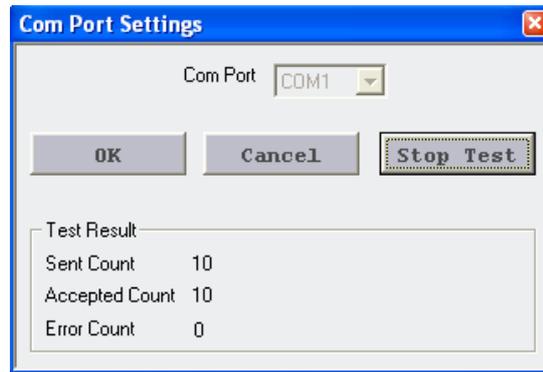

Test the functioning of the COM Port of the PC and the communication cable, before you install the EONSOFT.

Testing the COM Port

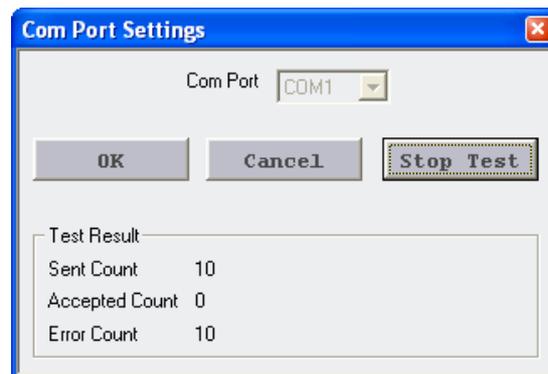

- From the drop down menu of 'Options', select the 'COM Port' to which you have connected the communication cable.
- The COM Port Settings dialog box will open.
- Connect the communication cable to the COM Port of the PC.
- Short pin2 and pin3 of the DB-9 connector at the free end of the cable.
- Click the button labeled 'Start Test' in the COM Port Settings dialog box.
- After clicking this button, observe the Test Result section in the dialog box.

- The **Error Count** value shows zero as value, if both the communication cable and the COM port are working.

The above screen shows that the COM Port/communication cable is working.

- If the **Error Count** shows a value other than zero, it means that either the communication cable or the COM port of the PC is faulty.

The above screen shows the faulty COM Port/Communication Cable.

- Remove the communication cable from the COM Port of the PC.
- Short pin2 and pin3 of the communication port of the computer and click 'Start Test' in the COM Port Settings dialog box.
- Now, if the error count is zero, please check the Communication Cable.
- If the error count is not a zero, the COM Port of the PC is faulty. Try another communication port.

The CO Card

The CO Card provides the interface to connect the ETERNITY PENX with the Two-Wire Analog Trunk lines from the CO Network. The CO Card supports the different standards and features of CO Networks across the world.

The CO Card is available in the following configurations for the variants of ETERNITY PENX. CO interface is also available in combination with SLT ports and with Digital Key Phone ports on a single card.

CO Cards for ETERNITY PENX

Card Name	Configuration and Application
ETERNITY PE Card CO8	8-port card to connect 8 Two-wire analog Trunk lines from the CO network
ETERNITY PE Card CO4+SLT4	Combination card, with 4 CO ports to connect 4 Two-wire analog Trunk lines from the CO network, and 4 SLT ports to connect 4 Single Line Telephones
ETERNITY PE Card CO2+DKP2+SLT4	Combination card, with 2 ports to connect to 2 Two-wire Analog trunk lines, 2 ports to connect 2 DKP/DSS Consoles, and 4 ports to connect 4 Single Line Telephones
ETERNITY PE Card CO2+SLT6	Combination card with 2 ports to connect 2 Two-wire Analog trunk lines, and 6 ports to connect 6 Single Line Telephones

Choose a CO Card with the configuration that meets your requirement for CO trunk ports, keeping in mind the maximum CO Trunk Port capacity of the system you are installing.

The maximum number of CO ports supported by ETERNITY PENX are 16 CO ports.

Connectors

The CO Card has RJ45 connectors, with 4 CO ports on each connector. A multi-pair, MDF cable is supplied for each connector on the card.

Installing the CO Card

For CO connectivity, you must install at least one of the above mentioned CO Cards in the system.

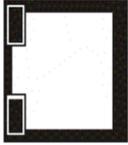

1. Take all the necessary precautions prescribed for handling the cards and electronic equipment. Make sure that power supply is turned off, and the power cord is unplugged before you begin the installation of the card. Put on an electrostatic-discharge preventive wrist strap/belt and use a grounding mat.
2. Unpack the CO card and check the package contents.
3. Unscrew and remove the top cover of the ETERNITY PENX, and keep it aside with the screws.
4. Select any of the free slots from the universal slots.
5. Seat the card onto the connectors of the selected slot. The connector pins of the card should make perfect contact with those on the CPU (motherboard) on the bottom plane.
6. Secure the card on the studs labeled H1, H2 and H3 with the three screws provided.

7. Repeat the same steps to install another CO card. You may install the other CO cards in any of the universal slots, but not necessarily in a sequence.
8. Now, use the cables supplied with the CO card to connect the CO ports with the Main Distribution Frame.

For each connector on the CO Card, there is a separate cable with an RJ45 plug on one end and free at the other end.

9. Plug in the RJ45 end of the CO cables into the respective connectors. Refer to the pinouts of the connectors illustrated below for each CO Card type.

ETERNITY PE Card CO8

Connector	Color	Connection	HW port Offset
	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Green - (Green & White)	CO	03
	Brown - (Brown & White)	CO	04
	Blue - (Blue & White)	CO	05
	Orange - (Orange & White)	CO	06
	Blue - (Blue & White)	CO	07
	Orange - (Orange & White)	CO	08

ETERNITY PE Card CO4+SLT4

Connector	Color	Connection	HW port Offset
	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
	Blue - (Blue & White)	CO	03
	Orange - (Orange & White)	CO	04

ETERNITY PE Card CO2+SLT6

Connector	Color	Connection	HW port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	SLT	05
	Orange - (Orange & White)	SLT	06
RJ45-3	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02

ETERNITY PE Card CO2+DKP2+SLT4

Connector	Color	Connection	HW port Offset
RJ45-1	Blue - (Blue & White)	SLT	01
	Orange - (Orange & White)	SLT	02
	Green - (Green & White)	SLT	03
	Brown - (Brown & White)	SLT	04
RJ45-2	Blue - (Blue & White)	CO	01
	Orange - (Orange & White)	CO	02
RJ45-3	Blue - (Blue & White)	DKP	01
	Orange - (Orange & White)	DKP	02

10. Lead the cables out of the enclosure through any of the two cable outlets on either side of the enclosure.
11. Terminate the free end of the cables into the punch down blocks of the Krone modules designated for 'Trunk Lines' in the Main Distribution Frame (MDF).

Each wire-pair from the ETERNITY PENX CO Port must be terminated to the bottom of the Krone Connector, while the wire-pair of the trunk line from the CO Network to be connected to this port must be terminated on the top of the Krone connector.

Refer the topics [“The Main Distribution Frame \(MDF\)”](#) and [“Terminating Trunk and Extension Cables on the MDF”](#).

12. If you have completed installing all cards, replace the top cover by sliding it in place. Secure the cover with the two screws you removed.

The T1E1PRI Card

The ETERNITY PENX T1E1PRI Card provides the interface to connect ETERNITY PENX to ISDN Network.

When connected to T1 carrier lines, the Card supports the following signaling types:

- PRI
- Robbed Bit Signaling
- Q-Signaling (QSIG)

When connected to E1 carrier lines, the card supports the following signaling types:

- PRI
- Channel Associated Signaling (CAS)
- Q-Signaling (QSIG)

The T1E1PRI Card is available in the following configuration for ETERNITY PENX:

T1E1PRI Card for ETERNITY PENX

Card Name	Configuration and Application
ETERNITY PE Card T1E1PRI Single	1-port card with QSIG support to connect 1 ISDN T1/E1 PRI Line or ISDN Compatible Device

The maximum number of ISDN PRI lines supported by Eternity PENX are 2 T1/E1 PRI Lines.

Connectors

The T1E1PRI card has an RJ45 Connector. A cable with RJ45 plugs on both ends is supplied with the card.

Installing the T1E1PRI Card

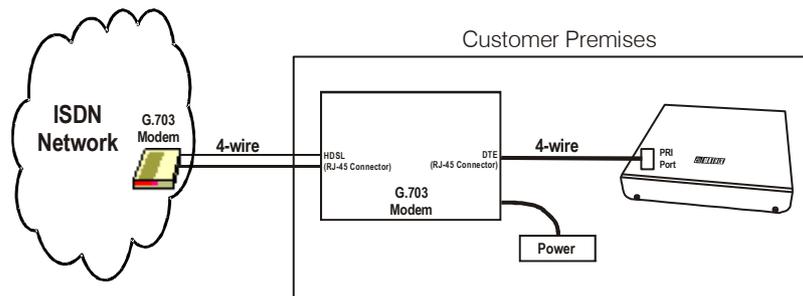

1. Before installing the card, take the necessary precautions prescribed for handling the cards. Always wear an electrostatic-discharge preventive wrist strap and use a grounding mat. Make sure the power supply is turned off.
2. Unpack the T1E1PRI card and check the package contents.
3. Unscrew and remove the top cover of the ETERNITY PENX (if not opened already). Keep the cover and the screws aside.
4. Select any free slot from the Universal Slots.
5. Grasp the card by its sides or corners. Fit the card's connectors into the connectors of the selected slot. Ensure that the card's connector pins make perfect contact with those on the CPU on the bottom plane.
6. Secure the card on the studs labeled H1, H2 and H3 with the three screws provided.

- Repeat the same steps to install another T1E1PRI card. You may install the other T1E1PRI cards in any of the universal slots, but not necessarily in a sequence. Any card can be inserted in any of the universal slots.

Connecting ISDN T1/E1 PRI Lines

- Use the cable supplied with the T1E1PRI Card to connect the ETERNITY PENX to the T1/E1 PRI network interface equipment (modem), which is usually supplied by your ISDN Service Provider along with the PRI line.

The block diagram illustrates this.

- Most Service Providers insist on connecting an ISDN modem at both the ends of the PRI line, one at the Local Exchange and other at the Customer's Premises.
 - At the Customer's Premises, the PRI line is terminated on the HDSL interface of the modem.
 - The DTE interface of the modem is to be connected to the PRI port (RJ45 connector on the Matrix ETERNITY PENX T1E1PRI Single Card).
- Plug in one end of the RJ45 cable supplied with the card into the card's connector. Lead the cable out of the enclosure through any of the two cable outlets on either side of the enclosure.
 - Plug the other end of the RJ45 cable into the Network Termination Unit.
 - Refer the following pin details for connecting the Network Termination Unit with the ETERNITY PENX.

Pin details of HDSL Interface of the G.703 Modem. (HDSL Network Termination Unit)

Pin Number	Pin Details
1	Line A
2	Line A
3	Not used
4	Line B
5	Line B
6	Not used
7	Not used
8	Not used

Pin details of DTE Interface of G.703 Modem. (HDSL Network Interface Unit)

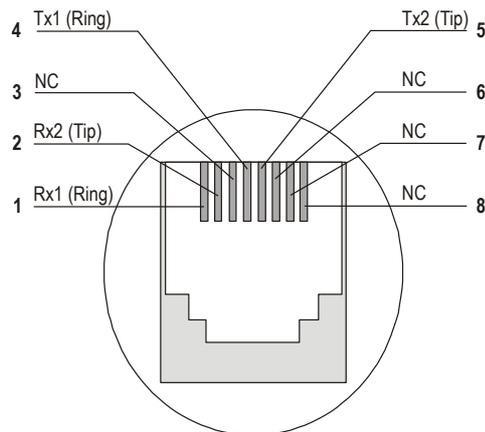

Pin Number	Pin Details
1	TX1 (Tip)
2	TX2 (Ring)
3	Not used
4	RX1 (Ring)
5	RX2 (Tip)
6	Not used
7	Not used
8	Not used

Most of the HDSL Network Termination Unit manufacturers use these connectors. But you are advised to read the installation guide of the HDSL Network Termination Unit being used by you.

Pin details of ETERNITY T1E1PR1 Port

The T1E1PRI Port of the ETERNITY PENX terminates in an 8-pin RJ45, female connector and is wired according to the figure below.

The cable wires may have to be crossed depending on the pin-out of the DTE Interface of the modem.

Setting Line Termination Resistor

12. Termination Resistance of the PRI Port for T1 or E1 Connectivity is set by changing the position of the Switch (S1) as given in the table below:

Switch (S1)	Meaning
ON	To set termination resistance of 100Ω for T1 connectivity
OFF	To set termination resistance of 120Ω for E1 connectivity

13. Repeat the same steps to connect another PRI card, if installed.
14. If you have no other card to install, replace the top cover, by sliding it in place. Secure the cover with the two screws you removed.
15. If you have completed all other installation tasks. Power the system and observe the Reset Cycle.

The Mobile Card

The Mobile Card interfaces the system with GSM/3G/LTE networks. It routes calls made and received over mobile networks, like a mobile handset.

The card does not support GPRS features, Fax and Data services, network supported services, except CLIR and USSD.

For compatibility and use of Matrix GSM products (2G/3G/4G) in Russia and Iran Province connect with Matrix Sales or Technical Support Team.

The Mobile card is available in the following configuration for ETERNITY PENX.

The Mobile Card for ETERNITY PENX

Card Name	Configuration and Application
ETERNITY PE Card GSM4	4-port card to connect to the GSM network (4 SIM Cards can be installed)
ETERNITY PE Card GSM4 3G	4-port card to connect to 3G network (4 SIM Cards can be installed)
ETERNITY PE Card GSM4 4G	4-port card to connect to 4G network (4 SIM Cards can be installed)

Just like mobile handsets, each Mobile Port has a unique IMEI (International Mobile Equipment Identity) number, pasted on the mobile engine.

The maximum number of Mobile ports trunks supported by ETERNITY PENX are 8 GSM Ports.

SIM of different service providers can be used.

Antenna

For all four mobile ports, there are four antennas with male connectors on the card. Antenna cables are also provided.

Personal Identification Number (PIN)

The SIM cards can be protected from unauthorized use by programming a Personal Identification Number (PIN) on the SIM. If the wrong SIM PIN is entered thrice in a row, by a user, the SIM Card suspects the user and asks for the Personal Unlock Keyword (PUK).

Installing the Mobile Card

1. Before you install the Mobile Card, make sure that
 - the ETERNITY is installed at a location where sufficient network coverage is available.
 - the power supply is turned off.

- you are wearing an electrostatic discharge preventive wrist strap and have a grounding mat, before you begin handling the card.
2. Get the SIM Card from the GSM service provider of your choice ready. Use SIM PIN protection, if required.

Disable Call Waiting in the SIM.

3. Unpack the Mobile card and verify the package contents.

SIM PIN Protection

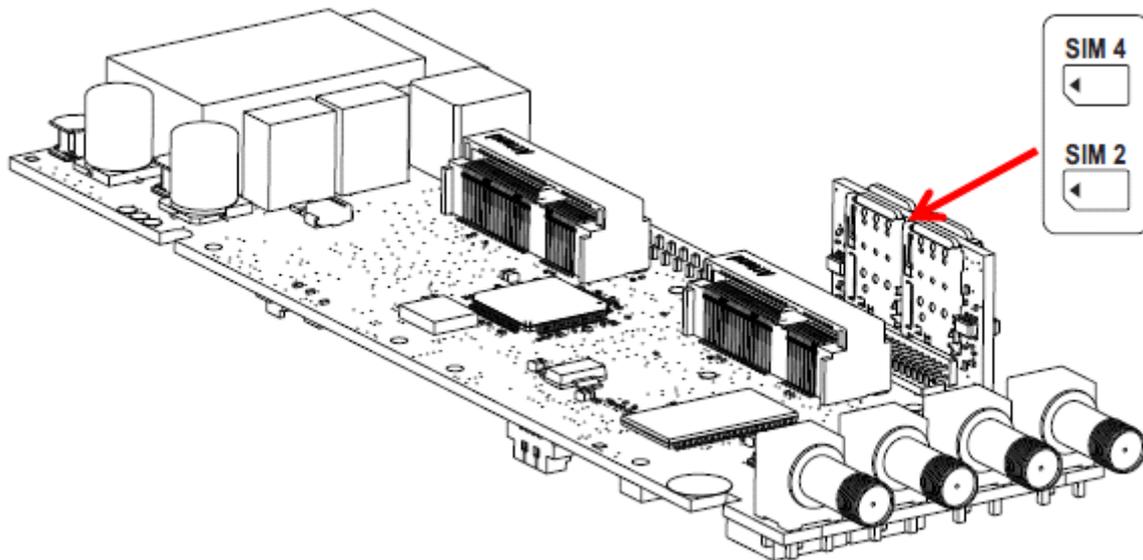

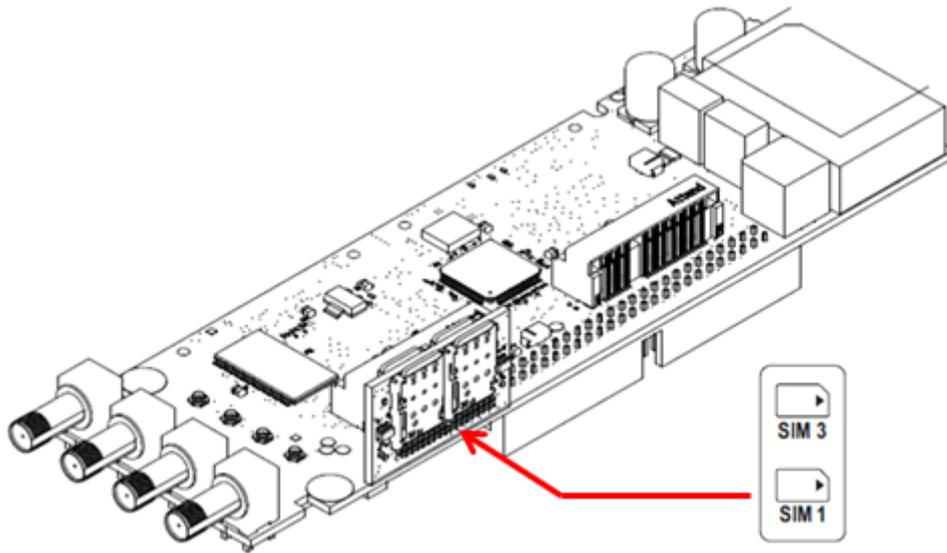

4. Enable SIM PIN to protect your SIM card. Before installing the SIM card in the system, insert the SIM into a mobile handset first. From the mobile handset,
 - enable PIN Protection.
 - change the SIM PIN to 1234 (this is the default PIN for all SIM cards used in the system). Changing the SIM PIN to '1234' enables you to change the SIM PIN from the ETERNITY later. (Refer SIM PIN under [“Configuring Mobile Trunks”](#) for instructions).
 - remove the SIM from the mobile handset.

If you do not want to use PIN protection, insert the SIM in the mobile handset and disable PIN protection. Remove the SIM Card from the mobile handset.

5. Now, insert the SIM card (PIN changed to 1234), with its connector side down into the SIM holder on the Mobile card. You can insert multiple SIM cards of the same GSM service provider or of different service providers.

ETERNITY PE Card GSM4

6. Remove the top cover of the ETERNITY PENX, if not opened already. Keep the cover and the screws aside.
7. Select any of the free universal slots. Grasping the card by its sides or corners fit it onto the connectors of the selected slot.

The card should be seated such that its connector pins make perfect contact with those on the CPU (motherboard) on the bottom plane.

8. Secure the card on the studs labeled H1, H2 and H3 with the three screws provided.

9. Screw one end of the Antenna cable onto the Antenna Male Connector on the card.
10. Lead the antenna cable out of the enclosure through any of the two cable outlets on either side of the enclosure. Now, place the antenna at an appropriate location.
11. Repeat the same steps to install another Mobile card, in another free slot. It is not necessary to install the Mobile cards in subsequent slots.
12. If you have completed installing all cards, replace the top cover by sliding it in place. Secure the cover with the two screws you removed.

- *At every power up of the system, it takes about 3 minutes for the Mobile ports to get registered with the network. Once registration with the GSM network is completed, the mobile port can be used.*
- *Each time the Mobile Port sends a request, such as a Registration Request, the system waits for the duration of the Network Response Timer. This Timer signifies the time for which the Mobile Port waits for a response from the GSM network. It is fixed for 150 seconds for all Mobile ports.*

SIP Extensions

SARVAM UCS supports up to 100 SIP/UC Users. The SIP/UC Users function in the same way as DKP/SLT extensions of the system. SIP/UC Users can make and receive calls to any extension user of the system and to external numbers over various telecom networks like CO, Mobile, ISDN PRI and VoIP¹⁰².

You may register any SIP-enabled device — a Matrix UC Client, an IP-phone, a Soft phone, Analog Phone Adapter — as the SIP User of the system.

The Matrix UC Clients also offer UC functionalities in addition to the SIP functionalities.

The SIP Users register with the CPU Card of the system. Five free SIP Users are provided by default. You may register any of the SIP-enabled devices except the Matrix UC Clients with these free SIP Users. For registering the Matrix UC Clients, you must purchase the Matrix VARTA User License. If you require additional SIP Extensions you must purchase the IP Subscribers License.

The system supports one NX DBM VOCODER64 Modules. You must purchase the module separately. NX DBM VOCODER64 module supports a maximum of 64 VOCODER channels. The Vocoder channels are required for — VoIP to Non-VoIP calls, VoIP to VMS calls and VoIP to VoIP calls — where transcoding is required.

The system provides 4 pre-activated VOCODER channels by default. To use these channels make sure you have installed the NX DBM VOCODER64 module.

For more information on Licenses — Matrix VARTA User License, IP Subscribers License and VOCODER Channel License, see [“License Management”](#).

You may connect any Standard Phone or Extended IP Phones of Matrix as SIP Users.

Matrix VARTA WIN200, VARTA ADR100 and VARTA AMP100 can be registered as SIP Users, also offering the support for UC functionalities.

You may also connect/register the following as SIP Extensions of the system:

- Connect SPARSH VP248, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP248 as Extended SIP Extension”](#).
- Connect SPARSH VP310, the Extended IP Phone. For instructions, see [“Connecting SPARSH VP310 as Extended SIP Extension”](#).
- Connect SPARSH VP330, the Touch Screen Extended IP Phone. For instruction, [“Connecting SPARSH VP330 as Extended SIP Extension”](#).
- Connect SPARSH VP510, the Premium IP Phone. For instruction, [“Connecting SPARSH VP510 as Extended SIP Extension”](#).
- Connect SPARSH VP210, the Entry Level IP Phone. For instruction, [“Connecting SPARSH VP210 as Extended SIP Extension”](#).
- Connect Extended SPARSH VP710, the Smart Video IP Phone. For instruction, [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#).

You can register following UC Clients as SIP Users of the system:

- Matrix VARTA WIN200, Unified Communication Client for Windows. For instruction, refer to the *MATRIX VARTA WIN200* User Guide.

¹⁰². *Calls between VoIP, Public and Private Networks may be subject to Regulation in your country. You may have to configure your system to allow or restrict call traffic between networks to comply with the telecom regulations of your country. To know more, read [“Logical Partition”](#).*

- Matrix Mobile UC Clients, as given below:
 - Matrix VARTA AMP100, the Mobile UC Client for iPhones. For instruction, refer to the *Matrix VARTA AMP100* User Guide.
 - Matrix VARTA ADR100, the Mobile UC Client for Android Smartphones/Tablets. For instruction, refer to the *Matrix VARTA ADR100* User Guide.

Refer to “[SARVAM UCS Features Supported in Terminals](#)” to know the features supported in each client.

The SIP Users may be registered over **WAN** or over **LAN** according to your preference and your IP network installation scenario. Extended SIP Phones and UC Clients can be registered with SARVAM UCS using IPv4 Addresses only.

You can register the same SIP User from three different locations.

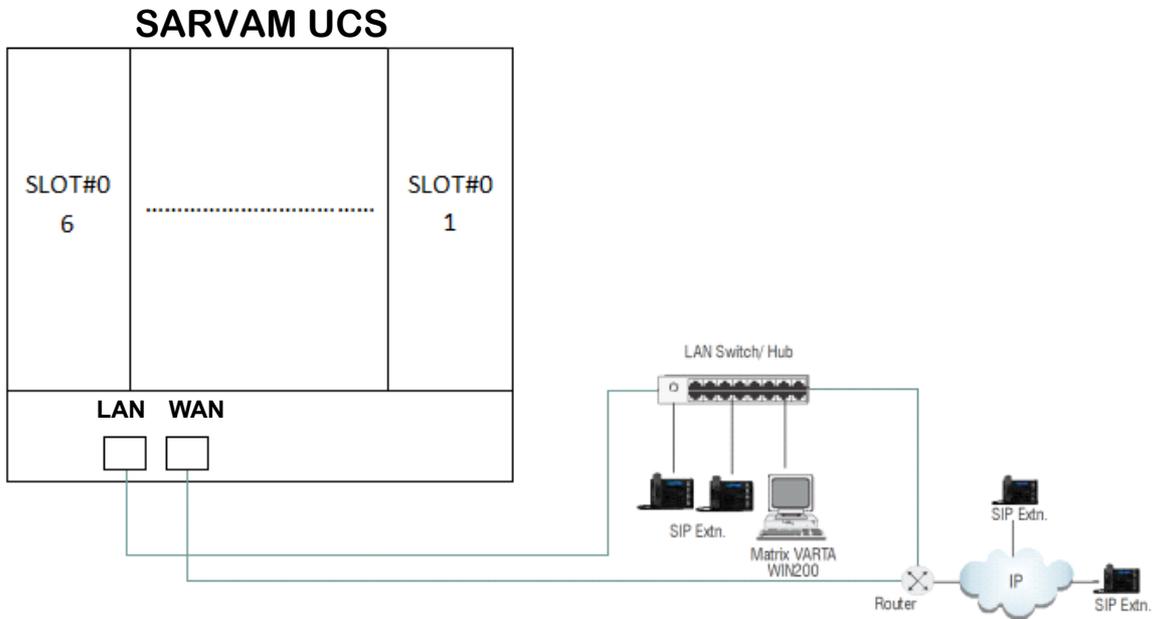

If you register the Extended IP Phone outside the Region/Country selected for SARVAM UCS, the time and Time Zone dependent features, such as Alarms, Reminders, Time Zone Display, of the phone at each location will operate according to the Real Time Clock of SARVAM UCS. Also, Access Codes and Emergency Numbers will work according to the Region/Country selected for SARVAM UCS.

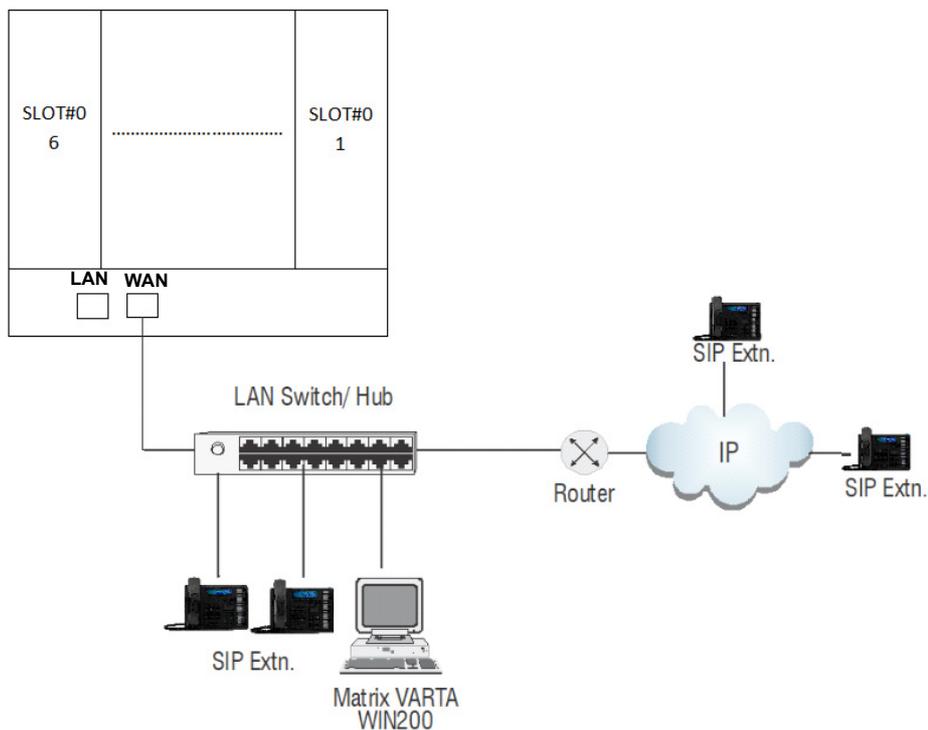

- Connect the Extended IP Phone, or any Standard IP Phone to the LAN Switch.
- Register any SIP device (Extended IP phone/ Soft clients or Standard IP phone) on the public network as SIP Extension.
- When you register the Matrix Extended IP Phone with the system, the WAN/LAN port is used for Auto Configuration as well for Registration of the Extended IP Phones.
- When you register a SIP device other than the Matrix Extended IP Phone on the public network as SIP Extension, do the following:
 - In this SIP device configure the following:
 - the Registrar Server Address of SARVAM UCS SMB
 - the Registrar Server Port
 - the SIP ID
 - Authentication ID and Password.
 - Configure Port Forwarding for the WAN Port of SARVAM UCS SMB on the Router.

If the SARVAM UCS is connected to a **Public Network**,

- Connect the Matrix VARTA WIN200, Extended IP Phone, or any Standard SIP device to the LAN Switch.
- Register any SIP device (Matrix VARTA UC Clients, Extended IP phone or Standard SIP phone) on the public network as SIP extension.

If the SARVAM UCS is connected to a **Private Network (Behind the NAT)**,

- Connect Matrix VARTA WIN200, Extended IP Phones or Standard SIP Phones to the LAN Switch

- You may also register any SIP device (Matrix VARTA UC Clients, Extended IP Phone or Standard SIP phone) on the public network as SIP Extension.

When you register the Matrix Extended IP Phone with SARVAM UCS, configure **Port Forwarding** for the **WAN port of the CPU Card** on the Router. The WAN Port is used for Auto Configuration of the Extended IP Phones.

Connecting SPARSH VP248 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

*If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your DHCP Server as per your installation scenario.*

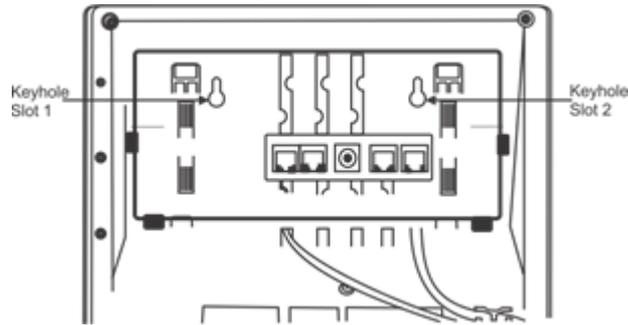

- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- Assign SIP User ID (will work as an extension number) to the Extended IP Phone. For instructions on assigning SIP ID, see "[Configuring SIP Extensions](#)".

For the SIP User ID you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic "[Configuring SIP Extension Settings as per the Extended Phone Type](#)" under *Configuring SIP Extensions*.

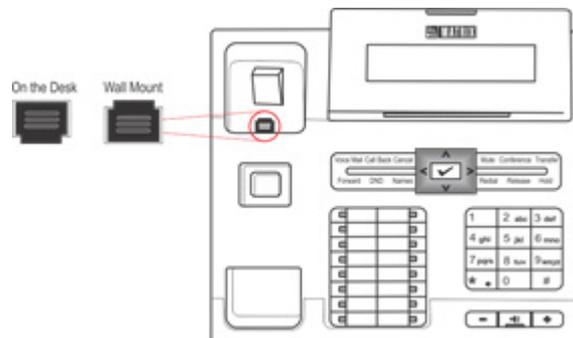

Now, follow the steps described below to install the Extended IP Phone. The instructions are common for all models of the SPARSH VP248. For the purpose of illustration, the premium model, SPARSH VP248P, has been used.

1. Unpack the SPARSH VP248 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.

- Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

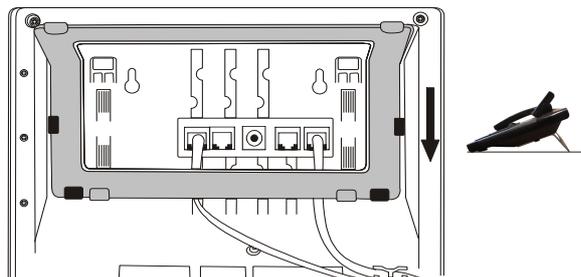

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.
- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

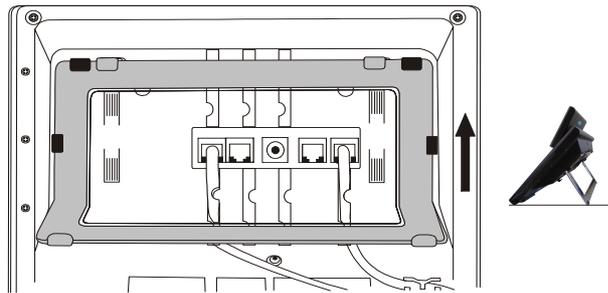

- When you mount the phone on a desk,
- You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 30° Angle

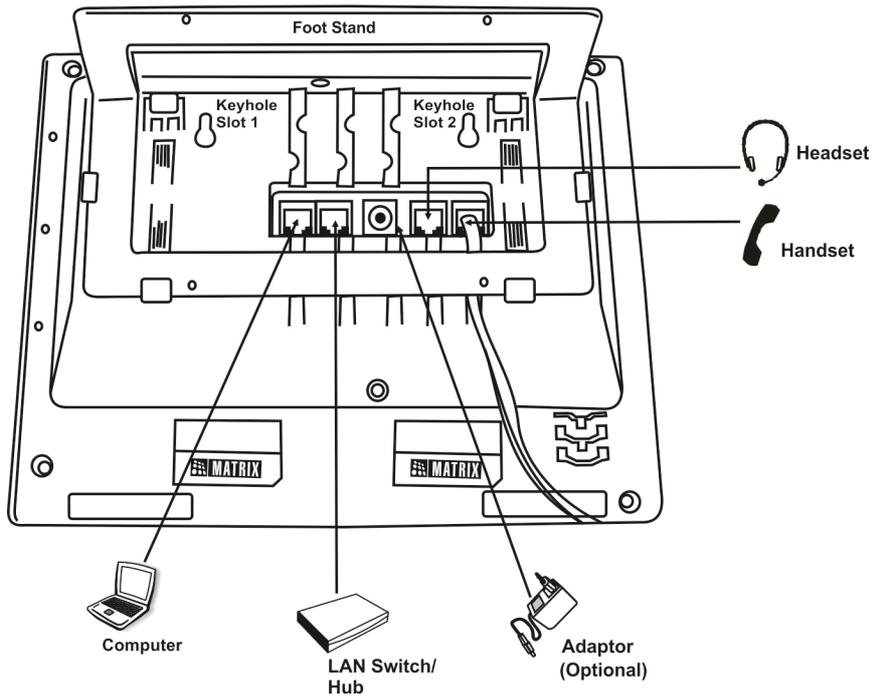

Foot Stand attached at 50° Angle

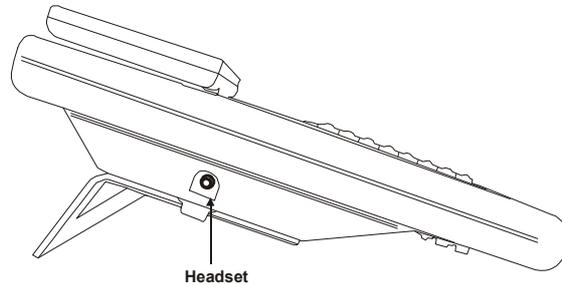

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.
3. Connect the Handset to the Phone body.
- Plug the long straightened end of the phone cord into the handset jack at the bottom of the phone marked with the handset symbol.
 - Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

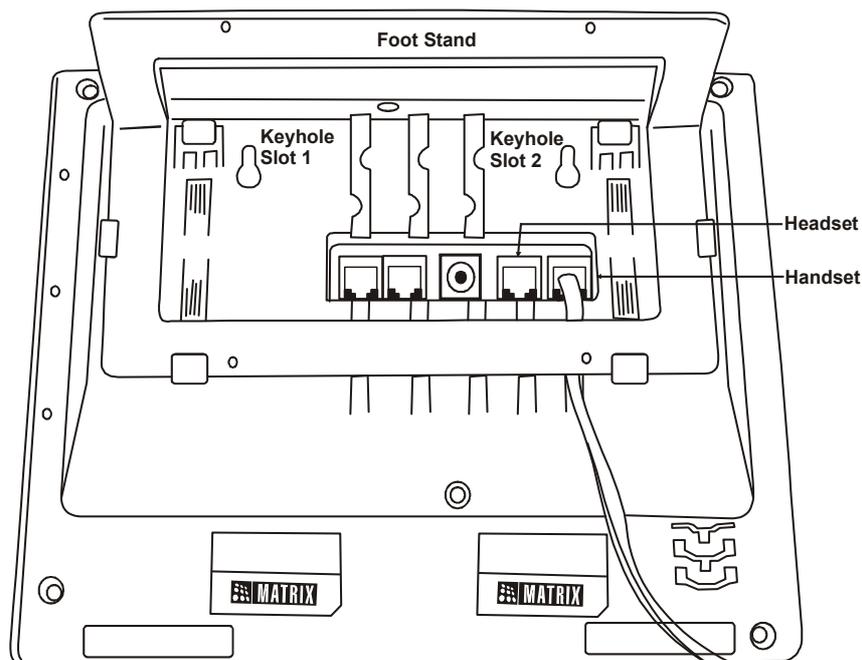

4. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 2.5 mm single connector into the headset jack headset jack with the symbol  on the left side panel of the phone, as illustrated in the figure below.

OR

- You may plug a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol , as illustrated in the figure below.

Connect the LAN Port of SPARSH VP248 to the LAN Switch/Hub or a Router, according to your installation scenario.

5. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.
6. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone. Plug in the Power Adapter into a power outlet.

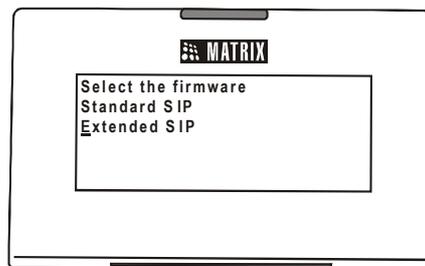

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

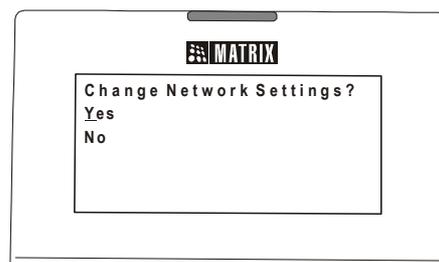

7. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- As soon as the 'Loading...' message appears on the phone display, press # key.
- Select the firmware **Extended - IP Phone**. Move the cursor by pressing the DOWN navigation key **V**.
- When the cursor is placed under the Extended IP Phone, press Enter key.

- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See [“Network Settings”](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone by accessing the Local Menu of the phone. To move the cursor and scroll through the menu and submenu options, use the following touch sense navigation keys on your phone.

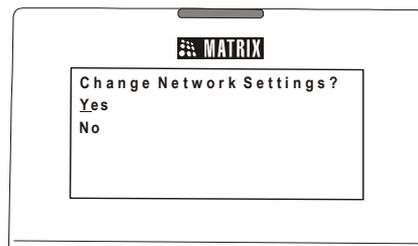

- The Enter key **✓** to make a selection or to complete an action.
- The Up key **▲** to move up the Menu.
- The Down key **▼** move down the Menu.
- The Forward key **➤** move the cursor one character.
- The Back key **◀** to move the cursor one character and to return from the submenu to the main menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

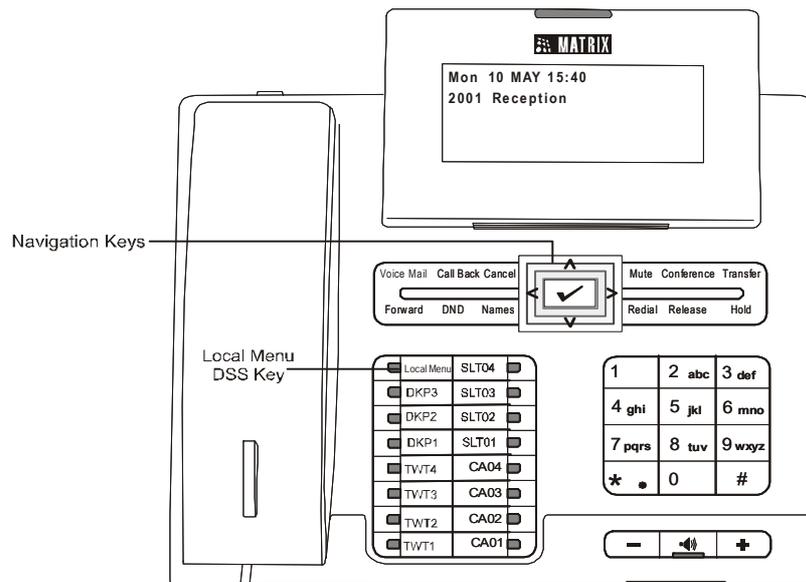

You must press the Enter Key to select Yes and access network settings.

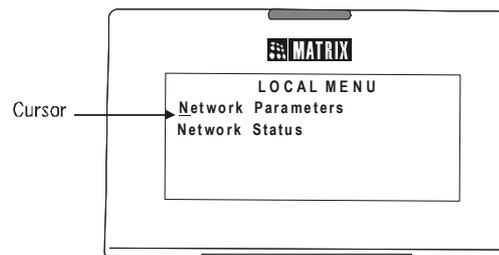

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Enter Key **✓** to access network settings,

- When the phone is in idle state. You must press the DSS key assigned to 'Local Menu'.

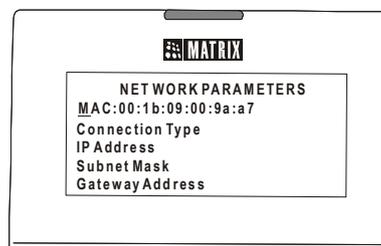

- When you press the Local Menu DSS Key (in idle state) or when you press the Enter key during any process, the Local Menu appears on your phone display.

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.
- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.
- If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star '*' key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star '*' key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic¹⁰³.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background

¹⁰³The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

CoS	Traffic Type
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see [“Using PCAP Trace for Matrix SPARSH VP248 Extended IP Phone”](#), under *PCAP Trace*.

When you change the Network Settings, the phone will restart.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?**.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

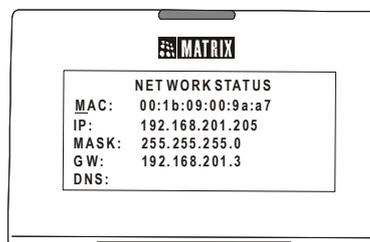

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?**.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

Viewing Network Status

- In the Local Menu of the phone, place the cursor on Network Status and press the Enter key.
- The Network Status submenu appears.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **S. ADD:** The LAN or WAN IP Address / Domain Name of the SARVAM UCS.
- **S. PORT:** The SPARSH Port SARVAM UCS.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Connecting SPARSH VP310 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to SARVAM UCS:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

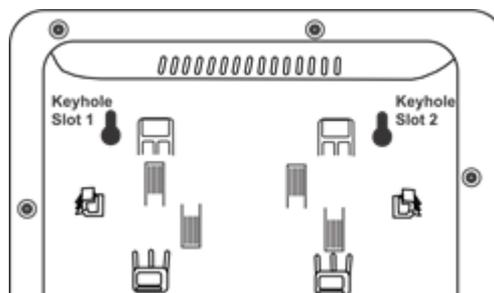

If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as **'String'** and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format **"IP_Address:Port"** in your DHCP Server as per your installation scenario.

- Log in to Jeeves. For instructions, read the topic ["Configuring SARVAM UCS"](#).
- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see ["Configuring SIP Extensions"](#).

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic ["Configuring SIP Extension Settings as per the Extended Phone Type"](#) under *Configuring SIP Extensions*.

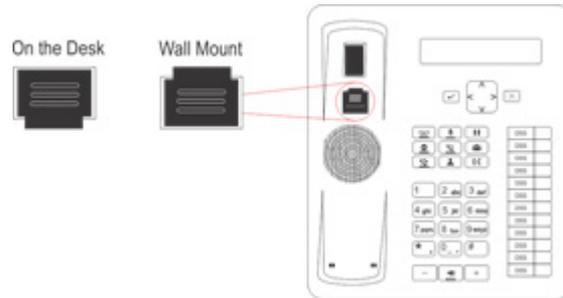

Now, follow the steps described below to install the Extended IP Phone.

1. Unpack the SPARSH VP310 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP310 on a wall,
 - Use the mounting template to drill holes of appropriate size and distance.
 - Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP310. The screws should protrude from the wall to fit into the Keyhole Slots.

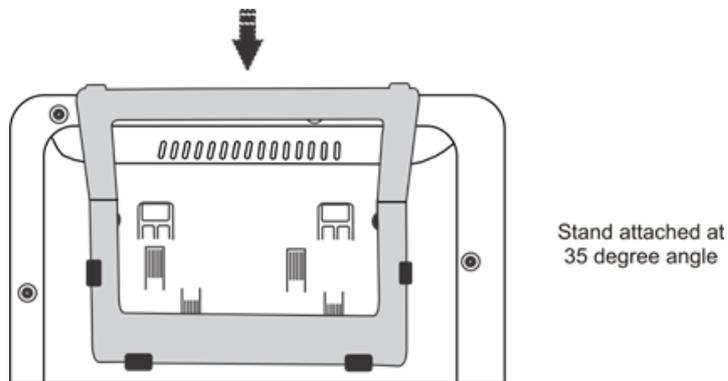

- Now, mount the phone with the screws fitting into the Keyhole Slot.

- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

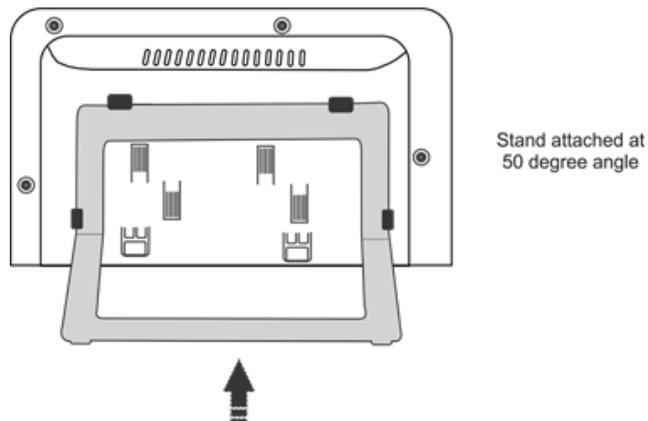

- When you mount the phone on a desk,
 - You can attach the Foot Stand in two ways as illustrated in the following.

Foot Stand attached at 35° Angle

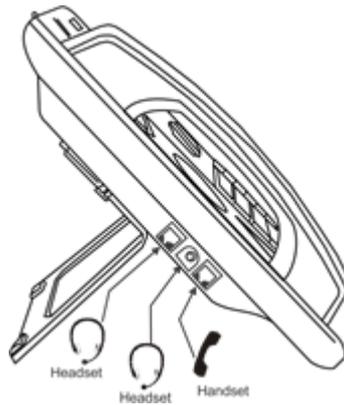

Foot Stand attached at 50° Angle

If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

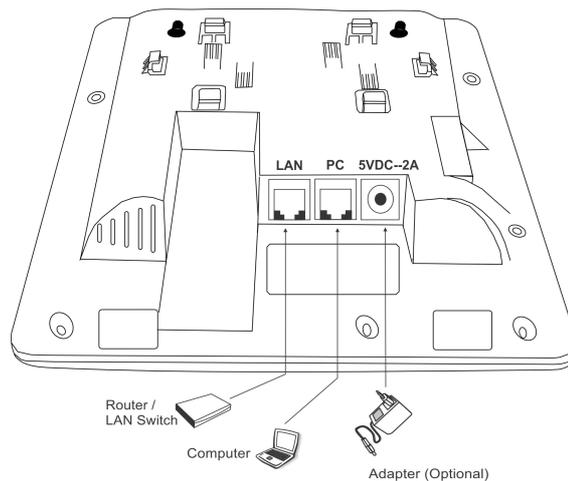

4. Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol .
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

5. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack with the symbol  on the left side panel of the phone, as illustrated in the figure above.

OR

You may also plug in a headset with RJ9 connector into the headset port on the left side panel of the phone, marked with the symbol .

6. Connect the LAN Port of SPARSH VP310 to the LAN Switch/Hub or a Router, according to your installation scenario.
7. To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port of the phone to the LAN Port of the computer.

8. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

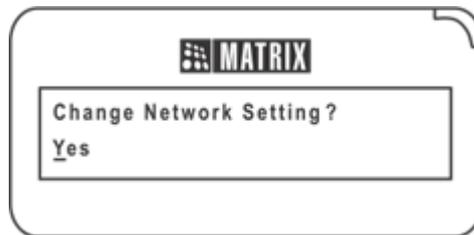

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

9. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the 'Loading...' message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.

- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press the Enter key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See "[Network Settings](#)" at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key ▼ when the phone is in idle state. To move the cursor and scroll through the menu and submenu options, use the following navigation keys on your phone.

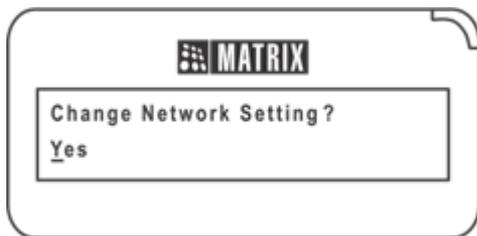

- The Enter key ✓ to make a selection or to complete an action.
- The Up key ▲ to move up the Menu.
- The Down key ▼ move down the Menu.
- The Forward key > move the cursor one character.
- The Back key < to move the cursor one character and to return from the submenu to the main menu.
- The Cancel key ✕ to exit a menu.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press the Enter key ✓ to select Yes and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

You must press the Down key ▼ to access network settings.

3. When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.

Configuring Network Parameters

- When the phone is in idle state. You must press the Down key ▼ to access the Network Settings.
- Press Enter key to select Network Parameters.
- The Network Parameters submenu appears.
- Use the Down/Up key to reach the desired network parameter and press Enter key to select and change the settings.
- You can configure all network parameters described below, except the MAC Address.

- To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.
- If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Cancel key. The digit to the left of the cursor will be deleted. If the cursor is to the extreme left and you press the Cancel key, you will go to the previous menu.

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone. Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star "*" key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star "*" key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.
To enter dot/period in the IP Address, press the Star "*" key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Sever Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic¹⁰⁴.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and for instructions on how to use PCAP Trace on the phone, see [“Using PCAP Trace for Matrix SPARSH VP310 Matrix Extended IP Phone”](#), under *PCAP Trace*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

104. The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.
- Again press Down key **▼** to select Network Status and press the Enter key **✓**.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.

- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

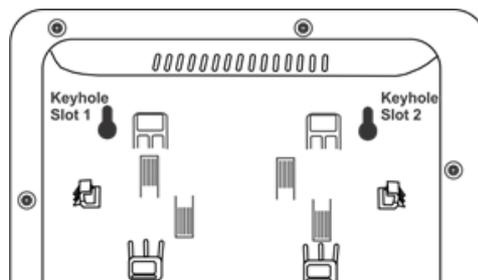

Connecting SPARSH VP330 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix SPARSH VP330 to SARVAM UCS:

- Decide the location where you want to place SPARSH VP330 within your LAN.
- By Default, in SPARSH VP330, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your LAN DHCP Server as per your installation scenario.
- Log in to Jeeves. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP330 can register as a SIP Extension. For instructions, see "[Configuring Matrix SPARSH VP330](#)".

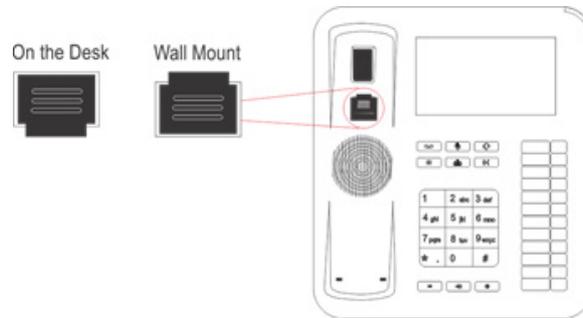

Now, follow the steps described below to install SPARSH VP330.

1. Unpack the SPARSH VP330 box and verify package contents.
2. Mount the phone on a desk or wall at a location convenient to you.
 - When mounting the phone on the wall,
 - Use the mounting template to drill holes of appropriate size and distance. Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2.
 - Use wall plugs, if required, to fix the screws. Leave the screw heads protruding from the wall to fit into the Keyholes.

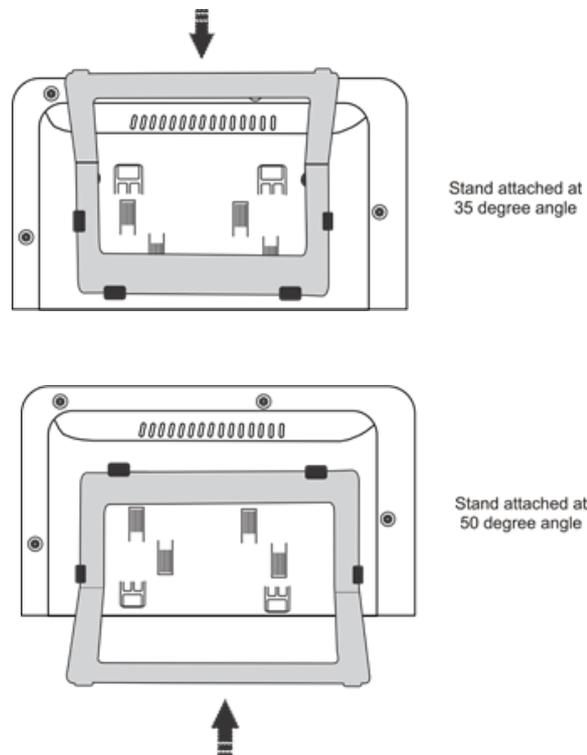

- Now, mount the phone on the wall, with the screws fitting into the Keyhole slots.

- Reverse the handset wall mount tab to make sure the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

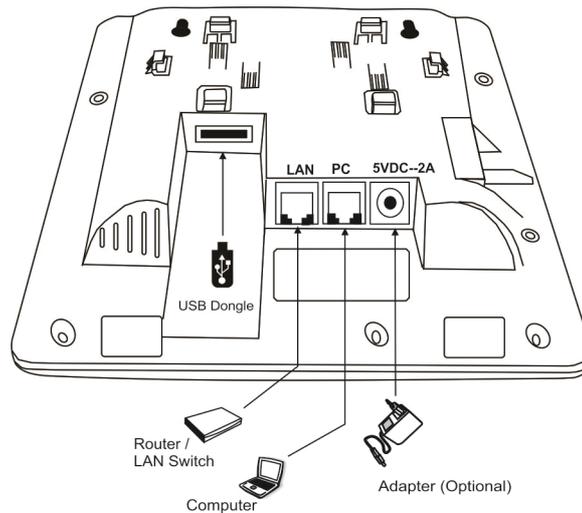

- When you mount the phone on a desk, you can attach the Foot Stand in two ways at **35° Angle** or at **50° Angle**.

- If you attach the Foot Stand at 50°, the phone will be placed in an almost upright position on your desk.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

4. Connect the Handset to the Phone body.

- Plug the long straightened end of the phone cord into the handset jack on the left side panel of the phone marked with the handset symbol.
- Plug the other (short straight) end of the phone cord into the jack at the bottom of the handset.

5. If you want to use a Headset (not supplied) with your phone, you may plug a headset with a 3.5 mm single connector into the headset jack headset jack with the symbol  on the left side panel of the phone.

OR

You may plug a headset with an RJ9 connector into the headset port on the side panel of the phone, marked with the symbol .

6. Connect the LAN Port of SPARSH VP330 to the IP Network — A Router or LAN Switch — using the Ethernet Cable.

OR

Connect the Wi-Fi USB Adapter into the USB port of the phone.

You can purchase the Wi-Fi USB Adapter from Matrix as an optional peripheral device to support wireless network.

- To connect your phone to a computer on your desk, use an Ethernet cable (not supplied with this phone) to connect the PC Port at the bottom of the phone to the LAN Port of the computer.
- It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) with the label 5VDC-2A at the bottom of the phone. Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

9. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display,
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Network Settings/Server Settings or want to use Wi-Fi for connectivity, press

Settings .

Refer to the SPARSH VP330 User Guide, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the **SPARSH VP330 User Guide** to know more.

Connecting SPARSH VP510 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended IP Phone to the system when used with SARVAM UCS application:

- Decide the location of the Extended IP Phone, whether within the same network or outside, according to your installation scenario.

If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as **'String'** and program the LAN or WAN Port IP Address /Domain Name and SPARSH Port in the format **"IP_Address:Port"** in your DHCP Server as per your installation scenario.

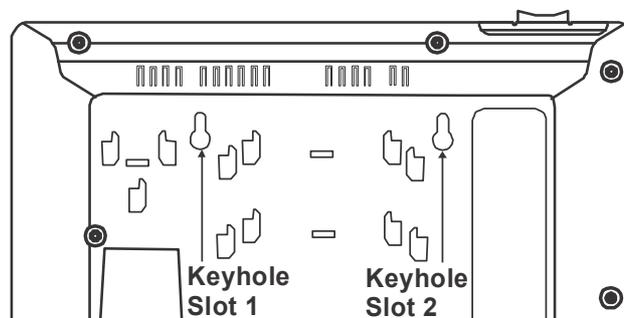

•Log in to Jeeves. For instructions, read the topic ["Configuring SARVAM UCS"](#).

- Assign an extension number (**SIP ID**) to the Extended IP Phone. For instructions on assigning SIP ID, see ["Configuring SIP Extensions"](#).

For the SIP extension number you assigned to the Extended IP Phone, you must configure the necessary parameters in SARVAM UCS so that Extended IP Phone can register as a SIP Extension. For instructions, see the topic ["Configuring SIP Extension Settings as per the Extended Phone Type"](#) under *Configuring SIP Extensions*.

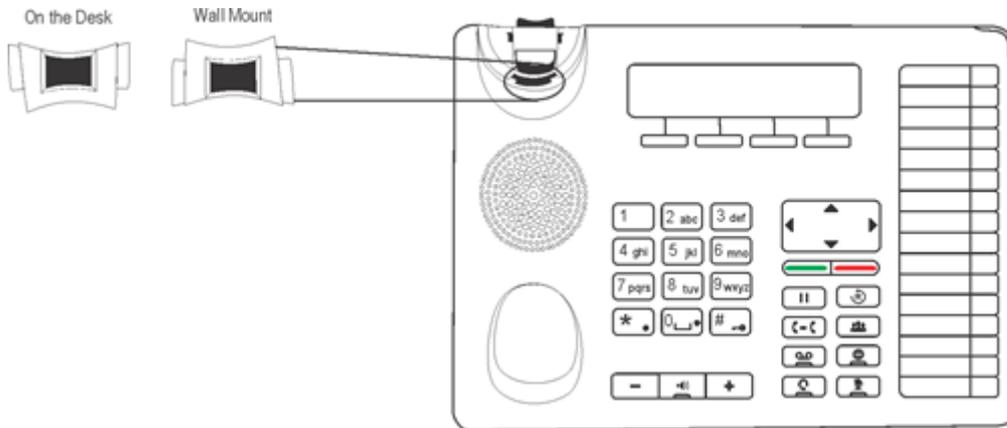

Now, follow the steps described below to install the Extended IP Phone:

1. Unpack the SPARSH VP510 box and verify package contents.
2. You can mount the phone on a wall or on the desk.
3. When you mount SPARSH VP510 on a wall,
 - Use the mounting template to drill holes of appropriate size and distance.
 - Fix the screw grips in the holes you drilled.
 - Fix two screws in the holes on the wall, ensuring that they are aligned with the Keyhole Slots 1 and 2 of SPARSH VP510. The screws should protrude from the wall to fit into the Keyhole Slots.

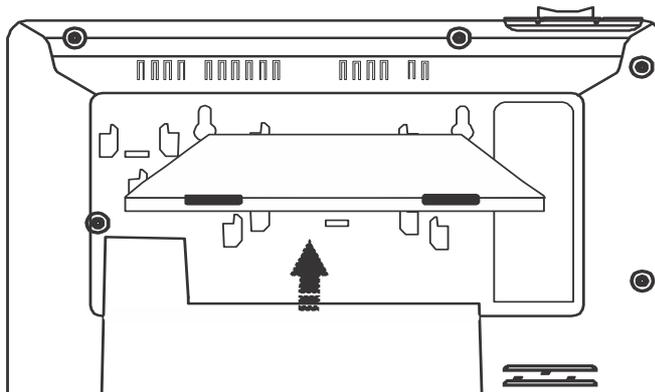

- Now, mount the phone with the screws into the Keyhole Slots.

- Reverse the handset wall mount tab to make sure that the handset remains intact when you mount the phone. Push the handset wall mount tab upwards to remove it from the slot. Rotate it 180 degrees clockwise and push it downwards into the slot.

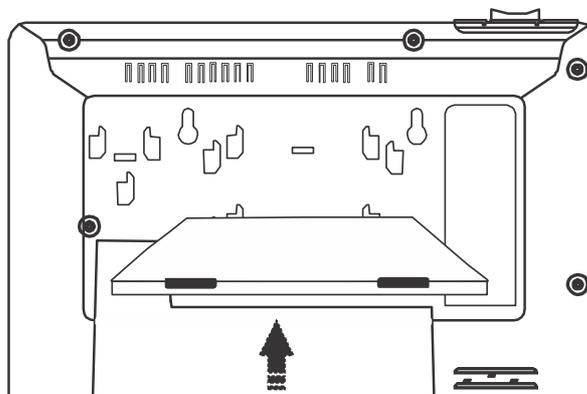

If you are unable to remove the wall mount tab, you may use a tool like a minus screw-driver to remove it.

- When you mount the phone on a desk,
- You can attach the Foot Stand in the following ways — at an angle of 45 degrees or 55 degrees

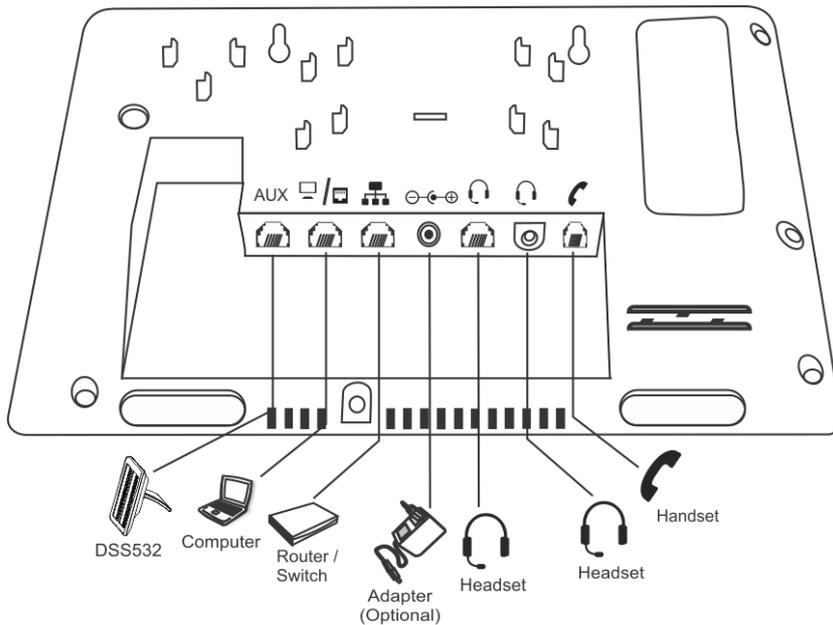

Stand attached at 45 degree angle

Stand attached at 55 degree angle

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

4. Connect the Handset.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
- Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.

5. Connect the Headset (not supplied by Matrix).

- To use a Headset (not supplied with the phone), plug any standard stereo headset with 3.5mm single connector into the headset audio jack at the bottom of the phone, marked with the symbol .
- OR**
- You may also plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .

6. Connect to the IP Network.

- Plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone, marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.

7. Connect a PC to the Phone.

- Plug one end of the Ethernet Cable into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.

8. Connect DSS532 with the Phone.

- To connect DSS532 with the phone, plug one end of the RJ11 cable into the AUX Port of the phone and the other end into the IN Port of the DSS532. For installation, see [“Installing DSS532 with SPARSH VP510”](#).

9. Connect the Power Supply.

- It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant).

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/2A) only. The use of any third-party power adapter may cause damage to the phone.

10. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- All keys with LED, including the Speaker key, and the Ringer LED, will glow.
- The LCD display will light up and the booting message appears.
- Then the ‘Loading...’ message appears on the phone display.
- The phone will start loading the Extended IP Phone Firmware. It will display current firmware being loaded.
- After loading the firmware, the phone will prompt you to change Network settings.
- Wait for a few seconds.

If you want to change the Network Settings or Server Settings, press Yes key. Detailed instructions for changing the Network Settings of the phone are provided at the end of this topic. See [“Network Settings”](#) at the end of this topic.

- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.

- As the phone downloads the configuration files, the file names will appear one by one.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.

- On successful registration, the phone will display the current day, date and time, the extension number and name assigned to the Extended IP Phone.

Network Settings

You can change the network settings of the Extended IP Phone. Press the Down key **▼** when the phone is in idle state.

To navigate the menu,

- Press the Menu Key when the phone is idle.
- Scroll by pressing the Up/Down Navigation Key to reach the desired Menu option.
- Press the Select / OK **▶** Key to select the desired Menu option.
- Scroll by pressing the Up/Down Navigation Key to reach the desired sub-menu option.
- Press the Select / OK **▶** Key to select the desired sub-menu option.

To exit menu,

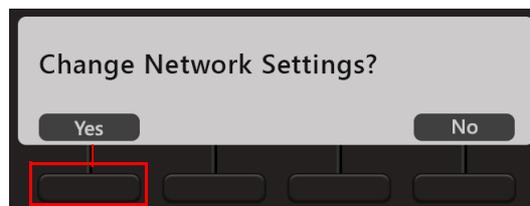

- Press Cancel **◀** Key.
or
Go ON-Hook.

The cursor is a non-blinking underscore that appears under the first letter of the first option in the menu. To make a selection in the menu, you must move the cursor in the desired direction using the Up, Down, Forward and Back key. When the cursor is at the desired position, press Enter key to make a selection.

Accessing Network Settings

You can access the Network Settings of the Extended IP Phone in any of the following stages:

1. During start-up, when the phone prompts you to change the network settings after loading the firmware.

You must press **Yes** key and access network settings.

2. When the phone is making Network discovery, downloading configuration files, attempting registration.

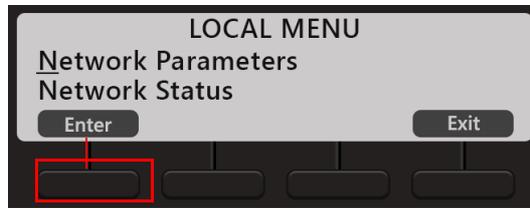

You must press the **Menu** key to access network settings.

3. When the phone is in idle state, press the Down key **▼**.

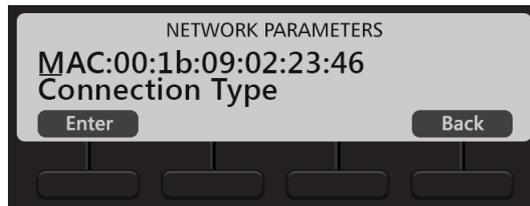

You can configure Network Parameters and view Network status from the Local Menu.

Configuring Network Parameters

- In the Local Menu of the phone, select Network Parameters by pressing the Enter Key.

- The Network Parameters submenu appears.

- Use the Down/Up key to reach the desired network parameter and press Enter key to select. Change the settings as per your requirements.
- Press **Save** key, to save the changes you make.
- You can configure all network parameters described below, except the MAC Address.

- To enter a dot in the editable fields — IP Address, Subnet Mask, Gateway Address, DNS Address, Server Address — press * (Star) key.
- If you want to clear a single digit/character, move the cursor to the right of the digit/character you wish to clear. Now press the Delete key. The digit to the left of the cursor will be deleted.

Before you start configuring the Network Parameters, get acquainted with following context keys:

Context Keys	Description
Enter/OK	To select a particular parameter
Save	To save the changes
Back	To move a step backwards without saving the changes
Delete	To delete previous characters from the cursor position
2Ab/123	2Ab - Alphanumeric Mode 123 - Numeric Mode

Connection Type

- Select the Connection Type as DHCP, PPPoE or Static according to the IP Addressing scheme of your network.

If you select DHCP or PPPoE, the phone will be assigned IP Address, Subnet Mask and Gateway Address, DNS Address, Server Address, automatically by the DHCP/PPPoE server.

For PPPoE Connection Type, you must configure the PPPoE User ID and Password provided by the Internet Service Provider.

If you select Static, you must assign the IP Address, Subnet Mask and Gateway Address to the phone.

IP Address

- If you select Static as Connection Type, enter the static IP Address to be assigned to the phone.

Enter the desired Static IP Address by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star "*" key.

Subnet Mask

- If you select Static as Connection Type, enter the Subnet Mask to be applied on the phone by pressing the digit keys.

To enter the dot/period in the IP Address, press the Star "*" key.

Gateway Address

- If you select Static as Connection Type, enter the Gateway Address here. This is the IP Address of the LAN Port of the Router.

DNS Server

- If you select Static as Connection Type, select the DNS Server option **Static** and configure the DNS Address.
- If you select DHCP or PPPoE as Connection Type and your Internet Service Provider provides DNS Address, select the DNS Server option **Automatic**. However, if your Internet Service Provider does not provide DNS Address, select **Static** and configure the DNS Address.

DNS Address

- If you select DNS Server as Static, enter the DNS Address here.

To enter dot/period in the IP Address, press the Star "*" key.

DNS Domain Name

- If you select DNS Server as Static, enter the DNS Domain Name here. DNS Domain Name is optional.

PPPoE User ID

- If you have selected PPPoE as Connection Type, you must enter the User ID provided to you by your Internet Service Provider.

PPPoE Password

- This is the password provided by your Internet Service Provider for the PPPoE User ID. If you have selected PPPoE as Connection Type, you must enter the password provided by your Internet Service provider here.

PPPoE Service Name

- If your Internet Service Provider has provided a Service Name, enter the Service Name here. If your Internet Service Provider has not provided a Service Name, do not configure this parameter.

Primary Server Address

- The system works as the Auto Configuration Server for the phone. Enter the LAN or WAN IP Address/ Domain Name of SARVAM UCS here. Default: blank. The phone sends the request for configuration files to this Server Address.

If you have selected DHCP as Connection Type, the phone will get the Primary Server Address and Port automatically from the DHCP Server. For this, use **DHCP option 224** and **Data Type** as '**String**' to provide Server Address and Port from the DHCP Server.

For PPPoE and Static Connection Types, you need to enter the Server Address.

Primary Server Port

- Enter the SPARSH Port of SARVAM UCS here. The phone sends the request for configuration files to this port.

Valid range of the port is: 80 or 1025–65535. Default: 80.

Secondary Server Address

- If required, you can also configure the Secondary Server Address as a fallback option. If the registration with the Primary Server fails the phone will send the registration and configuration requests to the Secondary Server Address. Speech-cut or unclear speech may be observed during on-going mature calls.

Secondary Server Port

- Enter the Secondary Server Port. The phone sends the request for configuration files to this port if the Primary Server fails.

Valid range of the port is: 80 or 1025–65535. Default: 80.

VLAN Setting

If your phone is connected to a virtual LAN, you need to configure VLAN Settings.

To enable the VLAN switch to correctly route packets generated by the phone and the computers (on the LAN) to each other, the packets must be tagged with a VLAN header.

The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic¹⁰⁵.

The meaning of CoS bits with respect to traffic type is as follows:

CoS	Traffic Type
0	Best Effort
1	Background
2	Spare

¹⁰⁵The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), that is, better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

CoS	Traffic Type
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- Select **Phone VLAN/COS** to add VLAN header to the packets generated by the phone, and add VLAN header to the packets relayed from the PC to its LAN port (packets generated by the PC connected to its PC port).
 - To configure Phone VLAN/COS, select **Enable?**. The VLAN ID will be tagged on all packets generated by the phone (SIP, RTP, DNS, ARP, etc.). Default: Disabled.
 - Select **VLAN ID** and enter the VLAN ID that you have assigned to the VLAN in which the IP Phones are connected. Valid range: 0-4094. Default: 1.
 - Select **SIP CoS** and define the CoS (priority) bits in all SIP packets. Valid range: 0-7. Default: 3
 - Select **RTP CoS** and define the CoS (priority) bits in all RTP packets. Valid range: 0-7. Default: 6.
- Select **PC/VLAN CoS** to add VLAN header to all packets entering the PC Port and leaving the LAN port of the phone. Default: Disabled.
 - To configure PC VLAN/COS, select **Enable?**.
 - Select **VLAN ID** and enter the same ID as you have assigned to the VLAN in which the computers are connected. Valid range: 0-4094. Default: 1.
 - Select **CoS** and define the Layer 2 CoS (priority) bits. Valid range: 0-7. Default: 0.

PCAP

To capture packets sent and received from and by the phone for monitoring and troubleshooting, you can enable PCAP on the phone. The phone captures up to 1 MB of packets. For more information and instructions on how to use PCAP Trace on the phone, refer to the *EON510_SPARSH VP510 User Guide*.

MAC Cloning

If you require cloning of the MAC Address, configure the following:

- Select **Enable?** and press the Enter key. Select Yes to enable.
- In **Enter Clone MAC Address**, enter the address you wish to clone.

802.1x Authentication

If you want to restrict unauthorized clients from connecting to your LAN, you need to enable 802.1x Authentication. Using EAP MD5 protocol the PC connected to the LAN port of the IP Phone is first authenticated and then it gets connected to LAN.

You need to configure the following 802.1x Authentication parameters:

- Select **Enable?** and press the Enter key. Select Yes to enable.

- Enter the 802.1x Authentication **Identity** provided by you network administrator.
- Enter the 802.1x Authentication **MD5 Password** associated with identity provided by your network administrator.

When you change the Network Settings, the phone will restart.

Viewing Network Status

- When the phone is in idle state. You must press the Down key **▼** to access the Network Settings.
- Again press Down key **▼** to select Network Status and press the Enter key.

Use the Down/Up key to view the status of the various network parameters. The status of the following parameters appear on your display as you scroll.

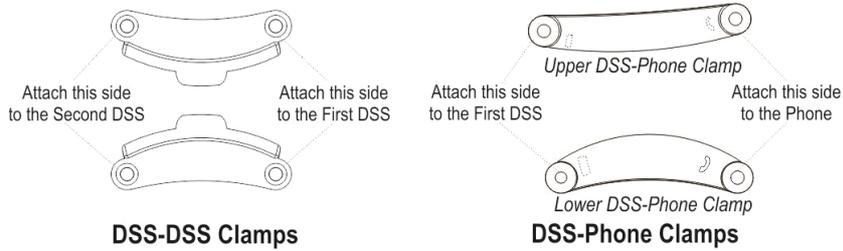

- **MAC:** This is the MAC Address of the phone.
- **IP:** The current IP Address assigned to the phone.
- **MASK:** The current Subnet mask assigned to the phone.
- **GW:** The current Gateway IP Address assigned to the phone.
- **DNS:** The Domain Name Server address assigned to the phone.
- **Active Server:** This displays the Server that is active — Primary, Secondary — with which the phone is currently registered.
- **S. ADD:** This displays the IP address of the Active Server. It may be the LAN or WAN IP Address / Domain Name of the SARVAM UCS or the Secondary Server IP Address (if configured) or any Fallback Server.
- **S. PORT:** This displays the port of the Active Server. It may be the SPARSH Port of SARVAM UCS or the Secondary Server Port (if configured) or the Fallback Server Port.
- **DOMAIN:** The Domain Name assigned to the phone.
- **802.1x Authentication:** The 802.1x authentication status is displayed—Success, Failure, Authenticating or Disabled.
- **FIRM:** The version of the current Firmware of the phone.
- **UBOOT:** The UBOOT release date.
- **KERNEL:** The KERNEL release date.

Refer to the *EON510_SPARSH VP510 User Guide* to know more.

Installing DSS532 with SPARSH VP510

Once you have installed SPARSH VP510 with SARVAM UCS, you can install the DSS532 by following the steps given below:

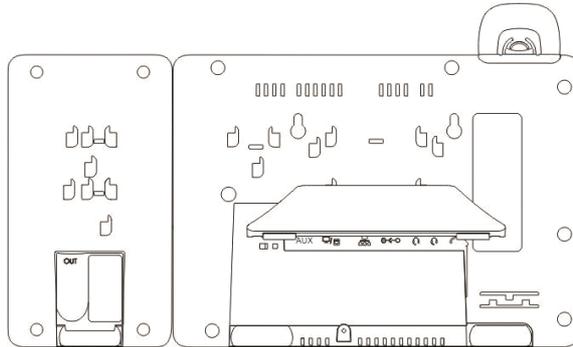

1. Unpack the box and verify the package contents¹⁰⁶.
2. Four clamps are provided with the phone — 2 DSS-Phone Clamps and 2 DSS-DSS Clamp.

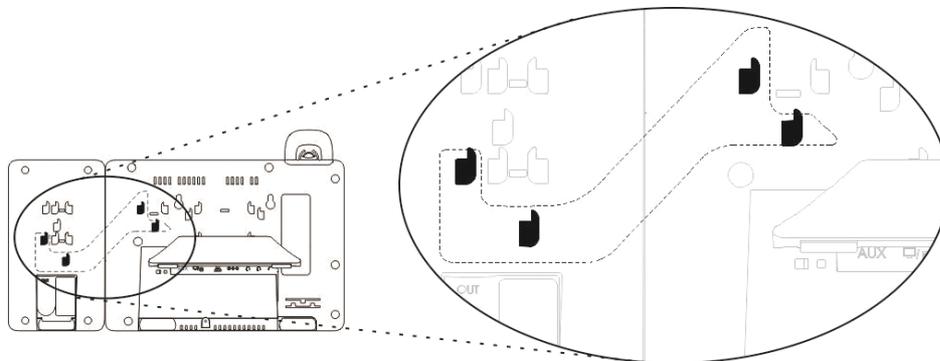

Connecting the First DSS532

Connecting the Extender

3. Turn the phone upside down on the table and place the inverted DSS532 adjacent to it.

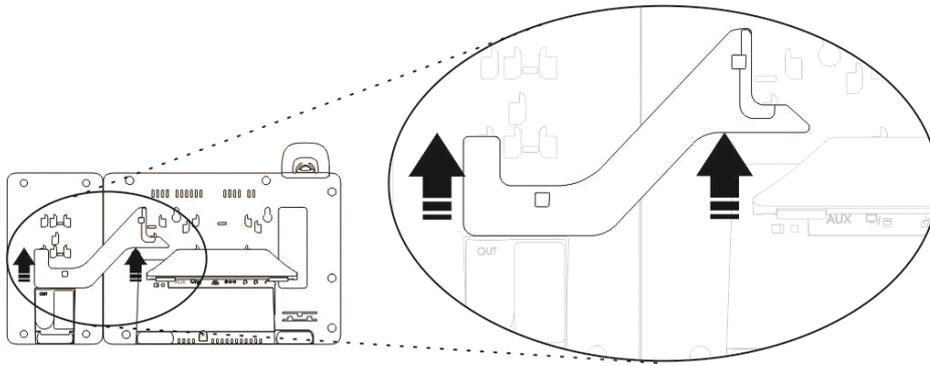

4. To attach the DSS532 with the phone, place the DSS Extender as illustrated below.

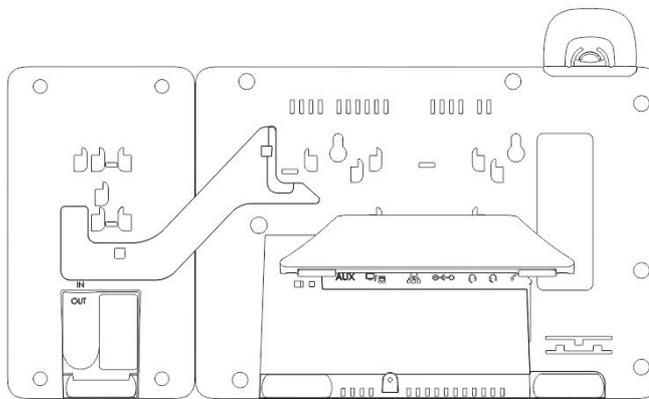

106. See "Packing List" of Appendix topic.

5. Insert the hooks on the Extender into the slots provided on the phone and the DSS532.

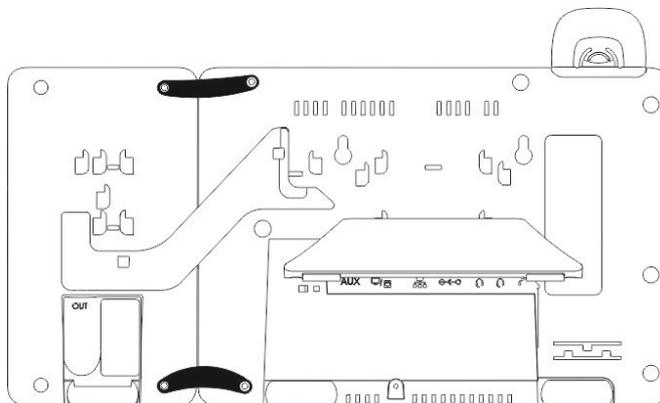

6. Firmly slide the DSS Extender upwards to lock them in place.

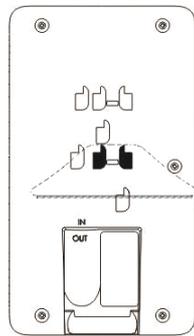

Attaching the Clamps

7. Now attach the clamps. To do so,
 - Remove the screws to attach the clamps.
 - Place the DSS-Phone Clamps between the DSS532 and the phone.
 - Insert the screws back to fix the clamps.

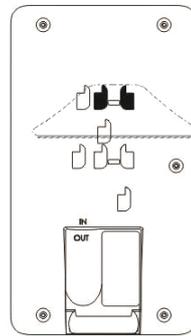

Attaching the Footstand

- You can mount the DSS532 with the phone on the desk at two angles — **45 degrees** or **55 degrees** by attaching the Foot Stand.

Stand attached at 45 degree angle

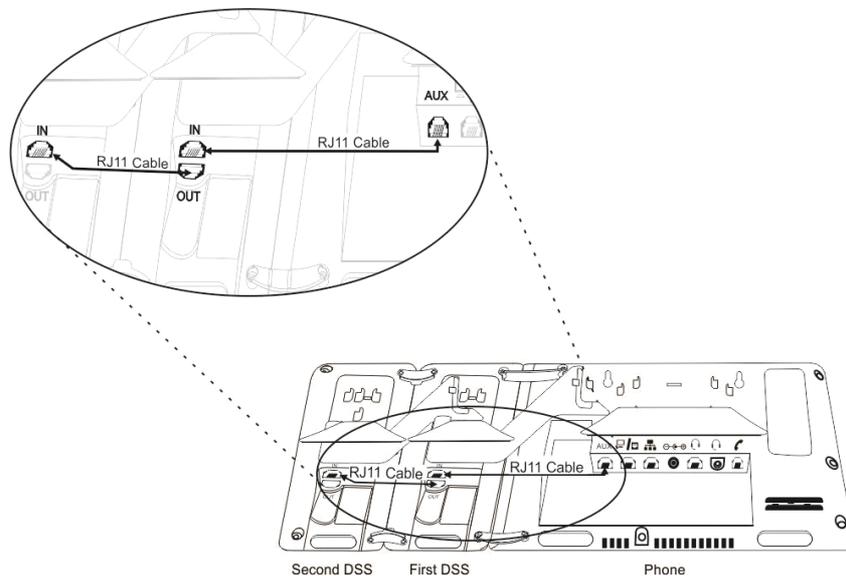

Stand attached at 55 degree angle

Make sure both, the DSS532 and phone are mounted at the same angle.

Connecting the Cables

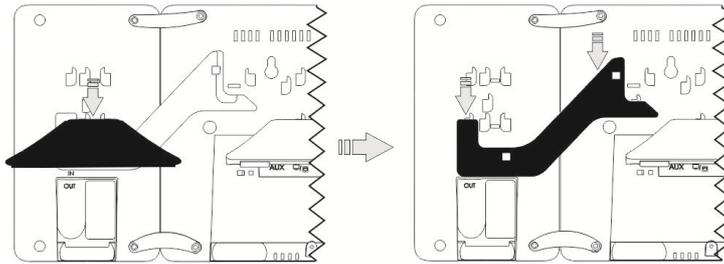

- To connect the DSS532 with phone, plug one end of RJ11 Cable into **Auxiliary(AUX) Port** of the phone and the other end into the **IN Port** of the DSS532.

Connecting Multiple DSS532

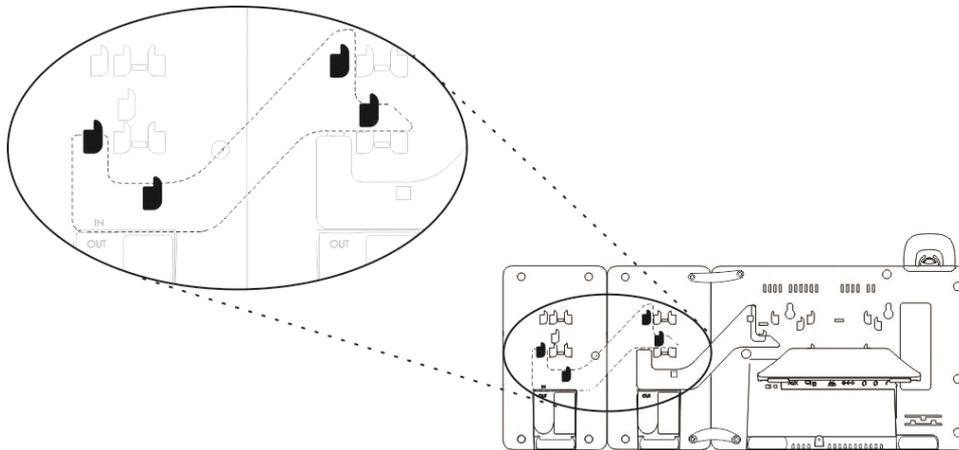

Remove the Foot Stand

- Remove the Foot Stand of attached DSS532. To do so,
 - Firmly slide the Foot Stand of the attached DSS532 downward to unlock.
 - Now, slide down the attached DSS Extender in downward direction.

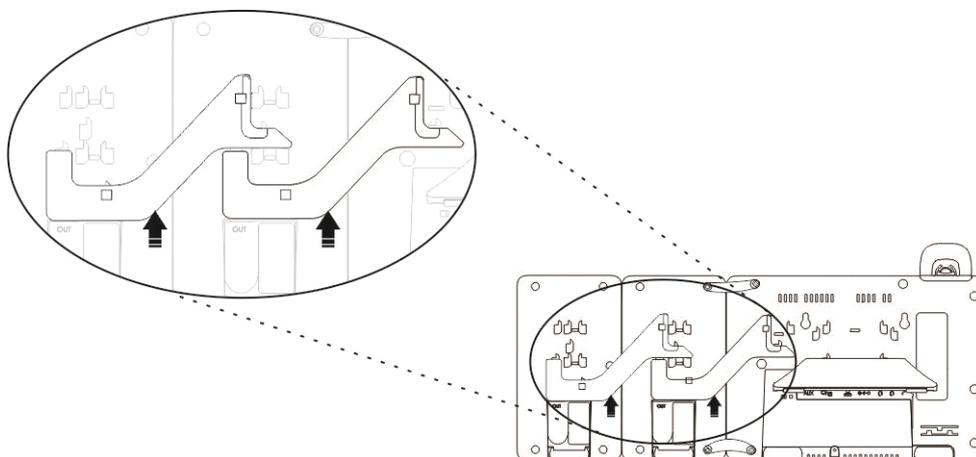

Attach the second DSS Extender

11. To attach the second DSS Extender,
 - Place another inverted DSS532 adjacent to the existing assembly.
 - Place the DSS Extender as illustrated in the diagram below.
 - Insert the hooks on the Extender into the slots provided on both the DSS532.

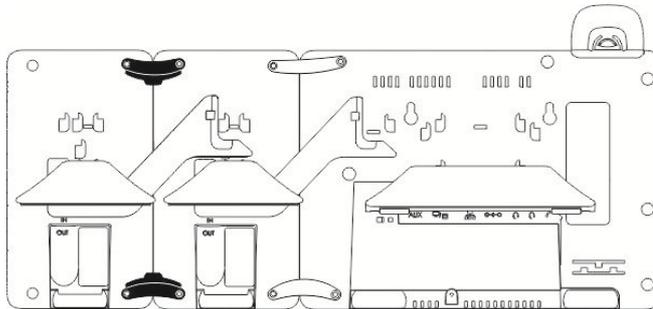

12. Firmly slide both the DSS Extenders upward consecutively (attach the second extender first followed by the existing one attached to the phone) and lock them in place.

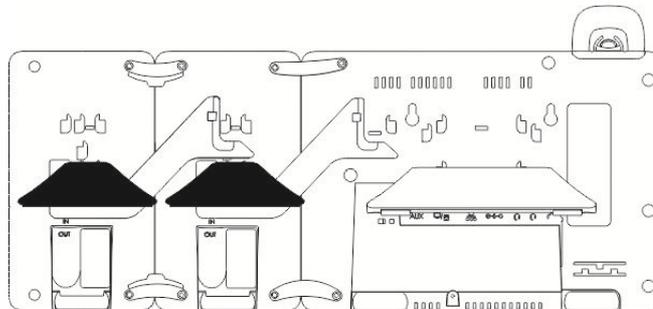

Attach the Clamps

13. Attach the DSS-DSS Clamps between both the DSS532.

Attach the Foot Stand

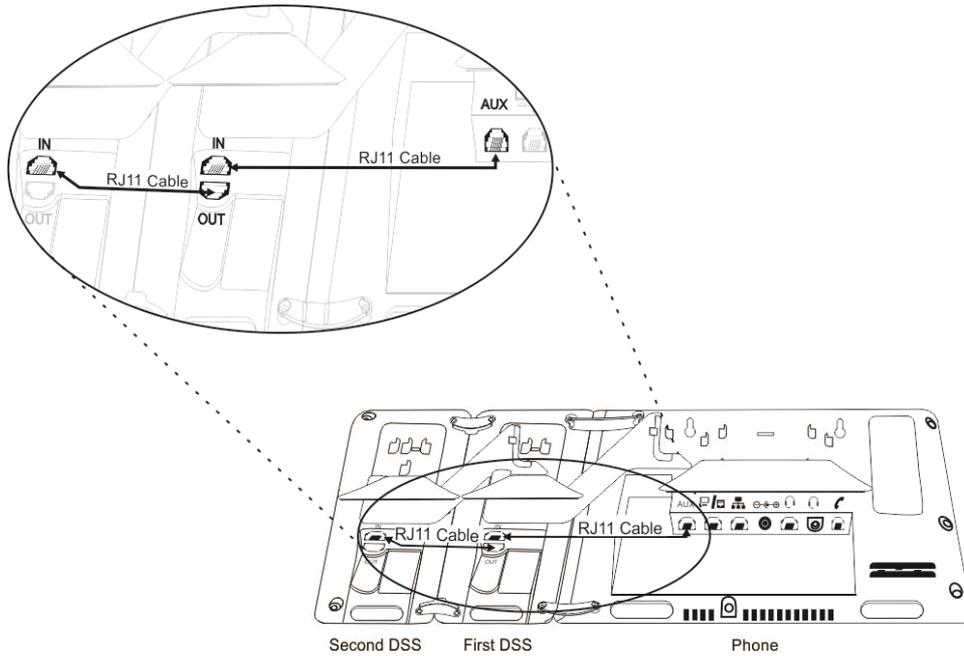

14. Attach the Foot Stand of both the DSS532.

Make sure both, the DSS532 and the phone are mounted at the same angle.

Connect the second DSS532 to the existing assembly

15. Plug one end of the RJ11 Cable into the OUT Port of the existing DSS532 (already connected with the phone) and the other end into the IN Port of the second DSS532.

You can install a maximum of four DSS532 with a phone.

16. After you have connected the DSS532 with the phone, you can configure the DSS Keys. For instructions, see ["Programming DSS Console Keys"](#).

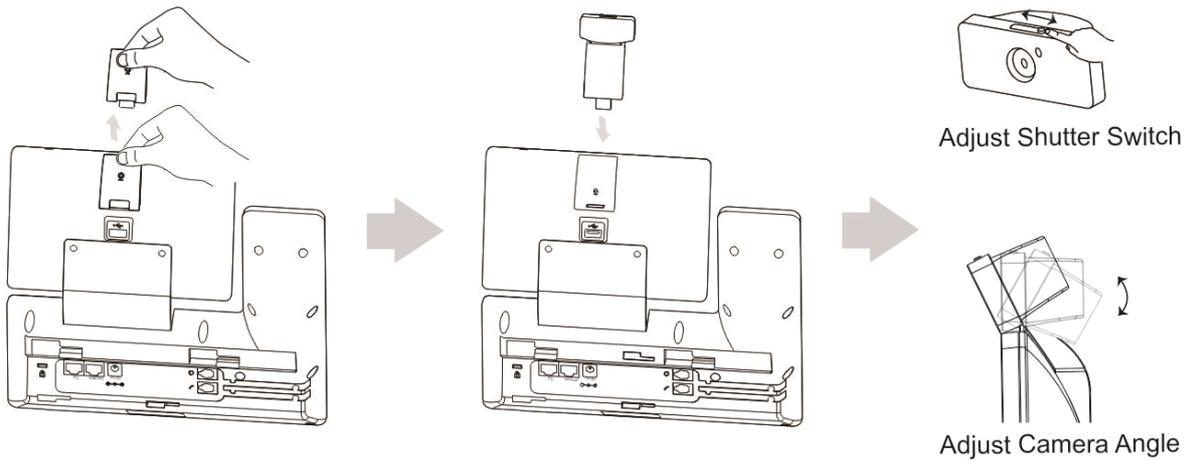

Connecting Extended SPARSH VP710 as Extended SIP Extension

You are recommended to complete the following steps before connecting the Matrix Extended SPARSH VP710 to SARVAM UCS:

- Decide the location where you want to place Matrix Extended SPARSH VP710 within your LAN.
- Log in to *Jeeves*. For instructions, read the topic ["Configuring SARVAM UCS"](#).
- You must configure the necessary parameters in SARVAM UCS so that Extended SPARSH VP710 can register as a SIP Extension. For instructions, see ["Configuring Matrix Extended SPARSH VP710"](#).

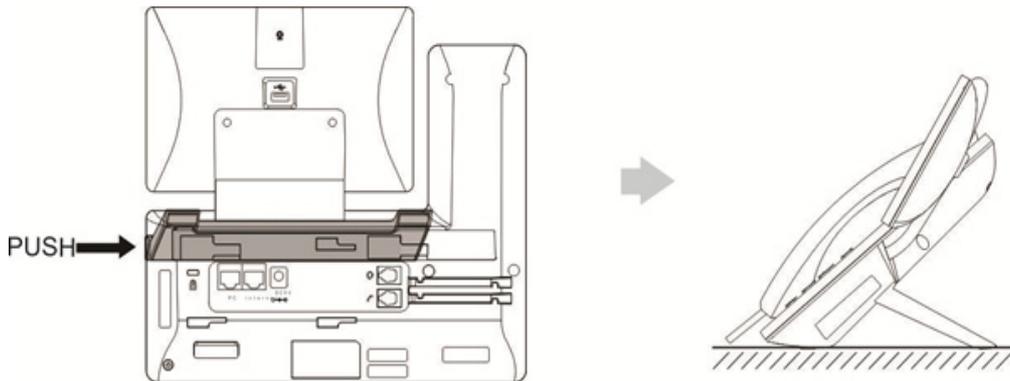

Now, follow the steps described below to install Extended SPARSH VP710.

1. Inserting the camera

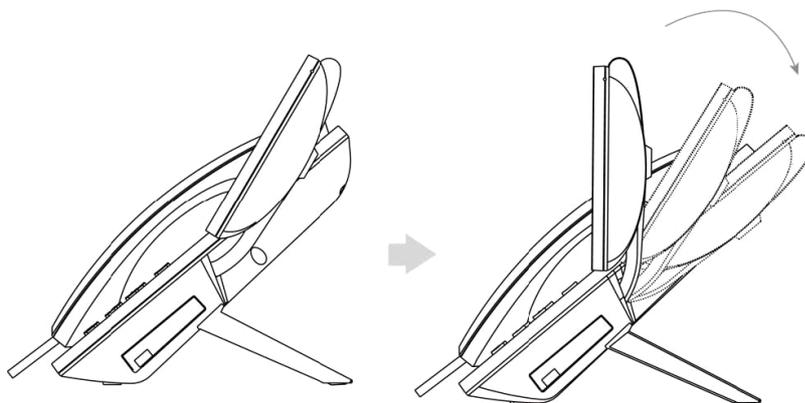

It is recommended to use only the Matrix original Camera, supplied with the IP Phone for video calling. The use of any third-party camera may cause damage to the phone. Damages to the phone caused by using third-party camera is not covered by Matrix warranty.

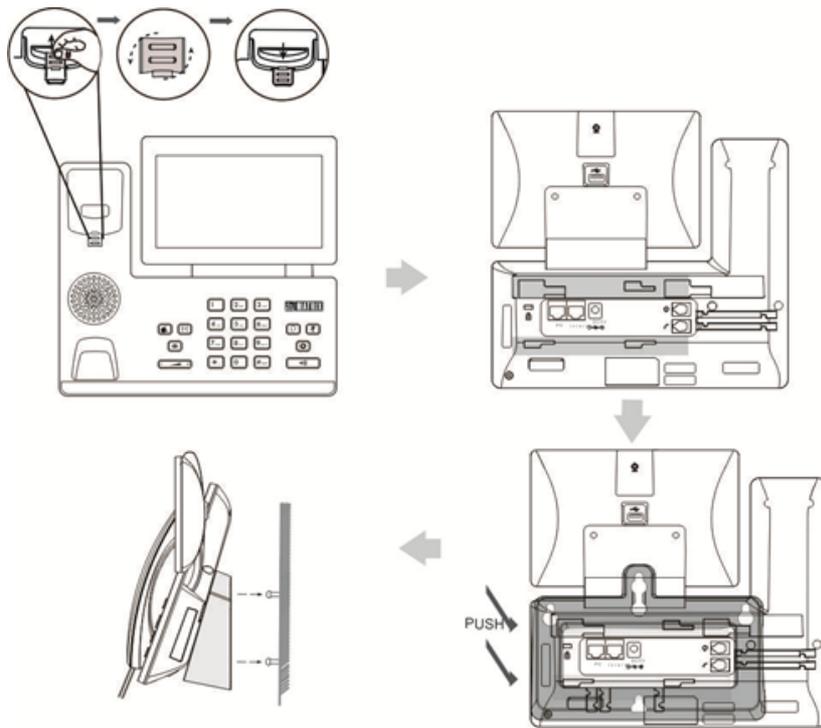

2. Attaching the stand

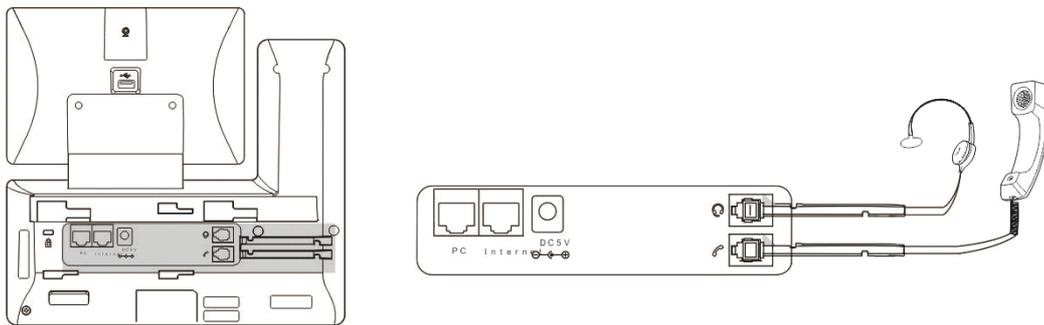

3. Adjusting the angle of the touch screen.

4. Attaching the optional wall mounting bracket

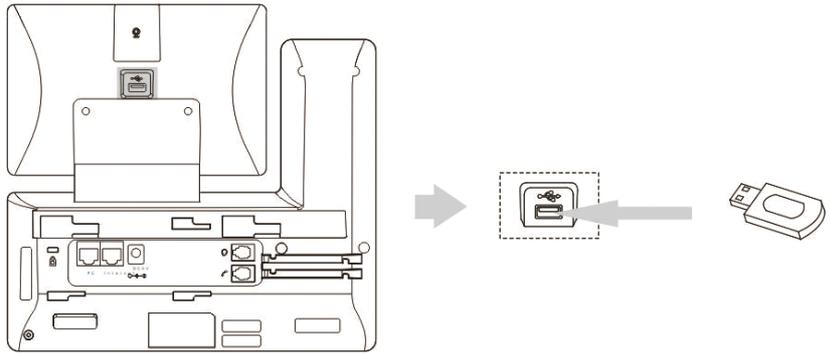

5. Connect the handset and optional headset.

A headset is not included in the packaging contents. Contact your dealer/reseller for more information.

6. Connect the optional USB Flash drive.

7. Connect the network and power.

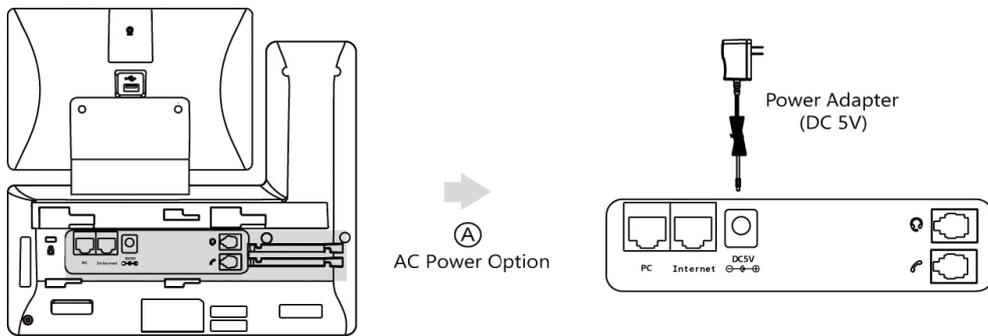

There are two options to connect the power and the network.

- AC power
- Power over Ethernet (PoE)

AC Power

To connect the AC power:

- Connect the DC plug on the power adapter to the DC5V port on the phone and connect the other end of the power adapter into an electrical power outlet.

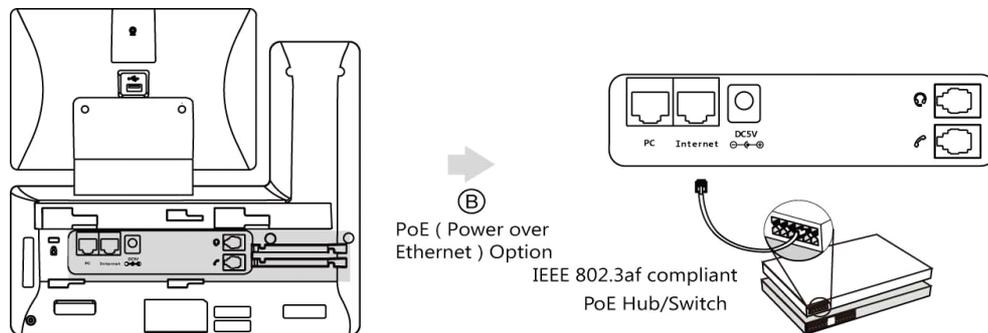

Power over Ethernet (PoE)

With the included or a regular Ethernet cable, the IP Phone can be powered from a PoE-compliant switch or hub.

To connect the PoE:

- Connect the Ethernet cable between the Internet port on the phone and an available port on the in-line power switch/hub.

If in-line power switch/hub is provided, you don't need to connect the phone to the power adapter. Make sure the switch/hub is PoE-compliant.

Do not unplug or remove power while the phone is updating firmware.

After the IP Phone is assembled and connected to the power supply, it automatically begins the initialization process.

During this process, the IP Phone displays the start up screen “Welcome Initializing...please wait”.

Once the IP Phone is initialized, it displays two different phone modes:

- Standard SIP
 - Extended SIP
- Select Extended SIP, to operate the IP Phone in the extended mode. As soon as you select this mode, the booting process initiates again and the start up screen displays “Welcome Initializing...please wait”. After the IP Phone is initialized, it attempts to contact a DHCP Server in your network to obtain valid IPv4 network settings (example: IP address, Subnet Mask, Gateway address, DNS address). You need to configure the basic network parameters of the IP Phone manually, if these are not provided by the DHCP Server or if your network does not support DHCP.

Refer to the *EXTENDED SPARSH VP710 User Guide*, for detailed instructions:

- To change the Network Settings of the phone and configure the network parameters.
- To use Wi-Fi for connectivity and configure its parameters.
- On getting the IP Address and Server Address, the phone initiates Auto Configuration (when DHCP is selected) to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

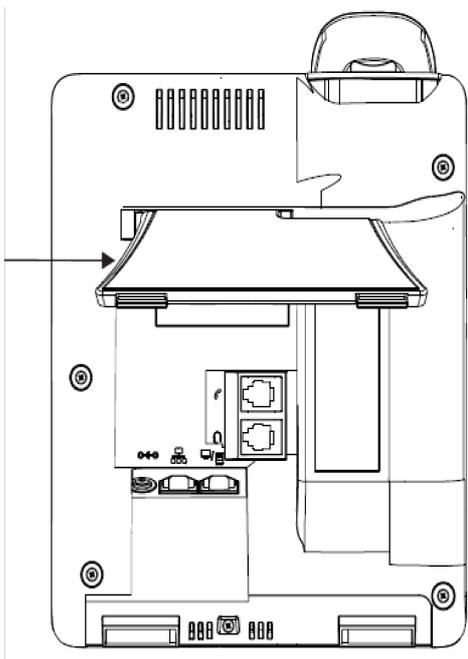

Connecting SPARSH VP210 as Extended SIP Extension

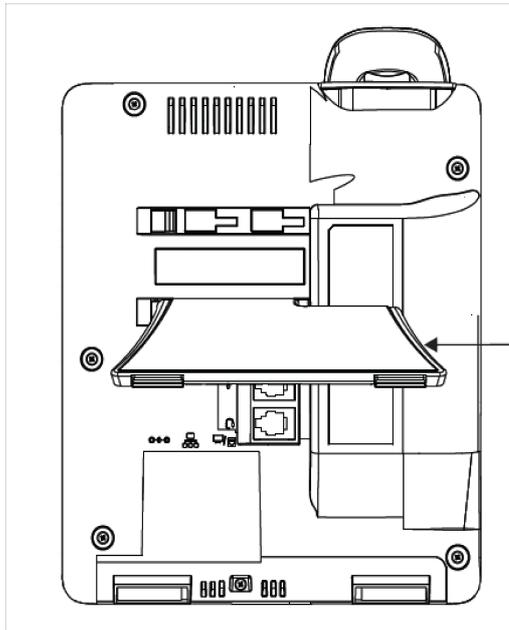

You are recommended to complete the following steps before connecting the Matrix SPARSH VP210 to SARVAM UCS:

- Decide the location where you want to place SPARSH VP210 within your LAN.
- By Default, in SPARSH VP210, the Connection Type selected is DHCP.
- If you want to use the **DHCP Server** for assigning IP Address to the Extended IP Phone, select **DHCP option 224** and **Data Type** as '**String**' and program the LAN or WAN IP Address /Domain Name of SARVAM UCS and SPARSH Port in the format "**IP_Address:Port**" in your LAN DHCP Server as per your installation scenario.
- Log in to *Jeeves*. For instructions, read the topic "[Configuring SARVAM UCS](#)".
- You must configure the necessary parameters in SARVAM UCS so that SPARSH VP210 can register as a SIP Extension. For instructions, see "[Configuring Matrix SPARSH VP210](#)".

Now, follow the steps described below to install SPARSH VP210.

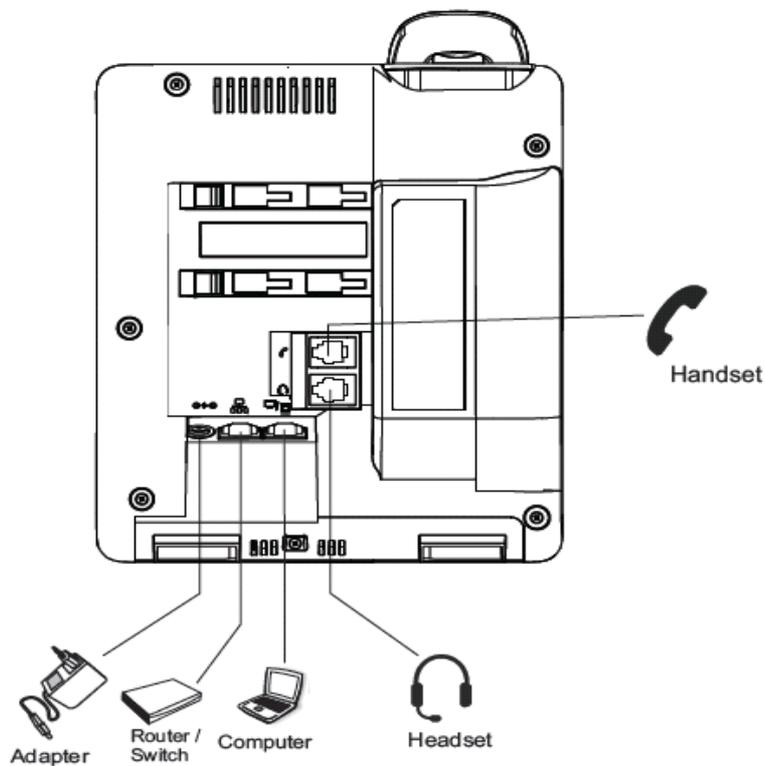

1. Unpack the SPARSH VP210 box and verify package contents.
2. When you mount the phone on a desk, you can attach the Foot Stand in two ways at **45° Angle** or at **55° Angle**.

- Decide which of these positions would work for you best and accordingly attach the Foot Stand.

Refer to the diagram below for connectivity.

3. Connect the Handset to the Phone body.

- Plug the long straightened end of the Spring Cord into the handset jack at the bottom of the phone, marked with the handset symbol .
 - Plug the other (short straight) end of the Spring Cord into the jack at the bottom of the handset.
4. If you want to use a Headset (not supplied) with your phone, You may plug in a headset with an RJ9 connector into the headset port at the bottom of the phone, marked with the symbol .
 5. To connect the LAN, Port , plug one end of the Ethernet Cable into the LAN Port at the bottom of the phone marked with the symbol  and the other end to the IP Network — A Router or LAN Switch.
 6. To connect your phone to a computer on your desk, plug one end of the Ethernet Cable (not supplied with this phone) into the PC Port at the bottom of the phone, marked with the symbol  and the other end into the LAN Port of your PC/LAN Switch.
 7. It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). In this case you need not connect the Power Adapter.

If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone, marked with the symbol . Plug in the Power Adapter into a power outlet.

If both the power options, that is, PoE as well as Power Adapter are available to the phone, then the phone will derive power from the PoE enabled LAN Switch.

The IP phone should be used with Matrix original power adapter (5V/0.6A) only. The use of any third-party power adapter may cause damage to the phone.

8. Switch ON power supply.

When you power the phone, the boot process will be initiated in the following sequence.

- The LCD display will light up and booting message appears.
- While loading the application then the loading message appears on the phone display.
- The phone makes DHCP Discovery and fetches its IP Address and Server Address from the DHCP Server.

If you want to change the Server Settings, press Settings.

Refer to the SPARSH VP210 (Extended) User Guide, for detailed instructions, to change the Network Settings of the phone and configure the network parameters.

- On getting the IP Address and Server Address, the phone initiates Auto Configuration to download the configuration files from SARVAM UCS.
- On successful download of all configuration files, the phone attempts to register with SARVAM UCS.
- On successful registration, the Home screen appears.

The phone will register successfully, only if the SIP Extension parameters in SARVAM UCS have been correctly configured as per your installation scenario.

Refer to the **SPARSH VP210 (Extended) User Guide** to know more.

Starting Up ETERNITY PENX

Power ON

1. If you have completed all the installation tasks, connect the three-prong plug of the power cord from the PENX into the AC outlet, and switch on the power supply.
2. Observe the Reset Cycle.

Reset Cycle

- Reset Cycle (Power-ON Self Test) takes about 2 minutes to finish.
- All the LEDs of the system and the keys of the DKP/SIP devices attached to the System are turned on.

When the Reset Cycle is successful, the default Extension Access Codes loaded by the system and the date and time of the Real Time Clock of the system will appear on the LCD display of the Digital Key Phones you have connected with the system.

Configuring ETERNITY GENX

ETERNITY GENX provides a Graphic User Interface (GUI), Jeeves, the proprietary web-based configuration software of Matrix. The built-in web server Jeeves allows you to select the Application you want to run on the ETERNITY GENX Platform.

The accessibility to the Web-based GUI is secured by a password. This password cannot be used to configure the system using commands.

To be able to access Jeeves,

- the LAN/WAN Port of the system must be connected with a stand-alone PC or in a LAN. The default IP Address of the LAN Port is 192.168.2.100, WAN Port is 192.168.1.100 and the Subnet Mask is 255.255.255.0.
- a web-browser, either Internet Explorer 7 or later or Mozilla Firefox 3.5.1 or later, must be installed on the PC.

If the computer for accessing Jeeves is connected in a LAN Switch and the WAN Port of the system is connected behind a NAT router, make sure that both the LAN and WAN connections are in different Subnet Masks.

To login,

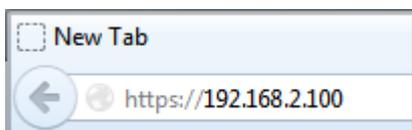

- Open the browser (Internet Explorer/Mozilla Firefox) on the PC (Standalone or LAN PC) to which the system is connected.
- Make sure the IP Address of the computer and the LAN Port of the system do not conflict, and that both are in the same Subnet.

The default IP Address of the LAN Port is: **192.168.2.100**

The default Subnet Mask of the LAN Port is: **255.255.255.000**

Change the Subnet of the computer, if necessary.

- In the address bar of the browser, enter **https://192.168.2.100**.

If you enter the IP Address **192.168.2.100** directly, you will be redirected to the HTTPS protocol for secure access. Click the **https://192.168.2.100** link provided.

- The **Login** page will open.
- In **Login Password**, enter **1234**, the default Password.

- Click the **Login** button.
- On successful login, the **Home** page of Jeeves opens.

The left navigation bar displays the links — **Application Selection**, **License Information**, **Status**, **Firmware Management** and **Debug**.

Application Selection enables you to select the application you wish to run on the ETERNITY GENX platform. You may select — SARVAM UCS SME or SARVAM UMG.

License Information displays the License key along with the License details of the applications.

Status displays the system details and the status of all the ports.

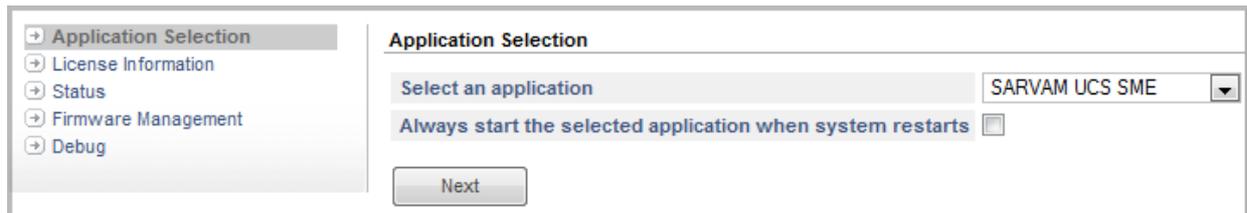

Firmware Management enables you to manage the upgradation of the system software with a click of a button.

Debug allows you to enable and configure the debug settings.

Application Selection

Through **Application Selection**, you can select the application you wish to run on the ETERNITY GENX Platform.

- In **Select an Application**, you may select the required application — SARVAM UCS SME or SARVAM UMG. Default: SARVAM UCS SME.

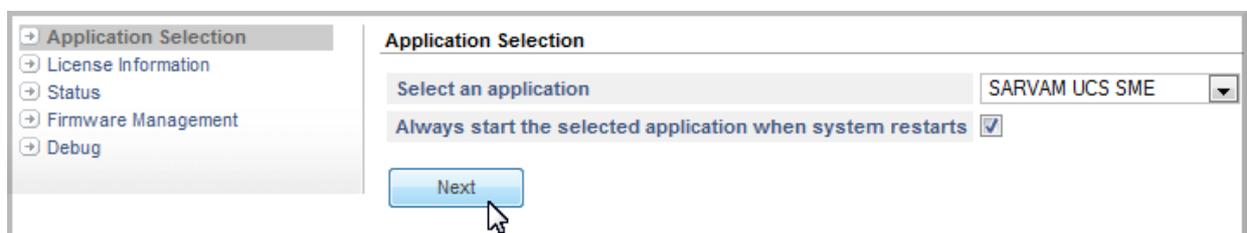

- Select the **Always start the selected application when system restarts** check box, if you want the selected application to start whenever the system restarts.

Keep the check box disabled only if you want to select the application to be run on the ETERNITY GENX platform everytime the system restarts. Default: Disabled.

To run the selected application directly whenever the system restarts, **Enable the Always start the selected application when system restarts** check box.

- Now, click on the **Next** button to proceed to the SARVAM UCS SME Configuration.

When you click the Next button, you will be redirected to the SARVAM UCS SME Application. To return back to this page, see [“Switch Application”](#) in [“System Details”](#).

Once you are redirected to the SARVAM UCS SME Application,

- If you have purchased the SARVAM UCS SME License, you must activate it. For detailed instructions, refer [“How to activate your License”](#).
- If you have not purchased the license and you wish to use the features on trial basis, you can use the Demo Provision. Demo Provision enables you to use the SARVAM UCS SME application, free of cost for a period of 60 days.

During the Demo Provision you can access and use all the features and functionalities¹⁰⁷ supported by the application. For detailed instructions, refer [“Pre-activated Licenses”](#).

- If you do not have the license for the SARVAM UCS SME Application and you do not start the Demo Period, the system will disconnect all the connected calls¹⁰⁸ from any port after 60 seconds.

License Information

License Information displays the License key along with the License details of the applications. Whenever you want to activate license for any software application, you can check the current license key from here.

- Application Selection
- License Information
- Status
- Firmware Management
- Debug

License Information

003E-00CF-1003-408B-014E-00EE-985F-DC86-1472-642B-80C0-9B03-6389-2C62-00

Service Profile

SARVAM UCS SME	No
SARVAM UMG SME	No
Expansion Slots	1-4
Vocoder Channels	4
VMS Channels	4
IP Subscribers	5
VARTA Essential Users	0
VARTA Professional Users	0
VARTA Collaboration Users	0
PLCC	No
Hospitality	No
PMS	No
QSIG	No
Gateway	No
SMS Server	No
CTI	No
SMS Gateway	No

To activate the license, refer topic [“How to activate your License”](#).

To know more regarding the licenses, refer topic [“License Management”](#).

107. The number of Vocoder channels that will be supported in demo period will be as per the license you purchase.

108. Connected calls means where speech is connected between the calling party port and the called party port even if the called party port is not matured.

Status

Status displays the system details, that is, Product name and the Available Software Application, Network status, WAN Port and LAN Port status.

The screenshot shows the 'Status' page in the Matrix SARVAM UCS System Manual. The left sidebar contains a navigation menu with the following items: Application Selection, License Information, Status (highlighted), Firmware Management, and Debug. The main content area is titled 'Status' and is divided into several sections:

- System**
 - Firmware: V1R1.2.0
 - Application Loader Version: V1R3.1.0
 - Available Software Application in Memory: SARVAM UCS SME
- Network Status**
 - IP Addressing Mode: IPV4
- WAN Port**
 - Ethernet Link: UP
 - Default MAC Address: 00:1b:09:02:91:94
 - MAC Address in use: 00:1b:09:02:91:94
 - Preferred DNS Server: IPV4
- IPv4 Status**
 - Stack State: UP
 - IP Address: 192.168.105.172
 - Subnet Mask: 255.255.255.0
 - Default Gateway: 192.168.105.1
 - DNS Address: 0.0.0.0

Firmware Management

To upgrade firmware of ETERNITY GENX,

- In **Upgrade Firmware from PC**, click the **Browse** button to reach the location on the local disk where the firmware files are stored in your PC. Make sure that the file is a zip file with **.zip** extension.

The screenshot shows the 'Firmware Management' page in the Matrix SARVAM UCS System Manual. The left sidebar contains a navigation menu with the following items: Application Selection, License Information, Status, Firmware Management (highlighted), and Debug. The main content area is titled 'Firmware Management' and contains the following elements:

- Upgrade firmware from PC** (button)
- Browse...** (button)
- No file selected. (text)
- Upgrade** (button)

- After selecting the required firmware zip file from the PC, click the **Upgrade** button.

The system starts the upgradation process. After successful upgradation and validating the file, the system restarts with the upgraded firmware.

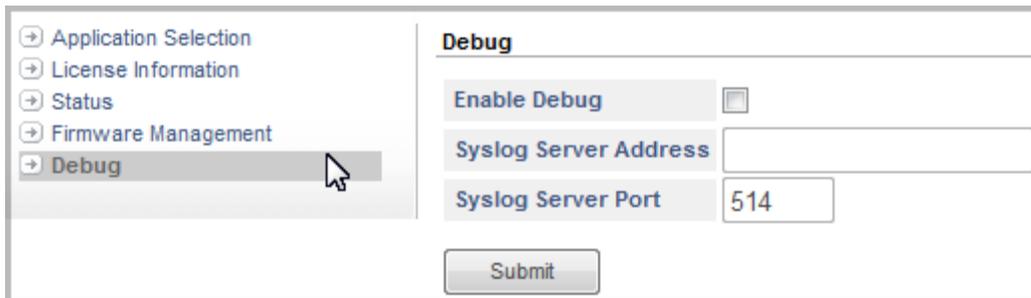

If you select a file other than zip file, an Alert Message is displayed when you click the Upgrade button.

Debug

ETERNITY GENX supports Syslog Client for debugging. Debug messages are sent to the remote Syslog Server.

- Select the **Enable Debug** check box to enable system debug. Default: Disabled.

You will be able to configure the Debug Settings only after you enable this check box.

The screenshot shows a web-based configuration interface. On the left, a vertical menu contains the following items: 'Application Selection', 'License Information', 'Status', 'Firmware Management', and 'Debug'. The 'Debug' item is highlighted with a mouse cursor. The main content area is titled 'Debug' and contains the following elements:

- Enable Debug**: A checkbox that is currently unchecked.
- Syslog Server Address**: A text input field that is currently empty.
- Syslog Server Port**: A text input field containing the value '514'.
- Submit**: A button located at the bottom center of the configuration area.

- In **Syslog Server IP Address**, enter the remote Syslog Server IP Address. Default: Blank.

In **Syslog Server Port**, enter the port number. The range of the server port is 514, 1024 to 65535. Default: 514.

The SARVAM UCS can be configured using the following tools:

- A web-based graphic user interface (GUI), called Jeeves.
- A telephone
- Serial Communication Port

Each of these is explained in detail in this chapter

Due to security concerns, the default system settings have been changed. If you have purchased a new system with Firmware later than V1R6.7, the new default settings will be applied automatically. Refer to [“Modified default parameter values for Firmwares later than V1R6.7”](#). With these default setting the incoming calls will be placed on the system but outgoing calls (except calls between extensions) will not be routed. For configuring the parameters to route outgoing calls refer to [“Outgoing Call Routing”](#).

If you are upgrading the system, refer to [“After updating Firmware later than V1R6.7”](#) and [“Modified default parameter values for Firmwares later than V1R6.7”](#).

Configuring using Web-based GUI: *Jeeves*

SARVAM UCS provides a Graphic User Interface (GUI), Jeeves, the proprietary web-based configuration software of Matrix. It is a Web server built into the SARVAM UCS.

The default IP Address of the LAN Port is 192.168.2.100, WAN Port is 192.168.1.100 and the Subnet Mask is 255.255.255.0.

Jeeves allows system configuration at three levels: System Engineer, System Administrator and the Front Desk User.

A distinct set of features and facilities can be configured at each of these levels. The accessibility to each level is secured by a password. These passwords cannot be used to configure the system using commands.

These passwords can be changed using Jeeves only.

It is possible to configure the SARVAM UCS from any location using Jeeves. You can use Jeeves to configure the system On-site (where it is installed) and Off-site, from a remote location.

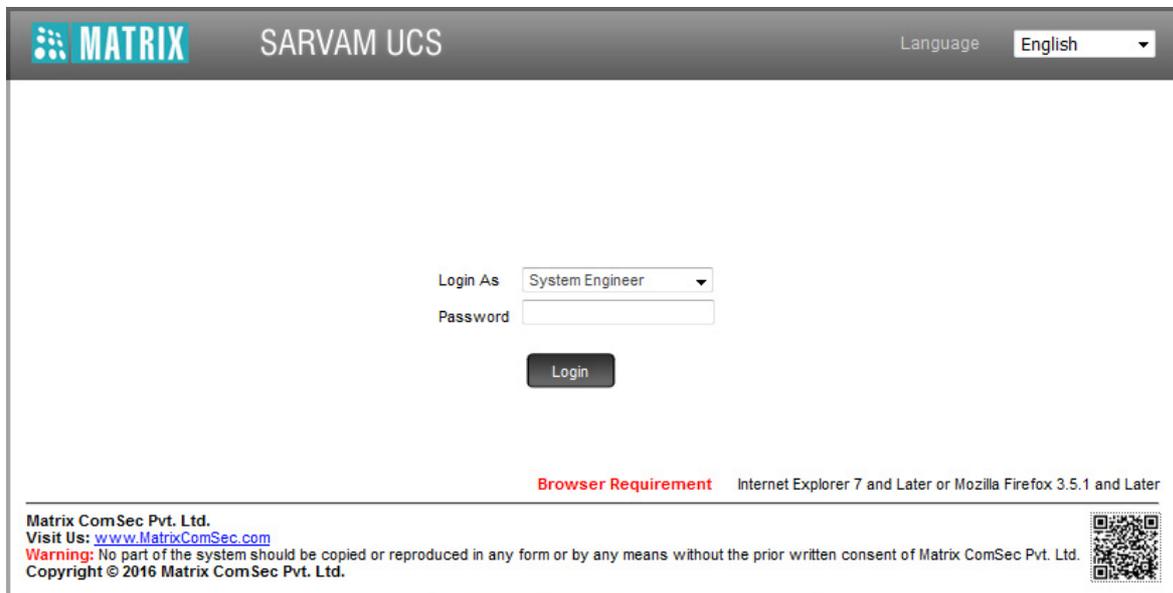

1. System Engineer Mode

At the System Engineer level, the entire system configuration, all configurable features and facilities of the SARVAM UCS can be changed to match user requirements and preferences.

To be able to do this, the System Engineer must enter the System Engineer (SE) configuration mode, by logging into Jeeves as System Engineer.

Only the System Engineer, who installs, configures and maintains the is allowed access to this mode. Hence access to the SE mode is protected by means of a password, referred throughout this document as the SE Password.

To login into the SE mode, on the login page in **Login as** select **System Engineer**.

- In **Password**, enter the default SE password, 1234.
- Click **Login**.

Before you start configuring the system, if you wish to view or download the SARVAM UCS Quick Start/ SARVAM UCS Hospitality Manual or other related documents, you can scan the QR Code present in the login page of Jeeves.

- You are prompted to change the default password.

Change Password

Login through default password is not allowed. Change the password to login.

Current Password	
New Password	
Confirm New Password	

Submit

Note :- Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

- In **Current Password**, enter the default SE password.
- Enter the **New Password**. The new password must be:
 - a minimum of 6 characters to a maximum of 12 characters.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.
 - include atleast one upper-case, one lower-case, one number and one special character.
- In **Confirm New Password**, re-enter the new password to confirm.
- Click **Submit**. You will be re-directed to the Login page again.
- Now, in **Login as** select **System Engineer** and in **Password** enter the new password.

You will be prompted to change the default **SE Extension Password**.

SE Extension Password

Please provide SE Password for Programming from Extension

New Password	
Confirm New Password	

Submit

- Enter the **New Password**. The new password can be a minimum of 4 digits to a maximum of 12 digits. The valid digits are from 0 to 9.

You cannot set 1234 as the New SE Extension Password as it is the default SE Extension Password.

- In **Confirm New Password**, re-enter the new password to confirm.

- Click **Submit** to save your new password. The Home page will open.

You can configure only the basic network and debug parameters from your telephone using the default SE Extension Password, 1234. However, if you want to configure other parameters from your telephone, you must change the default SE Extension Password. You can change the default SE Extension Password using Jeeves only.

To configure these parameters using the default SE Extension Password, you must connect a SLT or DKP extension to the system. To know the detailed list of parameters, which can be configured using the default SE Extension Password, see [“Basic Network”](#) and [“System Debug”](#).

As this password is meant for restricting access to the SE mode, we strongly recommend you to:

- *Keep the password secret.*
- *Select a complex password that cannot be easily guessed.*
- *Change the password regularly. See [“System Security”](#).*
- *Not use the **“Remember Password”** property of your Web Browser.*

- *Each login session into the SE Mode is set to 60 minutes by default. So, the login session will expire at the end of 60 minutes. The duration of the login session can be extended or shortened according to your preference by changing the settings for the 'Web Configuration Timer'. Refer the topic [“Changing Login Session Time Out of Jeeves”](#).*
- *It is possible for four users to simultaneously log into the System Engineer Mode of Jeeves. It is also possible to log out all of these users at once or log out any of these users selectively. Refer the topic [“Logging Out Users from Jeeves”](#).*

Quick Installation Wizards

For the ease of installation, as well as to simplify and speed up the process of setting up the SARVAM UCS, the Jeeves offers two Wizards, namely:

- **Quick Installation Wizard - Standard PBX:** This wizard helps the Installer/System Engineer to quickly set-up the SARVAM UCS for the standard UC (Enterprise) Application.

Using this Wizard, the Installer/System Engineer can configure as much as 80 percent of the system configuration, covering all the parameters necessary for the functioning of the system. For advanced configuration of features and facilities, the Installer/System Engineer must use the [“Using Configuration”](#) mode.

Detailed information on this Wizard and instructions for using it for system configuration are given later in this chapter. Refer the topic [“Using Quick Installation Wizard - Standard PBX”](#).

- **Quick Installation Wizard - Hotel:** This is a special wizard for the Hospitality Application of the SARVAM UCS. The Hotel Installation Wizard simplifies the configuration process and helps the Installer/System Engineer to configure the system for the special telephone and guest/patient management facilities and features for hotels and hospitals.

You may use this Wizard if you have deployed the SARVAM UCS as a Hospitality Application. The Hotel Installation Wizard is recommended to be used when configuring the SARVAM UCS for the first time.

Refer the separate *SARVAM UCS Hospitality System Manual* to know more.

Configuration

While the Quick Installation Wizard provides a fast-track way for system configuration, detailed and advanced configuration of the system can be done only from the links under Configuration of Jeeves.

The Configuration, as the title itself suggests, enables the Installer to change the values of all configurable parameters of the system, including those not covered by the Wizard.

Refer the topic [“Using Configuration”](#) for more information and instructions.

As many as four System Engineers can simultaneously login into SE Mode and configure the system via the Configuration and the Quick Installation Wizard-Standard PBX. However, it is recommended that multiple login be avoided when using the Quick Installation Wizard and the use of the Wizard be restricted to a single person only.

2. System Administrator Mode

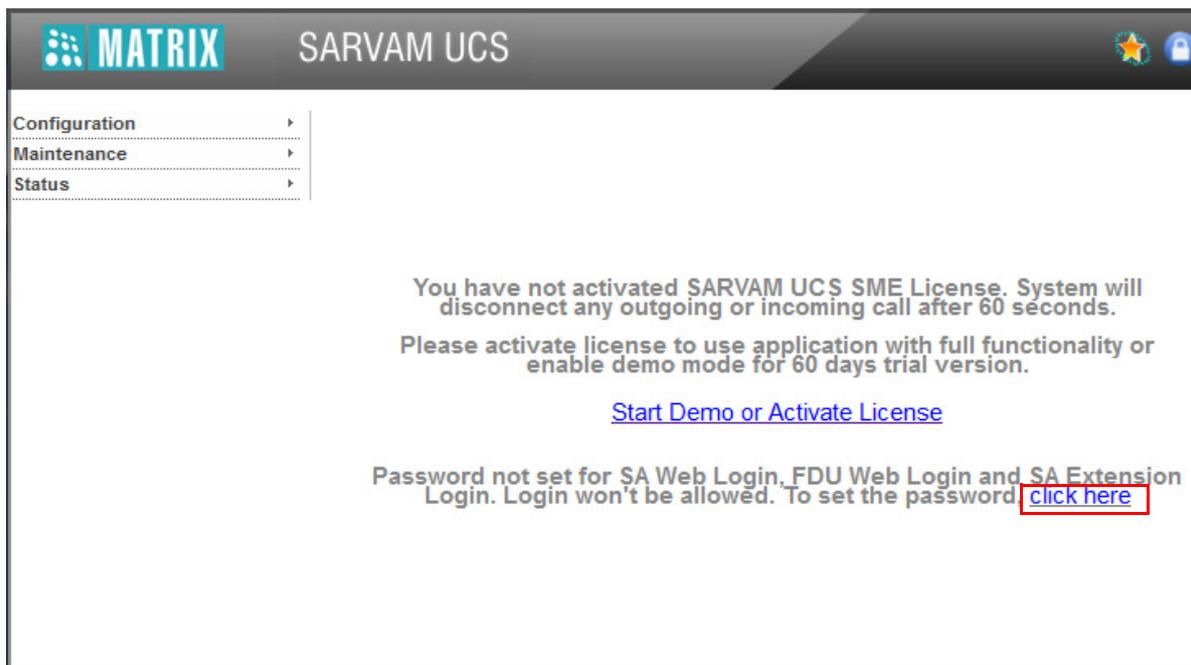

At the System Administrator level, the settings of the features for the Extension users can be changed, and various system activity logs and reports such as fault log reports, Station Message Detail Recording reports, and Hotel reports, can be captured and printed.

For this, the System Administrator, who is usually the operator or receptionist, must login as System Administrator into Jeeves.

To login into the SA mode,

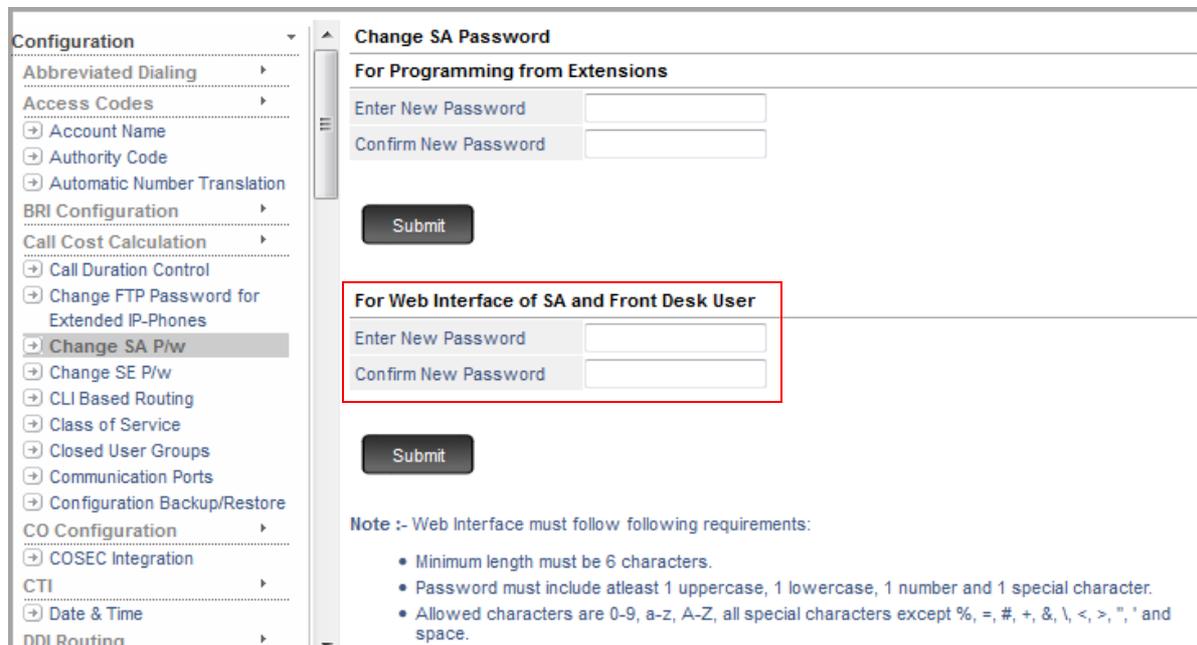

- On the Login page, in **Login As** select **System Engineer**. To know more, refer to [“1. System Engineer Mode”](#).

- Click **Login**. The Home page opens.

- To set the password for **SA Web Login**, **FDU Web Login** and **SA Extension Login**, click on the link.

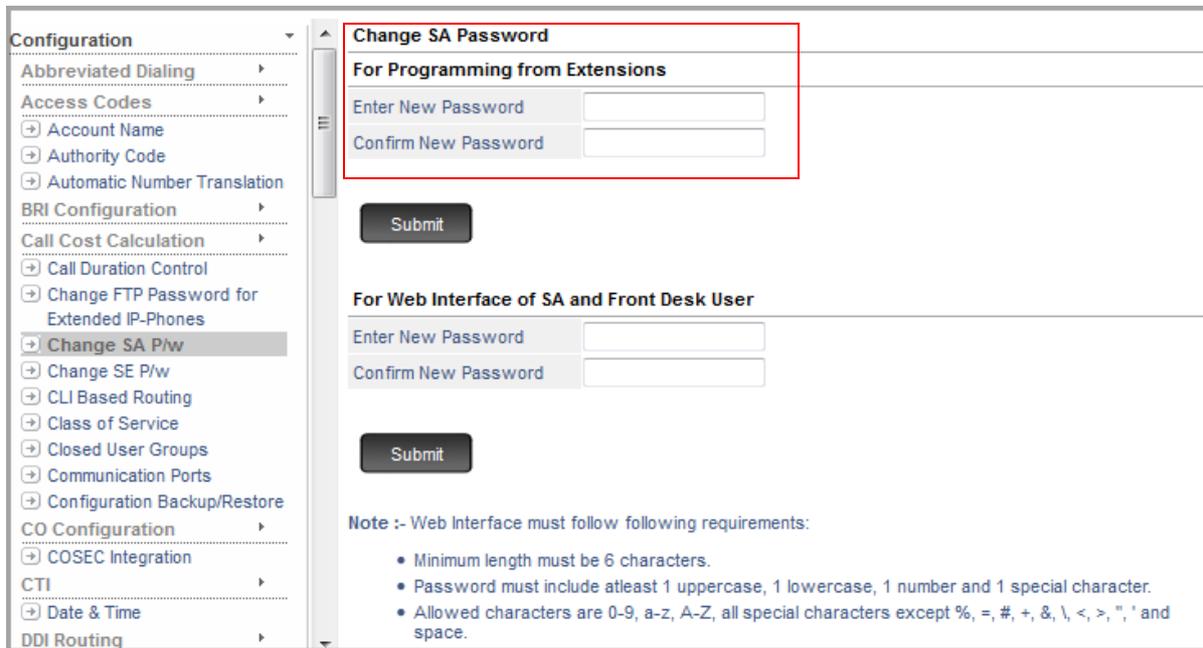

For Accessing Jeeves

- Under **For Web Interface of SA User and Front Desk User**,
 - **Enter New Password.** All ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ' , Double Quote " and **Space**) are allowed. The new password must be:
 - a minimum of 6 characters to a maximum of 12 characters.

- include atleast one upper-case, one lower-case, one number and one special character.
- In **Confirm New Password**, re-enter the new password to confirm.
- Click **Submit** to save your new password.

For Programming from Extensions

- Under **For Programming from Extensions**,
 - **Enter New Password**. The new password can be a minimum of 4 digits to a maximum of 12 digits. The valid digits are from 0 to 9.
 - In **Confirm New Password**, re-enter the new password to confirm.
 - Click **Submit** to save your new SA password.
- Log out of SE mode to enter SA mode.

The SA password is a code for preventing unauthorized access to the SA mode. As this password is meant for restricting access to the SA mode, we strongly recommend you to:

- *Keep the password secret.*
- *Select a complex password that cannot be easily guessed.*
- *Change the password regularly. See “[System Security](#)”.*
- *Not to use the “**Remember Password**” property of your Web Browser.*

You can log into the SA mode through Jeeves or from extensions only after you have set the password from SE mode. The password can be set using Jeeves only and it must be as per the specifications given below:

- It must be a minimum of 6 characters and a maximum of 12 characters.
- It must include at least one upper-case, one lower-case, one number and one special character.
- All ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and Space) are allowed.

To provide additional security,

- the password will be valid for 90 days only and you will not be able to login with the existing password after 90 days. You will be prompted to change the password.
- if you enter a wrong password for five times consecutively within 10 minutes, the system will block the source IP Address for 10 minutes. This activity will be logged in the "System Activity Log".

Once the SA password is set, you can log into the SA mode through Jeeves.

To enter the SA mode,

- On the **Login** page, in **Login as** select **System Administrator**.

MATRIX SARVAM UCS Language English

- In **Password**, enter the new SA password.
- Click **Login**.

3. Front Desk User Mode

The Front Desk Mode is relevant only for the Hospitality Application of the SARVAM UCS.

This mode is meant for the personnel at the Front Desk of the Hotels/Motels, allowing them access to and operation of the hospitality features of SARVAM UCS, for example: Check-In/Out of guests, Changing Room Occupancy and Clean Status, setting Call Budgets for guests, setting Wake-up calls, Reminders, Do Not Disturb for guests, printing Call Reports and Hotel reports, and several others.

The Front Desk User mode too is password protected. Refer the *SARVAM UCS Hospitality System Manual* to know more.

- *If you select the language on the 'Welcome' page or on any of the Login pages, it is valid for the session only. The default language will be applied on next login.*
- *When you select the “[Configuring 'Region'](#)” for the country in which SARVAM UCS is being installed, the system will load the country-specific default settings and automatically select the local language of the country, if the local language is among the above listed languages. The default local language set on selecting the Region will be applied for every login session, unless you select another language as the default local language.*
- *The default local language set on selecting the Region can also be changed from the “[System Parameters](#)” page of Jeeves.*

The system can be configured both, 'on site' and from a remote location (refer “[Remote Programming](#)”), and from multiple extensions simultaneously, without its functioning being affected.

With the default setting in the system, outgoing calls (except calls between SIP extensions) will not be routed. For details, refer “[Outgoing Call Routing](#)”.

Configuring using a Telephone

The SARVAM UCS can be configured by dialing the relevant command strings from a telephone. The telephone may be any Single Line Telephone (SLT), the Matrix proprietary Digital Key Phone (DKP), EON, or the Matrix Extended IP Phone connected as an extension of the SARVAM UCS.

For the ease of operation, you may use EON. Using EON has the advantage as,

- you can view the command strings that you have keyed in on the LCD display of EON.
- you will get prompts and confirmatory messages on the phone's LCD display, in addition to confirmation tone played to you.
- you can dial alphanumeric command strings.

All these facilities will not be available to you on an SLT.

System Configuration using a Telephone can be done at two levels: System Engineer Level and System Administrator Level.

A distinct set of features and facilities can be programmed at each of these levels.

It is possible to configure the SARVAM UCS from any location using a Telephone. You can use a Telephone connected as an extension of the SARVAM UCS to configure the system On-site (where it is installed). You can also configure the system using a Telephone Off-site, from a Remote location, using the [“Direct Inward System Access \(DISA\)”](#) feature of the SARVAM UCS. You can access both the System Engineer mode as well as the System Administrator mode from the remote location. Refer the topic [‘Remote Configuration using a Telephone’](#) later in this chapter for instructions.

Make sure you change the default SE Extension password, before configuring SARVAM UCS from your telephone. You can only configure the basic network and debug parameters using this default SE Extension Password. The default SE Extension password can be changed only from Jeeves. To know more, refer to [“Configuring SARVAM UCS”](#).

1. System Engineer Mode

At the System Engineer level, the entire system configuration, all programmable features and facilities of the SARVAM UCS can be configured by dialing command strings referred to in this document as SE Commands.

The System Engineer has Full Programming Access when configuring the system using a Telephone. In other words, the System Engineer can configure the entire system, nearly all the programmable parameters, using a telephone.

Refer the topic [“Using Configuration”](#) for more information and instructions.

SE Commands

These are number strings to be dialed by the System Engineer on entering the SE mode via a telephone. SE Commands are unique to the feature/facility being programmed. Hence SE Commands for configuring a particular feature/facility are presented in description of that feature/facility in this manual.

For a complete List of all SE Commands, refer [“System Commands”](#) and for SE Commands for PENX, refer [“System Commands for PENX”](#)

SE Password for programming from extensions

The SE password is a code used to restrict unauthorized access to the SE Mode. The password can be a minimum of 4 digits to a maximum of 12 digits. The valid digits are from 0 to 9. The default SE Password is 1234. To avoid unauthorized access, we recommend you to change the password. Make sure it is strong and is kept confidential.

Refer the topic “[System Security](#)” for instructions on how to change the SE password. In case the System Engineer forgets the password, it can be restored to the default password and changed again. Read the section “[Default Settings](#)” for instructions on restoring the default SE password.

There is no restriction on the number of persons who can simultaneously enter SE mode from a Telephone and configure the system.

Entering the SE mode using a Telephone

The telephone that you use to enter the SE programming mode may be a DKP or an SLT connected as extension phone of the SARVAM UCS.

To enter the SE mode via a DKP/SLT (for all countries except New Zealand):

- Dial **1#91-SE Password**
- You get programming tone to indicate entry into the SE mode.
- Now, dial the desired SE Command to configure.
- You get confirmation tone and message on the LCD if using EON.

To enter the SE mode via a DKP/SLT (for New Zealand):

- Dial ***1#91-SE Password**
- You get programming tone.
- Dial the desired SE Command to configure.
- You get confirmation tone and message on the LCD if using EON.

To exit the SE mode:

- Dial **00**.
- You will hear the dial tone of the SARVAM UCS.

- *If the SE Password you entered is incorrect, you will be played an Error Tone and an Error Message on EON.*
- *The system accepts and executes the command immediately, but it takes approximately 2 minutes to save a command. So, it is advisable that you do not turn OFF the system for 2 to 3 minutes after entering the last command.*

2. System Administrator Mode

Make sure you set the SA Extension password, before configuring SARVAM UCS from your telephone. The SA Extension password can be set only from Jeeves. To know more, refer to “[2. System Administrator Mode](#)”.

At the System Administrator level, you can set/cancel features settings for extensions, capture and print various system activity logs and reports.

The Operator or Receptionist, who usually administer the system, must enter the System Administrator (SA) mode and then after dial command strings referred to as SA Commands from a telephone.

SA Commands

SA commands consist of a prefix string 1072, followed by the Command string. For example: the SA command for setting Do Not Disturb for an extension is **1072-001-extension number-1**, where 1072 is the prefix string and 001 is the command string.

The Prefix string in the SA Command (1072) can be changed by the installer/System Engineer. However, the command strings of the SA Command (001 in the above example) cannot be changed.

The command for entering SA mode is also non-programmable. Refer "[Access Codes](#)" in the chapter Features and Facilities.

To know how to use or change feature settings with SA Commands, please refer the description of individual features under "[Features and Facilities](#)".

For a complete list of SA Commands, refer "[SA Commands](#)".

SA Password for programming from extensions

The access to SA mode may be protected by means of an SA password.

The SA password is code for preventing unauthorized access to the SA mode. The password can be a minimum of 4 digits to a maximum of 12 digits. The valid digits are from 0 to 9. To avoid unauthorized access, we recommend you to change the password. Make sure it is strong and is kept confidential. It can be changed and reset by the System Engineer.

Refer the topic "[System Security](#)" for instructions on how to change and reset the SA Password using SE commands.

- *When the SARVAM UCS is used in the Standard Application, you can enter SA mode only from extensions which have the features 'SA Mode' and/or 'SA Extension' enabled in their Class of Service.*
- *When the feature 'SA Extension' is enabled in the Class of Service of an extension, the extension will always be in SA mode. You do not need to enter SA mode by dialing the SA password. You can enter the SA mode by dialing the SA command prefix string.*
- *When the feature 'SA Mode' is enabled in the Class of Service of an extension, dialing of the SA Password is required to enter the SA mode. SA Commands can be dialed only after successfully entering the SA Mode.*
- *There is no restriction on the number of persons who can simultaneously enter and operate from the SA mode using a telephone.*

Entering SA Mode using a Telephone

You may use a DKP or an SLT extension of the SARVAM UCS to enter the SA Mode.

To enter SA mode via an extension phone (for all countries except New Zealand),

- Dial **1#92-SA Password**¹⁰⁹
- You get a confirmation Tone of the SARVAM UCS to indicate successful entry into the SA mode.
- Dial SA Command strings: **1072-Feature Access Code**.
- You get a confirmatory tone and text message on the phone display (if using EON).
- Replace handset to exit SA mode.

OR

- Dial **1#92**

To enter SA mode from an extension phone (for New Zealand),

- Dial ***1#92-SA Password**¹¹⁰
- You get a confirmation Tone.
- Dial SA Command strings: **1072-Feature Access Code**.
- You get a confirmation tone and text message on the phone display (if using EON).
- Replace handset to exit SA mode.

OR

- Dial ***1#92**

You can exit from the SA mode automatically or manually. To exit the SA mode automatically, you must configure the SA Mode Timer. On the expiry of the set time, the system disconnects the extension phone from the SA mode. This Timer is loaded automatically every time a new SA command is issued.

To program the SA Mode Timer:

- Dial **1072-016-SA Mode Timer**
Where,
SA Mode Timer = 000 to 255 minutes.
- You can also exit the SA mode before the SA Mode Timer expires by dialing this command. If the SA Mode Timer is set to 000 minutes, you can exit the SA mode only by dialing the command.

You may change the SA Mode Timer from the SA mode of Jeeves also.

Changing Login Session Time Out of Jeeves

As mentioned earlier, each login session of Jeeves has been set to 60 minutes by default. The Login session will expire at the end of 60 minutes. The duration of the Login session can be changed as per your preference by changing the settings of the 'Web Configuration Time Out Timer'.

To do this:

- Dial **1#91-SE Password** to enter SE mode from a DKP/SLT.
- Dial **2118-Time**
Where,
Time is from 001 to 255 minutes.
For example, to set log out time to 45 minutes, dial **2118-045**.
- Press 'Enter' key to save setting, if using EON.

109. *If the password is less than 12 digits, you must dial #* after the new password to indicate end of dialing. When you dial this command, the system will check if the facility 'SA Mode' is enabled in the Class of Service allowed to the extension from which you have dialed this command. If the SA mode is not allowed, an Error Tone will be played. The Error Tone will be played also when the SA password is entered incorrectly.*

If the facility 'SA Extension' is enabled in the Class of Service of the extension you are using, you can skip this step and directly dial the SA Command (1072-<Command String>).

110. *When you dial this command, the system will check if the facility 'SA Mode' is enabled in the Class of Service allowed to the extension from which you have dialed this command. If the SA mode is not allowed, an Error Tone will be played. The Error Tone will be played also when the SA password is entered incorrectly.*

If the facility 'SA Extension' is enabled in the Class of Service of the extension you are using, you can skip this step and directly dial the SA Command (1072-<Command String>).

Logging Out Users from Jeeves

It is possible for four users to simultaneously log in as System Engineers and use Jeeves. It is also possible to log out all these users at once. To do this,

- Dial **1#91-SE Password** to enter SE mode from a DKP/SLT.
- Dial **2188** to log out all users.
- Press 'Enter' key to save setting, if using EON.

Using Quick Installation Wizard - Standard PBX

The Quick Installation Wizard-Standard PBX helps you with the basic configuration of the system in easy steps. It is designed to break down the complexities of programming and can cover as much as 80% of your basic installation requirements.

The advantage of using the Wizard is that it speeds up system configuration, as you configure parameters that are specific to the SARVAM UCS and show only those Trunks and Extensions that are connected to the system for configuration. For instance, if you are installing only 12 out of the 64 CO trunks supported by SARVAM UCS, 12 DKP extensions and 240 SLT extensions, the Wizard will show only these many trunks and extension ports for configuration. Thus, the Wizard makes the entire system configuration very focused.

Further, the Wizard can be used for system configuration for first time installation as well as any time post-installation to make modifications in the system configuration.

Structure of the Wizard

The Wizard stores its own set of configuration files and once the installation is completed, it updates the system configuration files with the data you entered. However, the reverse does not work. The changes you make in the system configurations under Configuration will not be reflected in the Quick Installation Wizard.

The Quick Installation Wizard - Standard PBX offers the configuration of the following parameters:

1. Region
2. Pre-requisites
3. Extension Numbers in Range
4. Extension Numbering Plan
5. Trunks
6. Day-Night time
7. Number Patterns
8. Operator
9. Extensions
10. Least Cost Routing (LCR)
11. Call Pickup Group
12. CO Trunks
13. BRI Trunks
14. T1E1 PRI Trunks
15. Mobile Trunks
16. VoIP Network
17. SIP Trunks
18. Emergency Numbers

Help Text

There is a help text to explain the parameters on each screen. You may use this help text to guide you in entering the information.

The Buttons

The Wizard has the following buttons:

- **Next:** Clicking this button will cause the existing values of the parameters in a page to be submitted and takes you to the next page of the Wizard.
- **Submit:** Clicking this button will cause the parameters configured in the page to be submitted, but will not take you to the next page. The 'Submit' button is to be used when there are multiple pages for configuring a facility, for example, configuring extensions, CO trunks. Instead of navigating all the pages, you can access the desired page, make changes and submit them. Similarly, if you want to make any changes post-installation, instead of navigating through all pages of the Wizard and clicking **Done** to effect the changes, you can reach the desired page, make the necessary changes and submit the changes.

To navigate further, you must click the **Next** button.

- **Skip:** Clicking this button will take you to the next page, without making any changes to the current page. The Skip button is to be used when the Wizard is used post-installation to reach a page which is to be modified, without changing the existing configuration settings on other pages.
- **Undo:** Clicking this button refreshes the page with the parameters configured in the system. You may use this button if you are not sure about the values you entered or have entered incorrect values and wish to start all over again. This button is available only on select pages of the Wizard.
- **Help:** Clicking this button on a page opens a new window, containing Help Text for that page. The window can be maximized.
- **Default:** Clicking this button will populate all the fields of the page with the default values. Use this button when you want to assign default values to parameters.
- **Clear:** Clicking this button will cause the values of all the fields on the page to be cleared. Use this button to make corrections or start entering the values all over again.
- **Exit:** Clicking this button will exit the Jeeves amidst of an activity.

The changes you make in the system configuration under Configuration will not be reflected in the Quick Installation Wizard.

You are advised to either use the Wizard only during installation and to make modifications post installation OR use the Wizard only for basic configuration (first time installation) and for making subsequent changes click the desired link under Configuration.

Entering the Wizard

- Open Jeeves (see [“Configuring SARVAM UCS”](#) for instructions). The **Login** page will open.

- In **Login as** select **System Engineer**.

MATRIX SARVAM UCS Language English

Login As System Engineer

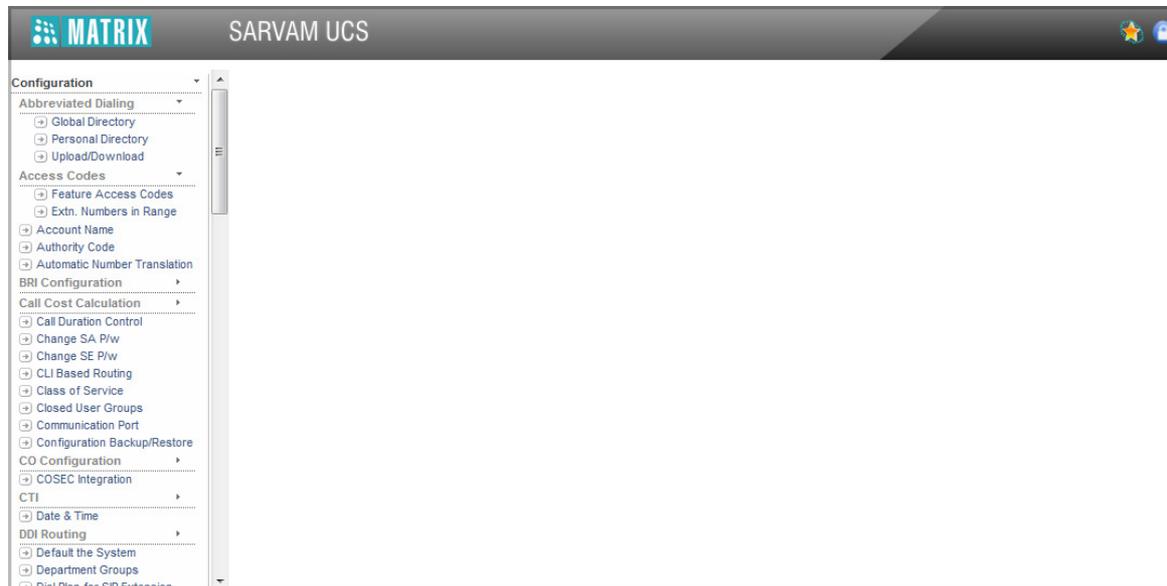

Password

Login

Browser Requirement Internet Explorer 7 and Later or Mozilla Firefox 3.5.1 and Later

Matrix ComSec Pvt. Ltd.
Visit Us: www.MatrixComSec.com
Warning: No part of the system should be copied or reproduced in any form or by any means without the prior written consent of Matrix ComSec Pvt. Ltd.
Copyright © 2016 Matrix ComSec Pvt. Ltd.

- In **Password** enter the SE password.
- Click **Login**.
- On successful login, the **Home** page opens.

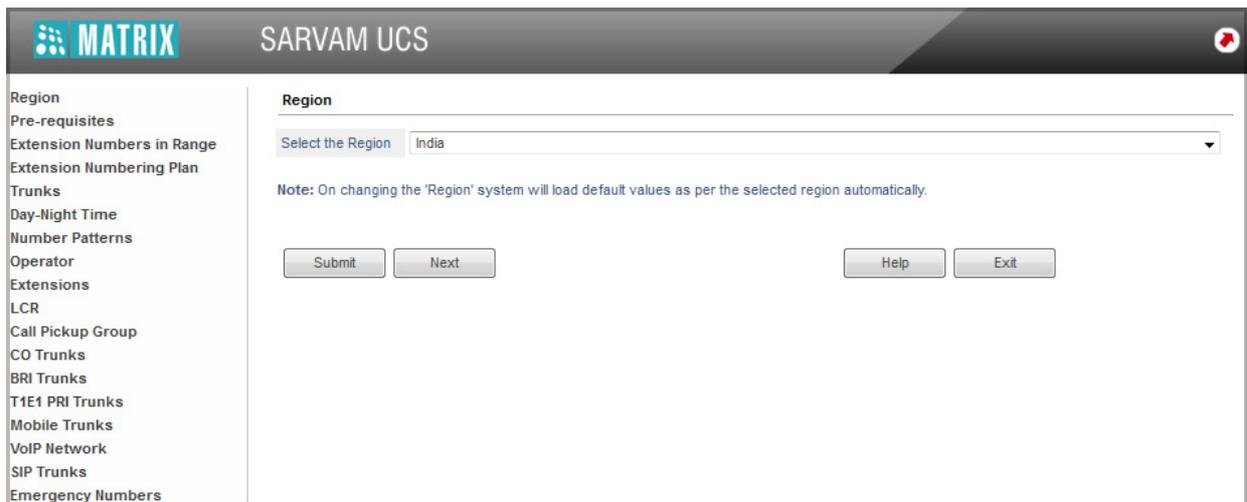

- Click the **Wizard icon**  on top right corner of the browser.

- To configure the Basic Settings, select the **Use Quick Installation Wizard-Standard PBX**.

- The **Quick Installation Wizard** opens.

Jeeves allows 4 persons to simultaneously log in as System Engineer. When you are logged into the Wizard, it is recommended that no other person logs into Jeeves as System Engineer.

Configuring Parameters

The Wizard gives you two options for configuring the system:

- **Selective Configuration** - This option allows you to choose what you want to configure and click the related links on the left navigation bar of the Wizard page. You are recommended to use this option for making the desired changes post-installation.
- **Navigate Wizard** - In this option, the Wizard will lead you logically, step-by-step through the configuration of the desired parameters. Click the **Next** button to navigate through the Wizard. You are recommended to use this option when installing the system for the first time.

Region

- In **Select the Region**, select the country where the system is installed, and then click **Next**.

Region

Select the Region

Note: On changing the 'Region' system will load default values as per the selected region automatically.

Selecting the **Region** will instruct the system to load the default values of features/facilities according to the country specific requirements.

The default **Region** is India.

System Pre-requisites

Region

Pre-requisites

System Pre-requisites

Customer Name

On Site Configuration

Model Type ETERNITY GENX

Number of Ports Used

SLT Extensions	240	▼
DKP Extensions	096	▼
CO Trunks	064	▼
Mobile Trunks	40	▼
BRI Ports	32	▼
BRI Trunks	32	▼
ISDN Terminals	00	▼
T1E1 PRI Trunks	08	▼
SIP Extensions	999	▼
SIP Trunks	99	▼

- Enter the “**Customer Name**”. You may enter the name (and address, if desired) of the organization/ enterprise. For example: Prudent Investment, 701 Sunshine Boulevard, Bannerghatta, Bangalore. The Customer Name can be a maximum of 80 characters.
- If you enable the **On Site configuration** check box, the configuration GUI of SARVAM UCS, Jeeves, will show the pages for only those trunks and extension port types that are on board in the system, that is, detected by the system at Power-On.
- The **Model Type** displays the name of the model that you are configuring — SARVAM UCS SME or SARVAM UCS ENT.
- Select the number of ports to be used for each Port Type (CO, DKP, SLT, Mobile, T1E1 PRI, BRI, SIP Trunks, SIP Extensions) from the respective boxes. For example, if you want 8 CO Trunks, 24 DKP extensions, and 128 SLT extensions to be used, select the same numbers from the box.
- Click **Submit** to save the changes.

If you have selected the System Pre-requisites, navigate to the next page of the Wizard by clicking the **Next** button.

- *You can set the Wizard to display only those trunk and extension port types which are present in the system. This can be done by enabling the 'On Site Configuration' check box.*
- *When the **On Site Configuration** check box is enabled, the Wizard will display the only those ports that are present in the system (detected by the system at Power-ON) on this page.*

For example, the system detects SLT20 Card at power-on, so the maximum number of SLT ports in the box will be 20. If you want only 18 SLTs to be used, select 18 in the box.

The Wizard will now consider that there are only 18 SLTs in the system and will modify the relevant pages accordingly.

The fields for port types which are not available on-board (detected at Power-On) are displayed as non-editable.

- *To enable the **On site Configuration** check box you must login as System Engineer.*
- *The Wizard does not provide for the port types **Magneto, Radio, Data, ILC and E&M** as these are less commonly used. If your system has Magneto Card and/or E&M Card installed, you must configure the related trunk parameters under Configuration.*

*It is recommended that you enable the **On Site Configuration** check box when you are configuring the system at the installation site.*

Extension Numbers in Range

You can assign Access Codes to a range of Extensions — SLT, DKP, ISDN, SIP. If you are assigning a range of Extension Numbers (Access Codes) to the desired ports, and a match is found for the same extension numbers, the system will clear these extension numbers from the existing database. The new extension numbers will be assigned according to the given range.

Extn. Numbers in Range				
Index	Extension Type	Start S/W Port Number	Start Extension Number	End Extension Number
1	None ▼			
2	None ▼			
3	None ▼			
4	None ▼			
5	None ▼			
6	None ▼			
7	None ▼			
8	None ▼			
9	None ▼			
10	None ▼			
11	None ▼			
12	None ▼			
13	None ▼			
14	None ▼			
15	None ▼			

Submit Skip Next Clear Extn. No. Help Exit

- Against each Index configure the following:
 - **Extension Type:** Select the Extension Type. You can select SLT,DKP, SIP, ISDN Terminal.
 - **Start S/W Port Number:** Enter the Software Port Number from which you want the system to start assigning the desired extension numbers.
 - Define the range of Station Access Codes/Extension Numbers (Flexible Number/Access Code) that you wish to assign to the Extension Type you selected in **Start Extension Number** and **End Extension Number**.

For the given range of extension numbers, the system will assign extension numbers from the software port number specified in Start S/W Port Number for this particular entry. The range of extension numbers will be assigned in ascending order of the Software Port Number.

For example:
 Extension Type you selected is SLT
 Start Software Port Number is 1
 Start Extension Number is 2001
 End Extension Number is 2100

The system will assign Extension Number 2001 to Software Port Number 1, 2002 to Software Port Number 2 and so on. The system will assign the last Extension Number 2100 to Software Port Number 100.

*If you want to assign access codes starting with # or * to a range of extensions, make sure both **Start** and **End extension numbers** begin with # or *.*

- Click **Submit**.

- If you do not want to assign access codes to range of extensions, click **Skip**.
- To assign the extension numbers to a range all over again, click the **Clear Extn. No.** button on this page.

Extension Numbering Plan

- Click the respective tab to assign extension numbers and names for the SLT, DKP and SIP Extension as desired on this page.

Slot # - Port #	Port Type	S/w Port #	Extension #	Extension Name
00 - 00	SLT	0001	2001	
00 - 00	SLT	0002	2002	
00 - 00	SLT	0003	2003	
00 - 00	SLT	0004	2004	
00 - 00	SLT	0005	2005	
00 - 00	SLT	0006	2006	
00 - 00	SLT	0007	2007	
00 - 00	SLT	0008	2008	
00 - 00	SLT	0009	2009	
00 - 00	SLT	0010	2010	
00 - 00	SLT	0011	2011	
00 - 00	SLT	0012	2012	
00 - 00	SLT	0013	2013	
00 - 00	SLT	0014	2014	
00 - 00	SLT	0015	2015	
00 - 00	SLT	0016	2016	
00 - 00	SLT	0017	2017	
00 - 00	SLT	0018	2018	
00 - 00	SLT	0019	2019	

Feature	Code
Abbreviated dialing	8
Account Code by Name	1059
Account Code by Number	1058
Alarm	161

Call Cost Display	1075
Call Forward	13
Call park	115
Call Park Retrieve	116
Call Pickup- Group	4
Call Pickup- Selective	12
Cancel all feature settings	1051
Change User P/w	114
CLI Restriction	103
Dial-In Conference	*19

You can also configure Access Codes from this page.

The desired Extension Number can be 6 digits long. The digits 0 to 9, # and * are allowed.

The desired Extension Name may be the name of the person who will use the extension. The name can be a maximum of 18 characters.

When you change the extension numbers, make sure that they do not clash with any other Feature Access Code in the dialing phase. To know more, refer the topic "[Access Codes](#)".

The Wizard pops up an alert about clashing extension numbers and prompts you to resolve the conflicting numbers.

- If you click the SIP tab, in **Authentication Password**, enter the password to be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. The password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.

- all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.
Default: Blank.

The Wizard will display only those ports available in the system and the number of ports you have defined earlier in the System Pre-requisites page. The Wizard automatically detects the Hardware Slot and Port Offset of the ports and assigns them to Software Ports. The Wizard also assigns the default extension numbers to the ports, but leaves the extension names blank.

The default extension numbers for the above port types are:

2001 to 2240 for SLTs 001 to 240.

3001 to 3128 for DKPs 001 to 96.

Blank for SIP Extensions 001 to 999.

Blank for ISDN Terminals 01 to 64.

The Hardware Slot and Port Offset is not applicable for SIP Trunks.

- If you have finished assigning numbers and names, click **Submit**.
- To assign the extension numbers and names all over again, click the **Clear** button on this page.
- To default all extension numbers, click the **Default** button on this page.

Access Codes

- Change the Feature Access Codes, if required. Feature Access Codes may consist of single digits or a sequence of a maximum of 6 digits. Digits 0 to 9, # and * are allowed. The default Access Codes that appear on the screen are country-dependant. Also, refer "[Access Codes](#)" to know more.
- Click **Submit** and click **Next** to move to the next page.

*If you assign the same Access Code to more than one feature, the Wizard will pop up a **Total Conflict** message and ask you to resolve the conflicting codes. It will not allow you to submit until you have resolved the conflict. If you assign an Access Code which has the same first digit as another Access Code, the Wizard will pop up an alert about the clashing numbers. You must resolve the clashing numbers by clicking **OK**.*

You may choose to resolve the clashing number by clicking 'Cancel' or you may ignore the alert and continue programming by clicking 'OK'.

Trunks

- Configure names for Trunk ports for easy identification of the trunks. The name may consist of a maximum of 18 alphanumeric characters.

The Wizard automatically detects the Hardware Slot and Port Offset of the trunk ports and assigns them to Software Ports. The Wizard also assigns the default trunk port names along with their respective software port numbers. For example, if a Two-wire Trunk is assigned software port number 001; the name will be displayed as CO -001. Thus CO trunks are named as CO-001 to CO-128, Mobile Ports as MOB-001 to 064, BRI Ports as BRI-001 to BRI-032, and so on.

Trunks

Slot #-Port #	Port Type	S/w Port #	Trunk Name
-	CO	001	CO-001
-	CO	002	CO-002
-	CO	003	CO-003
-	CO	004	CO-004
-	CO	005	CO-005
-	CO	006	CO-006
-	CO	007	CO-007
-	CO	008	CO-008
-	CO	009	CO-009
-	CO	010	CO-010
-	CO	011	CO-011
-	CO	012	CO-012
-	CO	013	CO-013
-	CO	014	CO-014
-	CO	015	CO-015
-	CO	016	CO-016
-	CO	017	CO-017
-	CO	018	CO-018
-	CO	019	CO-019
-	CO	020	CO-020
-	CO	021	CO-021

Submit Skip Next Default Help Exit

The Wizard will display only those Trunk port types available in the system and the number of Trunk ports you have defined for each trunk port type earlier on the System Pre-requisites page.

The Hardware Slot and Port Offset is not applicable for SIP Trunks.

- Click **Submit** and click **Next** to navigate the page further.

Day-Night Time

- Ask your customer about their working days and working hours (24 hours format) and program the parameters accordingly. The Wizard considers the working hours you have selected as Daytime and the remaining hours as Night Time (non-working hours). The default working hours are from 09:00 to 18:00. The default Working Days are Monday to Saturday.

Day-Night Time

Day Time 09 ▾ Hrs 00 ▾ Mins To 18 ▾ Hrs 00 ▾ Mins

Sunday	<input type="checkbox"/>
Monday	<input checked="" type="checkbox"/>
Tuesday	<input checked="" type="checkbox"/>
Wednesday	<input checked="" type="checkbox"/>
Thursday	<input checked="" type="checkbox"/>
Friday	<input checked="" type="checkbox"/>
Saturday	<input checked="" type="checkbox"/>

Submit Next Help Exit

- *Day-Night Time is assigned to Trunks and Extensions, so that they behave differently according to the Time of the day. For example, the customer may want the system to route trunk calls to the security personnel when the office is closed, or deny certain extensions access to outgoing long distance calls during non-working hours and days, or to play a different greeting message to callers on holidays.*
- *This parameter is based on Time Table 1¹¹¹, which is assigned to Trunks and Extensions by default.*
- *The Wizard simplifies the assignment of Time Tables to trunks and extensions, requiring you to configure only the working hours and working days, instead of prompting you to define the non-working hours and break hours. The Wizard automatically applies the working hours and days you have programmed to time table-dependent facilities and features such as Class of Service, Toll Control, Outgoing Trunk Access, etc.*
- *Skip this page if you feel that the requirements of your customer are not served by this parameter¹¹². Configure the Time Tables and related features like Class of Service, Toll Control, Outgoing Trunk Access, etc. under Configuration.*
- *If you want to change the working hours and days at a later stage while navigating the Wizard, you may use the **Back** button of your browser to return to this page and make the changes.*
- Click the **Next** button to navigate the Wizard further.

111. A Time Table is a schedule of the three time zones (working hours, break hours, non-working hours) for a week. There are 8 different Time Table templates to select from. Different Time Tables can be assigned to different trunks and extensions. Refer the section "Time Tables" to know more.

112. For instance, the working hours are not the same throughout the week.

Number Patterns

This parameter is related to the “[Toll Control](#)” feature, which allows you to define a particular calling permission for each extension, referred to as **Call Privilege**. A Call Privilege allows the extension to call certain areas and restricts it from calling others. The extension can also be restricted from the dialing of specific telephone numbers. The SARVAM UCS supports different types of Call Privileges, these are: No Calls, All Calls, Local Calls, Regional Calls, National Calls and International Calls.

- On this page, you are required to define the number strings which the system should consider as **Local Numbers, Regional Numbers, National Numbers** and **International Numbers**.

In **Numbers starting with**, you may enter only the first digit of the number string, or a part of the string, or the complete number string.

In **except**, enter the number strings which you want to restrict from being dialed out.

Each number string you enter must not exceed 16 characters. Separate number strings with comma.

Do not provide <space> between commas and numbers.

Number Patterns			
Local Numbers start with	<input type="text"/>	except	<input type="text" value="00,0,*,#,F"/>
Regional Numbers start with	<input type="text"/>	except	<input type="text" value="00,*,#,F"/>
National Numbers start with	<input type="text"/>	except	<input type="text" value="00,*,#,F"/>
International Numbers start with	<input type="text"/>	except	<input type="text"/>

- Click the **Next** button to navigate the Wizard further.

- The Call Privilege Type **No Calls** and **All Calls** does not require any number pattern programming.
- The Call Privilege Type **Limited Calls** allows the dialing of only specific telephone numbers. It can be programmed only under Configuration. To know more, refer the feature description for “[Toll Control](#)”.

Operator

- Select the extensions which are to be used as Operator.

When you double click the **Operator** field, a multiple selection box opens.

Operator

↓

OK Cancel

It is possible to change the sequence of extensions on the right side box using the Up/Down Arrow.

To remove/delete any extension number from the right box, select the extension number and press the delete key from the keyboard.

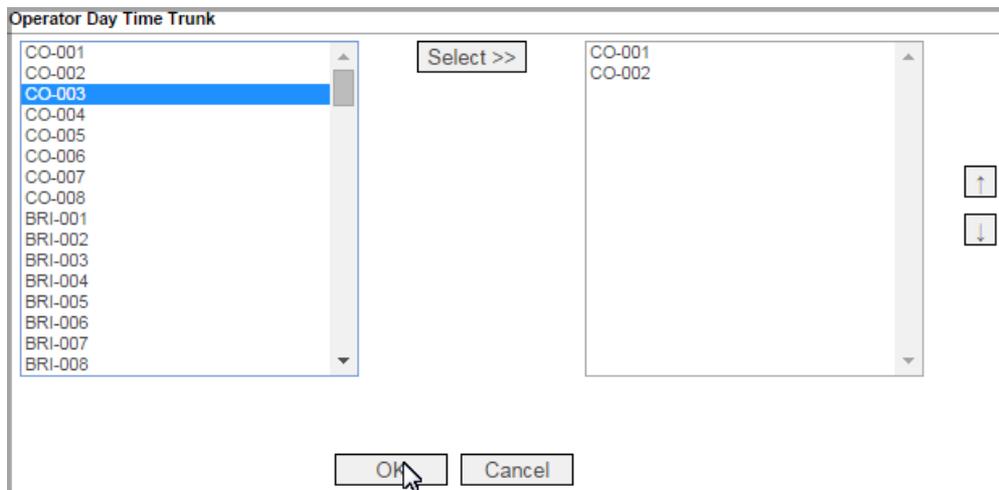

A maximum of 16 extensions can be selected as Operator extension.

You will be shown an alert if you configure more than 16 extensions. You may select and delete the excess extensions or choose to ignore the alert by clicking 'OK' or closing the alert dialog box. Regardless of this, the system will consider only 16 extensions. You can change the sequence of the extensions on the right hand side using the Up and Down arrows.

When you click **OK**, all the extensions you selected will appear sequentially, separated by comma in the order you selected the extensions.

- Define the Class of Service for the Operator extension. Select the features to be allowed to the Operator extension during the day and at night by selecting the check boxes of the features listed in the table.
- Configure the Toll Control for the Operator extension for day time and night time. Select the type of calls to be allowed during the day, and the type of calls to be allowed during the night. By default, all types of calls are allowed during the day and at night.
- Select the Outgoing Trunks for the Day Time (the trunks through which calls are to be routed during the day). If you want the system to use Least Cost Routing, select the check box.

When you double click this field, the multiple selection box opens. Select the outgoing trunks from the left side box.

As you can see, the same trunk types are arranged sequentially, regardless of their hardware port location.

If you select trunks of the same type in sequential order, for example: CO-001, CO-002, CO-003, BRI-001, BRI-002 and MOB-002, the same trunk type will be grouped in one OG Trunk Bundle: CO-001, CO-002, CO-003 will be OG TB #1, BRI-001 and BRI-002 will be grouped as OG TB#2, and MOB-002 as OG TB#3.

These are default trunk names. If you have changed the trunk names (see Naming of Trunks), the name will appear here, instead of the default trunk names.

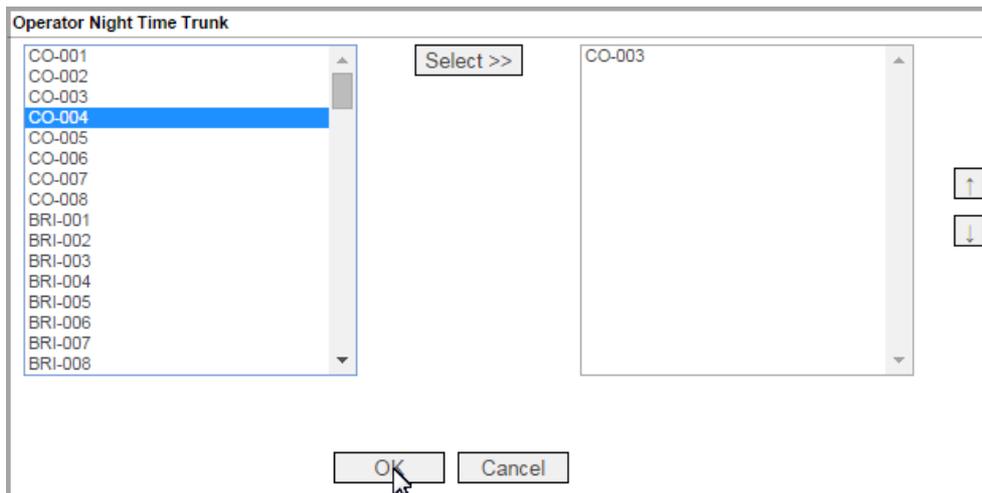

If you select the trunks of the same type in a non-sequential order, for example, CO-001, MOB-001, BRI-001 and CO-002, four OG TBs will be formed with CO-001 as member of OG TB#1, MOB-001 as member of OG TB#2, BRI-001 in OG TB#3 and CO-002 in OG TB#4. So, despite two same trunk types being selected (CO-001 and CO-002) they are grouped in separate OG TBs.

A maximum of 8 OGTB are allowed. If you exceed the number, the Wizard will show an alert indicating that the system is short of resources.

It is possible to change the sequence of the trunks on the right side box using the Up/Down Arrow.

To remove/delete any trunk number from the right box, select the trunk number and press the delete key from the keyboard.

- Select the Outgoing Trunks for the Night Time (the trunks through which calls are to be routed during the night). If you want the system to use Least Cost Routing, select the check box.

Follow the same instructions for selecting the trunks from the multiple selection box as described in the previous step.

- Set the “Priority”¹¹³ for the Operator extension, by selecting the desired Priority Level from 1-9 from the box. By default the priority level for the Operator extension is set to level 5.

Toll Control

Calls allowed during Day

Calls allowed during Night

Select Outgoing Trunks

Trunks allowed during Day Use LCR

Trunks allowed during Night Use LCR

Priority

Priority

- Click **Next** to navigate to the next page.

For the parameters of the Operator extension, the Wizard uses the following resources:

- Class of Service Groups 18 to 19.
- Outgoing Trunk Bundle Groups 18 and 19
- Outgoing Trunk Bundles 69 to 76.

When configuring the system from the links under Configuration, do not modify the settings of these parameters. It will affect the settings made by the Wizard.

Extensions

- Create a User Profile for extensions. A User Profile consists of Class of Service (COS), Toll Control and Trunk Access to be assigned to an extension during day time and night time.

113. Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3, 4...to 9. With 1 being the lowest priority and 9 being the highest priority. The calls from an extension with higher priority have preference in call landing. When an extension with higher priority calls another with lower priority, a triple ring is placed on the called extension, and the call will land first on the extension when there are multiple incoming calls on the extension with lower priority.

The Wizard makes configuration of the extensions easy with **User Profiles**. Instead of configuring each extension individually, you can group together extensions that are to be allowed the same COS group, Toll Control, Trunk Access (Outgoing Trunk Bundle and Outgoing Trunk Bundle Group) and Priority in a single User Profile.

User Profiles meet the requirements of organizations that desire to assign a different set of features to their personnel according to their position in the organization, like senior managers, field executives, administrative assistants etc. In such cases, each of these groups of users can be assigned a different User Profile.

As many as 8 different User Profiles can be programmed using the Wizard.

Priority

Priority ▼

You can name each User Profile such that it reflects the extension user group to which it is assigned. For example, you may rename User Profile-1 created for managers as 'Manager', User Profile-2 created for field executives as 'Executive', User Profile-3 created for administrative assistants as 'Admin'.

- To change the label of the User Profile, click the 'Pencil' icon.
- A prompt will pop up, asking you if you want to rename the User Profile Name. Enter the desired name in the field. You can enter a maximum of 18 characters as name. Click 'OK'.

- The name you entered will appear in place of 'User Profile' number.
- To assign the User Profile to the desired extensions, double click the box.

The Wizard will display the configured extension numbers on the left box. Place your cursor on the desired extension numbers and click **Select >>**. The selected extension numbers will appear on the right box.

You can select the extensions for the User Profile after configuring the other parameters of the User Profile.

- Define the Class of Service for the User Profile for day time and night time by selecting the check boxes of the features you want to allow in the Class of Service.
- Define the Toll Control for the User Profile for the day time and night time by selecting the desired Toll Control level in the box.

The Toll Control levels on this page are based on the number lists you have programmed earlier on the **Number Patterns** page of the Wizard.

- Select the Outgoing Trunks for the Day Time (the trunks through which calls are to be routed during the day). If you want to the system to use Least Cost Routing, select the check box.

When you double click the field, the multiple selection box opens. Select the outgoing trunks from the left box.

As you can see, the same trunk types are arranged sequentially, regardless of their hardware port location.

If you select trunks of the same type in sequential order, for example, CO-001, CO-002, CO-003, BRI-001, BRI-002 and MOB-002, the same trunk type will be grouped in one OG Trunk Bundle: CO-001, CO-002, CO-003 will be OGTB #1, BRI-001 and BRI-002 will be grouped as OGTB#2, and MOB-002 as OGTB#3.

If you select the trunks of the same type in a non-sequential order, such as: CO-001, MOB-001, BRI-001 and CO-002, four OGTBs will be formed with CO-001 as member of OGTB#1, MOB-001 as member of OGTB#2, BRI-001 in OGTB#3 and CO-002 in OGTB#4. So, despite two same trunk types being selected (CO001 and CO002) they are grouped in separate OGTBs.

A maximum of 8 OGTB are allowed. If you exceed the number, the Wizard will show an alert indicating that the system is short of resources.

It is possible to change the sequence of trunks on the right side box using the Up/Down Arrow. You can also delete a particular trunk from the right box.

- Select the Outgoing Trunks for the Night Time (the trunks through which calls are to be routed during the night). If you want to the system to use Least Cost Routing, select the check box.

Follow the same instructions for selecting the trunks from the box as described in the previous step.

- Set the “**Priority**”¹¹⁴ for the extension, by selecting the desired Priority Level from 1-9 in the box. By default the priority level for the extension is set to level 5.

You may set a different Priority Level in each User Profile, depending on the requirement of the extension users, whose extension the User Profile is to be assigned. For example, you may set a higher Priority level to the User Profile to be assigned to Managers.

- Click **Submit** to save the changes in the User Profile.
- To program another User Profile, click the label.
- Rename the label, if required, by clicking the 'Pencil' icon. Repeat all the steps described above to define Class of Service, Toll Control, Trunk Access and Priority.
- Click **Submit** to save changes. Repeat the same steps to program another User Profile.
- When you have finished programming the desired number of User Profiles, click **Next** button to navigate the Wizard further.

- *The User Profiles 1-8 use the following resources in the system:*
 - *Station Basic Feature Template number 2 to 9*
 - *Class of Service Groups 2 to 17.*
 - *Outgoing Trunk Bundle Groups 2 to 17*
 - *Outgoing Trunk Bundles 5 to 68.*
- *Do not use them when configuring the system from Configuration.*

114. Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3, 4...to 9. With 1 being the lowest priority and 9 being the highest priority. The calls from an extension with higher priority has preference in call landing. When an extension with higher priority calls another with lower priority, a triple ring is placed on the called extension, and the call will land first on the extension when there are multiple incoming calls on the extension with lower priority. Refer the feature description for “**Priority**” to know more.

Least Cost Routing (LCR)

LCR

Assign the Cost Factor to the trunks				
Slot # - Port #	Port Type	S/w Port #	Trunk Name	Cost Factor
00 - 00	CO	001	CO-001	01
00 - 00	CO	002	CO-002	01
00 - 00	CO	003	CO-003	01
00 - 00	CO	004	CO-004	01
00 - 00	CO	005	CO-005	01
00 - 00	CO	006	CO-006	01

Configure the number/part of number and its preferred trunk				
Number	Cost Factor			
	Preference 1	Preference 2	Preference 3	Preference 4
	01	01	01	01
	01	01	01	01
	01	01	01	01
	01	01	01	01

Submit Next Help Exit

- Assign Cost Factor to the trunks. This parameter is of relevance only if 'Least Cost Routing' feature is applied on the CO Trunk port.
- On this page, the Wizard displays the number of trunk ports you selected in the **System Pre-Requisites** page.
- Cost Factor is a number assigned to each trunk for identification. This number also serves as a preference number for the trunk. The Cost Factor can be from 1 to 99. Trunks having the same preference must be assigned the same Cost Factor. Different trunk types can also be assigned the same Cost Factor. These trunks are used for routing calls.
- Now configure the number of or part of the number and the preferred trunk to route that number. The number can be a maximum of 16 digits.
- Select the cost factor trunk applicable for each number in the order of preference. Select the foremost preferred Cost Factor trunk in Preference 1, the second most preferred Cost Factor trunk in Preference 2, the third preferred Cost Factor trunk in Preference 3 and the least preferred Cost Factor trunk in Preference 4.
- Click **Next** to navigate the Wizard further.

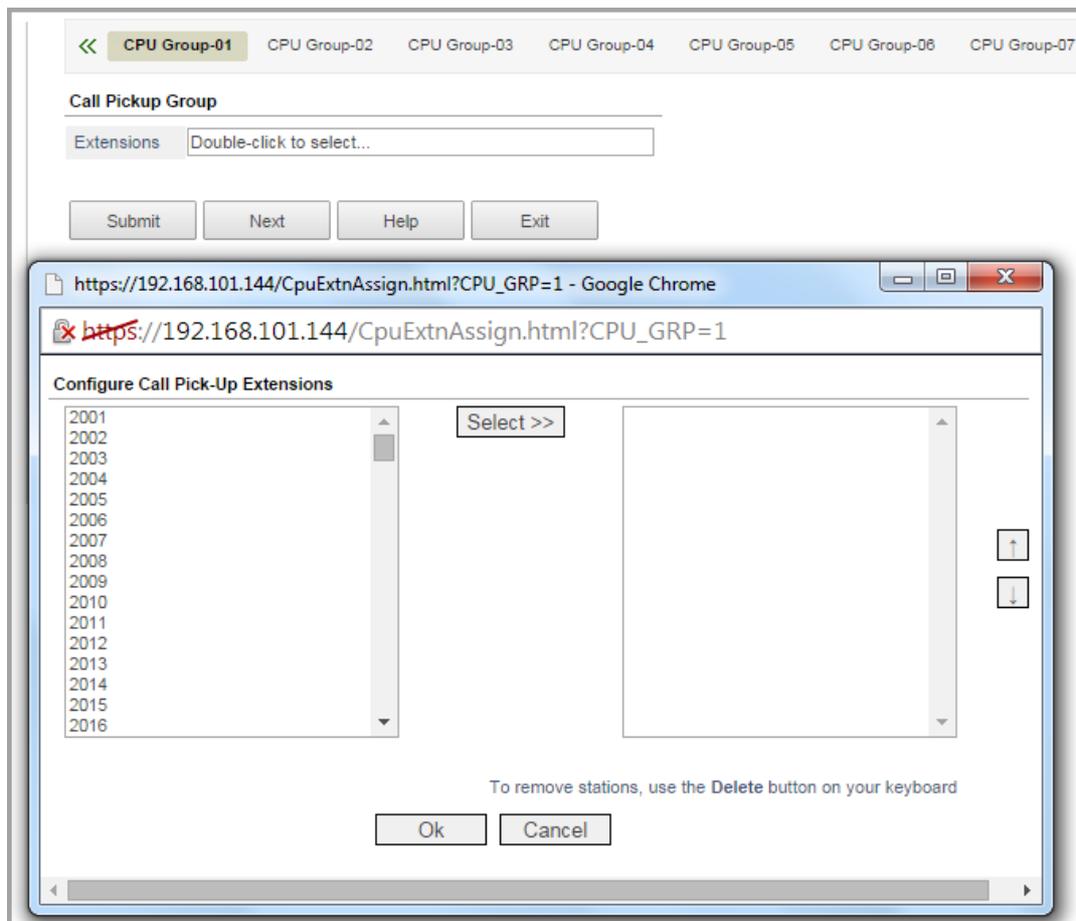

SARVAM UCS supports four different types of LCR, but the Wizard supports only Number based LCR. To know more, refer [“Configuring LCR”](#).

Call Pickup Group

- Assign extensions to Call Pick-Up (CPU) groups.

Call Pick-Up allows extension users to answer (internal and trunk) calls ringing on other extensions from their own extension; without physically going to the ringing extensions. For this extensions must be assigned to CPU Groups.

- While you can create as many as 01 to 99 CPU Groups, and assign extensions to these groups, the Wizard allows you to create and assign extensions to 01 to 16 CPU Groups. By default, all extensions are assigned to CPU Group number 99.
- To create a CPU group, click the CPU group number, for example CPU 01, and double click to select the extensions to be assigned to this group from the box.

- Click **Submit** to save the settings of the CPU group you created. Now, repeat the same steps to create another group.
- If you have finished programming CPU groups, click **Next** to navigate to the next page of the Wizard.

To know more about this feature, refer the topic [“Call Pick Up”](#).

CO Trunks

The screenshot shows a configuration window titled "CO Trunks" with a tabbed interface at the top for "CO Profile-1" through "CO Profile-8". The main area is divided into sections:

- CO Trunks:** A text field labeled "Select Trunks/Apply to Trunks" with the placeholder "Double-click to select...". Below it is a dropdown menu for "Calling Line Identification format" set to "None".
- Route Incoming Calls:** A section header.
- Route calls during day to:** A group of radio buttons with "Operator" selected. Below are "Extension/s" (with "Double-click to select..."), "Built-in Auto Attendant", and "Voice Mail Auto Attendant".
- Route calls during night to:** A group of radio buttons with "Operator" selected. Below are "Extension/s" (with "Double-click to select..."), "Built-in Auto Attendant", and "Voice Mail Auto Attendant".

At the bottom, there are five buttons: "Submit", "Undo", "Next", "Help", and "Exit".

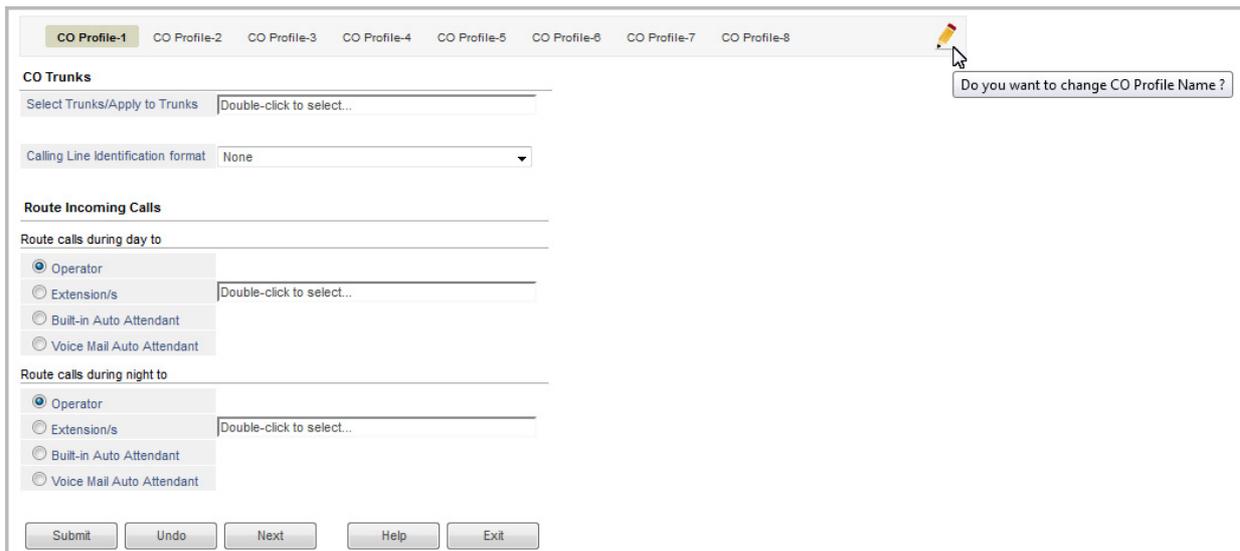

- Configure features of the Two-wire Trunks (CO) connected to the SARVAM UCS on this page.

The Wizard makes configuration of the CO Trunks easy with **CO Profiles**. Instead of configuring each CO Trunk individually, you can group together trunks that are to be assigned the same features - Calling Line Identification, Trunk Landing Group - in a single CO Profile.

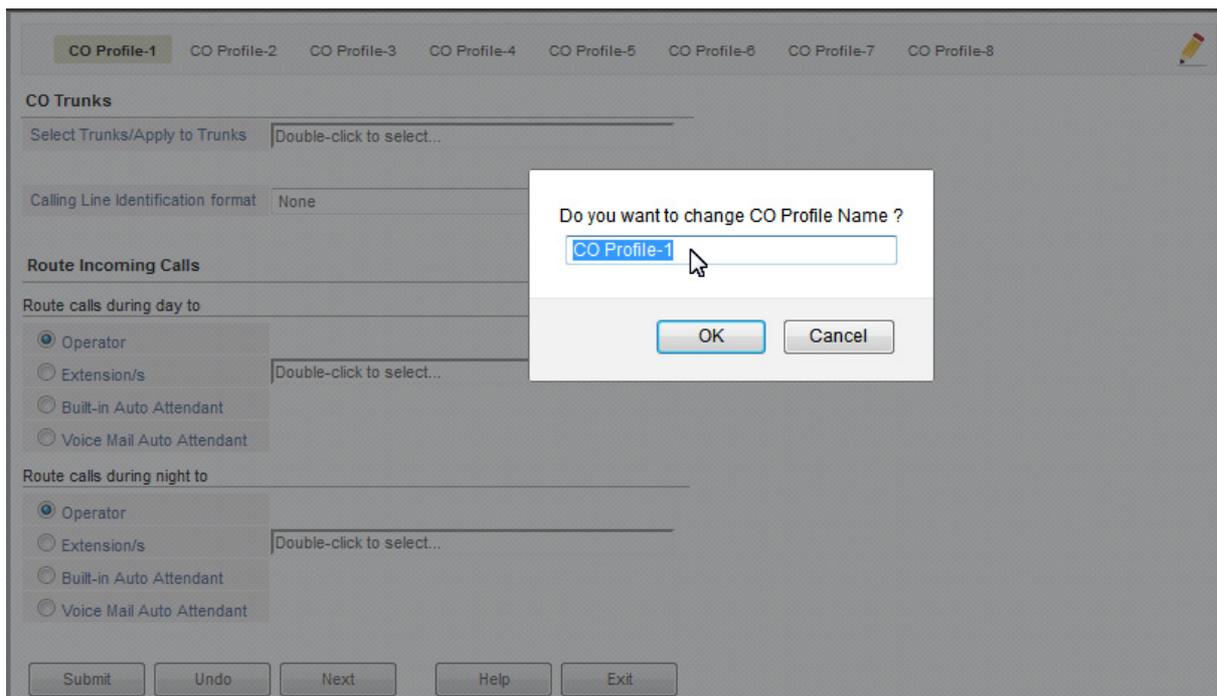

You can configure as many as 8 different CO Profiles using the Wizard.

It is also possible to name each CO Profile by the service provider. For example, you may rename CO Profile-1 created as 'BSNL', CO Profile-2 as 'Reliance' and so on.

- To change the label of the CO Profile, click the **Pencil** icon.

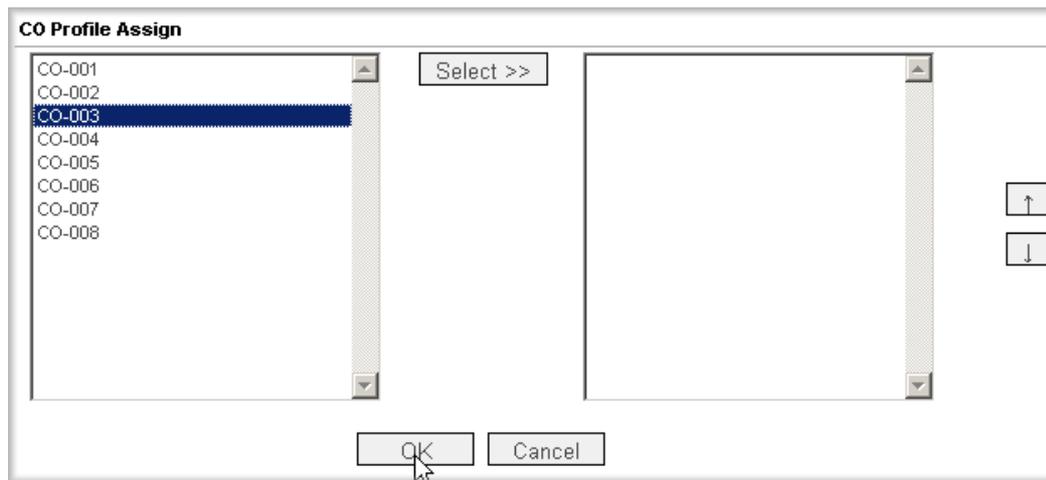

- A prompt will pop up, asking you if you want to rename the CO Profile Name. Enter the desired name in the field. You can enter a maximum of 18 characters as name. Click **OK**.

- The name you entered will appear in place of **CO Profile** number.

- To assign the CO Profile to the desired trunks, double click the field Select Trunks/Apply to Trunks.

The left side box will display the number of CO trunks (along their names) you configured in the **System Pre-requisites** page. Place your cursor on the desired trunks and click **Select >>**. The selected CO trunks will appear on the right side box.

You can select the trunks for the CO Profile after configuring the other parameters of the CO Profile.

- Define the Calling Line Identification Format for the CO Profile by selecting the desired option in the box. You are advised to consult the service provider in this regard.
- In the field **Route Calls during day to**, select the landing destination for calls on trunks in the CO Profile during day time. You may select any option: Operator extension, other extensions, Built-In Auto Attendant or the Voice Mail Auto Attendant (if available) from the box.
- If you select **Built-In Auto Attendant**, the default Voice Modules 02 to 13 containing the default Voice Messages (Morning, Afternoon and Evening Greetings, Built-In Auto Attendant Greeting and Guidance Messages) will be applied. Refer "[Voice Message Applications](#)" to know more.
- If you select **Voice Mail Auto Attendant**, the voice messages recorded and stored in Voice Mail module will be played.
- If you select **Extension/s** as the landing destination, select the extensions in the corresponding field. Double click the field, the multiple selection box will open. Select the extensions from the left box.

A maximum of 16 extensions can be selected. If you exceed the number, the Wizard will prompt you to make the selection again. You can delete the excess extensions from those you selected. You can also change the order of the selected landing extensions in the right side box using the Up/Down Arrow.

The selected extension numbers will appear in the field, separated by comma.

- In the field **Route Calls during Night to**, select the landing destination for calls on trunks in the CO Profile during night time. Follow the same instruction as in the previous step.
- Click **Submit** to save your settings in the CO Profile. Repeat these steps to create another CO Profile.
- If you have finished creating CO profiles and assigning them to trunks, click **Next** to navigate further.

- If there is any trunk you have not assigned a CO Profile, the Wizard will pop-up an alert informing you about the trunk you have not programmed.

You must complete configuring the parameters for this CO trunk and only then will the wizard allow you to configure other parameters.

The Wizard uses the following resources for this page:

- Trunk Feature Templates 34 to 41.
- Routing Groups 34 to 49.
- CO Hardware Templates 02 to 09.

Do not make any modifications to them when configuring the system from Configuration.

BRI Trunks

- You will reach this page only if your system has detected the presence of BRI Trunks or if you have specified the number of BRI Trunks to be used in the **System Pre-requisites** page.
- The SARVAM UCS supports a maximum of 32 BRI Trunks.
- Using the Wizard, you can configure only the first four BRI Trunks in your system. You can configure the remaining BRI Trunks from Configuration.
- The Wizard will display the name of first BRI Trunk.

Submit Undo Next Help Exit

The name will be displayed only if you have programmed names in the **Trunks** page of the Wizard. If you have not named the trunk on that page, you may change the label; select the desired BRI Trunk tab and click the **Pencil** icon.

A prompt will pop up, asking you if you want to rename the BRI Trunk. Enter the desired name in the field. The name you entered will appear on the screen.

If required, you may change the Hardware slot and port number of the BRI trunk displayed here.

- Select the mode for routing incoming calls. Incoming calls may be routed according to MSN Numbers, DDI Numbers or Port-wise.
 - **Route Incoming Calls MSN Number wise:** Select this option if you want to route incoming calls according to MSN numbers¹¹⁵. You can program maximum 6 MSN numbers.
 - **Route Incoming Calls DDI Number wise:** Select this option if you want to route incoming calls according to DDI Numbers¹¹⁶. Select this option only if your extensions are arranged sequentially. If the extensions are not arranged sequentially (for example, DDI numbers 2630551 to 2630559 are to be routed to extensions 3001 to 3009) you are recommended to program this parameter from the Full Programming Access mode. You can program maximum 12 DDI numbers.
 - **Route Incoming Calls Port wise:** Select this option if you want to route all incoming calls on the BRI trunk port to extensions, irrespective of dialed MSN/DDI number.
- If you select MSN Number-wise routing, configure the following parameters:
 - **MSN Number:** Enter the MSN Number provided by your Service Provider. This number is used to route the incoming calls and sent to the ISDN Exchange when making an outgoing call. You can enter up to 6 MSN numbers using the Wizard.
 - **Route calls during day to:** Select where you want to route the calls during day time. You can route the calls to the Operator or to a group of extensions or to Built-In Auto Attendant or to the Voice Mail Auto Attendant¹¹⁷.

If you click the option **Built-In Auto Attendant**, the default Voice Modules 02 to 13 containing the default Voice Messages (Morning, Afternoon and Evening Greetings, Built-In Auto Attendant Greeting and Guidance Messages) will be applied by the Wizard. Refer "[Voice Message Applications](#)" to know more.

If you select **Voice Mail Auto Attendant**, the voice messages recorded and stored in Voice Mail module will be played.

If you select **Extensions**, double click the empty field, the multiple selection box will open. Select the extensions from the left side box.

A maximum of 16 extensions can be selected. If you exceed the number, the Wizard will prompt you to make the selection again. You can delete the excess extensions from those you selected. You can also change the order of the selected landing extensions in the right side box using drag and drop option.

The selected extension numbers will appear in the field, separated by comma.

- **When NR?:** Select an option for what action the system should take when there is no response (NR), that is, the incoming call is not answered within the DDI Ring Timer (default: 45 sec.) by the destination. By default, it is set to 'Disconnect'.
- **When Busy?:** Select an option for what action the system should take when the landing destination is busy. By default, it is set to 'Disconnect'.

115. MSN numbers is a set of numbers with no logical connection between the numbers themselves. For example, MSN numbers for a BRI connection could be 2630555, 2634872, 2635098, etc. Up to 8 MSN numbers are provided on a single BRI connection.

116. DDI numbers are a set of numbers arranged sequentially, for example DDI numbers for a BRI connection could be 2630551 to 2630559.

117. The in-built Auto Attendant offers 9 simultaneous calls and Voice Mail's Auto Attendant offers 64 simultaneous calls.

- **Route calls during night to:** Select where you want to route the calls during night time. You can route the calls to the Operator or to a group of extensions or to Built-In Auto Attendant or to the Voice Mail Auto Attendant.

If you select **Extensions**, you must now select the extensions by clicking the field provided for it. A maximum of 16 extensions can be selected. Follow the same procedure described above for selection of extensions for calls during day time.

- **When NR?:** Select an option for what action the system should take when there is no response (NR), that is, the incoming call is not answered within the DDI Ring Timer (default: 45 sec.) by the destination. By default, it is set to 'Disconnect'.
- **When Busy?:** Select an option for what action the system should take when the landing destination is busy. By default, it is set to 'Disconnect'.

- *The Wizard allows you to select the desired landing extension (Operator/ extensions/ Built-In Auto Attendant/Voice Mail's Auto Attendant) only for the first 3 MSN numbers. The remaining 3 MSN numbers can be routed to a single extension only.*
- *So, if you want to route incoming calls to a particular extension during the day time and night time, enter the MSN numbers in MSN number 4 to MSN number 6.*
- Configure the same parameters for MSN number 2 to 6, as applicable.
- If you select DDI Number-wise routing, configure the following parameters for each DDI#:
 - **Root DDI #:** Enter the Root DDI number. This number is used to send the DDI number to the ISDN Exchange. This number is also sent to the Exchange when an outgoing call is made by an extension which is not assigned DDI number. This is the same as the Pilot Number.
 - **Start DDI #:** Enter the first DDI number provided by your Service Provider. More often than not, the Start DDI# is the same as the Root DDI#.
 - **Total DDIs:** Enter the total DDI numbers provided by your Service Provider.
 - **Start Extension#:** Enter the number of the first extension from which the DDI number assignment is to be done.

For example, your Service Provider has given you DDI numbers 2630550 to 2630560. These are to be assigned to extension numbers 2001 to 2010. In this case 2630550 will be the Root DDI# as well as Start DDI#. As 10 DDI numbers are provided to you, the Total DDI# would be 10, and the Start Extension# would be 2001.
- **When NR?:** Select an option for what action the system should take when there is no response (NR), that is, the incoming call is not answered within the DDI Ring Timer (default: 45 sec.) by the destination. By default, it is set to 'Disconnect'.
- **When Busy?:** Select an option for what action the system should take when the landing destination is busy, during DDI Ring Timer (default: 45 sec.). By default, it is set to 'Disconnect'.
- Now, configure the same parameters for DDI#2 to #12.
- If you select BRI port-wise routing, configure the following parameters:

- **Route Calls during Day to:** Select the landing destination for calls on BRI trunk during day time. You may select any option: Operator extension, other extensions, Built-In Auto Attendant or the Auto Attendant of the Voice Mail (if available).

If you select **Built-In Auto Attendant**, the default Voice Modules 02 to 13 containing the default Voice Messages (Morning, Afternoon and Evening Greetings, Built-In Auto Attendant Greeting and Guidance Messages) will be applied by the Wizard. Refer "[Voice Message Applications](#)" to know more.

If you select **Voice Mail Auto Attendant**, the voice messages recorded and stored in Voice Mail module will be played.

If you select **Extensions** as landing destination, you must select the extensions. Double click the field and select the extensions from the left box.

A maximum of 16 extensions can be selected. If you exceed the number, the Wizard will prompt you to make the selection again. You can delete the excess extensions from those you selected. You can also change the order of the selected landing extensions in the right side box using the Up/Down Arrow.

The selected extension numbers will appear in the field, separated by comma.

- **Route Calls during Night to:** Select the landing destination for calls on BRI trunk during night time. Follow the same procedure for selecting extensions as described above.
- Click **Submit** to save changes. Repeat the same steps to program the other BRI Trunks.
- If you have finished configuring the BRI Trunks, click **Next** to navigate further.
- If there is a BRI trunk you have not configured, the Wizard will pop-up an alert informing you about the trunk you have not programmed.

You must complete configuring the parameters for this trunk and only then will the wizard allow you to configure other parameters.

For the BRI parameters, the Wizard uses the following resources:

- *Entries 01 to 48 of the Incoming Call (IC) Reference Table.*
- *Entries 01 to 48 of the Outgoing Reference Table.*
- *Routing Groups 01 to 25*
- *Trunk Feature Template 01 to 25.*

When programming the system from Configuration, do not modify the settings of these resources. It will affect the settings made by the Wizard.

T1E1 PRI Trunks

- *The SARVAM UCS supports a maximum of 8 T1E1PRI Trunks.*
- *However, using the Wizard you can configure only the first 2 PRI Trunks in the system. You may configure the remaining Trunks, if applicable, from Configuration.*

T1E1-1 T1E1-2

T1E1PRI Trunks

H/w Slot - Port Number -

Carrier

Signaling Type

Framing Type

Line Coding

ISDN Switch Variant

Route IC calls DDI Number wise Route IC calls Port wise

Route IC calls DDI Number wise

Root DDI#1	Route calls during day to	When NR?	When Busy?	Route
	Operator	Double-click to select...	Disconnect	Disconnect
	Operator	Double-click to select...	Disconnect	Disconnect

Route IC calls Port wise

Route calls during day to Route calls during night to

Operator Operator

- Change the label of the T1E1PRI Trunk, if required. Click the **Pencil** icon. A prompt will pop-up. Enter the desired name in the field of the prompt and click **OK**. The name you programmed will appear.

You may enter the name of the Service Provider to make the identification of the Trunk easy.

- The Wizard will display the Hardware Slot-Port Number of the first T1E1 PRI Trunk the system has detected in this field.
- Select the carrier type as E1 or T1. By default **E1** is selected.
- Select the Signaling Type as applicable: from PRI, RBS, QSIG, and E&M. These are the signaling types supported by the SARVAM UCS. By default **PRI** selected.
- Select the Framing Mode, as applicable. By default **CEPT1 MF (Auto CRC)** is selected as Framing Mode.
- Select the Line Coding as applicable. By default **HDB3** is selected.
- Select the ISDN Switch variant. By default **ETSI NET5** is selected as the variant.
- Select the mode for routing incoming calls. Incoming calls may be routed according to DDI Numbers or Port-wise.
 - **Route Incoming Calls Port wise:** Select this option if you want to route all incoming calls on the T1E1PRI trunk port to groups of extensions, without identifying the DDI number.

- **Route Incoming Calls DDI Number wise:** Select this option if you want to route incoming calls according to DDI numbers. Select this option only if your extension numbers are arranged sequentially. If the extensions are not arranged sequentially you are recommended to program this parameter from the Full Programming Access mode.

If your installation uses multiple DDI blocks on the same T1E1PRI connection, you can configure only 2 such DDI blocks using the Wizard. You can configure more DDI blocks on a single T1E1PRI connection from Configuration.

- If you select DDI Number-wise routing, configure the following parameters:

- **Root DDI #1:** enter the Root DDI # provided by your Service Provider. The Root DDI # is the main number assigned to the T1E1PRI trunk. It is also known as MSN Number, Pilot Number or Main Number¹¹⁸.

If your exchange requires area code to be sent with the DDI number, program the root number with area code. For example: Root DDI # is 2630555 and area code where the PBX is installed is 265, enter 2652630555.

- **Route calls during day to:** Select where you want to route the calls during day time. You can route the calls to the Operator or to a group of extensions or to Built-In Auto Attendant or to the Voice Mail Auto Attendant¹¹⁹.

If you select **Built-In Auto Attendant**, the default Voice Modules 02 to 13 containing the default Voice Messages (Morning, Afternoon and Evening Greetings, Built-In Auto Attendant Greeting and Guidance Messages) will be applied by the Wizard. Refer "[Voice Message Applications](#)" to know more.

If you select **Voice Mail Auto Attendant**, the voice messages recorded and stored in Voice Mail module will be played.

If you select **Extensions**, then select the extensions by clicking the empty field. A multiple selection box will open. Select the extensions from the left box.

A maximum of 16 extensions can be selected. If you exceed the number, the Wizard will prompt you to make the selection again. You can delete the excess extensions from those you selected. You can also change the order of the selected landing extensions in the right box using drag and drop option.

The selected extension numbers will appear in the field, separated by comma.

- **When NR?:** Select an option for what action the system should take when there is no response (the incoming call is not answered within the *DDI Ring Timer*, set by default to 45 seconds) by the destination. By default, it is set to 'Disconnect'.
- **When Busy?:** Select an option for what action the system should take when the landing destination is busy (for the duration of the *DDI Ring Timer*; default: 45 seconds). By default, it is set to 'Disconnect'.

118. This number will be used to prepare the DDI number to the Exchange (Reverse DDI) when an Outgoing call is made from the SARVAM UCS by the Extension assigned DDI Number. Also, this number will be sent to the Exchange without any modification when an Outgoing call will be made by an extension which is not assigned DDI number.

119. The Built-In Attendant offers 5 simultaneous calls, whereas Voice Mail's Auto Attendant offers 16 simultaneous calls.

- **Route calls during night to:** Select where you want to route the calls during night time from the options: Operator or to a group of extensions or to Built-In Auto Attendant or to the Voice Mail Auto Attendant.

If you select **Extensions**, you must now select the extensions by clicking the field provided for it. A maximum of 16 extensions can be selected. Follow the same procedure described above for selection of extensions for calls during day time.

- **When NR?:** same as described above for calls during day time.
- **When Busy?:** same as described above for calls during day time.
- **Start DDI#:** Enter the first DDI number given by the Service Provider. The Start DDI Number may be the Root DDI number, as seen in most of the cases.
- **Total DDIs:** Enter the Total DDI numbers. Ask your Service Provider.
- **Start Extension#:** Enter the number of the first extension from which the DDI assignment is to be done.

For example, your Service Provider has given you DDI numbers 2630551 to 2630560. These numbers are to be routed to extensions 2001 to 2010. In this case, the Root DDI number as well as the Start DDI# will be 2630550. As 10 DDI numbers are used, enter Total DDI numbers =10 and Start Extension # = 2001.

- **When NR?:** same as described above for calls during day time.
- **When Busy?:** same as described above for calls during day time.

Now, configure the same parameters for Root DDI#2

- If you select Port-wise routing, configure the following parameters:
 - **Route Calls during Day to:** Select the landing destination for calls on T1E1PRI trunks during day time. You may select any option: Operator extension, other extensions, Built-In Auto Attendant or the Auto Attendant of the Voice Mail (if available).

If you select **Built-In Auto Attendant**, the default Voice Modules 02 to 13 containing the default Voice Messages (Morning, Afternoon and Evening Greetings, Built-In Auto Attendant Greeting and Guidance Messages) will be applied by the Wizard. Refer "[Voice Message Applications](#)" to know more.

If you select **Voice Mail Auto Attendant**, the voice messages recorded and stored in Voice Mail module will be played.

If you select **Extensions** as landing destination, you must select the extensions. Double click the field and select the extensions from the left box.

A maximum of 16 extensions can be selected. If you exceed the number, the Wizard will prompt you to make the selection again. You can delete the excess extensions from those you selected. You can also change the order of the selected landing extensions in the right side box using the Up/Down Arrow.

The selected extension numbers will appear in the field, separated by comma.

- **Route Calls during Night to:** Select the landing destination for calls on T1E1PRI trunks during night time. Follow the same procedure for selecting extensions as described above.
- Click **Submit** to save changes. Repeat the same steps to program the second T1E1PRI Trunk.
- If you have finished configuring the T1E1 PRI Trunks, click **Next** to navigate further.

Mobile Trunks

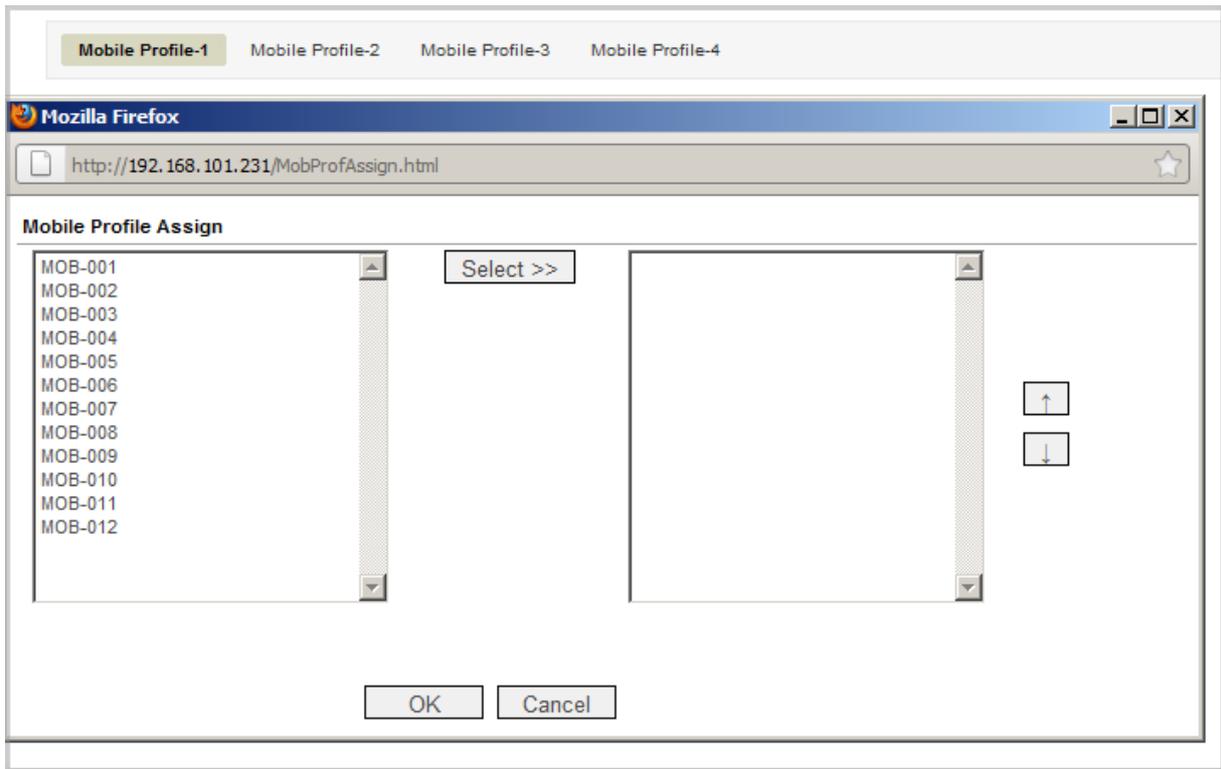

- You will reach this page only if your system has detected the presence of the Mobile Card in the system (as the **On-Site Configuration** check box is enabled) or if you have specified the number of Mobile Ports Used earlier in the **System Pre-requisites** page of the Wizard.
- SARVAM UCS supports up to 40 Mobile Ports.
- The Wizard makes configuration of the Mobile Trunks easy with **Mobile Profiles**. Instead of configuring each Mobile Trunk individually, you can group together trunks that are to be assigned the same features in a single Mobile Profile.

You can configure as many as 4 different Mobile Profiles using the Wizard.

The screenshot shows the 'Mobile Profile-1' configuration screen. At the top, there are four tabs: 'Mobile Profile-1', 'Mobile Profile-2', 'Mobile Profile-3', and 'Mobile Profile-4'. The 'Mobile Profile-1' tab is active. Below the tabs, the 'Mobile Trunks' section has a dropdown menu labeled 'Select Trunks/Apply to Trunks' with the text 'Double-click to select...'. The 'SIM PIN' section has a label 'Change SIM PIN to' and a text input field containing '1234'. The 'Route Incoming Calls' section is divided into two parts: 'Route calls during day to' and 'Route calls during night to'. Each part has three radio button options: 'Operator' (selected), 'Extension/s' (with a dropdown menu labeled 'Double-click to select...'), and 'Built-in Auto Attendant'. At the bottom of the form, there are five buttons: 'Submit', 'Undo', 'Next', 'Help', and 'Exit'.

- Change the label of the Mobile Profile, if required. Select the desired Mobile Trunk tab and click the **Pencil** icon. A prompt will pop-up. Enter the desired name in the field of the prompt and click **OK**. The name you programmed will appear. For example rename Mobile Profile 1 as 'Vodafone'. Naming the profile with the Service Provider's name makes identification of the Trunk on which this profile is applied easy.

- Select the mobile trunks on which this Mobile Profile is to be applied. It is also possible to configure all the other parameters and then select the mobile trunks.

To select the desired mobile trunks, double click the box. The Wizard will display the number of Mobile Trunks you specified in the **System Pre-requisites** page on the left side box. All the Mobile Trunks appear in this box and are arranged sequentially in the increasing order of their software port number.

Place your cursor on the desired trunks and click **Select>>** button. The selected Mobile Trunks will appear on the right side box. It is also possible to select a range of trunks at a time pressing the 'SHIFT and 'Down' arrow keys.

- Change the SIM PIN for the mobile profile.

Recall that you have changed the SIM PIN of the SIM Card using a Handset before installing it in the system to the default **1234**. Now, you may change it to a desired SIM PIN.

Since you are changing the SIM PIN for a Mobile Profile, this SIM PIN will be applied for all the Mobile Trunks you selected for this Mobile Profile.

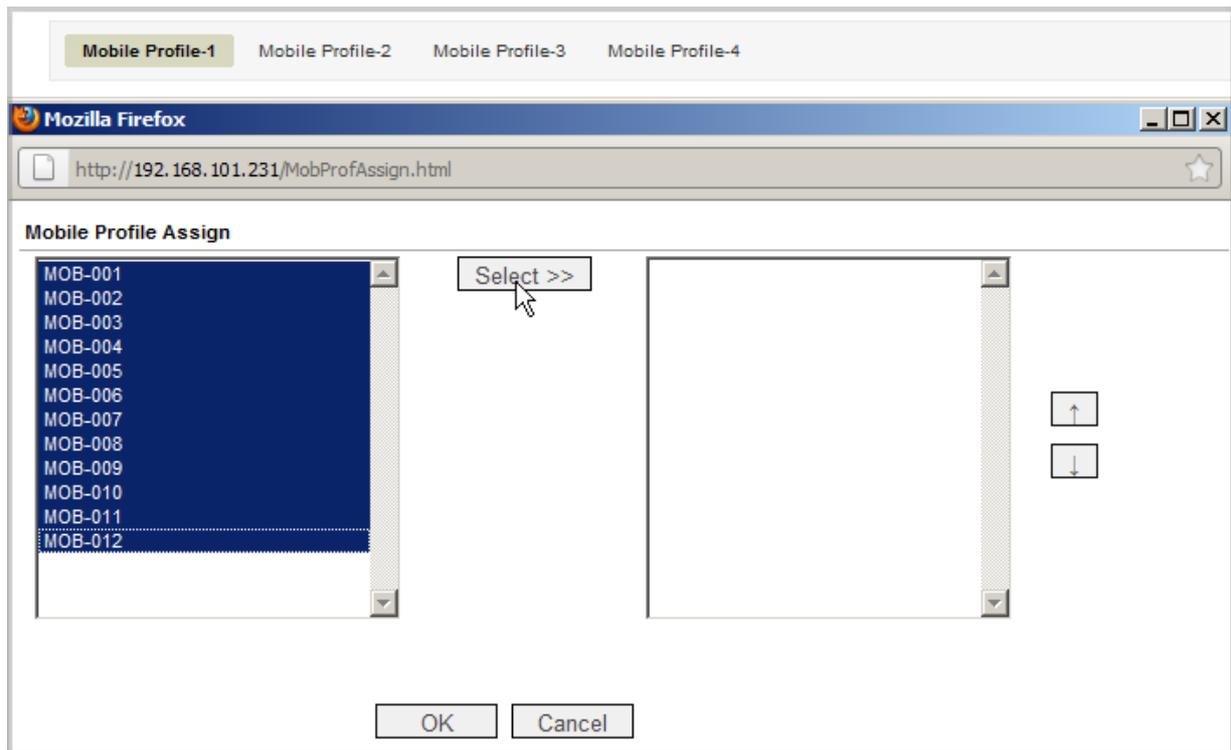

You must click 'Submit' after you enter the new PIN. Wait for 5 seconds, and then refresh this page to view the new SIM PIN.

- Select the extensions to which the incoming calls on the Mobile Trunks should be routed.
- In **Route Calls during Day to**, select the landing destination for calls on Mobile trunks during day time. You may select any option: Operator extension, other extensions, Built-In Auto Attendant or the Auto Attendant of the Voice Mail (if available).

If you select **Built-In Auto Attendant**, the default Voice Modules 02 to 13 containing the default Voice Messages (Morning, Afternoon and Evening Greetings, Built-In Auto Attendant Greeting and Guidance Messages) will be applied by the Wizard. Refer "[Voice Message Applications](#)" to know more.

If you select **Voice Mail Auto Attendant**, the voice messages recorded and stored in Voice Mail module will be played.

If you select **Extensions** as the landing destination, select the extensions in the corresponding field. Double click this field, the multiple selection box will open. Select the extensions from the left side box.

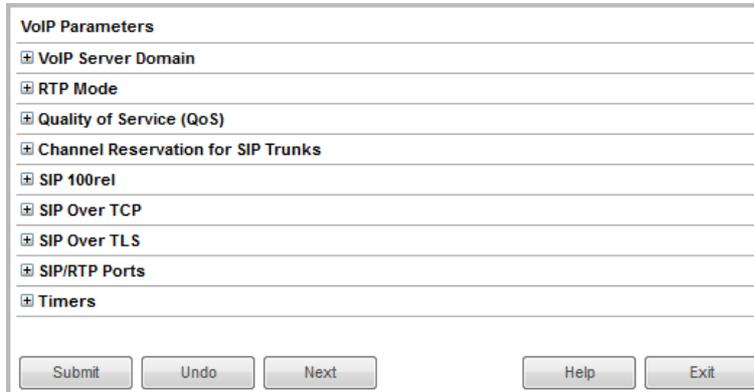

A maximum of 16 extensions can be selected. If you exceed the number, the Wizard will prompt you to make the selection again. You can delete the excess extensions from those you selected. You can also change the order of the selected landing extensions in the right side box using the Up/Down Arrow.

The selected extension numbers will appear in the field, separated by a comma.

- In **Route Calls during Night to**, select the landing destination for calls on Mobile trunks during night time. Follow the same instruction as in the previous step to select extensions as the landing destination.
- Click **Submit** to save your settings in the Mobile Profile. Repeat these steps to configure another Mobile Profile.
- If you have finished configuring the Mobile Profiles, click **Next** to navigate further.
- If there is any mobile trunk you have not assigned a Mobile Profile, the Wizard will pop-up an alert informing you about the trunk you have not programmed. You must complete configuring the parameters for this trunk and only then will the wizard allow you to configure other parameters.

VoIP Network

- To configure the VoIP Parameters, click **VoIP Network**. The VoIP Parameters page opens.

VoIP Parameters	
+	VoIP Server Domain
+	RTP Mode
+	Quality of Service (QoS)
+	Channel Reservation for SIP Trunks
+	SIP 100rel
+	SIP Over TCP
+	SIP Over TLS
+	SIP/RTP Ports
+	Timers

Submit Undo Next Help Exit

VoIP Server Domain

Click **VoIP Server Domain** to expand.

VoIP Server Domain

- VoIP Server Domain:** This parameter is of relevance only if you are configuring SIP Extensions on the system.

The system is capable of maintaining a domain for registering SIP/UC clients (any SIP-enabled device) as SIP Extensions.

Configure the Server Domain if you want SIP/UC clients to register with the Registrar Server of the system using the domain handled by the system¹²⁰. The Domain Name can be a maximum of 40 characters. Default: Blank.

If you configure Server Domain for registration of SIP clients, you must also map the Domain Name and the IP Address of the WAN Port to the DNS Server in the network.

120. SIP clients can be registered with the CPU either using the domain handled by the Vocoder module or using the WAN or LAN Port IP Address.

If domain is programmed, the CPU will listen for the SIP message which is redirected to the programmed domain only. It will also listen for SIP messages on the WAN IP address and LAN IP address.

But if domain is not programmed, the CPU will listen for SIP messages only on the WAN IP Address and LAN IP address.

RTP Mode

Click **RTP Mode** to expand.

RTP Mode	
RTP Mode	Transcoding
MoH Vocoder Preference 1	G.729 AB
MoH Vocoder Preference 2	G.711 A-Law
MoH Vocoder Preference 3	G.711 μ -Law

- **RTP Mode:** Select the desired RTP mode using which you want SARVAM UCS to route SIP to SIP calls. You can select from the following:
 - **Transcoding:** When this option is selected, RTP packets will be routed through the Vocoder module and Vocoder channels¹²¹ will be used for SIP to SIP calls. SIP/UC Users (Standard/Extended SIP Devices and Matrix VARTA UC Clients) will be able to access all the features of SARVAM UCS. This option uses two Vocoder channels for SIP to SIP calls. Thus the maximum number of SIP to SIP calls per Vocoder Module is equal to the number of Vocoder channels divide by 2.
 - **RTP Relay:** When this option is selected, RTP packets will be routed through the Vocoder module but no Vocoder channel will be used for SIP to SIP calls. The system will use Vocoder channels to route SIP to TDM calls and vice versa. System will use Vocoder channels for some features and Standard SIP Clients will be able to use limited features of SARVAM UCS. Refer to [“SARVAM UCS Features supported with RTP/Direct RTP”](#) for more details.
 - **Direct RTP:** When this option is selected, no Vocoder channel will be used for SIP to SIP calls and RTP packets will be sent to and fro directly between SIP end points. If transfer of RTP packets is not possible between SIP end points, system will use RTP Relay as the fallback option. The system will use Vocoder channels to route SIP to TDM calls and vice versa. System will use Vocoder channels for some features and Standard SIP Clients will be able to use limited features of SARVAM UCS. Refer to [“SARVAM UCS Features supported with RTP/Direct RTP”](#) for more details.
-  *Direct RTP is not supported on SIP Trunks and Matrix VARTA UC Clients. System will use RTP Relay for SIP Trunks and Matrix VARTA UC Clients.*
 - *If RTP Relay or Direct RTP is selected,*
 - *Maximum 550 Audio calls¹²² or 55 Video calls are supported in SARVAM UCS.*
 - *Certain voice messages will not be played. See [“Voice Message Applications”](#) for more details.*
 - *If you change the RTP Mode, the system will release all ongoing calls.*
- **MoH Vocoder Preference:** If RTP Mode is set as RTP Relay or Direct RTP, the system will play the MoH through the Vocoder module when the system holds any SIP end point. The MoH is played as per the configured MoH Vocoder Preference.

Select the Vocoders in the order of their preference, for **MoH Vocoder Preference 1**, **MoH Vocoder Preference 2** and **MoH Vocoder Preference 3**.

If required, you can customize the MoH to be played as per your requirement. For detailed instructions, see [“Uploading Custom MoH”](#).

121. The number of Vocoder channels that will be supported would be as per the license you purchase.

122. For PENX, maximum 64 Audio Calls or 16 Video Calls are supported in SARVAM SMB.

Quality of Service (QoS)

Click **Quality of Service (QoS)** to expand.

Quality of Service (QoS)	
SIP DiffServe/ToS	<input type="text" value="26"/>
Voice DiffServe/ToS	<input type="text" value="46"/>
Video DiffServe/ToS	<input type="text" value="46"/>
FAX DiffServe/ToS	<input type="text" value="46"/>

- **Quality of Service (QoS):** QoS refers to priority of IP packets on network layer. It can be programmed for both signaling (SIP) and media (Voice, Video and Fax). Configure the following types QoS:
 - **SIP DiffServe/ToS:** The system sends all the SIP signaling messages with this QoS setting. This field defines the priority bits for SIP messages. The Valid *DiffServe* range is from 00-63, default: 26
 - **Voice DiffServe/ToS:** The system sends all the Voice packets with this QoS setting. This field defines the priority bits for Voice packet. The Valid *DiffServe* range is from 00-63, default: 46
 - **Video DiffServe/ToS:** The system sends all the Video packets with this QoS setting. This field defines the priority bits for Video packet. The Valid *DiffServe* range is from 00-63, default: 46
 - **Fax DiffServe/ToS:** The system sends all the Fax packets with this QoS setting. This field defines the priority bits for Fax packet. The Valid *DiffServe* range is from 00-63, default: 46

QoS parameters are applicable for all packets (SIP/ Media) leaving both LAN and WAN port as well as TCP connection.

Channel Reservation for SIP Trunks

Click **Channel Reservation for SIP Trunks** to expand.

Channel Reservation for SIP Trunks	
Reserve Channels for SIP Trunks	<input type="text" value="00"/>

- **Channels Reserved for SIP Trunks:** The system supports up to 128 voice channels, which can be used by SIP Extensions and SIP trunks.

It may happen that SIP Extension users use up most of the channels of the Vocoder module, leaving too few or none for making/receiving SIP Trunk calls.

This can be avoided by reserving some voice channels exclusively for SIP trunk calls.

Specify the minimum number of voice channels you want to reserve for SIP Trunk calls. By default, no channel is reserved.

SIP 100rel

Click **SIP 100rel** to expand.

- **SIP 100rel:** This parameter is to be configured if you want to support reliable transmission of (SIP) provisional responses. Enable 100rel by selecting the check box, if you want CPU to use 100rel for reliable transmission of SIP provisional responses and to use PRACK (Provisional Acknowledgement). Default: Disabled.

SIP Over TCP

Click **SIP Over TCP** to expand.

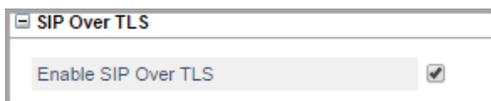

- **SIP Over TCP:** SARVAM UCS supports transporting of SIP messages over User Datagram Protocol (UDP), Transfer Control Protocol (TCP) as well as Transport Layer Security connection (TLS). Despite the advantages that SIP over TCP and SIP over TLS offer, it is more common to use UDP to transport SIP messages.

By default, SIP Over TCP is enabled. To be able to send SIP messages over TCP, you must configure 'TCP' as the 'Default Transport for Outgoing Messages' on the 'SIP Trunk Parameters' page.

If you do not want to transport SIP messages using TCP, clear the SIP Over TCP check box.

SIP Over TLS

Click **SIP Over TLS** to expand.

- **SIP Over TLS:** SARVAM UCS supports transporting of SIP messages over Transport Layer Security. TLS offers secure SIP signaling.

By default, SIP Over TLS is enabled. To be able to send SIP messages over TLS, you must configure 'TLS' as the 'Default Transport for Outgoing Messages' on the 'SIP Trunk Parameters' page.

If you do not want SIP messages to be transported using TLS, clear the SIP Over TLS check box.

SIP/RTP Ports

Click **SIP/RTP Ports** to expand.

SIP/RTP Ports	
SIP UDP Port	<input type="text" value="05060"/>
SIP TCP Port	<input type="text" value="05060"/>
SIP TLS Port	<input type="text" value="05061"/>
RTP Listening Port	<input type="text" value="08000"/>

- **SIP UDP Port:** This port defines the port on which SARVAM UCS listens for SIP messages transported over UDP. This port is also used as the source port for sending SIP messages to the remote peer. The valid range for this port is 1025-65535. Default: 05060.
- **SIP TCP Port:** This port defines the port on which SARVAM UCS listens for SIP messages transported over TCP. This port is also used as the source port for sending SIP messages to the remote peer. The valid range for this port is 1025-65535. The default SIP TCP Port is 05060.
- **SIP TLS Port:** This port defines the port on which SARVAM UCS listens for SIP messages transported over TLS. This port is also used as the source port for sending SIP messages to the remote peer. The valid range for this port is 1025-65535. The default SIP TLS Port is 05061.
- **RTP Listening Port:** This port defines the port on which SARVAM UCS listens for RTP Packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-64510. The default RTP Listening Port is 08000.

Timers

Click **Timers** to expand.

Timers	
SIP INVITE Timer (sec)	<input type="text" value="030"/>
SIP Provisional Timer (sec)	<input type="text" value="060"/>
General Request Timer (sec)	<input type="text" value="20"/>

- **SIP Invite Timer (sec):** This is the time in seconds that the Vocoder module waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the call process is terminated by the SARVAM UCS and an error tone is played to the user. The range of the SIP Invite Timer is 010-180 seconds. Default: 30 seconds.
- **SIP Provisional Timer (sec):** This is the time in seconds that the Vocoder module waits for the final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the SARVAM UCS terminates the call process and plays error tone to the user. The range of SIP provisional Timer is 010-180. Default: 60 seconds.
- **General Request Timer (sec):** The time in seconds for which the Vocoder module waits for response for a transaction request. This timer starts on the initiation of a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the Vocoder module clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.

- Click **Submit** to save.
- Click 'Next' to navigate to further.

SIP Trunks

- You will reach this page only if you have specified **Number of SIP Trunks Used** on the **System Pre-requisites** page.
- SIP Trunks are to be configured only if you are using Internet Telephony Service Providers for VoIP calls.
- The Wizard however, allows you to configure only 4 SIP Trunks (even if you have specified more than 4 SIP Trunks being used on the **System Pre-Requisites** page). You can program the remaining SIP Trunks from Configuration.

SIP-001	SIP-002	SIP-003	SIP-004

<input type="button" value="Submit"/> <input type="button" value="Undo"/> <input type="button" value="Next"/> <input type="button" value="Help"/> <input type="button" value="Exit"/>			

- You may change the label of the SIP Trunk (rename 'SIP Trunk 1'), if required. You may use the name of the ITSP to make identification of the SIP Trunk easy.

Click the **Pencil** icon. A prompt will pop up, asking you if you want to change the name of this SIP Trunk. Enter the desired name in the blank field. Click **OK**. The new name will appear instead of the SIP Trunk number.

- Select the **Enable SIP Trunk** check box to enable the SIP Trunk.
- Enter the **SIP ID** provided by the ITSP. This is the ID which callers will use to call this SIP Trunk. The SIP ID may be a number or text.
- Enter the **Proxy/Registrar Server Address** and the **Registrar Server Port** provided by the ITSP. The Registrar Server Address can be an IP Address or domain. The Registrar Server Listening Port ranges from 1025 to 65535. The default Registrar Server Port is 5060.
- Enter the **Authentication ID** (User ID) and Password provided by the ITSP.
- Select the **Enable Outbound Proxy** check box, if the ITSP who provided this SIP Trunk has a SIP outbound server to handle voice calls. By default Outbound Proxy is disabled.
- If you have enabled Outbound Proxy, enter the **Outbound Proxy Server Address** and the **Server Port** provided by the ITSP. This can be an IP Address or Domain name.
- Set the desired **Vocoder Preference** for this SIP Trunk. Vcoders are the various Voice Codecs used to compress the data in RTP packets for optimum use of bandwidth and for ensuring voice quality. You can set 7 Vcoders options in the order of preference for this SIP account.
- Select the **DTMF Option**. The DTMF option you select will determine how the DTMF digits will be sent over the IP Network, when a DTMF digit is pressed. The system supports three DTMF options: RTP (RFC 2833), SIP Info, and InBand. Select the appropriate option. By default RTP (RFC 2833) is selected.
- **RFC2833 Payload Type:** If you have selected RTP (RFC 2833) as the DTMF Type, you must configure the value of RFC2833 Payload Type. The RTP packets will be tagged as DTMF as per the set value. The value of RFC2833 Payload Type can be set from 96 to 124.
- Select the appropriate **Fax Type**. The system supports T.38 (UDPTL), T.39 (RTP) and Pass-Through.
- Select the **Source Port IP Address**.
 - Select **Use Ethernet Port IP Address**, if the WAN port of the system is connected directly to the public internet.
 - Select **Use IP Address Fetched Using STUN**, if the WAN port of the system is located behind a NAT router other than Symmetric.
 - Select **Use Router's Public IP Address**, if the WAN port of the system is located behind a NAT Router (any type).
- In **No. of Simultaneous Calls**, select the number of simultaneous calls you want to allow on this SIP Trunk.

The number of simultaneous SIP calls depends on the number of simultaneous calls allowed by the ITSP with whom you have subscribed this SIP Trunk and the number of simultaneous calls supported by SARVAM UCS.

- In **Route Calls during Day to**, select the landing destination for calls on SIP trunks during day time. You may select any option: Operator extension, other extensions, Built-In Auto Attendant or the Auto Attendant of the Voice Mail (if available).

If you select **Built-In Auto Attendant**, the default Voice Modules 02 to 13 containing the default Voice Messages (Morning, Afternoon and Evening Greetings, Built-In Auto Attendant Greeting and Guidance Messages) will be applied by the Wizard. Refer "[Voice Message Applications](#)" to know more.

If you select **Voice Mail Auto Attendant**, the voice messages recorded and stored in Voice Mail module will be played.

If you select **Extensions** as the landing destination, select the extensions in the corresponding field. Double click the field, the multiple selection box will open. Select the extensions from the left box.

A maximum of 16 extensions can be selected. If you exceed the number, the Wizard will prompt you to make the selection again. You can delete the excess extensions from those you selected. You can also change the order of the selected landing extensions in the right side box using Up/Down Arrow.

The selected extension numbers will appear in the field, separated by comma.

- In **Route Calls during Night to**, select the landing destination for calls on SIP trunks during night time. Follow the same instruction as in the previous step to select extensions as the landing destination.
- Click **Submit** to save your settings in the SIP Trunk. Repeat these steps to configure another SIP Trunk.
- If you have finished configuring the SIP Trunks, click **Next** to navigate further.
- If there is any SIP Trunk you have not configured, the Wizard will pop-up an alert informing you about the trunk you have not programmed.

You must complete configuring the parameters for this SIP Trunk and only then will the wizard allow you to configure other parameters.

For the SIP Trunks, the Wizard uses the following resources:

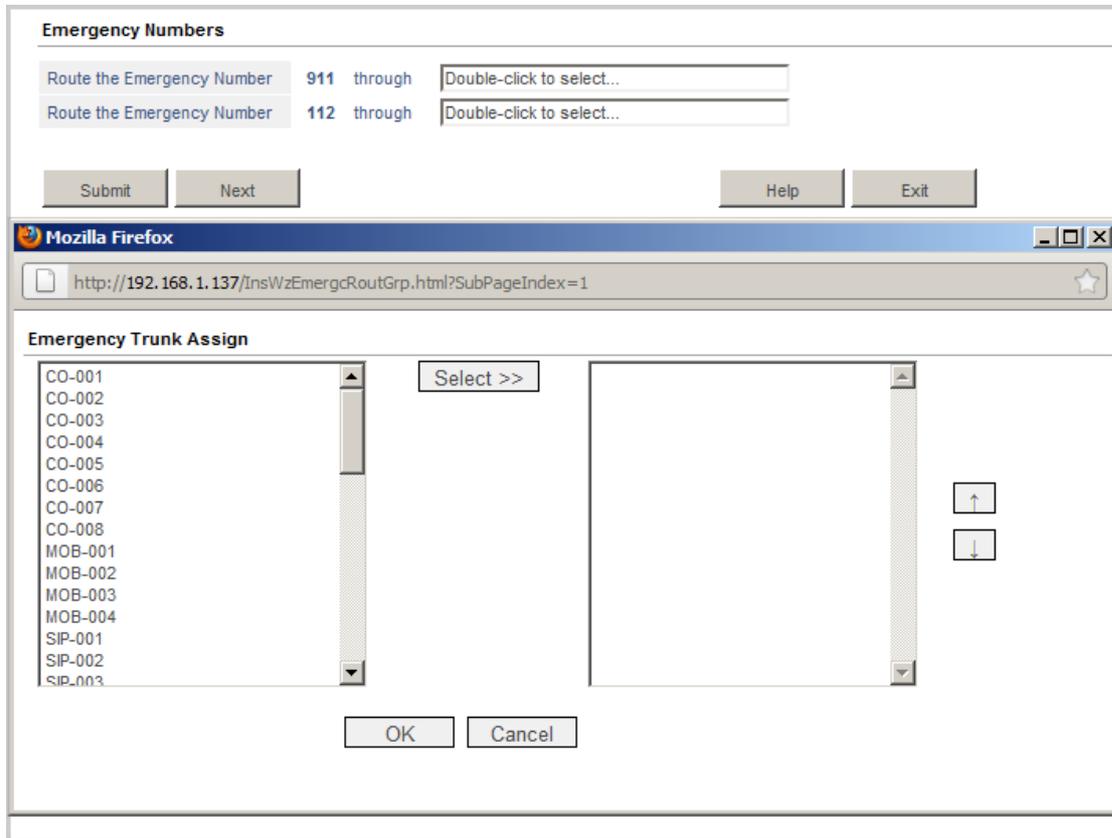

- *Routing Groups 67-74.*
- *Trunk Feature Template 46-49.*
- *SIP Hardware Template 2-5.*
- *Do not change these resources when using Configuration.*

Emergency Numbers

- *This page displays the default Emergency Numbers according to the **Region** selected for the system. In other words, it displays the Emergency Numbers specific to your country where the SARVAM UCS is installed.*
- *If there are no Emergency Numbers defined as per the selected region, the system displays the message 'No Emergency Number programmed.'*
- *The Emergency Numbers on this page are non-editable. All you need to do is to select the Outgoing Trunk Bundle Group (OGTB) for each Emergency Number. For example, '112' is the default Emergency Number for the mobile network. So, you may select the Mobile Trunk for dialing this number.*
- *Make sure that the trunks configured by default for each Emergency number route the Emergency call to the correct network.*

- For each default Emergency number, select the trunks to be used to route this call. Double click the **Through** field. The box will open, displaying the trunk types present in the system in the left box. All the Trunk types present in the system are arranged by their type, in the sequence of their software port, irrespective of their hardware location.
- Double click the desired trunk type and click **Select>>**. The selected trunk type will appear on the box on the right.

If you select trunks of the same type in sequential order, like: CO-001, CO-002, CO-003, BRI-001, BRI-002 and MOB-002, the same trunk type will be grouped in one OG Trunk Bundle; CO-001, CO-002, CO-003 will be OGTB #1, BRI-001 and BRI-002 will be grouped as OGTB#2, and MOB-002 as OGTB#3.

If you select the trunks of the same type in a non-sequential order, for example: CO-001, MOB-001, BRI-001 and CO-002, four OGTBs will be formed with CO-001 as member of OGTB#1, MOB-001 as member of OGTB#2, BRI-001 in OGTB#3 and CO-002 in OGTB#4. So, despite two same trunk types being selected (CO-001 and CO-002) they are grouped in separate OGTBs.

It is possible to change the sequence of trunks on the right side box using the Up/Down Arrow. You can also delete a particular trunk from the right box.

A maximum of 8 OGTB are allowed. If you exceed the number, the Wizard will show an alert indicating that the system is short of resources.

- Click **OK**. All the trunks you selected for a particular Emergency Number (in the right-hand side box) will appear on the 'Through' field, sequentially separated by comma in the order of selection made.
- Click **Submit** to save the values entered on this page.
- Click **Next** to navigate further.

You may program the Emergency Numbers of your country from Configuration.

Disclaimer:

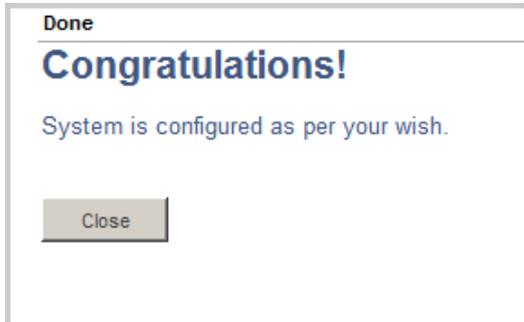

- Matrix Comsec will not be responsible for incorrect programming of Emergency Numbers.

Done

You have now reached the last screen of the Wizard. Click **Done** to submit the configuration you have done using the Wizard.

After completing the validation of the configuration, the Wizard will inform you about successful configuration of the system with the message: "Congratulations! System is configured as per your wish".

Exiting the Wizard

Each page of the Wizard also has an **Exit** button, which you may click to exit the Wizard.

However, the changes you made till the page you exited from will not be applied to the system configuration files.

The Standard PBX Wizard has been designed keeping a very broad user base in mind and is limited to the configuration of the parameters most commonly required by a broad user group. So, it does not cover the configuration of all the features and facilities of the system. You can configure other features "[Configuring SARVAM UCS](#)".

Using Configuration

The Configuration allows configuration of all programmable parameters of the system.

You can program all the parameters using Jeeves or an extension Telephone (DKP or SLT) of the SARVAM UCS.

You are recommended to use Jeeves. If you choose to use a telephone, you are recommended to use a DKP for ease of operation.

If you use an extension telephone to configure the system then make sure you change the default SE Extension Password. You can only configure the basic network and debug parameters using this default SE Extension Password.

To configure the Configuration parameters, you must log into Jeeves via System Engineer Login and click the **Configuration** link.

MATRIX SARVAM UCS Language English

Login As System Engineer

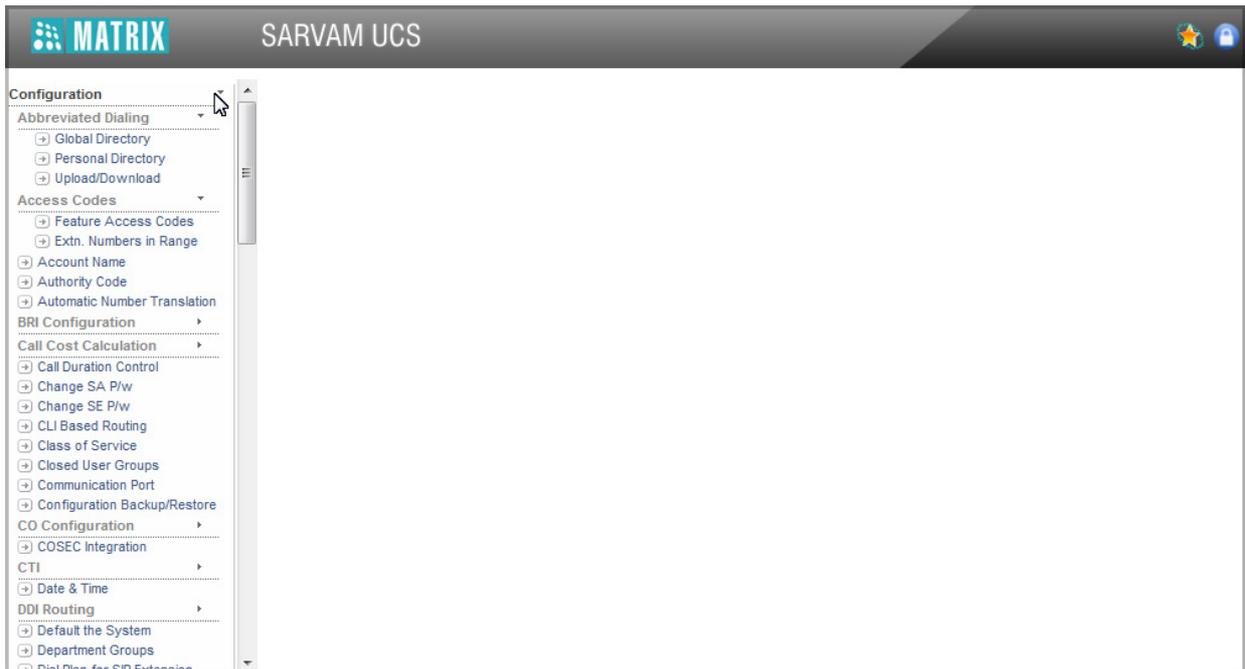

Password

Matrix ComSec Pvt. Ltd.
Visit Us: www.MatrixComSec.com
Warning: No part of the system should be copied or reproduced in any form or by any means without the prior written consent of Matrix ComSec Pvt. Ltd.
Copyright © 2016 Matrix ComSec Pvt. Ltd.

Also, refer the topic [“Configuring SARVAM UCS”](#).

To program the parameters using a Telephone, enter into SE mode from a DKP/SLT by dialing **1#91** followed by the SE password.

For detailed instructions, refer the topic [“Entering the SE mode using a Telephone”](#).

Avoid modifications or use of the following system resources, when configuring the system from the Configuration.

- *Station Basic Feature Template number 2 to 10.*
- *Class of Service Groups 2 to 19.*
- *Outgoing Trunk Bundle Groups 2 to 27*
- *Outgoing Trunk Bundles 5 to 108.*

The system uses these resources for the Quick Installation Wizard-Standard PBX. Changes made in them will not be updated in the Wizard.

Configuring System Pre-requisites

System Pre-requisites for SARVAM UCS

This displays the System resources (number of trunk and extension ports supported) of SARVAM UCS. It is quite common for users to utilize the system resources below its capacity, especially when they begin using a new system.

To make the task of configuring for such users easier, SARVAM UCS allows you to specify the number of trunks and extension ports you want to configure. Accordingly all the relevant pages of Jeeves will show only as many trunk and extension ports that you have specified, instead of showing all the ports supported by SARVAM UCS.

To be able to do this, you must configure the **System Pre-requisites** using Jeeves or a Telephone.

On-site Configuration

SARVAM UCS makes configuration even more focused by making it possible to configure only those trunk and extension ports which are actually present in the system.

This can be done by enabling the **On Site Configuration** flag.

When **On Site Configuration** flag is enabled, SARVAM UCS will detect all the different trunk and extension port types present in the system (at Power-ON). Accordingly, all the relevant pages of Jeeves will show only those ports detected by the system for configuration.

The system will detect the presence of ports at each Power ON/Reset. Whenever a new card is found, the range of ports is updated and displayed on Jeeves. You can then define the number of ports to be used.

By default, the On-site Configuration flag is disabled.

When the On Site Configuration flag is enabled, the Quick Installation Wizard - Standard PBX will also display only the ports and port types that are on-board. Enable this flag if you want the Wizard to display only the port types present in the system.

It is recommended that you enable the On-Site Configuration flag when you are configuring the system at the installation site.

Defining System Pre-requisites using Jeeves

- Log into Jeeves as System Engineer.

- Under **Configuration**, click **System Pre-requisites** to open the page.

- Configure the following parameters:

- **Customer Name:** You can assign the name of the enterprise/organization that is using SARVAM UCS as the Customer Name. The Customer Name may contain up to 80 characters. You may enter the address of organization/enterprise along with the name.

The Customer Name you assign will appear on the various System Reports generated and printed by the SARVAM UCS.

- **On Site Configuration:** Click the **On-site Configuration** check box to enable.

Click **Submit** at the bottom of the page.

The fields for **Number of Ports Used**, will be populated with exactly the number the system has detected.

The fields for port types which are not available on-board are displayed as non-editable fields.

For example, the system has detected SLT20 Card at power-on, so the maximum number of SLT ports will be 20. If you want only 18 SLTs to be used, select 18.

- *If the system has detected BRI ports, the fields **BRI Trunks** and **ISDN Terminals** will be editable.*
- *By default, the number of BRI Trunks will be equal to the Number of BRI ports used.*
- *The number of ISDN terminals used by default will be zero. Only when the System Engineer changes the value of the Number of BRI Trunks to be used will the number of ISDN Terminals change to the*

number of available BRI ports x 8. In other words, the number of ISDN terminals will be: Number of BRI Ports used minus the Number of BRI Trunks used multiplied by 8.

- **Model Type:** This displays the name of the model that you are configuring — ETERNITY LENX, ETERNITY MENX, ETERNITY GENX or ETERNITY PENX.
- **Number of Ports Used:** Define the number of ports to be used for each Port Type (CO, DKP, SLT, Mobile, T1E1 PRI, BRI, SIP) in the respective boxes.

For example, if you want 8 CO Trunks, 24 DKP extensions, and 128 SLT extensions to be used, select the same numbers in the respective boxes.

- Click **Submit** at the bottom of the page to save changes.

Configuring 'Region'

The SARVAM UCS is a versatile system that can operate anywhere in the world, meeting the diverse customer requirements worldwide.

To speed up the process of system configuration, SARVAM UCS is supplied with factory-set values for the system and feature settings, referred to as “Default Settings”. These factory-set values are loaded when the system is installed and are sufficient for getting the system into operation. However, users may alter or customize the Default Settings to match their exact requirement.

SARVAM UCS provides Default Settings to match country/region-specific requirements of users around the world. The system is designed to work efficiently in any country with these default settings.

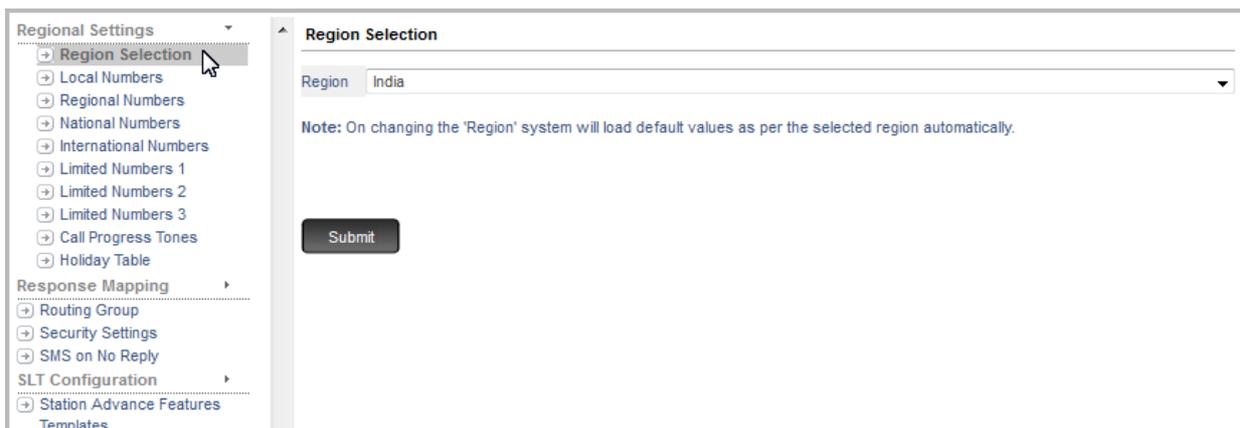

To load the country-specific Default Settings, users must select the Region that is the country in which the system is installed.

Certain countries are divided into various regions. If you select only a different region in the same country the DST and Date and Time Settings only will be change as per the selected region. The other parameters are country-specific.

India is selected as the default Region. So, if you are installing SARVAM UCS in a country other than India, change the Region.

Changing Region using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Regional Settings**.
- Click **Region Selection** to open the page.

The screenshot displays the Jeeves web interface. On the left, a navigation menu under 'Regional Settings' has 'Region Selection' highlighted. The main content area is titled 'Region Selection' and features a dropdown menu for 'Region' with 'India' selected. Below the dropdown, a note reads: "Note: On changing the 'Region' system will load default values as per the selected region automatically." A 'Submit' button is located at the bottom of the form.

- In the Region list, select the country where the system is installed.
- Click **Submit** at the bottom of the page to save changes.

Changing Region using a Telephone

- Enter SE mode from a DKP/SLT.

To select Region, dial:

- **5301-Region Code**

Where,

Region Code is the code for the country in which SARVAM UCS is installed.

Refer the following table and select the appropriate Region Code.

Region Code	Country Name
001	Afghanistan
002	Algeria
003	Antigua and Barbuda
004	Argentina
005	Australia (Perth)*
006	Australia (Adelaide)*
007	Australia (Brisbane, Canberra, Melbourne, Sydney)*
008	Austria
009	Bahamas
010	Bahrain
011	Bangladesh
012	Belarus
013	Belgium
014	Bhutan
015	Bolivia
016	Bosnia and Herzegovina
017	Botswana
018	Brunei
019	Brazil (Fernando De Noronha)*
020	Brazil (Brasilia, Rio de Janeiro, Sao Paulo)*
021	Brazil (Manaus)*
022	Brazil (Acre)*
023	Bulgaria
024	Cambodia
025	Cameroon
026	Canada (St. John's)*
027	Canada (Halifax)*
028	Canada (Montreal, Ottawa, Toronto)*
029	Canada (Winnipeg)*
030	Canada (Calgary)*
031	Canada (Vancouver)*
032	Chile
033	China
034	Colombia
035	Costa Rica

105	Thailand
106	Turkey
107	Uganda
108	Ukraine
109	United Arab Emirates
110	United Kingdom
111	United States (Atlanta, Augusta, Boston, Charlotte, Columbus, Detroit, Indiapolis, Miami, NY, Philadelphia, Washington)*
112	United States (Chicago, Dallas, Des Moines, Memphis, Minneapolis, New Orleans, Oklahoma, Omaha, St. Louis)*
113	United States (Albuquerque, Boise, Cheyenne, Denver, Salt Lake City)*
114	United States (Las Vegas, Los Angeles, Phoenix, San Francisco, Seattle)*
115	United States (Juneau)*
116	United States (Hawaii)*
117	Uzbekistan
118	Venezuela
119	Vietnam
120	Yemen
121	Yugoslavia
122	Zambia
123	Zimbabwe
124	Saudi Arabia
125	Cote d'Ivoire

** These countries are divided into several regions hence only Date and Time Settings and DST will change as per the region you select. Other parameters will be country-specific.*

By default, the region code is 050 (India).

For example, if SARVAM UCS is installed in the Philippines, dial **5301-086**

- Exit SE mode.

Configuring Network Parameters

SARVAM UCS has a LAN and WAN Port. The network parameters must be configured according to your network scenario.

SARVAM UCS may be installed typically, in a Public IP Network or in a Private network, behind a NAT Router.

When the SARVAM UCS is installed in a Public IP Network,

- the WAN Port of the card is connected to a Broadband Router/Modem.
- Public IP is assigned to the WAN Port.
- the LAN Port of the card is connected to a LAN Switch/Hub to which SIP devices are connected.

When the SARVAM UCS is installed in a Private Network, behind a NAT Router,

- the WAN Port of the card is connected to the LAN Switch/Hub.
- Private IP is assigned to the WAN Port.
- SIP devices within the LAN can get registered with the card.

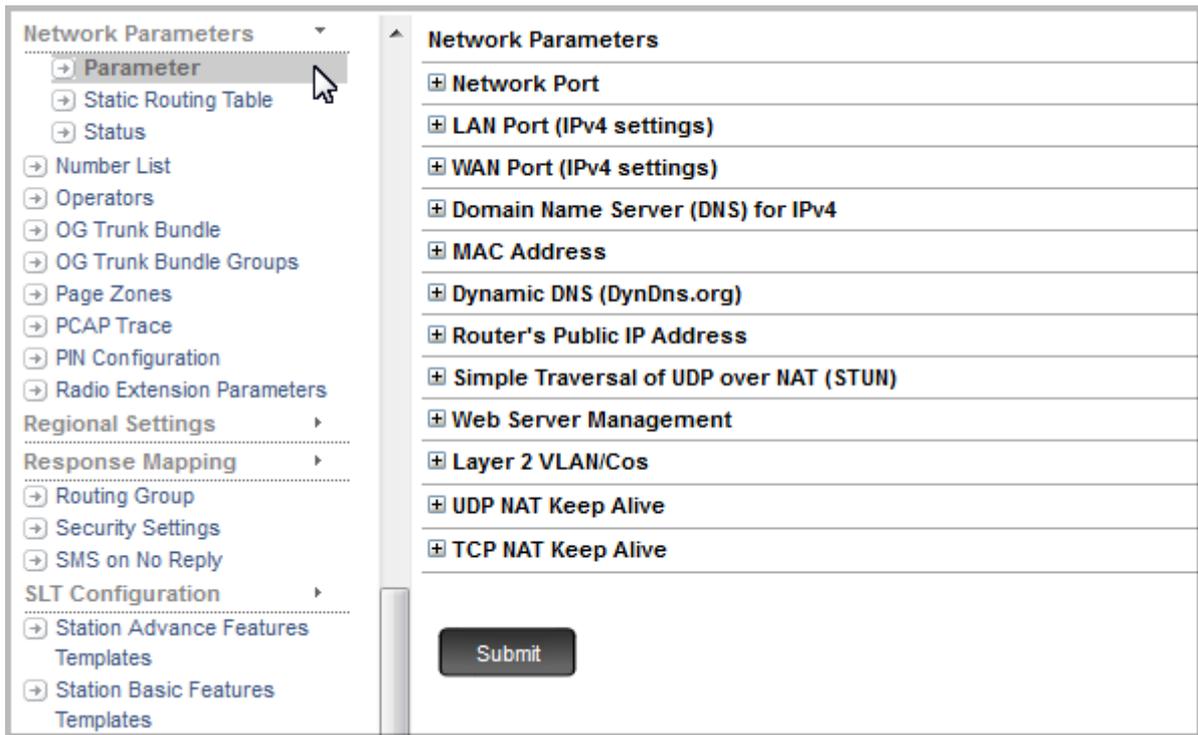

When your system is installed in a Private Network, you may have to change the IP Address and Subnet Mask of the WAN Port, before connecting it to the LAN Switch/Hub. However, this will not be necessary, if there is a DHCP server on the LAN which will automatically assign an IP Address that does not conflict with any other device on the LAN.

If you need to change the IP Address and the Subnet Mask of the LAN Port and the WAN Port of SARVAM UCS, you may do so by dialing System Commands from the telephone connected to the SLT Port. It is also possible to view the current IP Address and Subnet Mask of the LAN Port and the WAN Port by dialing System Commands from the telephone connected to the SLT Port. For instructions, see [“System Commands”](#).

Depending on your installation scenario, configure the Network Parameters using Jeeves or dialing commands from a Telephone.

Configuring Network Parameters using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **Network Parameters**.
- Click **Parameters** to open the page.

Network Port

Click **Network Port** to expand.

- **IP Addressing mode:** Select the IP version you want the system to use. You may select — IPv4 only or IPv4 and IPv6. Default: IPv4 only.

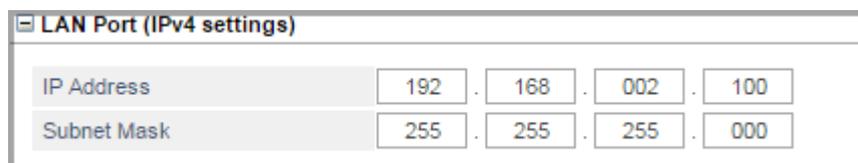

If you select IPv4 only, you can configure the IPv4 parameters only.

If you select IPv4 and IPv6, you can configure both IPv4 and IPv6 parameters.

- **Preferred DNS Server:** If you select IPv4 and IPv6 as the IP Addressing mode, you must select the Preferred DNS Server — IPv4 or IPv6. Default: IPv4

LAN Port (IPv4 settings)

Click **LAN Port (IPv4 settings)** to expand.

- **IP Address:** Enter the IP Address to be assigned to the LAN Port. The default IP Address is 192.168.002.100. You can assign only Static IP to the LAN Port.
- **Subnet Mask:** Enter the Subnet Mask to be assigned to the LAN Port. The default Subnet Mask is 255.255.255.0

WAN Port (IPv4 settings)

Click **WAN Port (IPv4 settings)** to expand.

WAN Port (IPv4 settings)				
Connection Type	Static ▼			
IP Address	192	168	001	100
Subnet Mask	255	255	255	000
Default Gateway	192	168	001	254

- **Connection Type:** Select the appropriate Connection Type for the WAN port, according to the IP Addressing scheme of your installation scenario. Consult your System Administrator also in this regard. Default: Static.
 - **Static:** Select this option if the connection type is Static. When you select this option, you must:
 - assign an IP Address to the WAN Port.
 - change the Subnet mask of the WAN Port as appropriate.
 - configure the Router's LAN Interface IP Address as the Gateway IP Address.
 - Configure the DNS Address/Domain Name provided by your ISP or ask your LAN Administrator for the DNS Address and Domain Name.
 - **DHCP:** Select this option if the connection type DHCP. As the DHCP Server will automatically assign IP Address, Subnet Mask, Gateway Address to the WAN Port, you need not configure any of these.
 - **PPPoE:** Select this option if the connection type is PPPoE. As the PPPoE server will automatically assign the IP Address, Subnet Mask and Gateway Address to the WAN Port, you need not change any of these. You must program the User ID, Password and PPPoE Service Name as provided by your ISP. Program the Service Name only if it has been provided. You must set DNS address.

Configure the following PPPoE parameters:

- **User ID:** Enter the User ID provided by the Internet Service Provider. The User ID may be a maximum of 64 characters.
- **Password:** Enter the User Password provided by the Internet Service Provider. The password may be a maximum of 64 characters.
- **Service Name:** Enter the PPPoE Service Name, if provided by your Internet Service Provider. The Service Name may consist of a maximum of 64 characters. If Service Name is not required, leave this field blank.
- **IP Address:** If you have selected 'Static' as the Connection Type, the default IP is 192.168.001.100.

If you configure the PPPoE User ID, Password and Service Name using commands, you can configure a maximum of 16 characters only.

If you have selected DHCP or PPPoE as the Connection Type, the IP Address will be assigned by the DHCP/PPPoE server.

- **Subnet Mask:** You must enter the Subnet Mask, only if you have selected 'Static' as the Connection Type.

If you have selected DHCP/PPPoE as the Connection Type, the Subnet Mask will be assigned by the DHCP/PPPoE server.

- **Default Gateway:** You must enter the Gateway IP Address, only if you have selected 'Static' as the Connection Type.

If you have selected DHCP/PPPoE as the Connection Type, the Gateway IP Address will be assigned by the DHCP/PPPoE server.

Domain Name Server (DNS) for IPv4

Click **Domain Name Server (DNS) for IPv4** to expand.

Domain Name Server (DNS) for IPv4	
DNS Address Assignment	Static ▼
DNS Address	000 . 000 . 000 . 000
DNS Domain Name	

- Configure the following DNS Connection settings for the WAN Port:

- **DNS Address Assignment:** If you have selected 'Static' as your network Connection Type (IP Addressing), you can select only 'Static' as the DNS Address Assignment.

If you have selected DHCP as your network Connection Type, and the DHCP server provides DNS Address, set the DNS Address Assignment to 'Auto'. If the DHCP server does not provide DNS Address, set DNS Address Assignment as 'Static' and configure the DNS Server Address provided by your ISP.

If you have selected PPPoE as your network Connection Type, and the PPPoE server provides DNS Address, set the DNS Address Assignment as 'Auto'. If the PPPoE server does not provide DNS Address, set the DNS Address Assignment as 'Static' and configure the DNS Server Address provided by your ISP.

- **DNS Address:** This field will be editable only if you have selected DNS Address Assignment as 'Static'. Enter the DNS Address here.

If you have selected DNS Address Assignment as 'Auto', the DNS Address will be assigned by the DHCP/PPPoE server.

- **DNS Domain Name:** Configure the DNS Domain Name if provided by your ITSP/LAN Administrator. Otherwise, keep it blank. The Domain Name may be a maximum of 40 characters. Default: Blank.

LAN Port (IPv6 settings)

Click **LAN Port (IPv6 settings)** to expand.

LAN Port (IPv6 settings)	
IPv6 Addressing using	Complete Address ▼
IPv6 Address	<input type="text"/>
Prefix length	064

- **IPv6 Addressing using:** You can select — Complete Address or Prefix. Default: Complete Address.

If you select Complete Address,

- Configure the **IPv6 Address** and the **Prefix Length**. The IP Address configured will be considered as the complete IPv6 address.

For example: 2001:0:3238:DFE1:63::FEFB

The Prefix Length is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

Valid Range of the IPv6 Address is A to F, a to f, 0 to 9,:(colon). It can be a maximum of 39 characters. Default: Blank.

The Prefix Length range is from 1 to 128 bits. Default: Blank.

If you select Prefix,

- Configure the **IPv6 Prefix**. The system will consider the configured value as 64 bit Prefix of the IPv6 Address. Then the system will generate the complete IPv6 Address from it. Default: Blank.

Valid characters 0 to 9, a to f, A to F and : (colon). It can be a maximum of 21 characters.

WAN Port (IPv6 Settings)

Click **WAN Port (IPv6 Settings)** to expand.

WAN Port (IPv6 Settings)	
IPv6 connection type	Static ▼
IPv6 Addressing using	Complete Address ▼
IPv6 Address	<input type="text"/>
Prefix length	064
Default Gateway for IPv6	<input type="text"/>

- **IPv6 Connection Type:** Select the appropriate Connection Type for the WAN port, according to the IP Addressing scheme of your installation scenario.

You can select — Static, Statefull DHCPv6, Stateless Auto-Configuration, PPPoE. Default: Static.

- **Static:** Select this option if the connection type is Static.

- **IPv6 Addressing using:** You can select — Complete Address or Prefix.

If you select Complete Address,

- Configure the **IPv6 Address** and the **Prefix Length**. The IP Address configured will be considered as the complete IPv6 Address.

The Prefix Length is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

Valid Range of the IPv6 Address is A to F, a to f, 0 to 9,:(colon). It can be a maximum of 39 characters. Default: Blank.

The Prefix Length range is from 1 to 128 bits. Default: Blank.

If you select Prefix,

- Configure the **IPv6 Prefix**. The system will consider the configured value as 64 bit Prefix of the IPv6 Address. Then the system will generate the complete IPv6 Address from it. Default: Blank.

Valid characters 0 to 9, a to f, A to F and : (colon). It can be a maximum of 21 characters.

- **Default Gateway:** Configure the Gateway IP Address for the WAN Port. It can be a maximum of 39 characters.
- **PPPoE:** Select this option if the connection type is PPPoE. As the PPPoE server will automatically assign the IP Address, Subnet Mask and Gateway Address to the WAN Port, you need not change any of these.

Configure the following PPPoE parameters:

- **IPv6 Scope Preference:** IPv6 includes support of Global as well as Non-Global Addresses(Unique). Select the scope of preference — Global or Unique. Default: Global.
- **User ID:** Enter the User ID provided by the Internet Service Provider. The User ID may be a maximum of 64 characters.
- **Password:** Enter the User Password provided by the Internet Service Provider. The password may be a maximum of 64 characters.
- **Service Name:** Enter the PPPoE Service Name, if provided by your Internet Service Provider. The Service Name may consist of a maximum of 64 characters. If Service Name is not required, leave this blank.
- **Prefix Length:** Configure the Prefix Length. Valid Range: 1 to 128 bits. Default: 064.

The Prefix Length is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

The Prefix Length range is from 1 to 128 bits. Default: Blank.

- **Statefull DHCPv6:** Select this option as the connection type, if your network uses DHCP to obtain various necessary parameters from DHCP Servers so the DHCP clients can operate in an Internet Protocol (IP)

network. Statefull DHCP is centrally managed on a DHCP server(s); and the DHCP clients use Statefull DHCP to obtain an IP address(es) and other useful configuration information from the DHCP server(s).

- **Prefix Length:** Configure the Prefix Length. Valid Range: 1 to 128 bits. Default: 064.

The Prefix Length is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

The Prefix Length range is from 1 to 128 bits. Default: Blank.

- **Stateless Auto-Configuration:** Select this option as the connection type, if your network uses DHCP to obtain various necessary parameters from DHCP Servers so the DHCP clients can operate in an Internet Protocol (IP) network. DHCPv6 for stateless configuration parameters allows a stateless or statefull DHCPv6 client to export configuration parameters (DHCPv6 options) to a local DHCPv6 server pool. The local DHCPv6 server can then provide the imported configuration parameters to other DHCPv6 clients.

- **IPv6 Scope Preference:** IPv6 includes support of Global as well as Non-Global Addresses. Select the scope of preference — Global or Unique. Default: Global.

- **Prefix Length:** Configure the Prefix Length. Valid Range: 1 to 128 bits. Default: 064.

The Prefix Length is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

The Prefix Length range is from 1 to 128 bits. Default: Blank.

Domain Name Server (DNS) for IPv6

Click **Domain Name Server (DNS) for IPv6** to expand.

The screenshot shows a configuration window titled "Domain Name Server (DNS) for IPv6". Inside the window, there are two main sections. The first section is "DNS Address Assignment", which has a dropdown menu currently set to "Static". The second section is "DNS Address", which has an empty text input field.

- Configure the following DNS Connection settings for the WAN Port:

- **DNS Address Assignment:** If you selected 'Static' as your IPv6 connection type, you can select only 'Static' as the DNS Address Assignment.

If you have selected PPPoE as your IPv6 connection type, and the PPPoE server provides DNS Address, set the DNS Address Assignment as 'Auto'. If the PPPoE server does not provide DNS Address, set the DNS Address Assignment as 'Static' and configure the DNS Server Address provided by your ISP.

If you have selected Statefull DHCP or Stateless Auto-Configuration as your network Connection Type, and the a server provides DNS Address, set the DNS Address Assignment as 'Auto'. If the server does not provide DNS Address, set the DNS Address Assignment as 'Static' and configure the DNS Server Address provided by your ISP

- **DNS Address:** This field will be editable only if you have selected DNS Address Assignment as 'Static'. Enter the DNS Address here. The DNS Address can be a maximum of 39 characters. If you selected DNS Address Assignment as 'Auto', the DNS Address will be assigned by the Server.

MAC Address

Click **MAC Address** to expand.

MAC Address	
LAN Port MAC Address	<input type="text"/>
WAN Port MAC Address	<input type="text"/>
Use MAC Cloning	<input type="checkbox"/>
Clone MAC Address	<input type="text"/>

- **LAN Port MAC Address:** This non-editable field displays the MAC Address of the LAN port.
- **WAN Port MAC Address:** This non-editable field displays the MAC Address of the WAN port.
- **Use MAC Cloning:** MAC Cloning is required when you want the WAN Port to use a MAC Address other than its own unique MAC Address as source MAC Address.

When MAC Address Cloning is disabled, the WAN Port will use its unique MAC Address as the source MAC Address on all Ethernet Frames. When MAC Cloning is enabled, the WAN Port will use the cloned MAC Address on all Ethernet frames.

Select the check box to enable cloning of the MAC Address of the WAN Port. Default: Disabled.

- **Clone MAC Address:** If you have enabled MAC Cloning, enter the MAC Address to be cloned here.

Dynamic DNS (DynDns.org)

Click **Dynamic DNS (DynDns.org)** to expand.

Dynamic DNS (DynDns.org)	
Enable Dynamic DNS	<input type="checkbox"/>
Update IP Address at Power ON	<input type="checkbox"/>
User ID	<input type="text"/>
Password	<input type="text"/>
Host Name	<input type="text"/>
Retry Trials	5 ▼
Update IP Address Now?	<input type="checkbox"/>

- **Dynamic DNS (DynDNS.org):** This parameter is applicable only when you are going to configure the SIP Extensions.

When the WAN port is assigned dynamic IP Address using DHCP or PPPoE, SIP-enabled devices registered with the system as SIP Extensions need to change their configuration whenever a new IP Address is assigned to the WAN port. Dynamic DNS resolves this.

SARVAM UCS supports Dynamic DNS Server client of the Service Provider Dynamic DNS.org.

If you want to use the DNS Service of DynDNS.org, configure these parameters:

- **Enable Dynamic DNS:** If you have taken the services of DynDNS.org, you must enable this check box. Default: Disabled.
- **Update IP Address at Power ON:** When your WAN port is registered with the DynDNS.org, the Dynamic DNS server stores the mapping between hostname and IP Address, which can be updated periodically. However, if the system frequently sends IP Address update request to the DDNS server, the server is likely to block the hostname in its database and terminate the DDNS services provided to you.

So, if you restart the SARVAM UCS frequently, there is a great chance that DDNS server will block the hostname configured in the system. This will in-turn affect the ability of the system to receive the calls using DDNS host name since the entry (mapping between host name and IP Address) in the DNS server will be deleted during those scenarios.

The system allows you a control over whether the system should update the IP Address in the DDNS server at each Power ON or not. It also allows you to update the IP Address at any time, as required.

If you want to update the IP Address in the DDNS Server at each Power ON, select the check box. Default: Disabled.

- **User ID:** Enter the User ID created by you with DynDNS.org here. A maximum of 40 characters, including all ASCII characters are allowed. Default: Blank.
- **Password:** Enter the Password created by you for your User ID with DynDNS.org here. The password may be not more than 24 characters long. Default: Blank.
- **Host Name:** Enter the Host Name created by you with DynDNS.org here. A maximum of 40 characters. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.
- **Retry Trials:** This count defines the number of attempts that the system should make to send the IP Address Update Request to the Dynamic DNS Server. The Retry Count may be set from 1 to 9. By default the count is set to 1. Default: 5.
- **Update IP Address Now?:** Click the **Click to Update IP Address** button, if you want to update the IP Address in the DDNS server at any point of time. Default: Disabled.

This option is useful if you have not enabled the option Update IP Address during each Power ON. You can update the IP Address in the DDNS server whenever required.

Router's Public IP Address

Click **Router's Public IP Address** to expand.

Router's Details	
Router's Public IP Address	000 . 000 . 000 . 000
Router's SPARSH Port	00080
Router's Secure SPARSH Port	00443

- **Router's Public IP Address:** This parameter is of relevance if the WAN port of the system is located behind a NAT Router and SIP Messages are to be forwarded to the public internet.

Router's Public IP Address specifies the fixed IP Address of your NAT router required for NAT Traversal in SIP messages.

- **Router's SPARSH Port:** Enter the Router's Port mapped with the SPARSH Port of the system. This allows auto configuration of the external VARTA clients (VARTA ADR100/ VARTA AMP100) using the Auto Sign-In Email. If you want the VARTA clients to auto configure with the system, you must enter the Router's SPARSH port value as the Server Port along with the Server Address in the VARTA ADR100/ VARTA AMP100.

Valid range: 80 or any value ranging from 1025 to 65535. Default: 80.

- **Router's Secure SPARSH Port:** Enter the Router's Port mapped with the SPARSH Secure Port of the system. This allows auto configuration of the external VARTA clients (VARTA ADR100/ VARTA AMP100) using the Auto Sign-In Email. If you want the VARTA clients to auto configure with the system using a secure protocol, you must enter the Router's Secure SPARSH port value as the Server Port along with the Server Address in the VARTA ADR100/ VARTA AMP100.

Valid range: 443 or any value ranging from 1025 to 65535. Default: 443.

Make sure you select the Use Router/STUN's IP Address option as the Registrar Server Address, when you configure SIP Extensions.

You can also use STUN as an alternative to the Router's Public IP Address as NAT Traversal mechanism. Ask your Network Administrator about the NAT Traversal mechanism that suits best for your voice network and program this parameter.

Simple Traversal of UDP through NATs (STUN)

Click **Simple Traversal of UDP through NATs (STUN)** to expand.

Simple Traversal of UDP through NATs (STUN)	
STUN Server Address	<input type="text"/>
STUN Port	<input type="text" value="03478"/>
Use SIP port fetched using STUN	<input checked="" type="checkbox"/>
Use RTP port fetched using STUN	<input checked="" type="checkbox"/>

- **Simple Traversal of UDPs through NATs (STUN):** This parameter is to be configured only if the WAN port is located behind a NAT Router and SIP Messages need to be forwarded to the public internet.

Simple Traversal of UDP through NAT (STUN) specifies the mechanism required for NAT traversal in SIP messages. The STUN Server facilitates traversing through most NATs, except symmetric NATs. If your router has symmetric NAT, do not program this parameter. If your router has asymmetric NAT, configure the following STUN parameters:

- **STUN Server Address:** Enter the STUN Server Address, a maximum of 40 characters. Default: Blank.
- **STUN Port:** Enter the Listening Port of the STUN Server. The valid range for this field is from 1025-65535. The default STUN Port is 03478.

- **Use SIP Port fetched using STUN:** By default, this check box is selected (enabled), to allow SIP Port Number to be fetched using STUN in the SIP message. Clear this check box, if you are using Port-Forwarding in the Router for SIP messages.
- **Use RTP Port fetched using STUN:** By default, this check box is selected (enabled), to allow RTP Port Number to be fetched using STUN in the SIP message. Clear this check box, if you are using Port-Forwarding in the Router for SIP messages.

You also need to select the 'Use IP Address fetched using STUN' check box in Network Parameters and select the same as the Registrar Server Address, when you configure SIP Extensions.

Since STUN does not work with symmetric NAT, as an alternative to STUN you can use the Router's Public IP Address as NAT Traversal mechanism. Ask your Network Administrator about the NAT Traversal mechanism that suits best for your voice network and program this parameter.

Web Server Management

Click **Web Server Management** to expand.

Web Server Management	
HTTPS Server Port	00443
SPARSH Port	00080
Secure SPARSH Port	00443

- **HTTPS Server Port:** Enter the HTTPS Port number. Valid range: 443 or any value ranging from 1025 to 65535. Default: 443.
- **SPARSH Port:** Enter the SPARSH port number. The system will listen for the configuration request of the Extended IP Phones/ VARTA clients/ Standard SIP Phones on this port. If you want any Extended IP Phones/ VARTA clients/ Standard SIP IP Phones to auto configure with the system, you must configure the SPARSH port value as the Server Port along with the Server Address in the Extended IP Phones/ VARTA clients/ Standard SIP IP Phones.

Valid range: 80 or any value ranging from 1025 to 65535. Default: 80.

When the system is set to default, the SPARSH Port value will not be set to default.

- **Secure SPARSH Port:** Enter the Secure SPARSH port number if you want to auto configure the VARTA AMP100/VARTA ADR100/ VARTA WIN200 with the server using a secure protocol. The system will listen for the configuration request from the VARTA clients on this port. You must also configure the Secure SPARSH port value as the Server Port along with the Server Address in the VARTA clients.

Valid range: 443 or any value ranging from 1025 to 65535. Default: 443.

- If you want the SARVAM UCS and VARTA AMP100/ VARTA ADR100/ VARTA WIN200 to communicate using secure protocol, make sure you have enabled the option Secure Connection with Server in the clients.
- When the system is set to default, the port values of HTTPS Port, SPARSH Port and Secure SPARSH Port are not set to default.

- We recommend you to connect SARVAM UCS behind a router/firewall to avoid attacks such as ping flood, DoS etc.
- If SARVAM UCS is connected on the public internet, the system is prone to attacks, hence to ensure system security we recommend you to change the default ports.

Layer 2 VLAN/Cos

Click **Layer 2 VLAN/Cos** to expand.

Layer 2 VLAN/Cos	
Enable Layer 2 VLAN/CoS	<input type="checkbox"/>
VLAN ID	0001
SIP CoS	3
RTP CoS	6

- **Layer 2 VLAN/CoS:** This parameter is to be configured if the WAN port is to be connected in VLAN network.

This parameter enables the SARVAM UCS to add VLAN header to the packets generated by it. The VLAN header consists of the VLAN ID (12-bit) and Class of Service (CoS, 3-bit) for prioritization of traffic¹²³.

VLAN Tag is applied on all packets generated by system (SIP, RTP, DNS, ARP, etc.), whereas CoS bits are applied only for SIP and RTP packets generated by system.

The corresponding meaning of CoS bits with respect to traffic type is as follows:

COS	Traffic Type
0	Best Effort
1	Background
2	Spare
3	Excellent Effort
4	Controlled Load
5	Video
6	Voice
7	Network Control

- **Enable Layer 2 VLAN/CoS:** Select this check box, if you want all packets generated by the system (SIP, RTP, DNS, ARP, etc.) to be tagged with VLAN ID as configured. The CoS bits as configured for SIP and RTP packets will be included in the VLAN header. Default: Disabled.
- **VLAN ID:** Consult your network administrator and configure the VLAN ID. The valid range for this is from 0 - 4094. Default: 1.

123. The IEEE 802.1P standard allows Layer2 switches to prioritize the traffic, thus providing Quality of Service (QoS), better handling of data that pass over a network, thereby resulting in greater reliability and quality. Quality of Service (QoS) on Layer2 is referred to as Class of Service (CoS) which is defined by IEEE 802.1P.

- **SIP CoS:** Define the CoS (priority) bits in all SIP packets. The range of CoS bits is from 0 to 7. Default: 3.
- **RTP CoS:** Define the CoS (priority) bits in all RTP packets. The range of CoS bits is from 0 to 7. Default: 6.

UDP NAT Keep Alive

Click **UDP NAT Keep Alive** to expand.

- **UDP NAT Keep Alive:** This parameter is to be configured when the WAN port is connected behind a NAT router¹²⁴ and SIP messages are transported over UDP. UDP NAT Keep Alive messages must be sent to refresh the UDP binding in the NAT router.
 - **Enable UDP NAT Keep Alive:** Enable this flag to send UDP NAT Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
 - **Interval (sec):** Select Time period after which the WAN Port should send UDP NAT Keep Alive messages. This time period should be less than the UDP Binding Timer of the router. The valid range is 001-999 seconds. Default: 180 seconds.
 - **Type of Message:** Select the type of message type to be sent when UDP NAT Keep Alive is enabled. Select either REGISTER or NOTIFY. Default: NOTIFY.

TCP NAT Keep Alive

Click **TCP NAT Keep Alive** to expand.

- **TCP NAT Keep Alive:** This parameter is to be configured when the WAN Port is connected behind a NAT router and SIP messages are transported over TCP. TCP NAT Keep Alive messages must be sent to refresh the TCP binding in the NAT router.
 - **Enable TCP NAT Keep Alive:** Enable this flag to send TCP NAT Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
 - **Interval:** Select Time period after which the WAN Port should send TCP NAT Keep Alive messages. This time period should be less than the Binding Timer of the router. The valid range is 0001-9999 seconds. Default: 120 seconds.

Viewing Network Parameters

You can view the status of WAN Port in Jeeves. To do this,

¹²⁴. Network Address Traversal (NAT) allows multiple hosts in the network to share the single public routable IP address. Means all the hosts in the private network shall be identified by single public IP address in the global IP cloud.

- Login as System Engineer.
- Under **Configuration**, click **Network Parameters**.
- Click **Status** to open the page.

Network Parameters

Ethernet Ports Status

IP Addressing Mode	IPv4 only
VoIP Server Domain	
RTP Mode	Transcoding
Relay/DRTP Free Call Count	1200

WAN Port

Ethernet Link	Up
Default MAC Address	
MAC Address in use	00:1b:09:02:91:67
Preferred DNS Server	IPv4
Dynamic DNS Status	Updaters none

IPv4 Status

Stack State	Static-Success
IP Address	192.168.1.201
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.254
DNS Address	0.0.0.0
NAT Status	Not Configured
NAT Type	Unknown
Router's Public IP Address	0.0.0.0
IP Address Fetched using STUN	0.0.0.0
SIP Port Fetched using STUN	

IPv4 Network Reinitialization

It displays the statuses of the various IPv6 and IPv4 parameters, Maintenance Port Parameters and Redundancy Configuration parameters.

When the system receives the IP Address from the DHCP/ PPPoE Server, the system performs DAD (Duplicate Address Detection). If DAD fails due to conflict in IP Address, the respective network parameters (WAN or LAN) need to be re-initialized.

To re-initialize the **WAN** parameters, click the **IPv4 Network Reinitialization** or **IPv6 Network Reinitialization** button under WAN. Similarly, to re-initialize the **LAN** parameters, click the **IPv4 Network Reinitialization** or **IPv6 Network Reinitialization** button.

Configuring WAN Port using a Telephone

- Enter SE mode from a DKP/SLT.

To select Connection Type, dial:

- **2116-Network Connection Type**

Where,

Connection Type is

1 for Static

2 for DHCP

3 for PPPoE

Default: Static

To program PPPoE User ID, dial:

- **2117 - PPPoE User ID**

Where,

PPPoE User ID may consist of a maximum of 16 ASCII characters.

Default: Blank.

To program PPPoE Password, dial:

- **2123- PPPoE Password**

Where,

PPPoE Password may consist of a maximum of 16 ASCII characters.

Default: Blank.

To program PPPoE Service Name, dial:

- **2124-PPPoE Service Name**

Where,

PPPoE Service Name may consist of a maximum of 16 ASCII characters.

Default: Blank.

To assign IP Address to WAN Port, dial:

- **2110-IP Address**

Where,

IP Address is 15 digits maximum. 000 to 255 for the first 3 Octets and 001 to 254 for the 4th Octet. Use zeros as fillers and dial the digits in a continuous sequence. Do not dial '.' in the IP Address.

For example: to change the IP Address to 192.168.50.10 dial **2110-192168050010**.

To assign Network Mask to the WAN Port, dial:

- **2111-Network Mask**

For example: to change the Subnet Mask to 255.255.255.0 dial **2111-255255255000**.

To program the Gateway Address, dial:

- **2112-Gateway Address**

Where,

Gateway Address is the Router's LAN Interface IP Address. Gateway IP Address may be a maximum of 15 digits max. Follow the same instructions as assigning IP Address to the WAN Port.

To select DNS Connection Type, dial:

- **2115-DNS Connection Type**

Where,

DNS Address Assignment Type is

1 for Static

2 for Automatic

Default: Static

To enable/disable Dynamic DNS, dial:

- **2125-Code**
Where,
Code is
0 for Disable
1 for Enable
Default: Disable.

To program Dynamic DNS User ID, dial:

- **2126-DDNS User ID**
Where,
DDNS User ID may be a maximum of 40 ASCII characters.

To program Dynamic DNS User Password, dial:

- **2127-DDNS User Password**
Where,
DynDNS User Password may consist of a maximum of 24 characters.

To program Dynamic DNS Host Name, dial:

- **2128 - DDNS Host Name**
Where,
Host Name may consist of a maximum of 40 ASCII characters.

To program Dynamic DNS - Retry Trial Count, dial:

- **2129 - DDNS Retry Count**
Where,
Retry Trial Count is from 1 to 9.
Default: 5.

To Update Dynamic DNS IP Address binding ('Update IP Address Now?' flag), dial

- **2130**

To program Router's Public IP Address, dial:

- **2132-IP Address**
Default: Blank.

To program STUN Server Address, dial:

- **2133-STUN Server Address.**
Where,
STUN Server Address may be a maximum of 40 ASCII Characters.
Default: Blank.

To program STUN Server Port, dial:

- **2134- Port**
Where,
STUN Server Port range is from 1025 to 65535.
Default: 3478.

To set STUN Query Interval, dial:

- **2135 - Interval**
Where,
Interval is from 0001 to 9999 minutes.
Default: 120 min.

To select IP Addressing Mode, dial:

- **2145 - IP Addressing Mode**

Where,

IP Addressing Mode is

1 for IPv4 Only

2 for IPv4 and IPv6

3 for IPv6 Only

To select IPv6 Connection Type, dial:

- **2146 - IPv6 Connection Type**

Where,

Connection Type is

1 for Statefull DHCP

2 for Stateless Auto-configuration

3 for PPPoE

4 for Static

Default: Static

- Exit SE mode.

Viewing WAN Status from a Telephone

- Enter SE mode from a DKP (only).

To view IP Address of the WAN Port, dial:

- **2150**

To view Network Mask of the WAN Port, dial:

- **2151**

To view Gateway Address of the WAN, dial:

- **2152**

To view current STUN query status, dial:

- **2159**

To view Router's Public IP Address fetched by STUN, dial:

- **2160**

To view Dynamic DNS Status, dial:

- **2161**

To view WAN link Status, dial:

- **2162**

To view the configured IPv6 Address, dial:

- **2164**

- Exit SE mode.

Configuring Maintenance Port Parameters

These Parameters are applicable only for ETERNITY LENX/MENX system.

You need to configure the Maintenance Port parameters to:

- transfer the configuration files from the Active card to the Redundant (Standby) card and vice-versa.
- access jeeves of the Redundant (Standby) card.
- restrict access to the facilities — Web Jeeves, Remote Login.

Configuring Maintenance Port Parameters using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **Network Parameters**.
- Click **Maintenance Port Parameters** to open the page.

The screenshot shows a web interface for configuring network parameters. On the left, a sidebar titled 'Network Parameters' has a dropdown menu with 'Maintenance Port Parameters' selected. The main content area is titled 'Maintenance Port Parameters' and contains three expandable sections: 'LAN Port', 'WAN Port', and 'Security Setting'. A 'Submit' button is located at the bottom of the main content area.

LAN Port

Click **LAN Port** to expand.

The screenshot shows the 'LAN Port' configuration form. It has two rows of input fields. The first row is labeled 'IP Address' and contains four input boxes with the values 192, 168, 002, and 101. The second row is labeled 'Subnet Mask' and contains four input boxes with the values 255, 255, 255, and 000.

- **IP Address:** Enter the IP Address to be assigned to the LAN Port of the Active Card. The default IP Address is 192.168.002.101. You can assign only Static IP to the LAN Port.
- **Subnet Mask:** Enter the Subnet Mask to be assigned to the LAN Port of the Active Card. The default Subnet Mask is 255.255.255.0

WAN Port

Click **WAN Port** to expand.

WAN Port				
IP Address	192	168	001	101
Subnet Mask	255	255	255	000
Default Gateway	192	168	001	254

- **IP Address:** Enter the IP Address to be assigned to the WAN Port of the Active Card. The default IP Address is 192.168.001.101. You can assign only Static IP to the WAN Port.
- **Subnet Mask:** Enter the Subnet Mask to be assigned to the WAN Port of the Active Card. The default Subnet Mask is 255.255.255.0
- **Default Gateway:** It displays the Gateway IP Address you configured on the Network Parameters page. This is un-editable.

Make sure the LAN and WAN IP Addresses are in different Subnets and these do not conflict with the LAN and WAN IP addresses configured on the Network Parameters page.

Security Settings

You can restrict unauthorized access to the system using Remote Login or Web. To know more, refer to "[Security Settings](#)".

Click **Security Settings** to expand.

Security Setting			
Allow Remote Login	Don't Allow ▼		
Allow Web Server Access	All IP Address/es ▼		
Trusted IP Address			
Trusted IP Address	Subnet Mask	Allow Remote Login	Allow Web Server
000 . 000 . 000 . 000	000 . 000 . 000 . 000	<input type="checkbox"/>	<input type="checkbox"/>
000 . 000 . 000 . 000	000 . 000 . 000 . 000	<input type="checkbox"/>	<input type="checkbox"/>
000 . 000 . 000 . 000	000 . 000 . 000 . 000	<input type="checkbox"/>	<input type="checkbox"/>
<input type="button" value="Submit"/>			

- In **Allow Remote Login**, you can select Don't Allow, All IP Address/es or Only Trusted IP Address/es option. By default, **Don't Allow** is selected.

If you want to allow access to generate the password for the Remote Login from all IP Addresses, select **All IP Address/es** option.

If you want to allow access to generate the password for the Remote Login from specific IP Addresses only:

- select **Only Trusted IP Address/es** option.

- configure the IP Address/es and their respective Subnet Mask in the **Trusted IP Address** table.
- enable the **Allow Remote Login** check box in the **Trusted IP Address** table.
- In **Allow Web Server** access, you can select Don't Allow, All IP Address/es or Only Trusted IP Address/es option. By default, All IP Address/es is selected.

If you do not want to allow access to the Web Server, select **Don't Allow** option.

If you want to allow access to the Web Server from specific IP Addresses only:

- select **Only Trusted IP Address/es** option.
- configure the IP Address/es and their respective Subnet Mask in the **Trusted IP Address** table.
- enable the **Allow Web Server** check box in the **Trusted IP Address** table.

Click **Submit**.

Configuring Redundancy Parameters

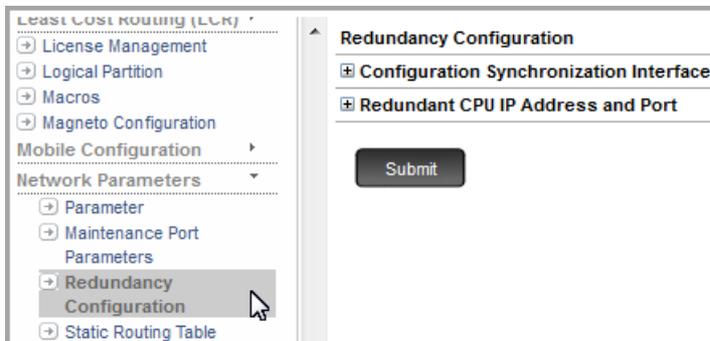

These Parameters are applicable only for ETERNITY LENX/MENX system.

The Redundancy parameters need to be configured to initiate the Redundancy process, that is, to transfer all configuration and call information from the CPU Card 1 (Active Card) to CPU Card 2 (Standby Card). To know about redundancy, refer to “Redundancy”.

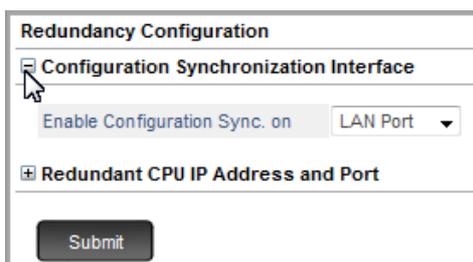

Configuring Redundancy Parameters using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **Network Parameters**.
- Click **Redundancy Configuration** to open the page.

Configuration Synchronization Interface

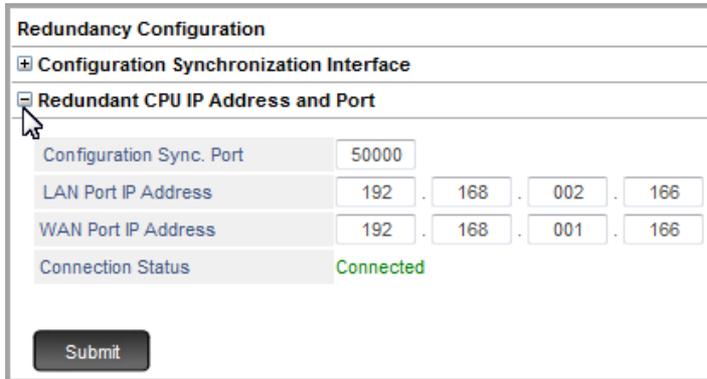

- Click **Configuration Synchronization Interface** to expand.

- In **Enable Configuration Sync. on**, you can select LAN Port or WAN Port. The connection between the CPU Card 1 (Active Card) and CPU Card 2 (Standby Card) will be established through this port. By default, LAN Port is selected.

Redundant CPU IP Address and Port

- Click **Redundant CPU IP Address and Port** to expand.

The screenshot shows a web interface titled "Redundancy Configuration". It has two expandable sections: "Configuration Synchronization Interface" and "Redundant CPU IP Address and Port". The second section is expanded, showing the following fields:

Configuration Sync. Port	50000
LAN Port IP Address	192 . 168 . 002 . 166
WAN Port IP Address	192 . 168 . 001 . 166
Connection Status	Connected

At the bottom of the form is a "Submit" button.

- In **Configuration Sync. Port**, enter the port number of CPU Card 2 (Standby Card). The CPU Card 1 (Active Card) will communicate with the CPU Card 2 (Standby Card) through this port.

Make sure the same port is configured in the CPU Card 2 (Standby Card).

- In **LAN Port IP Address**, enter the LAN Port IP Address of the CPU Card 2 (Standby Card). If you have selected LAN Port as the **Enable Configuration Sync. on** option, the CPU Card 1 (Active Card) will use this IP to communicate with the CPU Card 2 (Standby Card). The default IP Address is 192.168.002.101. You can assign only Static IP to the LAN Port.
- In **WAN Port IP Address**, enter the WAN IP Address of the CPU Card 2 (Standby Card). If you have selected WAN Port as the **Enable Configuration Sync. on** option, the CPU Card 1 (Active Card) will use this IP to communicate with the CPU Card 2 (Standby Card). The default IP Address is 192.168.001.101. You can assign only Static IP to the WAN Port.
- The **Connection Status** will display the connectivity status between CPU Card 1 (Active Card) and CPU Card 2 (Standby Card). It will display — Connected or Not Connected accordingly.

Click **Submit**.

Make sure you have configured these parameters for the other CPU Card also by accessing its respective IP Address.

Configuring Extensions

The SARVAM UCS supports the following types of extension ports:

- **SIP Extensions:** Any SIP-enabled device like a Matrix VARTA UC Client, an IP-phone, a Softphone or a Wi-Fi mobile handset can be registered with the SARVAM UCS and function as the 'SIP Extension' of the SARVAM UCS.

SIP Extensions function like any normal DKP/SLT extension of the SARVAM UCS, allowing you to make and receive calls to any extension user of the SARVAM UCS as well as any external numbers over PSTN, GSM, VoIP and E&M lines, depending on the “[Logical Partition](#)” configured in the System.

SARVAM UCS supports 999 SIP Extensions. SIP Extensions are a licensed feature. To know more, refer the topic “[License Management](#)”.

- **DKP Extension Ports:** The proprietary Digital Key Phone of Matrix is connected to these ports. SARVAM UCS supports up to 96¹²⁵ DKP extensions. The number of DKP ports available to you depends on the number and configuration of the DKP Cards installed in the system.
- **ISDN Terminals:** These are ISDN phones connected to the BRI Ports of the SARVAM UCS. ISDN Terminals can be connected only in a Point-to-Multipoint BRI configuration (Short or Extended Passive Bus Configuration). Refer the topic *Installing BRI Card* under Installation instructions for your model of SARVAM UCS to know more.

A maximum of 8 ISDN Terminals (phones) can be connected on a single BRI Bus line in a Point-to-Multipoint configuration. In a Short Passive Bus Configuration, you can connect up to 8 ISDN Terminals while in the Extended Passive Bus Configuration you can connect up to 3 ISDN Terminals.

Depending on the number of BRI ports available to you and the type of Point-to-Multipoint Configuration (Short or Extended Passive Bus), a maximum of 64 ISDN Terminals can be connected to the SARVAM UCS.

- **SLT Extension Ports:** Single Line Telephones (SLT) is connected to these ports. SARVAM UCS supports up to 240¹²⁶ SLT extensions. The number of SLT ports available to you depends on the number and configuration of the SLT Cards installed in the system.
- **Radio Extensions/Ports:** Radio devices are connected to these ports and function as extensions of the SARVAM UCS. A maximum of 16 Radio Ports are supported.
- **Magneto Ports:** Magneto telephones are connected to these ports and function as extensions of the SARVAM UCS. A maximum of 16 Magneto Ports are supported.
- **E&M Ports functioning as Stations:** An E&M port of SARVAM UCS can be programmed to take on the function of a Subscriber (Station), to work like an extension interface, receiving incoming calls.

Presuming that you have connected the extensions successfully, you may now configure the extensions using Jeeves or a Telephone.

125. The maximum number of DKP ports supported in ETERNITY MENX may vary according to the type of Power Supply (whether PSUNI or DC) being used. See Technical Specifications provided in the Appendix.

126. The maximum number of concurrent off-hook SLT ports supported may vary according to the type of Power Supply (whether PSUNI or DC) being used. See Technical Specifications provided in the Appendix.

- **Virtual Extensions.** For more information see [“Virtual Extension”](#).

Templates for Configuring Extensions

To make the task of configuring of extensions easy, the SARVAM UCS offers Templates, namely:

- SIP Hardware Template - for SIP Extensions (and SIP Trunks) only. See [“SIP Hardware Template”](#) under *Configuring Trunks*.
- SLT Hardware Template - for SLT extensions.
- Station Basic Feature Template - for DKP, SLT, SIP Extensions, ISDN Terminals, and E&M Ports functioning as Stations, Magneto ports, Radio ports and Virtual Extensions.
- Station Advanced Feature Template - for DKP, SLT, SIP Extensions, ISDN Terminals, and E&M Ports functioning as Stations, Radio ports, Magneto ports, and Virtual Extensions.

You can use these templates to program extensions which are to be assigned the same set of features at one go, saving you the effort for painstaking configuration of each extension.

The features in these templates are loaded with default values that fulfill the requirements of a very broad user base. The Templates may be customized as per user requirements and applied to the extensions.

Before you start the configuration of the extensions, please read the description of the templates and how to customize the templates according to user requirements.

SLT Hardware Template

An SLT Hardware Template is a set of features that define the behavior of the SLT hardware port, and needless to say, it is assigned to SLT Ports only.

The SLT Hardware Template allows you to configure according to user requirements, a common set parameters (features) like Caller ID Presentation (DTMF, FSK), Digit Pad Count, Ring Type, AC Impedance, Answer Signaling type, etc. to be assigned to all SLT Hardware Ports.

Each of these hardware parameters are briefly described below.

SLT Hardware Template Parameters

1. **CLIP Type:** The SARVAM UCS provides a facility to detect the calling number and present it to the SLT. This is known as Calling Line Identification and Presentation (CLIP). For this feature to work, the telephone instrument connected to the SLT port must support CLIP.

The SARVAM UCS supports 3 signaling protocols for CLI on the SLT port: DTMF, FSK-V.23, and FSK-BellCore. Select the appropriate signaling protocol.

If you want to disable CLI on the SLT port, select 'None'.

By default, DTMF protocol is set as CLIP Type.

2. **Digit Pad Count:** Certain SLT instruments that support CLI require a minimum number of digits in the calling party's number to be able identify and display it. The Digit Pad Count signifies the number of zeroes

to be added with the Calling party's number before displaying it on the called party's instrument. This count entirely depends on the instrument connected to it. By default, Digit Pad Count is set as 0.

3. **Ring Type:** The SLIC used with SLT port allows you to change the Ring type: Sinusoidal, Trapezoidal, Low Sinusoidal, Low Trapezoidal. This is helpful in cases when telephone instruments, which expect sinusoidal type of ringing current, are connected to the SLT port. By default the Ring Type for all SLT ports is Trapezoidal.
4. **SLT Gain Settings Template:** You can increase or decrease the level of Incoming Speech (Receive Gain) and Outgoing Speech (Transmit Gain) on the SLT port by changing the Rx Gain and Tx Gain to the desired level. Different levels can be set for each port type in the SLT Gain Settings Template. By default, SLT Gain Template 1 is assigned to all the SLT Hardware Templates. If you want to assign a different Template, you must customize the SLT Gain Settings Template first and then assign the number of the SLT Gain Settings Template in this Template. To customize the SLT Gain Settings, see "[Gain Settings](#)".
5. **AC Impedance:** The SLIC used with each SLT port provides a facility to adjust the AC impedance of the SLT port with the communication equipment connected to it.

Generally, most telephone instruments that are connected have nominal characteristics with AC impedance of 600Ω. However, the SARVAM UCS allows you to connect instruments with AC impedance other than 600Ω.

6. **Flash Timer (msec):** In Pulse Dialing, codes are dialed in pulses. A Flash key is generally used to dial this code. Flash is breaking the loop current for 70ms to 900ms. Flash Timer defines the time period which should be considered as Flash, if the loop current breaks.

The range of the timer is from 70 to 900 msec. By default, the Flash Timer is set to 101-600 msec. Program the Flash Timer as per user requirement.

If the Flash Timer range is configured as 70-100 msec, Pulse dialing for that particular SLT Phone will not work.

7. **Answer Signaling:** An Answer Signal is a signal generated on the SLT port to indicate that the called party (remote party) has answered the call and the call is now mature.

Answer Signaling on the SLT port is particularly useful when there is a PCO machine or any Billing equipment connected to the SLT port. With Answer Signaling enabled on an SLT port, during an outgoing call is made from that SLT port to any other port - CO/Mobile/SIP/T1E1/BRI - when the called party (remote party) answers, the Public Network provides an Answer Signal to the trunk port to indicate call maturity.

This information can be passed on to the PCO machine billing equipment in the form of Answer Signaling. On detecting Answer Signaling the PCO machine billing equipment can start billing.

Answer Signaling is generated in the form of **Polarity Reversal** or **Battery Reversal**, whereby the Battery polarity of the SLT port gets reversed. For example, if the battery polarity of the SLT port is +ve for TIP and -ve for RING in speech condition, then on call maturity, TIP becomes -ve and Ring becomes +ve.

To generate Answer Signaling on the SLT Port, select Polarity Reversal. Select **None** if Answer Signaling is not be generated on the SLT port.

By default None is selected.

8. **Disconnect Signaling:** A Disconnect Signal is the signal generated on the SLT port to indicate that the called party (remote party has disconnected the call).

Disconnect Signaling on the SLT port is useful when there is a PCO machine or any Billing equipment connected to the SLT port. With Disconnect Signaling enabled on an SLT port, during an outgoing call is made from that SLT port to any other port - CO/Mobile/SIP/T1E1/BRI - when the called party (remote party) disconnects (goes ON Hook), the Public Network provides a Disconnect Signal to trunk port indicate call disconnection. This signal can be generated on the on the SLT port to indicate to the PCO machine/ Billing equipment connected to this port to consider the call as disconnected and stop billing. Thus, Disconnect Signaling on the SLT port helps prevent excessive billing.

SARVAM UCS supports two types of Disconnect Signals on the SLT Port:

- **Polarity Reversal:** Call Disconnection is signaled in the form of Polarity Reversal. The Battery polarity of the SLT port will be reversed. For example, if the battery polarity of the SLT port is '+ve' for TIP and '-ve' for RING in speech condition then on disconnection on other port, TIP will become '-ve' and Ring '+ve'. When call is disconnected, user will get Error tone.
- **Open Loop:** Call Disconnection is signaled in the form of Open Loop Disconnect Pulse, whereby the Battery voltage on the SLT port is removed for the duration of the Open Loop Disconnect Timer programmed for that SLT port and will be restored on the expiry of this Timer. However, the Polarity of Battery Voltage on the SLT port is not changed. When call is disconnected, the SLT extension user gets an Error tone.

To generate Disconnect Signaling on the SLT Port, select Polarity Reversal or Open Loop as appropriate. Select **None** if Disconnect Signaling is not be generated on the SLT port.

By default None is selected.

9. **Open Loop Disconnect Timer (msec):** This parameter is applicable only if the option Open Loop Disconnect is selected as Disconnect Signaling type on the SLT port.

Open Loop Disconnect Timer is the time period for which the system will remove Battery Voltage on the SLT port and restore Battery Voltage on the expiry of the Timer to signal Call Disconnection.

The range of the timer is from 68 to 952 msec. By default, the Timer is set to 478 msec.

10. **Loop Current (mA):** The SLT Port provides Loop Current to the telephone instrument connected to the SLT port to drive the telephone instrument.

The Loop Current is to be increased/decreased according to the length of the telephony wiring cable between the wall jack (into which the SLT telephone instrument is plugged) and the MDF (into which the cables from the SLT port are terminated).

The longer the Loop Length of the SLT port, the greater the likelihood of current dissipation, affecting speech quality of the telephone instrument connected to the SLT port.

The system supports Loop Current of 25, 30, 35 and 40 mA. By default the Loop Current for SLT ports is set to 25mA and the SLT port, which is sufficient to support Loop Length of 1 kilometer.

You may change the Loop Current according to the Loop Length of the SLT.

11. Loop Length: The Loop Length is the distance between the Central Office and the telephone instrument connected to the SLT port. Select the **Loop Length** as **Upto 5 Km** or **Above 5 Km** according to your installation scenario.

12. Minimum Current for OFF-Hook Detection: The system detects OFF-Hook state of an SLT instrument and gives dial tone on the basis of the current drawn by it from the SLT port. However, all types and brands of SLT instruments may not uniformly draw the same minimum current; some may draw lesser and some may draw more, making OFF-Hook detection difficult for the system. To resolve this, SARVAM UCS provides for programmable values for threshold current for OFF-Hook detection: 10mA, 12mA, 14mA, 16mA and 18mA.

By default, the value of the Minimum Current for OFF-Hook detection is set to 12 mA. Change this value according to the current drawn by your SLT instrument.

When an SLT instrument draws current equal to or greater than the programmed threshold value of current for off-hook detection, the system will consider the SLT instrument as OFF-Hook and will offer dial tone to the SLT.

13. ON-Hook Detection Current (mA): SARVAM UCS detects ON-Hook state of an SLT instrument to route calls on the basis of the current drawn by it from the SLT port. However, as all types and brands of SLT instruments may not uniformly draw the same current, ON-Hook detection becomes difficult for the system.

To resolve this, SARVAM UCS provides for programmable values for threshold current for ON-Hook Detection: 10mA, 12mA, 14mA, 16mA and 18mA.

By default, the value of the ON-Hook Detection Current is set to 10 mA.

When an SLT instrument draws current equal to or lower than the programmed threshold value of current for ON-Hook detection, SARVAM UCS will consider the SLT instrument as ON-Hook.

SLT instruments also vary in the level of current drawn during the normal 'idle' state and when Flash is dialed¹²⁷ (the simulated idle state). So, when the Flash key of an SLT instrument is pressed, and if the instrument draws a higher current than the threshold defined for the 'idle' state, the system will not be able to detect Flash (ON-Hook state).

Consider this when changing the value of ON-Hook Detection Current. Define the value considering the current drawn by your SLT instrument in idle state, as well as when Flash key is pressed.

14. Low Power Mode: SARVAM UCS supports Low Power Mode option. That is, in On-Hook state the SLT instrument will consume less power. Select the Low Power Mode check box to enable this mode.

SARVAM UCS also supports Thermal Shutdown. If the thermal temperature of the SLIC increases above the threshold level, the SLT instrument will stop functioning. This port number appears red in SLT Parameters. You must restart the card or the system to resume functioning of the phone.

¹²⁷. Dialing 'Flash' either with the 'Flash Key' or by pressing the Hook-switch causes the phone to go in ON-Hook state briefly for 600-800 milliseconds. Thus ON-Hook state is simulated briefly. The SLT may draw a higher current when 'Flash' is dialed.

Customizing SLT Hardware Templates

There are 50 SLT Hardware Templates that can be customized and assigned to the SLT ports. These templates contain the default values of the above-listed parameters.

The default parameter values of the SLT Hardware Templates are country specific and are loaded in each template according to the Country selected as the **Region**.

For example, when India is selected as the Region, the default value of the CLIP Type in the SLT Hardware Templates is DTMF, whereas it is FSK-Bellcore when the Region is selected as US or Canada and FSK-V.23 when UK is selected as Region. Similarly, the default values of AC Impedance on the SLT Hardware Templates will vary according to the Region selected; 600 ohms for Region India, 900Ω for Region the Philippines, and 350Ω +(1000Ω || 0.21μF) for Region UK.

By default SLT Hardware Template Number 01 is assigned to all the SLT ports. This template has default values fulfilling the common requirements of a very broad user base.

If the default SLT Hardware Template 01 fulfills the user and country requirements, retain Template 01.

If you want to change the values of certain SLT Hardware Parameters, but apply the same parameter values to all SLT ports, simply customize the desired parameters in Template 01.

However, if different hardware parameters are to be applied to different SLTs, then you can customize different the SLT Hardware Templates using Jeeves or a Telephone.

Customizing SLT Hardware Template using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **SLT Configuration**.
- Click **SLT Hardware Template** to open the page.

Template No.	CLIP Type	Digit Pad Count	Ring Type	SLT Gain Settings Template	AC Impedance	Flash Timer (msec)	Answer Signaling
1	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
2	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
3	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
4	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
5	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
6	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
7	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
8	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
9	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None
10	DTMF	0	Trapezoidal	1	600 Ohms	101-600	None

- Select a Template number you wish to customize, for example Template 03.

- Change the values of the SLT Hardware Template parameters as desired.

SLT Hardware Templates

Template No.	CLIP Type	Digit Pad Count	Ring Type	SLT Gain Settings Template
1	DTMF	0	Trapezoidal	1
2	DTMF	0	Trapezoidal	1
3	DTMF	0	Trapezoidal	1
4	None	0	Trapezoidal	1
5	DTMF	0	Trapezoidal	1
6	FSK-V.23	0	Trapezoidal	1
7	FSK-Bellcore	0	Trapezoidal	1
8	DTMF	0	Trapezoidal	1
9	DTMF	0	Trapezoidal	1
10	DTMF	0	Trapezoidal	1

Submit Default Default One

- Click **Submit** at the bottom of the page to save your changes.
- Now, apply this SLT Hardware Template 03 on the SLT ports. To do this,
- Click **SLT Parameters** to open the page.

8	02 - 14	2008		01	01	02

- Click **Submit** at the bottom of the page to save your setting.
- Repeat the same steps to customize another template.

Customizing SLT Hardware Template using a Telephone

- Enter SE mode from a DKP/SLT.

To change the default values of a SLT Hardware Parameter in a Template, dial:

- **5702-1-Template Number-Parameter Number-Code** to program the value of a parameter in a single template.
- **5702-2-Template Number-Template Number-Parameter Number-Code** to program the same value for the parameter in a range of templates.
- **5702-*-Parameter Number-Code** to program the same value for the parameter in all templates.

Where,

Template Number is the number of the SLT Hardware Template from 01 to 50.

Parameter Number is the number of the SLT Hardware Template Parameter from 01 to 13.

Code is the value for each parameter from 0 to 14.

Refer the table below for parameter numbers and meaning of codes.

For example, to change the CLIP Type in Template 02 from default the DTMF to FSK-Bell, dial **5702-1-02-01-3**

Where,

02 is the template number

01 is the parameter number for CLIP Type

3 is the code for FSK-Bell

Default values of SLT Hardware Templates

Parameter No.	01	02	03		06	07	08
Template No.	CLIP Type	Digit Pad Count	Ring Type	SLT Gain Settings Template	AC Impedance	Flash Timer (msec)	Answer Signaling
01	DTMF	0	Trapezoidal	1	600W	101-600	None
02 50	Same as Template Number 01						
Parameters Values							
0	None	0-9					None
1	DTMF		Low Sinusoidal	1	600W	70-100	Polarity Reversal
2	FSK-V.23		LowTrapezoidal	2	900W	101-200	
3	FSK-Bellcore		Sinusoidal	3	350W+(1000W 0.21µF)	101-300	
4			Trapezoidal	4	220W+(820W 120nF)	101-400	
5					270Ω+(750Ω 150 nF)	101-500	
6						101-600	
7						101-700	
8						101-800	
9						101-900	
10							
11							
12							
13							
14							

Parameter No.	09	10	11	17	12	13
Template No.	Disconnect Signaling	Open Loop Disconnect Timer (msec)	Loop Current (mA)	Loop Length	Minimum Current for Off-Hook Detection (mA)	On-Hook Detection Current (mA) or lower
01	None	476	25	Upto 5 Km (16404 ft)	12	10
02 50	Same as Template Number 01					
Parameters Values						
0	None					
1	Polarity Reversal	68	25	Upto 5 Km (16404 ft)	10	10
2	Open Loop	136	30	Above 5 Km (16404 ft)	12	12
3		204	35		14	14
4		272	40		16	16
5		340			18	18
6		408				
7		476				
8		544				
9		612

11		748				
12		816				
13		884				
14		952				

- The default values of the SLT Hardware Templates are for the default Region India. The default values will differ according to the Region you have selected for the system.

To default SLT Hardware Template, dial:

- **5701-1-Template Number** to default a single template.
- **5701-2-Template Number-Template Number** to default a range of templates.
- **5701-*** to default all templates.

When the SE command to set the AC impedance for the SLT is issued, the settings will be effective when the SLT extension (for which AC Impedance is programmed) goes ON-Hook. SARVAM UCS will restart, if the SLT is OFF-Hook.

To apply the Customized SLT Hardware Template to SLT port, dial:

- **5703-1-SLT-Template Number** to assign a hardware template to a single SLT port.
- **5703-2-SLT-SLT-Template Number** to assign a hardware template to a range of SLT ports.
- **5703-*-Template Number** to assign a hardware template to all SLT ports.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Template Number is the number of the customized SLT Hardware Template, from 01 to 50. Default: 01.

For example, to assign Template 02 to SLT ports 003 to 010, dial **5703-2-003-010-02**

- Exit SE mode.

Station Basic Feature Template

The Station Basic Feature Template is a set of general features that completely define the basic behavior of an extension. Instead of programming each extension individually, the Station Basic Feature makes it possible to group together extensions that are to be assigned the same set of features, prepare a Station Basic Feature Template with the common set of features and apply it on these extensions.

The SARVAM UCS offers 50 such Station Basic Feature Templates. A Station Basic Feature Template is assigned to all the types of extensions, namely SLT, DKP, ISDN Terminals, E&M¹²⁸, T1E1PRI and BRI¹²⁹, Radio Extensions, Virtual Extensions.

These templates have commonly used values, but can be customized as per the requirement and applied on the extensions.

Station Basic Feature Template Parameters

The Station Basic Feature Template contains the following features:

- **Time Table:** A Time Table is a schedule of the three Time Zones, namely: Working Hours, Break Hours, Non-Working hours for a week.

Certain features of the SARVAM UCS like Operator, Class of Service, Toll Control, Outgoing Trunk Access, among others, require the extension to behave differently in each Time Zone¹³⁰.

So, a Time Table is assigned to extensions defining the Time Zones for the entire week, so that the system can execute the Time Zone-dependent features and facilities according to the Time Table.

There are 8 different Time Table templates to select from. By default, the Time Table 1 is assigned to all Station Basic Feature Templates.

You may also customize the default Time Table 1 OR customize and assign a different Time Table to the Station Basic Feature Template. Please refer the topic "[Time Tables](#)" for more details.

- **Operator:** Define the Operator for the extensions on which the template is applied.

The system supports multiple Operators. In each Time Zone one of the 20 Operators can be programmed.

Operator can be a single extension or a group of extensions, so that call management is more efficient. For instance certain extensions may be assigned Operator 1, certain others Operator 2 and the rest may be assigned Operator 3.

Operator 1 is the default in the Station Basic Feature Template. If you want to assign different extensions to different Operators, you must program a separate Station Basic Feature Template with a different Operator for each extension group.

Refer the topic "[Configuring 'Operator'](#)" to know more.

128. Applicable only when Orientation type is 'Station'.

129. Applicable only when the T1E1PRI and BRI ports are in NT mode.

130. For example, incoming calls are to be routed to the security personnel extension, instead of the Operator when the office is closed (non-working hours), or certain features in the Class of Service are to be allowed only during working hours, or access to outgoing long distance calls are to be denied during non-working hours, or the extension must play a different greeting message to the callers during break hours and holidays (non-working hours).

- **Class of Service:** Class of Service (COS) defines the set features of the system that the extension is to be allowed access to.

Not all extensions may require the same set of features. Some extensions may require voice mail, while another group of extensions may need the ability to forward calls to a cell phone, and still others may have no need to make calls outside the office.

Similarly, certain features may be required during working hours, but not during break or non-working hours.

It is possible to assign a different Class of Service to different extensions according to their feature requirements as well as according to the Time Zones.

By default COS group 01 is assigned to the Station Basic Feature Templates for all Time Zones. If you want to assign a different COS for each Time Zone, you must customize the COS group first and then assign the number of the COS group in the Template.

Refer the topic "[Class of Service \(COS\)](#)" to know more and for instructions on how to enable or disable a feature in a COS group.

- **Call Budget:** This flag is for enabling the Call Budget feature. The Call Budget feature will allot a 'budget' limit for outgoing calls made by extensions on which the template is applied. Refer "[Call Budget on Extension](#)" for more details.
- **Toll Control:** This Toll Control Level allows you to define the Call Privilege (calling permission) to be allowed to extensions according to the time of the day, during working hours (WH), break hours (BH) and non-working hours (NH). For each Time Zone, you may define the calling permission to be allowed to extensions by selecting the Type of Call Privilege.

With the default Toll Control Levels assigned, calling will not be possible. Make sure you configure the parameters as per your requirements.

Toll Control Level 0 (WH): This Toll Control Level allows you to define the Call Privilege (calling permission) allowed to an extension during Working Hours.

- **Call Privilege:** Define the type of calling permission to be allowed to the extension during the Working Hours. The call privilege options are: No Calls, Local Calls, Regional Calls, National Calls, International Calls, All Calls, Limited Calls. Default: No Calls.
- **Allowed List:** For the type of Call Privilege you select, define the list of numbers to be allowed during Working Hours.
- **Denied List:** For the type of Call Privilege you select, define the list of numbers to be denied during the Working Hours.

Toll Control Level 0 (BH): This Toll Control Level allows you to define the Call Privilege (calling permission) allowed to an extension during Break Hours.

- **Call Privilege:** Define the type of calling permission to be allowed to the extension during the Break Hours. The call privilege options are: No Calls, Local Calls, Regional Calls, National Calls, International Calls, All Calls, Limited Calls. Default: No Calls.

- **Allowed List:** For the type of Call Privilege you select, define the list of numbers to be allowed during Break Hours.
- **Denied List:** For the type of Call Privilege you select, define the list of numbers to be denied during the Break Hours.

Toll Control Level 0 (NH): This Toll Control Level allows you to define the Call Privilege (calling permission) allowed to an extension during Non-Working Hours.

- **Call Privilege:** Define the type of calling permission to be allowed to the extension during the Non-Working Hours. The call privilege options are: No Calls, Local Calls, Regional Calls, National Calls, International Calls, All Calls, Limited Calls. Default: No Calls.
- **Allowed List:** For the type of Call Privilege you select, define the list of numbers to be allowed during Non-Working Hours.
- **Denied List:** For the type of Call Privilege you select, define the list of numbers to be denied during the Non-Working Hours.
- **Toll Control Level 1:** This Toll Control Level allows you to define the Call Privilege (calling permission) to be allowed to an extension, regardless of Time Zone. Default: No Calls.
- **Toll Control Level 2:** This Toll Control Level allows you to define the Call Privilege (calling permission) to be allowed to an extension, regardless of Time Zone. Default: No Calls.
- **Toll Control Level 3:** This Toll Control Level allows you to define the Call Privilege (calling permission) to be allowed to an extension, regardless of Time Zone. Default: No Calls.
- **OG-Trunk Bundle Group (WH):** This is the Outgoing Trunk Bundle Group to be allotted to the extension for Working Hours. The extension will be allowed to make outgoing calls through the trunks in this group.

With the default **OG-Trunk Bundle Group** assigned, calling will not be possible. Make sure you configure the parameters as per your requirements.

- **OG-Trunk Bundle Group (BH):** This is the Outgoing Trunk Bundle Group to be allotted to the extension for Break Hours.

With the default **OG-Trunk Bundle Group** assigned, calling will not be possible. Make sure you configure the parameters as per your requirements.

- **OG-Trunk Bundle Group (NH):** This is the Outgoing Trunk Bundle Group to be allotted to the extension for Non-Working Hours.

With the default **OG-Trunk Bundle Group** assigned, calling will not be possible. Make sure you configure the parameters as per your requirements.

Refer the topic [“OG Trunk Bundle Group”](#) for more details.

- **Store Outgoing Calls:** You can enable or disable the storage of call details - Station Message Detail Records - of Outgoing Calls landing on the extensions on which the template is applied. Select the check box to enable and clear it to disable. Refer the topic [“Station Message Detail Recording-Storage”](#) for more details.

- **Store Incoming Calls:** You can enable or disable the storage of call details - Station Message Detail Records - of Incoming Calls landing on the extensions on which the template is applied. Select the check box to enable and clear it to disable. Refer the topic “[Station Message Detail Recording-Storage](#)” for more details.

Customizing Station Basic Feature Template using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Station Basic Feature Template** to open the page.

The screenshot displays the 'Station Basic Features Templates' configuration page. On the left is a navigation menu with 'Station Basic Features Templates' selected. The main area contains a table with the following structure:

Template No.	Time Table	Operator	Class Of Service			Call Budget	Call Privilege			
			WH	BH	NH		Toll Control Level-0 (WH)	Toll Control Level-0 (BH)	Toll Control Level-0 (NH)	Toll Control (Level 1)
1	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
2	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
3	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
4	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
5	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
6	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
7	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
8	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
9	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls
10	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	All Calls	Local Calls

At the bottom of the table, there are three buttons: 'Submit', 'Default', and 'Default One'.

- Select a Template number you wish to customize, for example Template 10.

Station Basic Features Templates									
Template No.	Time Table	Operator	Class Of Service			Call Budget	Toll Control Level-0		
			WH	BH	NH		(WH)	(BH)	
1	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
2	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
3	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
4	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
5	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
6	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
7	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
8	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
9	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	
10	1	1	01	01	01	<input type="checkbox"/>	All Calls	All Calls	

- No Calls
- Local Calls
- Regional Calls
- National Calls
- International Calls
- All Calls
- Limited Calls 1
- Limited Calls 2
- Limited Calls 3

- Change the values of the Station Basic Feature Template parameters as desired.
- Click **Submit** at the bottom of the page to save your changes.
- Now, apply this Template 10 on the SLT/DKP/ISDN Terminals/SIP Extensions.

To apply the customized template on SLT ports,

- Under **Configuration**, click **SLT Configuration**.
- Click **SLT Parameters** to open the page.
- Go to the SLT software ports to which this Template is to be assigned, for example SLT-003 and 004.

- Enter the number of the Template you customized, 10, in the field **Station Basic Feature Template** of each of these SLT ports.

SLT Parameters					
Port No.	H/w Slot - Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template
1	02 - 07	2001		01	01
2	02 - 08	2002		01	01
3	02 - 09	2003		01	10
4	02 - 10	2004		01	10
5	02 - 11	2005		01	01
6	02 - 12	2006		01	01
7	02 - 13	2007		01	01

- Click **Submit** at the bottom of the page to save your setting.

To apply the customized template on DKP ports,

- Under **Configuration**, click **DKP Configuration**.
- Click **DKP Parameters** to open the page.
- Go to the DKP software ports to which this Template is to be assigned, for example DKP-005 to 008.
- Enter the number of the Template you customized, 10, in the field **Station Basic Feature Template** of each of these DKP software ports.

- Click **Submit** at the bottom of the page to save your setting.

To apply the customized template on ISDN Terminal ports,

- Under **Configuration**, click the link **ISDN Terminal Parameters** to open the page.
- Go to the ISDN Terminal software ports to which this Template is to be assigned, for example ISDN-01.
- Enter the number of the Template you customized, 10, in the field **Station Basic Feature Template** of each of the ISDN Terminal software port.

The screenshot displays the 'ISDN Terminal Parameters' configuration page. On the left, a navigation menu lists various settings, with 'ISDN Terminal Parameters' selected. The main area shows a table with the following data:

ISDN Terminal	BRI Port	Access Code	Name	Station Basic Features Template
1	00			10
2	00			01
3	00			01
4	00			01
5	00			01
6	00			01
7	00			01
8	00			01
9	00			01

- Click **Submit** at the bottom of the page to save your setting.

To apply the customized template on SIP Extensions,

- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings**.

- Go to the SIP Extensions, for example SIP Extension 1, to which this Template is to be assigned, and enter the Template number.

- Click **Submit** to save your setting.
- Repeat the same steps to customize another template and apply it on the extension ports.

Customizing Station Basic Feature Template using a Telephone

- Enter SE mode from a DKP/SLT.

To program a feature in a Station Basic Feature Template, dial:

- **5502-1-Template Number-Feature Number-Code** to program the value of a feature in a single template.
- **5502-2-Template Number-Template Number-Feature Number-Code** to program the same value for a feature in a range of templates.
- **5502-*-Feature Number-Code** to program the same value for a feature in all templates.

Where,

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Feature Number is the number of the Feature in the Template, from 01 to 39.

Code is the parameter value of the Feature.

For example, you want to customize Template number 10, by enabling Call Budget feature and select 'Local Calls' as the Toll Control when Call Budget Consumed.

Dial **5502-1-10-06-1** to enable Call Budget feature (number 06) on Template 10.

Dial **5502-1-10-19-1** to select Local Calls (1) as Toll Control when Call Budget Consumed (19) in Template 10.

Refer the following Table for the Feature Number and Codes for the Station Basic Feature Templates.

Parameter No.	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17
Template No.	Time Table	Operator	Class Of Service			Call Budget	Toll Control - Level 0 (VMH)			Toll Control - Level 0 (BH)			Toll Control - Level 0 (NH)			Toll Control (Level 1)	Toll Control (Level 2)

To default a Station Basic Feature Template, dial:

- **5501-1-Template Number** to default the values of a single template.
- **5501-2-Template Number-Template Number** to default the values of a range of templates.
- **5501-*** to default the values of all templates

To assign a Station Basic Feature Template to SLT, dial:

- **5503-1-SLT-Template Number** to assign the template to a single SLT port.
- **5503-2-SLT-SLT-Template Number** to assign the same template number to a range of SLT ports.
- **5503-*-Template Number** to assign the same template number to all SLT ports.

Where,

SLT is the number of the Software port of the SLT, from 001 to 512.

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all SLT ports.

For example, to assign Station Basic Feature Template number 10 to the SLT software ports 004 to 010, dial **5503-2-004-010-10**.

To assign a Station Basic Feature Template to a DKP, dial:

- **5504-1-DKP-Template Number** to assign a template to a single DKP.
- **5504-2-DKP-DKP-Template Number** to assign the same template to a range of DKPs.
- **5504-*-Template Number** to assign the same template to all DKPs.

Where,

DKP is the number of the Software port of the DKP, from 001 to 128.

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all DKP ports.

For example, to assign Station Basic Feature Template 10 to DKP software ports DKP-005 to 010, dial **5504-2-005-010-10**

To assign a Station Basic Feature Template to an ISDN Terminal port, dial:

- **5507-1-ISDN-Template Number** to assign a template to a single ISDN Terminal port.
- **5507-2-ISDN-ISDN-Template Number** to assign the same template to a range of ISDN terminal ports.
- **5507-*-Template Number** to assign the same template to all ISDN terminal ports.

Where,

ISDN Terminal is the number of the ISDN Terminal Software port, from 01 to 64.

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all ISDN Terminals.

For example, to assign Station Basic Feature Template number 10 to the ISDN Terminal Software ports 01 to 04, dial **5507-2-01-04-10**

To assign a Template to an E&M (Station) port, dial:

- **5505-1-E&M-Template Number** to assign a template to a single E&M port.
- **5505-2-E&M-E&M-Template Number** to assign the same template to a range of E&M ports.
- **5505-*-Template Number** to assign the same template to all E&M ports.

Where,

E&M is the number of the E&M Software port, from 001 to 128.

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all E&M (Station) ports

To assign a Station Basic Feature Template to a T1E1PRI port, dial:

- **5506-1-T1E1PRI-Template Number** to assign a template to a single T1E1 port.
- **5506-2-T1E1PRI-T1E1PRI-Template Number** to assign the same template to a range of T1E1 ports.
- **5506-*-Template Number** to assign the same template to all T1E1 ports.

Where,

T1E1PRI is the number of the T1E1PRI Software port, from 01 to 08.

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all T1E1 ports.

To assign a Station Basic Feature Template to a BRI port, dial:

- **5509-1-BRI-Template Number** to assign a template to a single BRI port.
- **5509-2-BRI-BRI-Template Number** to assign the same template to a range of BRI ports.
- **5509-*-Template Number** to assign the same template to all BRI ports

Where,

BRI is the number of the BRI Software port, from 01 to 32.

Template is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all BRI ports.

To assign a Station Basic Feature Template to a Virtual Extension, dial:

- **5513-1-Virtual Extension-Template Number** to assign template to a single Virtual extension.
- **5513-2-Virtual Extension-Virtual Extension-Template Number** to assign the same template to a range of Virtual extensions.

- **5513-*-Template Number** to assign the same template to all the Virtual extensions.
Where,
Virtual Extension is from 01 to 64.
Station Basic Feature Template is from 01 to 50.
By default, Template 01 is assigned.

To assign a Station Basic Feature Template to a Magneto Port, dial:

- **5511-1-Magneto Port-Template Number** to assign template to a single Magneto Port.
- **5511-2-Magneto Port-Magneto Port-Template Number** to assign the same template to a range of Magneto Port.
- **5511-*-Template Number** to assign the same template to all the Magneto Port.
Where,
Magneto Port is from 001 to 128.
Station Basic Feature Template is from 01 to 50.
By default, Template 01 is assigned.

- Exit SE mode.

Station Advanced Feature Template

The Station Advanced Feature Template is a set of advanced extension features, to be applied on extensions to support features like CLIP, Call Duration Control, Storage of Internal SMDR, Call Taping, Alarm Notification, Floor Service, Walk-In Class of Service, etc.

Instead of programming each extension individually, the Station Advanced Feature makes it possible to group together extensions that are to be assigned the same set of features, prepare a Station Advanced Feature Template with the common set of features and apply it on these extensions.

The SARVAM UCS offers 50 such Station Advanced Feature Templates. A Station Advanced Feature Template is assigned to all the types of extensions viz. SLT, DKP, ISDN Terminals, E&M¹³¹, T1E1PRI and BRI¹³², Radio Virtual and SIP.

These templates have commonly used values, but can be customized per the requirement and applied on the extensions.

Station Advanced Feature Template Parameters

The Advanced Feature Template comprises the following features on extensions:

- **Caller ID Presentation while Transfer:** This parameter is related to the CLIP feature. It allows you to select whether you want the CLI of the 'Held Party' or the CLI of the 'Transferring Party' to be displayed to the transfer destination extension while the call is being transferred. Refer the feature description for "[Calling Line Identification and Presentation \(CLIP\)](#)" to know more.
- **Call Forward No-Reply Timer:** This parameter is related to the Call-Forward-No Reply/Preset Call Forward No reply feature. The Timer is the duration for which the system will wait for an extension to answer an incoming call, before forwarding the call it to the programmed destination phone number as Call Forward-No Reply. By default the Timer is set to 30 seconds. Refer the feature description for "[Call Forward](#)" and "[Preset Call Forward](#)" to know more.

131. Applicable only when Orientation type is 'Station'.

132. Applicable only when the T1E1PRI and BRI ports are in NT mode.

- **Preset Call Forward:** This parameter is relevant when users do not want to set/cancel Call Forward from their extensions. You can enable the desired type of Preset Call Forward — When Busy, When No Reply or When Busy or No Reply and the calls will be forwarded to the selected destination— Voicemail, Extension or Department Group. You can set Preset Call Forward for each time zone—Working Hours, Break Hours and Non-working Hours. Refer the feature description of [“Preset Call Forward”](#) to know more.
- **DDI IC Routing:** This flag is relevant only if you are using DDI IC Routing. As this flag is enabled by default, hence all the extensions configured in the IC Reference Table will behave as DDI Extensions. If you do not want any of these extensions to function as a DDI extensions, disable this flag in the feature template applied on that extension. By default, the flag is enabled.

Refer the topics [“Direct Dialing-In \(DDI\)”](#) to know more.

- **Send DDI Number as CLI?:** This flag is relevant only if the extension is programmed as a DDI Extensions (the DDI IC Routing is enabled). You can choose whether to the Calling Line Identification (CLI) of the DDI extension should be sent for outgoing calls made from that extension. By default the flag is enabled.
- **Internal Calls Storage:** This parameter is related to the storage of Station Message Detail Records of internal calls, made between extensions of the SARVAM UCS. You can select the type of internal calls to be stored by the system: i) Calls made from the extension, ii) Calls made to the extension, iii) Calls made from as well as calls made to the extension, and iv) no internal calls. By default, Calls made from as well as calls made to the extension are stored. Select desired type of internal call storage. Refer [“Station Message Detail Recording-Storage”](#) to know more.
- **Walk-Out Mode:** This parameter is related to the feature Walk-In Class of Service. SARVAM UCS offers two types of Walk-In: i) One-Call per Walk-In, whereby the user is automatically logged out after a call. ii) Walk-In until Logout, whereby the user remains logged on until s/he manually walks out or a second user walks into the same extension.

You must select the Walk-Out mode for the extension. If One-Call per Walk-In is to be supported on the extension, select 'One Call' as Walk-Out mode.

If Walk-In until Logout is to be supported on the extension, select 'Multiple Calls' as the Walk-Out mode.

To know more about this feature, refer [“Walk-In Class of Service”](#).

- **CDC Table:** This parameter is to be programmed if you have enabled the [“Call Duration Control \(CDC\)”](#) feature on the extension. The system will check the Call Duration Control (CDC) Table applied to the extension to implement this feature on the extension. So, you must first program the CDC Table and enter the number of the CDC Table you have programmed in this field.

You can program 8 different CDC tables. By default, CDC Table No. 1 is assigned to all extensions. If CDC is to be applied on extensions of the SARVAM UCS, simply program the default CDC Table No. 1.

To do this, click the link CDC Table to open the page. Program the CDC Table parameters and 'Submit' to save your settings. Now return to the Station Advanced Feature Template and enter the number of the CDC Table you programmed in the CDC Table field of the template.

Refer the feature description [“Call Duration Control \(CDC\)”](#) to know more and for instructions on creating CDC Tables.

- **Forced Account Code:** This flag used to enable or disable the feature Forced Account Code on the SLT/ DKP/ISDN Terminal extensions. When this flag is enabled, the system will allow the extension user to dial

an external number only after entering the Account Code. Refer the feature description for [“Account Codes”](#) to know more.

- **Department Billing Group:** This parameter enables you to know the total cost of the calls made by a particular group of extensions. This parameter is used as a one of the filters for printing SMDR Reports namely, “Print outgoing calls department group wise”. To be able to use this filter, you must assign the extensions to a Department Bill Group. You can create as many as 99 different Department Bill Groups. Enter the number of the Bill Group you want to assign the extensions to in this field.
- **Floor Service Group:** This parameter is related to the Floor Service feature. Floor Service can be floor-wise or centralized. Floor Service requires you to program Routing Groups as landing destinations for extension calls.

Program the Floor Service (Routing) Group first and enter this Floor Service (Routing) Group number in this field. There are 96 different Routing Groups to be programmed as Floor Service Groups. By default, no Routing Group is assigned to Floor Service in the Template ('00').

To know more about this feature, refer the feature description for [“Floor Service”](#).

Calls from the extension will land on the Floor Service (Routing) Group you have assigned in this field.

- **Alarm Notification Type:** This parameter is related to the Alarm feature of the SARVAM UCS. You can select any from the following options for Alarm Notification to extension users for Alarm calls:
 - **Voice Message:** Extension users will be played a message recorded in the Voice Module, when they answer the alarm call. By default, this option is selected.
 - **Music-on-Hold:** Extension users will be played music-on-hold when they answer the alarm call.
 - **Voice Mail:** The Extension users will be played the message recorded in the VMS, when they answer the alarm call. You must have the VMS Module installed in your system if you want to select this option.
 - **Routing Group:** Extension users will be connected to the extensions programmed in the 'Alarm Notification Group'. For this you must have programmed a Routing Group.

If you select this option, you can also connect external Messaging Devices to play real-time updated information like date, time, greetings, weather information, specific event announcements, etc., when then extension users answer the alarm calls. The messaging devices must be connected to any of the SLT ports and included in the Routing Group for alarm notification.

- **Alarm Notification Routing Group:** Program this parameter if you have selected 'Routing Group' as the Alarm Notification Type. Enter the number of the Routing Group you have programmed for Alarm Calls.

By default Routing Group 31 is assigned as the Alarm Notification Routing Group. If the same Routing Group is to be assigned to all extensions, click the link 'Alarm Notification Routing Group' to open the Routing Groups page. Select members (extensions) in this routing group. Save your changes by clicking 'Submit' button.

You can program a different Routing Group repeating these steps. Make sure to enter the number of the Routing Group you programmed in this field.

Refer the feature description for [“Alarms”](#) to know more.

- **Help Desk:** Enable this flag if you want to define the extension as a “[Help Desk](#)”. When this flag is enabled, Auto Call Back will be automatically set whenever this extension is found busy.
- **GPAX - Charge Internal Calls:** This parameter is related to the GPAX application. If the extension is programmed as a GPAX user, enable this flag for billing internal calls made by the extension. When this flag is enabled, the system will record all calls made from the extension in the Station Message Detail Record-Outgoing buffer for “[GPAX Billing](#)”. If the flag is disabled the calls will not be billed and will be recorded in the Station Message Detail Record - Internal buffer as an internal call.
- **Call Taping:** If you want to use the “[Call Taping](#)” feature on the extension, you must program the related parameters described below.
 - **Tape Calls coming without CLI:** Enable this flag if you want incoming calls without CLI to be taped. By default, the flag is disabled. The system will not tape incoming calls without CLI.
 - **Number List-Incoming Calls:** Assign a Number List containing numbers of Incoming Calls that must be taped. You must first program the Number List. By default, Number List 09 is assigned.
 - **Number List-Outgoing Calls:** Assign a Number List containing numbers of Outgoing Calls that must be taped. You must first program the Number List. By default, Number List 10 is assigned also for outgoing calls.

If Number list 10 is already used for another application, prepare a different number list and assign it to the template.

- **Call Taping for Internal Calls:** Enable this flag if you want to allow Call Taping of internal calls made and received by the extension.
- **Caller Category:** Program this parameter only:
 - a. if the extensions are connected to T1 Trunks using RBS protocol.
 - b. If you want to define extensions of the systems networked over E&M lines using MFCR2 Signaling as either 'Priority Subscriber' or 'Ordinary Subscriber'.

Select the appropriate extension category from the following options:

- Ordinary Subscriber (default)
- Priority Subscriber
- Maintenance Equipment
- Operator
- Pay Phone
- Data Transmission
- Interception Operator
- **Allow External Call Forward for:** This parameter defines the types of calls for which the External Call Forwarding is to be applied. This parameter is relevant for the features “[Call Forward](#)” and “[Mobility Extension](#)”. You may select from the following options:
 - Internal Calls Only
 - Trunk Calls Only
 - Internal + Trunk Calls.
- **Intercept Destination for DND:** This parameter defines the destination extension to route incoming calls landing on the DND set extension. You may select the desired destination for all three time zones —

Working Hours (WH), Break Hours (BH) and Non-working Hours (NH). The **Destination** can be a Voicemail or any extension (SLT, DKP, SIP). If you select the **Destination** as an extension, enter the desired Port Number (**Port No.**). For details, see [“Do Not Disturb \(DND\)”](#).

- **Route Global Directory Calls using:** This parameter decides the OGTBG to be used to route the Global Directory number. You may select either **OGTBG configured in the Global Dir.** or any other **OGTBG from 01 to 32.**
- **SMS for OG Call - No Reply:** This parameter decides whether to send an SMS or not to the called party for the calls that have not been answered. For more details, see [“SMS on No Reply”](#).
- **Ringer LED:** This parameter decides whether the Ringer LED should glow or not on the desired extensions for incoming calls and as missed call notification. By default, the LED will continue to blink until the missed call log is read or the call is answered/disconnected or the silent CSF Key¹³³ is pressed. Disable this check box if you do not want the Ringer LED to glow.

- *The Ringer LED for incoming calls is supported on the phones — EON310, EON510, SPARSH VP310 and SPARSH VP510.*
- *The Ringer LED for missed call notification is supported on the phones EON510 and SPARSH VP510 only.*

Customizing Station Advanced Feature Template using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Station Advanced Feature Template** to open the page.

Template No.	Caller ID Presentation while Transfer	Call Forward No Reply Timer (sec)	Preset Call Forward (WH)			Preset Call Forward (BH)		
			Forward Type	Destination	Port No.	Forward Type	Destination	Port No.
1	Transferring Party	030	None	Voice Mail	0001	None	Voice Mail	0001
2	Transferring Party	030	None	Voice Mail	0001	None	Voice Mail	0001

!!!

- Click **Submit** at the bottom of the page to save your changes.
- Now, apply this Template 02 on the SLT/DKP/ISDN Terminal ports, and Virtual Extensions.

To apply the customized template on SLT ports,

- Under **Configuration**, click **SLT Configuration**.
- Click **SLT Parameters** to open the page.
- Go to the SLT software ports to which this Template is to be assigned, for example SLT-003 and 004.

- Enter the number of the Template you customized, 02, in the field **Station Advanced Feature Template** of each of these SLT ports.

SLT Parameters					
Port No.	H/w Slot - Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template
1	02 - 07	2001		01	01
2	02 - 08	2002		01	01
3	02 - 09	2003		01	02
4	02 - 10	2004		01	02
5	02 - 11	2005		01	01
6	02 - 12	2006		01	01
7	02 - 13	2007		01	01
8	02 - 14	2008		01	01

- Click **Submit** at the bottom of the page to save your setting.

To apply the customized template on DKP ports,

- Under **Configuration**, click the link **DKP Configuration**.
- Click **DKP Parameters** to open the page.
- Go to the DKP software ports to which this Template is to be assigned, for example DKP-005 to 008. Enter the number of the Template you customized, 02, in the field **Station Advanced Feature Template** of each of these DKP software ports.

The screenshot shows the 'DKP Parameters' configuration page. The table below represents the data shown in the interface:

Port No.	DKP H/w Slot - Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template	Call Capacity
1	02 - 01	3001		01	01	02
2	02 - 02	3002		01	01	02
3	03 - 01	3003		01	01	02
4	03 - 02	3004		01	01	02
5	03 - 03	3005		01	01	02
6	03 - 04	3006		01	01	02
7	03 - 05	3007		01	01	02
8	03 - 06	3008		01	01	02

- Click **Submit** at the bottom of the page to save your setting.

To apply the customized template on ISDN Terminal ports,

- Under **Configuration**, click **ISDN Terminal Parameters** to open the page.
- Go to the ISDN Terminal software ports to which this Template is to be assigned, for example ISDN-01.
- Enter the number of the Template you customized, 02, in the field **Station Basic Feature Template** of each of this ISDN Terminal software port.

ISDN Terminal	BRI Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template	Station Type
1	00			02	01	Administration
2	00			01	01	Administration
3	00			01	01	Administration
4	00			01	01	Administration
5	00			01	01	Administration
6	00			01	01	Administration
7	00			01	01	Administration
8	00			01	01	Administration
9	00			01	01	Administration
10	00			01	01	Administration
11	00			01	01	Administration
12	00			01	01	Administration
13	00			01	01	Administration
14	00			01	01	Administration
15	00			01	01	Administration
16	00			01	01	Administration

- Click **Submit** at the bottom of the page to save your setting.
- Repeat the same steps to customize another template and apply it on other extension ports.

Customizing Station Advanced Feature Template using a Telephone

- Enter SE mode from a DKP/SLT.

To program a feature in a Station Advanced Feature Template, dial:

- **5602-1-Template Number-Feature Number-Code** to program the value of a feature in a single template.
- **5602-2-Template Number-Template Number-Feature Number-Code** to program the same value for a feature in a range of templates.
- **5602-*-Feature Number-Code** to program the same value for a feature in all templates.

Where,

Template Number is the number of the Station Advanced Feature Template, from 01 to 50.

Feature Number is the number of the Feature in the Template, from 01 to 20.

For example, you want to customize Template number 02, by changing the default settings of the following features:

- *Call Forward No Reply Timer* to set to 45 seconds, dial **5602-1-02-02-045** (Template 02, Feature Number 02 for No Reply Timer, Code 045 for 45 seconds).
- *Forced Account Code Flag* to be enabled, **5602-1-02-08-1** (Template 02, Feature Number 08 for Forced Account Code, Code 1 for enable flag).

Refer the following Table for the Feature Number and Codes for the Station Advanced Feature Templates.

Parameter No.	01	02	03	04	05	06	07	08	09
Template No.	Caller ID Presentation while Transfer	Call Forward No Reply Timer (sec)	DDI/C Routing	Send DDI Number as CLI?	Internal Calls Storage	Walk Out Mode	<u>CDC Table</u>	Force Account Code	Department Billing Group
01	Held Party	30	✓	✓	Store all Calls	One Call	1	X	00
02 - 50	same as Template No. 1								

Parameter Values

code	0	001 - 255	X	X	Don't Store any Call	One Call	1 to 8	X	00-99
1	Held Party		✓	✓	Store Call if made from this station	One Call		✓	
2	Transferring Party				Store call if made to this station	Multiple Calls			
3					Store all the calls made to/from this station				

Parameter No.	10	11	12	13	14	15	16	17	18	19	20
Template No.	<u>Floor Service Group</u>	Alarm Notification Type	<u>Alarm Notification Routing Group</u>	Help Desk	GPA-X - Charge Internal Calls	Call Taping				Caller Category	Allow External Call Forward For
						Tape calls coming without CLI	Number List - Incoming Calls	Number List - Outgoing Calls	Call Tapping for Internal Calls		
01	00	Voice Message	32	X	X	X	32	32	X	Ordinary Subscriber	Trunk Calls
02 - 50											

Parameter Values

code	0	01 to 95	01-95	X	X	X	01 to 32	01 to 32	X		
1		Music on Hold		✓	✓	✓			✓	Ordinary Subscriber	Internal Calls
2		Voice Message								Priority Subscriber	Trunk Calls
3		External Music								Maintenance Equipment	Internal + Trunk Calls
4		Routing								Operator	
5										Pay phone	
6										Data Transmission	
7										Interception	

To default a Station Advanced Feature Template, dial:

- **5601-1-Template Number** to default the values of a single template.
- **5601-2-Template Number-Template Number** to default the values of a range of templates.
- **5601-*** to default the values of all templates

To assign a Station Advanced Feature Template to SLT, dial:

- **5603-1-SLT-Template Number** to assign the template to a single SLT port.
- **5603-2-SLT-SLT-Template Number** to assign the same template number to a range of SLT ports.
- **5603-*-Template Number** to assign the same template number to all SLT ports.

Where,

SLT is the number of the Software port of the SLT, from 001 to 512.

Template Number is the number of the Station Advanced Feature Template, from 01 to 50.

Default: Template 01 is assigned to all SLT ports.

For example, to assign Station Advanced Feature Template number 02 to the SLT software ports 004 to 010, dial **5603-2-004-010-02**

To assign a Station Advanced Feature Template to a DKP, dial:

- **5604-1-DKP-Template Number** to assign a template to a single DKP.
- **5604-2-DKP-DKP-Template Number** to assign the same template to a range of DKPs.
- **5604-*-Template Number** to assign the same template to all DKPs.

Where,

DKP is the number of the Software port of the DKP, from 001 to 128.

Template Number is the number of the Station Advanced Feature Template, from 01 to 50.

Default: Template 01 is assigned to all DKP ports.

For example, to assign Station Advanced Feature Template 02 to DKP software ports DKP-005 to 010, dial **5604-2-005-010-02**

To assign a Station Advanced Feature Template to an ISDN Terminal port, dial:

- **5607-1-ISDN-Template Number** to assign a template to a single ISDN Terminal port.
- **5607-2-ISDN-ISDN-Template Number** to assign the same template to a range of ISDN terminal ports.
- **5607-*-Template Number** to assign the same template to all ISDN terminal ports.

Where,

ISDN is the number of the ISDN Terminal Software port, from 01 to 64.

Template Number is the number of ~Template number is the number of the Station Advanced Feature Template, from 01 to 50.

Default: Template 01 is assigned to all SIP extensions.

To assign a Station Advanced Feature Template to a Virtual Extension, dial:

- **5613 - 1 - Virtual Extension - Station Advance Feature Template** to assign the template to a single extension.
- **5613-2-Virtual Extension-Virtual Extension-Station Advance Feature Template** to assign the same template to a range of extensions.
- **5613-*- Station Advance Feature Template** to assign the same template to all extensions.

Where,

Virtual Extension is from 01 to 64.

Station Advance Feature Template is the number of the Station Advanced Feature Template, from 01 to 50.

Default: Template 01 is assigned to all Virtual Extensions.

To assign a Station Advance Feature Template to a Magneto Port, dial:

- **5611-1-Magneto-Station Advanced Feature Template Number** to assign a template to a single Magneto port.
- **5611-2-Magneto-Magneto- Station Advanced Feature Template Number** to assign the same template to a range of Magneto ports.
- **5611-*- Station Advanced Feature Template Number** to assign the same template to all Magneto ports.

Where,

Magneto is the Software Port number of the Magneto port from 001 to 128.

Station Advanced Feature Template is from 01 to 50.

Default: Station Advanced Feature Template Number 01.

- Exit SE mode.

Configuring SIP Extensions

SARVAM UCS supports 999 SIP extensions. You can:

- Connect SPARSH VP248, the Extended IP Phone for SARVAM UCS supplied by Matrix.
- Connect SPARSH VP330, the Touch Screen Extended IP Phone for SARVAM UCS supplied by Matrix.
- Connect SPARSH VP310, the Executive IP Phone for SARVAM UCS supplied by Matrix.
- Connect SPARSH VP510, the Premium IP Phone for SARVAM UCS supplied by Matrix.
- Connect Extended SPARSH VP710, the Smart Video IP Phone for SARVAM UCS supplied by Matrix.
- Connect SPARSH VP210, the Entry Level IP Phone for SARVAM UCS supplied by Matrix.
- Register the Matrix VARTA ADR100 and VARTA AMP100 UC Clients for Mobile with SARVAM UCS.
- Register the MATRIX VARTA WIN200 Desktop UC Client with SARVAM UCS.
- Connect Matrix Standard SIP Phones.
- Connect any other Standard SIP phone or SIP enabled device, such as an IP phone, a Soft phone, an Analog phone adapter.

To know more about Extended IP Phones, Mobile and Desktop UC Clients, see [“Extended IP Phone/VARTA UC Client - Operation”](#).

SARVAM UCS supports interoperability with the standard IP Phones. For a list of IP phones on which various features of SARVAM UCS have been tested, see [“SARVAM UCS Features tested on IP Phones of different Brands”](#) in the Appendix.

SIP Extensions function like any normal DKP/SLT extension of the SARVAM UCS. SIP Extensions can make and receive calls to any extension user of the SARVAM UCS as well as to external numbers over PSTN, GSM, VoIP and E&M lines, depending on the [“Logical Partition”](#) configured in the System.

- *SIP Extensions (IP Subscribers) are a licensed feature. Decide the number of IP Subscribers you will require and buy the license. Refer the topic [“License Management”](#) to know more.*
- *You can register a SIP Extension at three different locations as a single SIP Extension for Call Forking.*

Configuring SIP Extension using Jeeves

You need to configure the following parameters for SIP Extensions:

- **SIP Extension General Parameters**, see [“Configuring SIP Extension General Parameters”](#).
- **SIP Extension Settings**, you can configure the SIP extensions either one by one or by using bulk configuration. See [“Configuring SIP Extension Settings as per the Extended Phone Type”](#) to know how to configure extensions one-by-one and [“Configuring SIP Extensions using Bulk Configuration”](#) to know how to configure extensions using bulk configuration.
- **Voice Mail Settings**, if you want to provide mailbox to the SIP extensions. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension General Parameters

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **SIP Extension General Parameters** link.

- Set the following SIP Extension General Parameters, as required.
 - As the **Source Port IP Address**, select the NAT Traversal mechanism for SIP messages from the following options:
 - **Use Ethernet Port IP Address:** Select this option, if your system is not located behind a NAT Router.
 - **Use IP Address fetched using STUN:** Select this parameter, if your system is located behind a NAT Router, and you have set 'Use IP Address fetched using STUN' as the NAT Traversal mechanism in the [“Configuring VoIP Parameters”](#).
 - **Use Router's Public IP Address:** Select this option, if your system is located behind a NAT Router, and you have set 'Router's Public IP Address' as the NAT Traversal mechanism in the [“Configuring Network Parameters”](#).
 - You may set the **Maximum Registration Timer (sec)** as required. This is the Maximum Expiry Timer, which the system will accept in the REGISTER request received. If the value of Maximum Expiry Timer received in the REGISTER request is greater than the value you have set here, the system will send the value you have set in the SIP message. The same timer is used for handling SUBSCRIBE requests. The valid range of this timer is from 10 to 99999 seconds. By default it is set to 3600 seconds.
 - You may set the **Minimum Registration Timer (sec)**, as required. This is the Minimum Expiry Timer, which the User Agent should send in its REGISTER request. If the expiry value in the REGISTER message is less than this value, the request will be rejected. The valid range of this timer is from 10 to 99999 seconds. By default, it is set to 45 seconds.

The Timers will be applicable only after System Restart.

- In the **Private Key field**, enter the MD5 authentication key of SARVAM UCS should use to encrypt/decrypt the SIP messages. The Private Key may consist of a maximum of 24 characters. By default, the field is blank.
- Click **Submit** to save your settings.
- You can restore the default values of any one or all the parameters on this page by clicking the **Default One** and the **Default** button respectively.

Configuring SIP Extension Settings as per the Extended Phone Type

- If you have registered the Matrix Mobile UC Clients as SIP Extensions, for configuration instructions see [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).
- If you have registered the MATRIX VARTA WIN200 Desktop UC Client as SIP Extensions, for configuration instructions see [“Configuring Matrix VARTA WIN200 UC Client”](#).
- If you have connected the Matrix SPARSH VP248 as SIP Extensions, for configuration instructions see [“Configuring Matrix SPARSH VP248”](#).
- If you have connected the Matrix SPARSH VP330 as SIP Extensions, for configuration instructions see [“Configuring Matrix SPARSH VP330”](#).
- If you have connected the Matrix SPARSH VP310 as SIP Extensions, for configuration instructions see [“Configuring Matrix SPARSH VP310”](#).
- If you have connected the Matrix SPARSH VP510 as SIP Extensions, for configuration instructions see [“Configuring Matrix SPARSH VP510”](#).
- If you have connected the Matrix Extended SPARSH VP710 as SIP Extensions, for configuration instructions see [“Configuring Matrix Extended SPARSH VP710”](#).
- If you have connected the Matrix SPARSH VP210 as SIP Extensions, for configuration instructions see [“Configuring Matrix SPARSH VP210”](#).
- If you have connected Standard SIP Phones or SIP enabled devices as SIP Extensions, for configuration instructions see [“Configuring Standard SIP Phones”](#).

Viewing SIP Extension Status

You can view the Status of SIP Extension using Jeeves. To do this,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **SIP Extension Status**.

SIP Extension	Name	SIP ID	Auto Sign-In Email	Status
1				Not Registered
2				Not Registered
3				Not Registered
4				Not Registered
5				Not Registered
6				Not Registered
7				Not Registered
8				Not Registered

- The SIP Extension Status page will open and display the following for each SIP Extension,
 - SIP Extension number
 - Name of the SIP extension
 - SIP ID assigned to the SIP Extension
 - Status of Auto Sign-In Email
 - REGISTRATION status; whether the SIP Extension is registered or not.
 - Contact 1
 - Contact 2
 - Contact 3
- You may Log out of Jeeves.

You can also view the SIP Extension Status from the **Status** link. To view, click the SIP Extension link under Status.

Configuring Matrix SPARSH VP248

SPARSH VP248¹³⁴, the proprietary SIP-based IP Phone for SARVAM UCS, supplied by Matrix, is a feature-rich phone, providing voice communication over IP network. It functions like EON48, the proprietary digital key phone of Matrix. To know the list of features supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For instructions on how to use SPARSH VP248, refer to the common *EON48_310_SPARSH VP248_310 User Guide*.

To be able to use SPARSH VP248 - Extended IP Phone, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension Settings using Jeeves”](#)
- Extended IP Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#)
- Voice Mail Settings, if you want to provide mailbox facility to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings**.

SIP Extension Settings

SIP Extension: 1

General Parameters | Location-1 | Location-2 | Location-3

SIP Extension - 1

Use SIP Extension

Name

SIP ID

Authentication ID

Authentication Password **Generate**

HTTP Authentication Password (Third Party IP-Phone) **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ', ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/NP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.

134. SARVAM UCS supports only IPv4 Addresses for registering SPARSH VP248.

The parameters of the SIP Extension number you selected will appear on this page.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering SIP Extensions.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default:disabled.
- In the **Name** field, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed. You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see ["Assigning Access Codes to a Range of Extensions"](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 alphanumeric characters. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.

Make sure the User ID configured in ["Digest Authentication"](#) does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See ["Black List IP Address - SIP Extensions"](#) for more details. This activity will be logged in the ["System Activity Log"](#) as well as ["Simple Network Management Protocol \(SNMP\)"](#).

Make sure you note down or copy the Authentication Password in a confidential file.

- In **Call Appearances**, define the maximum number¹³⁵ of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- During an on-going conversation, if there is a second incoming call, the system plays beeps to indicate the second incoming call. You can set the frequency of the **Call Waiting Tone (for SPARSH VP248/VP310/VP510)** beeps as per your requirement. You can select from the following options:
 - Off
 - Beep Once
 - Beep until Answered

Default: Beep Once

However, when an ongoing call is being taped or recorded, the call waiting tone for any new incoming call will not be played.

- Under **Auto Sign-In**, enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Email ID is used for various server features.

***Auto Sign-In parameters — Send Configuration Mail and Mail Status**, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.*

*The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.*

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - **INVITE Request**
 - **SUBSCRIBE Request**By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.

¹³⁵. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

- **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks.

Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic [“SIP Hardware Template”](#) to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The [“Station Basic Feature Template”](#) has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension ([“Class of Service \(COS\)”](#), [“Toll Control”](#), [“OG Trunk Bundle Group”](#), etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.

- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The "[Station Advanced Feature Template](#)" has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic "[Station Advanced Feature Template](#)" for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see "[Extension Voice Mail Settings](#)".

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see ["SMS/Email Group"](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required.

Call Pick Up allows the SIP Extension to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer ["Call Pick Up"](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of

Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to [“Call Pick Up”](#) and [“Class of Service \(COS\)”](#). Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See [“COSEC Integration”](#) for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic [“Abbreviated Dialing”](#) for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description [“Priority”](#).

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can register three Matrix Extended IP Phones/UC Clients at three different locations as a single SIP Extension. You can connect/register the same or different types of Extended Phones/UC Clients —SPARSH VP248, SPARSH VP310, SPARSH VP510, SPARSH VP210, SPARSH VP330, Matrix VARTA UC Clients or MATRIX VARTA WIN200 Desktop UC Client — at each location. In this case we assume that SPARSH VP248 is connected at Location 1, 2 and 3.

If you want to use more than one SPARSH VP248 Extended IP Phones as a SIP Extension, configure their settings at **Location 1**, **Location 2** and **Location 3**.

If you have connected SPARSH VP310 at any of the locations, refer to [“Configuring Matrix SPARSH VP310”](#).

If you have connected SPARSH VP330 at any of the locations, refer to [“Configuring Matrix SPARSH VP330”](#).

If you have connected SPARSH VP510 at any of the locations, refer to [“Configuring Matrix SPARSH VP510”](#).

If you have connected Extended SPARSH VP710 at any of the locations, refer to [“Configuring Matrix Extended SPARSH VP710”](#).

If you have connected Extended SPARSH VP210 at any of the locations, refer to [“Configuring Matrix SPARSH VP210”](#).

If you have registered Matrix VARTA ADR100 and VARTA AMP100 Mobile UC Clients in any of the locations, refer to [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

If you have registered MATRIX VARTA WIN200 Desktop UC Client in any of the locations, refer to [“Configuring Matrix VARTA WIN200 UC Client”](#).

- Click **Location 1**.

SIP Extension Settings

SIP Extension: 1

General Parameters: [Location-1](#) [Location-2](#) [Location-3](#)

SIP Extension - 1

Use SIP Extension:

Name:

SIP ID:

Authentication ID:

Authentication Password: **Generate**

HTTP Authentication Password (Third Party IP-Phone): **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/VP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

- The settings of the phone at **Location 1** appear.

SIP Extension Settings

SIP Extension: 1

General Parameters | **Location-1** | Location-2 | Location-3

SIP Extension - 1

Location-1

Enable Device:

Location Name:

Device Type: MATRIX SPARSH VP248

MAC Address:

Registrar Server Address: Use WAN Port IP Address

Call Progress Tone - Region: Region 3

Date and Time - Region: India (GMT+05:30)

Apply DST?: No

Submit Default Copy

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX SPARSH VP248** as the **Device Type** at this location.
- Enter the **MAC Address**¹³⁶ of the SPARSH VP248 connected at this location in hexadecimal format: 00:1b:09:XX:XX:XX. Default: blank.

SARVAM UCS validates the Extended Phone on the basis of the MAC Address, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed MAC address.

- Select the appropriate **Registrar Server Address** to register the SPARSH VP248 with the SIP Registrar of SARVAM UCS, according to your installation scenario:
 - If the SPARSH VP248 is connected on the WAN network, select **Use WAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP248 is connected on the LAN network, select **Use LAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP248 is connected in the Global Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as Registrar Server IP Address.

136. MAC address is the address of the electronic hardware devices such as a computer, which is hard-coded into the device during manufacture and cannot be modified. No two devices can have similar MAC address and thus it uniquely identifies your phone. MAC address is assigned as per the IANA standard. The MAC Address of the phone will be used as source MAC address on all Ethernet frames.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see "[Configuring Network Parameters](#)".

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Registrar Server IP Address.

By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.

- To set the call progress tone generation standards of the country where the SPARSH VP248 is installed, select the **Call Progress Tone - Region**. Default: Region 1.

See "[Call Progress Tones](#)" to know more.

- To display the Date and Time of the country where the SPARSH VP248 is installed, select the **Date and Time - Region**. Default: India.
- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to Yes. Default: No.

The Daylight Saving Time convention followed in the country/region you selected will be automatically applied. The SPARSH VP248 will change its date and time settings according to the DST convention of the selected country/region.

- Select the **CO CLIP Pattern** for the SPARSH VP248. This is the type of Calling Line Presentation on the phone for incoming calls from trunks. You can select any of these options:
 - **Name Only** (only the name of the caller will be displayed).
 - **Number Only** (only the number of the caller will be displayed).
 - **Number + Name** (both the name and the number of the caller will be displayed).

Default: Number + Name.

- Select the **Language** for the SPARSH VP248. Default: English.

SARVAM UCS provides language support for English, French, German, Spanish, Portuguese, and Italian on the SPARSH VP248. When you select any of these languages, all the prompts and command strings will appear in the selected language.

SIP Extension users can change the language by accessing and navigating through the phone menu.

The SA can change the Language by logging into the SA Jeeves.

- Select a **Ringer Mode** for the phone from the four options:
 - Ring immediately (it rings immediately as a fresh calls lands on the phone).
 - Ring if idle (rings only if the phone is idle).
 - Ring after a delay (if the call is still not answered).
 - Silent.

Default: Ring Immediate.

- If you selected *Ring after a delay* as Ringer Mode, set the **Ring Delay Timer (sec)**, if required, to the desired value.

The Ring Delay Timer is the time in seconds the system waits on receiving a call before ringing on the phone. The range of this timer is 0 to 99 seconds. Default: 10 seconds.

- If you want to enable *Ringer Auto Acknowledge* mode, set the **Acknowledge Timer** (sec) to the desired value.

The Ringer Auto Acknowledge mode determines when to stop the ring on the phone. There are two options for Ringer Auto Acknowledge:

- Stop only when the call is answered.
- Stop after a delay.

To stop the ring on the phone after a delay, the Acknowledge Timer must be configured. The range of this timer is 01 to 99 seconds. Default: 00 seconds.

To stop the ring only when the Call is answered or manually acknowledged, the Acknowledge Timer must be set to '00'. By default, Ring Auto Acknowledge is turned OFF.

- To assign the Ring Destination for the SPARSH VP248, select the desired destination for **Play Ring on**. You may choose
 - **Speakerphone**: The ring will be played on the Speakerphone.
 - **Headset**: The ring will be played on the Headset.
 Default: Speakerphone.

When you select the Headset as the destination, make sure that you set the flag '*Headset Connected?*' to Yes, connect a Headset to the SPARSH VP248.

- Select the desired **Ring Tune** according to your/SPARSH VP248 user's preference. Default: 1.
- Set the **Ringer Volume** to the desired level, from 0 to 7, according to your preference. Default: 4.
- To increase/decrease the volume of outgoing speech (Transmit Gain) on the handset of the SPARSH VP248, set the **Handset Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of incoming speech (Receive Gain) on the handset of the SPARSH VP248, set the **Handset Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of outgoing speech (Transmit Gain) on the headset of the SPARSH VP248, set the **Headset Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of outgoing speech (Receive Gain) on the headset of the SPARSH VP248, set the **Headset Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To change the Transmit Gain of the Speakerphone MIC Volume, set **Speaker Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To change the Receive Gain of the Speakerphone MIC Volume, set **Speaker Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To use a Headset with the SPARSH VP248, select the **Headset Connected?** check box. Default: Disabled.

Make sure that you connect a Headset to the SPARSH VP248, if you enable this option.

- Select the **Auto Answer** check box to enable this feature on the SPARSH VP248. Default: Disabled.

When you set the “[Auto Answer](#)” feature on the SPARSH VP248, the phone goes OFF-Hook automatically after a preset period of time, without the extension user having to pick up the handset or press the speaker or headset key. When you enable Auto Answer, you must configure the Auto Answer Timer.

- If you enabled Auto Answer on the phone, set the **Auto Answer Timer (sec)** to the desired value.

This timer defines the time in seconds that the SPARSH VP248 should wait before going OFF-Hook to auto answer a call. The range of this timer is 1 to 9 seconds. Default: 1 second.

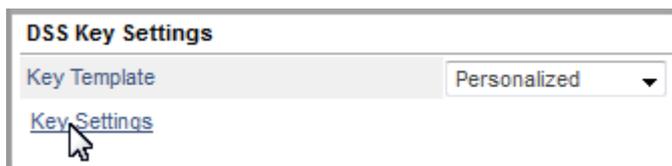

- Adjust the Backlight brightness of the phone’s LCD display, by setting the **LCD Backlight Level** to the desired value, from 1 to 4. Default: 3.
- Set the **Back Light Off Timer (sec)** to the desired value, if required, from 000 to 999 seconds. Default: 10 seconds.
- Set the **LCD Contrast Level** to a level from 1 to 4 that is comfortable to you. Default: 3.

DSS Key Settings

- You can select the desired key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant, Guest or any other template you added. See “[Customizing Extended IP Phone Templates using Jeeves](#)” for more details.

OR

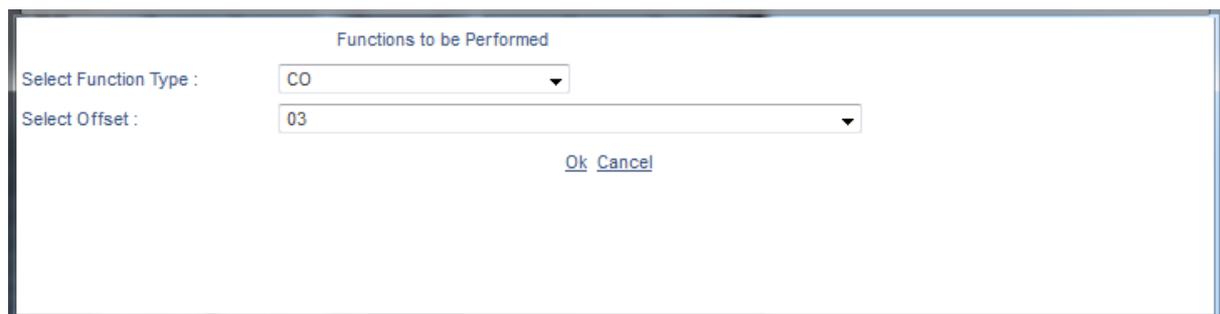

- You can personalize the key map of the SPARSH VP248 for this location. To do so,
 - Select **Personalized** as the **Key Template** option.
 - Click **Key Settings**.

- The key map of the Extended Phone opens in a new window on your screen.

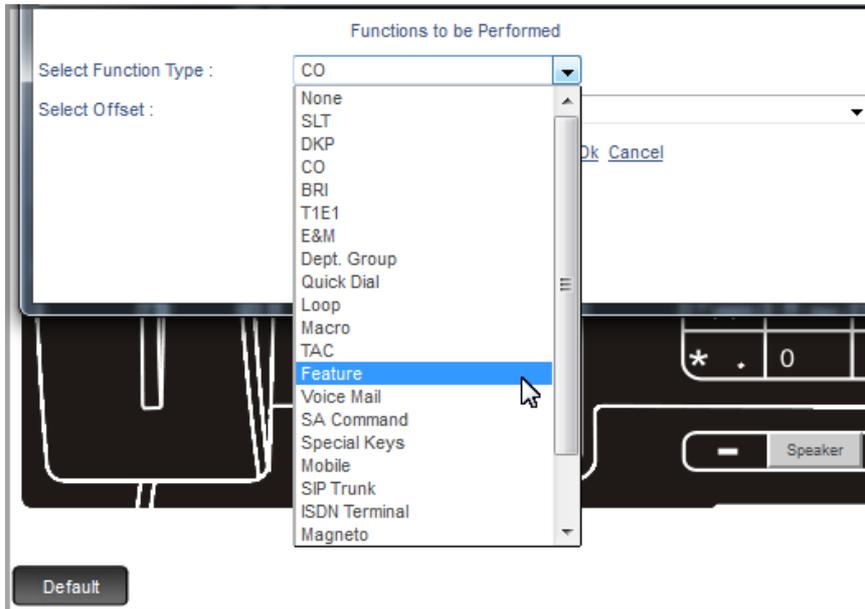

- Click the key you want to configure. For example, **CO3**.
The **Functions to be Performed** by the key opens in a new window.

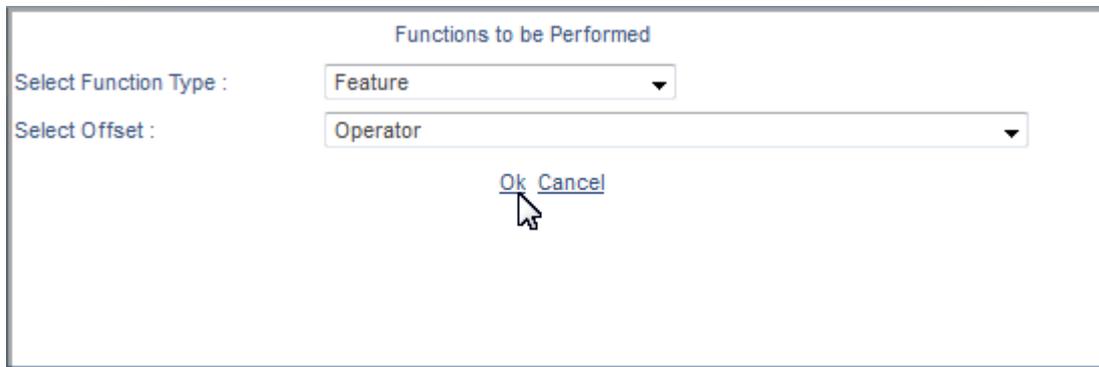

- In the **Select Function Type** list, select the function to be performed by the key. For example, you want to use the key to call the **Operator**.

The Operator function is a Feature, so select the option **FEATURE** from the **Select Function Type** list box.

From the **Select Offset** drop down list, all the features that can be assigned to keys are listed.

- Select **Operator** from the list of features in the **Select Offset** box.
- Click **OK**.

The *Operator* feature appears on the key label.

- To take a second example, if you want to assign **Remote DND** to the key currently assigned **CO 2** key, click the key.

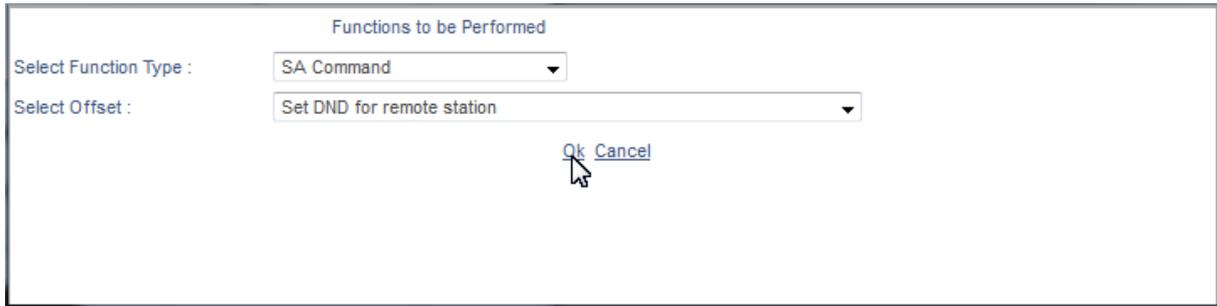

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- In the **Select Function Type** list box, select the option **SA Command**, as Remote DND is a System Administrator (SA) Command.

- In the **Select Offset** box, select the option **Set DND for remote station**.
- Click **OK**. The box closes. Remote DND feature will appear in abbreviated form as *R-DND* on the key label.

- Follow the same instructions to assign features to other DSS keys. Selecting the appropriate Function Type and the Offset for each feature/function.

If you want assign a feature, select **FEATURE** as function type, and select the desired feature as Offset.

If you want to use the key to call a DKP or a SIP extension, select **DKP** or **SIP Extension** as Function Type and select the number of the extension as Offset.

To assign direct access to a mobile trunk, select **MOBILE** as Function Type and the desired port number **1** or **2** as Offset.

To assign direct access to a SIP Trunk, select **SIP** as Function Type and the desired trunk number from **1** to **4** as Offset.

Click **OK**, each time you select a Function Type and Offset in the dialog box.

You can reinstate default key assignment any time, by clicking the **Default** button at the bottom of the window.

- When you complete assigning functions to keys, close the window.
- If you assign/re-assign functions to the following keys, the Phone will restart:
 - Speaker
 - Headset
 - Ringer
 - Acknowledge
 - Local Menu

If you have upgraded your SPARSH VP248 to an Extended IP Phone with firmware V5Rx, the key labels listed in the table below will have the following functions:

Key Label	Function assumed with Firmware V5Rx
Fwd Busy	Voice Mail
Fwd NR	Auto Call Back
DND	Forward
Reject	Release

RTP Port

- Define **RTP Port**:
 - **RTP Listening Port**: This is the port on which the SPARSH VP248 listens for RTP messages over UDP. This port is also used as the source port for sending RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **SIP Quality of Service (QoS)** for SIP signaling as:
 - **SIP DiffServe/ToS**. Valid range is 00 to 63. Default: 26.
OR
 - **RTP DiffServe/ToS**. Valid range is 00 to 63. Default: 46.

NAT Keep Alive

- If the SPARSH VP248 is connected behind a NAT router, configure **NAT Keep Alive**.

- Select the check box **Enable NAT Keep Alive** to send Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
- Define as **Interval (sec)**, the time period, from 001 to 999 seconds, after which the phone should send Keep Alive message. Default: 120 seconds.

The time period you define should be less than the binding timer of the router.

Timers

- Set the following **Timers** to the desired value, where required:
 - **SIP INVITE Timer (sec)**: This is the time in seconds that the phone waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the phone terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
 - **SIP Provisional Timer (sec)**: This is the time in seconds that the phone waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the IP phone terminates the call process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds. Default: 60 seconds.
 - **General Request Timer (sec)**: This is the time in seconds for which the phone waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.

Debug

- To debug using Syslog Client supported by the SPARSH VP248, configure Debug parameters:
 - Select the **Enable Debug?** check box. Default: disabled.

When the Debug flag is enabled, the phone will send the debug messages to the Syslog Server IP address. Debug report can be viewed on the Syslog Server or any other application which can capture the Syslog messages/debug sent by the phone.

- Enter the IP Address and port of the remote Syslog Server and as **Syslog Server Address and Server Port**.

The address of the Listening Port of the Syslog Server is from 1025-65535;514. Default: 514. Syslog uses the UDP as transport protocol and listens on the port 514 (the default listening port).

- You may select the **Debug Level** from the following options, by selecting the respective check box:
 - SIP
 - System
 - Hardware
 - Call
 - Network
 - VoPP

You may select any or all of these debug levels. The Syslog Client will send only the debug messages for the selected level to the remote server on the IP network. For example, if the debug log of 'Call's is required, you can select this option, and disable all others.

- Click **Submit** to save settings.
- If you have completed the configuration of the SPARSH VP248 Settings at Location 1, follow the same steps as described above to configure the SPARSH VP248 at Location 2 and Location 3.

However, if you want to replicate the configuration of SPARSH VP248 Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to "[Copy Parameter Values](#)".

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you only clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

The SA can change the Language by logging into the SA Jeeves.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will restart automatically, if registered:

- Use SIP Extension
- SIP ID
- Authentication ID
- Authentication Password
- Registrar Server IP Address
- MAC Address
- Enable Device
- Device Type
- Key Map in the Key Template assigned to phone
- Call Progress Tone
- Date and Time
- Apply DST?
- QoS
- RTP Ports
- NAT Keep Alive
- SIP Timers
- The SE Password of SARVAM UCS is changed
- Specific parameters in VoIP Parameters are changed
- Specific parameters Network Port parameters are changed
- You restart the System
- Set the System to Default

Configuring Matrix SPARSH VP310

SPARSH VP310, the Executive IP Phone is engineered to offer a contemporary design with crystal-clear audio and feature-rich capabilities at economical price. It functions like SPARSH VP248, the proprietary SIP-based IP Phone for SARVAM UCS, of Matrix. To know the list of features supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For instructions on how to use SPARSH VP310, refer to the common *EON48_310_SPARSH VP248_310 User Guide*.

To be able to use SPARSH VP310¹³⁷ - Extended IP Phone, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension Settings using Jeeves”](#)
- Extended IP Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#)
- Voice Mail Settings, if you want to provide mailbox facility to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings**.

SIP Extension Settings

SIP Extension: 1

General Parameters | Location-1 | Location-2 | Location-3

SIP Extension - 1

Use SIP Extension

Name

SIP ID

Authentication ID

Authentication Password **Generate**

HTTP Authentication Password (Third Party IP-Phone) **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/VP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

The page of SIP Extension 001 opens.

137. SARVAM UCS supports only IPv4 Addresses for registering SPARSH VP310.

- You may select the **SIP Extension** number you want to configure.

The parameters of the SIP Extension number you selected will appear on this page.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering Extended IP Phones.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default: disabled.
- In the **Name** field, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed. You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see [“Assigning Access Codes to a Range of Extensions”](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 alphanumeric characters. All ASCII characters except < > and “ (double quote) are allowed. Default: Blank.

Make sure the User ID configured in [“Digest Authentication”](#) does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.
 Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address

list. See [“Black List IP Address - SIP Extensions”](#) for more details. This activity will be logged in the [“System Activity Log”](#) as well as [“Simple Network Management Protocol \(SNMP\)”](#).

Make sure you note down or copy the Authentication Password in a confidential file.

- In **Call Appearances**, define the maximum number¹³⁸ of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- During an on-going conversation, if there is a second incoming call, the system plays beeps to indicate the second incoming call. You can set the frequency of the **Call Waiting Tone (for SPARSH VP248/VP310/VP510)** beeps as per your requirement. You can select from the following options:
 - Off
 - Beep Once
 - Beep until Answered

Default: Beep Once.

However, when an ongoing call is being taped or recorded, the call waiting tone for any new incoming call will not be played.

- Under **Auto Sign-In**, enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Email ID is used for various server features.

Auto Sign-In parameters — Send Configuration Mail and Mail Status, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.

*The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.*

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - **INVITE Request**
 - **SUBSCRIBE Request**

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.

¹³⁸. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

- **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks.

Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic [“SIP Hardware Template”](#) to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The [“Station Basic Feature Template”](#) has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension ([“Class of Service \(COS\)”](#), [“Toll Control”](#), [“OG Trunk Bundle Group”](#), etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.

- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic [“Station Basic Feature Template”](#) to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The [“Station Advanced Feature Template”](#) has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic [“Station Advanced Feature Template”](#) for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see [“Extension Voice Mail Settings”](#).

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	<input type="text"/>
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see ["SMS/Email Group"](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required. Default: 01

Call Pick Up allows the SIP Extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer ["Call Pick Up"](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of

Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to “[Call Pick Up](#)” and “[Class of Service \(COS\)](#)”. Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See “[COSEC Integration](#)” for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features “[Abbreviated Dialing](#)” and “[Dial By Name](#)”.

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic “[Abbreviated Dialing](#)” for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description “[Priority](#)”.

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can register three Matrix Extended IP Phones/Soft Clients at three different locations as a single SIP Extension. You can connect/register the same or different types of Extended Phones—SPARSH VP248, SPARSH VP310, SPARSH VP510, SPARSH VP330, SPARSH VP210, Matrix VARTA ADR100 Mobile UC Client, VARTA AMP100 Mobile UC Client or MATRIX VARTA WIN200 Desktop UC Client — at each location. In this case we assume that SPARSH VP310 is connected at Location 1, 2 and 3.

If you want to use more than one SPARSH VP310 Extended IP Phones as a SIP Extension, configure their settings at **Location 1**, **Location 2** and **Location 3**.

If you have connected SPARSH VP248 at any of the locations, refer to [“Configuring Matrix Extended Phone Settings using Jeeves”](#).

If you have connected SPARSH VP330 at any of the locations, refer to [“Configuring Matrix SPARSH VP330”](#).

If you have connected SPARSH VP510 at any of the locations, refer to [“Configuring Matrix SPARSH VP510”](#).

If you have connected Extended SPARSH VP710 at any of the locations, refer to [“Configuring Matrix Extended SPARSH VP710”](#).

If you have connected Extended SPARSH VP210 at any of the locations, refer to [“Configuring Matrix SPARSH VP210”](#).

If you have registered Matrix VARTA Mobile UC Clients in any of the locations, refer to [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

If you have registered MATRIX VARTA WIN200 Desktop UC Client in any of the locations, refer to [“Configuring Matrix VARTA WIN200 UC Client”](#).

- Click **Location 1**.

SIP Extension Settings

SIP Extension: 1

General Parameters: [Location-1](#) [Location-2](#) [Location-3](#)

SIP Extension - 1

Use SIP Extension:

Name:

SIP ID:

Authentication ID:

Authentication Password: **Generate**

HTTP Authentication Password (Third Party IP-Phone): **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/VP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

- The settings of the phone at **Location 1** appear.

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX SPARSH VP310** as the **Device Type** at this location.
- Enter the **MAC Address**¹³⁹ of the SPARSH VP310 connected at this location in hexadecimal format: 00:1b:09:XX:XX:XX. Default: blank.
SARVAM UCS validates the Extended Phone on the basis of the MAC Address, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed MAC address.

- Select the appropriate **Registrar Server Address** to register the SPARSH VP310 with the SIP Registrar of SARVAM UCS, according to your installation scenario:
 - If the SPARSH VP310 is connected on the WAN network, select **Use WAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP310 is connected on the LAN network, select **Use LAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP310 is connected in the Global Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as Registrar Server IP Address.

139. MAC address is the address of the electronic hardware devices such as a computer, which is hard-coded into the device during manufacture and cannot be modified. No two devices can have similar MAC address and thus it uniquely identifies your phone. MAC address is assigned as per the IANA standard. The MAC Address of the phone will be used as source MAC address on all Ethernet frames.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see ["Configuring Network Parameters"](#).

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Registrar Server IP Address.

By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.

- To set the call progress tone generation standards of the country where the SPARSH VP310 is installed, select the **Call Progress Tone - Region**. Default: Region 1.

See ["Call Progress Tones"](#) to know more.

- To display the Date and Time of the country where the SPARSH VP310 is installed, select the **Date and Time - Region**. Default: India.
- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to either **Manual** or **Scheduled** as per your requirement.

When you select **Scheduled** as the DST option, the Real Time Clock of SARVAM UCS is advanced and set backward automatically according to the DST convention of the country/region where the IP Phone is installed.

Scheduled DST Adjustment is useful in countries/regions where DST Time is fixed, such as in Europe, USA and Canada, without yearly variations.

SARVAM UCS supports 18 DST Types for Scheduled DST Adjustment. To know more, refer to ["Daylight Saving Time \(DST\)"](#). To know more about Scheduled DST assigned for the respective region, refer to *Time Zone* in ["Default Settings"](#).

When you select **Manual** as the DST option, the Real Time Clock of SARVAM UCS is advanced manually and set backward automatically according to the DST convention of the country/region where the IP Phone is installed.

Manual DST Adjustment is to be used in regions/countries that have no fixed DST Convention and where yearly variations in DST practices are likely.

When DST option is set as 'Manual', you must set the DST Start and the DST End time, that is, the time at which the clock is to be advanced and the time at which the clock is to be delayed. To do so,

- In **Time Offset**, enter the time you wish to forward or backward the DST start time with.
- In **DST Type**, select the desired option: **Date-Month Wise** OR **Day-Month Wise**.

If you select '**Date-Month Wise**' in **DST Type**, you should now select the desired options in each of the following to specify the **DST Start** details.

- **Date**: Select the date on which DST begins (1-31).
- **Month**: Select the month when DST begins (January-December).
- **Time (Hours)**: Select the time at which DST will begin to change. The time mode is of 24 hours ranging from 00 to 23 hours.
- **Time (Minutes)**: Select the time at which DST will begin to change. The time mode is of 60 minutes ranging from 00 to 59 minutes.

Similarly, in the **DST End** configure the desired DST End Time details.

If you select '**Day-Month Wise**' in **DST Type**, you should now select the desired options in each of the following to specify the **DST Start** details.

- **Ordinal**: Select the Ordinal number of the day of the month, that is, the 1st, 2nd, 3rd, 4th, 5th day, when DST begins.
- **Day**: Select the day of the month - Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday- when DST begins.
- **Month**: Select the month when DST begins (January-December).
- **Time (Hours)**: Select the time at which DST must begin to change. The duration is of 24 hours ranging from 00 to 23.
- **Time (Minutes)**: Select the time at which DST must begin to change. The duration is of 60 minutes ranging from 00 to 59.

Similarly, in **DST End** configure the DST End Time details.

Once the DST Ends, the time of the IP Phone is set back to the Standard time automatically.

When the DST of a particular country starts or ends on the Last Sunday or any other day, for example, the last Tuesday, last Friday of the month, always set the Ordinal Number as '5th'.

- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to Yes. Default: No. The Daylight Saving Time convention followed in the country/region you selected will be automatically applied. The SPARSH VP310 will change its date and time settings according to the DST convention of the selected country/region.
- Select the **CO CLIP Pattern** for the SPARSH VP310. This is the type of Calling Line Presentation on the phone for incoming calls from trunks. You can select any of these options:
 - **Name Only** (only the name of the caller will be displayed).
 - **Number Only** (only the number of the caller will be displayed).
 - **Number + Name** (both the name and the number of the caller will be displayed).

Default: Number + Name.

- Select the **Language** for the SPARSH VP310. Default: English.

SARVAM UCS provides language support for English, French, German, Spanish, Portuguese, and Italian on the SPARSH VP310. When you select any of these languages, all the prompts and command strings will appear in the selected language.

SIP Extension users can change the language by accessing and navigating through the phone menu.

The SA can change the Language by logging into the SA Jeeves.

- Select a **Ringer Mode** for the phone from the four options:
 - Ring immediately (it rings immediately as a fresh calls lands on the phone).
 - Ring if idle (rings only if the phone is idle).
 - Ring after a delay (if the call is still not answered).
 - Silent.

Default: Ring Immediate.

- If you selected *Ring after a delay* as Ringer Mode, set the **Ring Delay Timer (sec)**, if required, to the desired value.

The Ring Delay Timer is the time in seconds the system waits on receiving a call before ringing on the phone. The range of this timer is 0 to 99 seconds. Default: 10 seconds.

- If you want to enable *Ringer Auto Acknowledge* mode, set the **Acknowledge Timer (sec)** to the desired value.

The Ringer Auto Acknowledge mode determines when to stop the ring on the phone. There are two options for Ringer Auto Acknowledge:

- Stop only when the call is answered.
- Stop after a delay.

To stop the ring on the phone after a delay, the Acknowledge Timer must be configured. The range of this timer is 01 to 99 seconds. Default: 00 seconds.

To stop the ring only when the Call is answered or manually acknowledged, the Acknowledge Timer must be set to '00'. By default, Ring Auto Acknowledge is turned OFF.

- To assign the Ring Destination for the SPARSH VP310, select the desired destination for **Play Ring on**. You may choose
 - **Speakerphone**: The ring will be played on the Speakerphone.
 - **Headset**: The ring will be played on the Headset.
 Default: Speakerphone.

When you select the Headset as the destination, make sure that you set the flag '*Headset Connected?*' to Yes, connect a Headset to the SPARSH VP310.

- Set the **Ringer Volume** to the desired level, from 0 to 7, according to your preference. Default: 4.
- To increase/decrease the volume of outgoing speech (Transmit Gain) on the handset of the SPARSH VP310, set the **Handset Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of incoming speech (Receive Gain) on the handset of the SPARSH VP310, set the **Handset Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of outgoing speech (Transmit Gain) on the headset of the SPARSH VP310, set the **Headset Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of incoming speech (Receive Gain) on the headset of the SPARSH VP310, set the **Headset Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To change the Transmit Gain of the Speakerphone MIC Volume, set **Speaker Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To change the Receive Gain of the Speakerphone MIC Volume, set **Speaker Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To use a Headset with the SPARSH VP310, select the **Headset Connected?** check box. Default: Disabled.

Make sure that you connect a Headset to the SPARSH VP310, if you enable this option.

- Select the **Auto Answer** check box to enable this feature on the SPARSH VP310. Default: Disabled.

When you set the “Auto Answer” feature on the SPARSH VP310, the phone goes OFF-Hook automatically after a preset period of time, without the extension user having to pick up the handset or press the speaker or headset key. When you enable Auto Answer, you must configure the Auto Answer Timer.

- If you enabled Auto Answer on the phone, set the **Auto Answer Timer (sec)** to the desired value.

This timer defines the time in seconds that the SPARSH VP310 should wait before going OFF-Hook to auto answer a call. The range of this timer is 1 to 9 seconds. Default: 1 second.

- Adjust the Backlight brightness of the phone’s LCD display, by setting the **LCD Backlight Level** to the desired value, from 1 to 4. Default: 3.
- Set the **Back Light Off Timer (sec)** to the desired value, if required, from 000 to 999 seconds. Default: 10 seconds.
- Set the **LCD Contrast Level** to a level from 1 to 4 that is comfortable to you. Default: 3.

DSS Key Settings

- You can select the desired key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant, Guest or any other template you added. See “[Customizing Extended IP Phone Templates using Jeeves](#)” for more details.

OR

- You can personalize the key map of the SPARSH VP310 for this location. To do so,
 - Select **Personalized** as the **Key Template** option.
 - Click **Key Settings**.

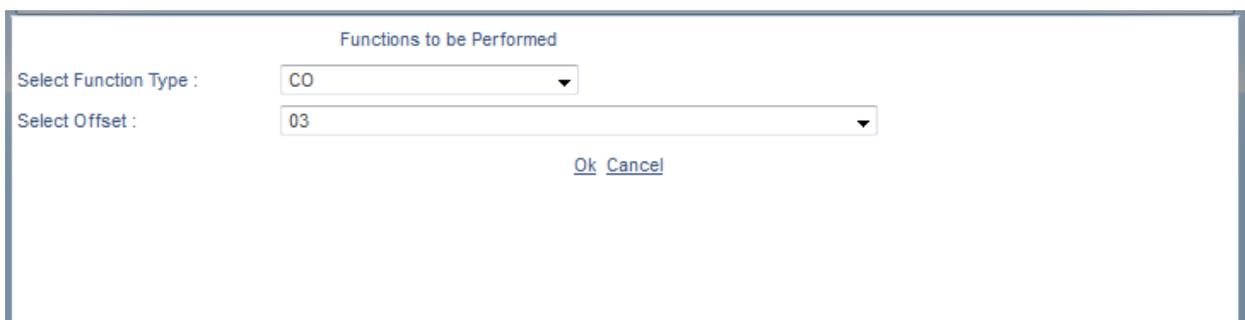

- The key map of the Extended Phone opens in a new window on your screen.

- Click the key you want to configure. For example, **CO3**.

The **Functions to be Performed** by the key opens in a new window.

- In the **Select Function Type** list, select the function to be performed by the key. For example, you want to use the key to call the **Operator**.

The Operator function is a Feature, so select the option **FEATURE** from the **Select Function Type** list box.

From the **Select Offset** drop down list, all the features that can be assigned to keys are listed.

- Select **Operator** from the list of features in the **Select Offset** box.
- Click **OK**.

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

The *Operator* feature appears on the key label.

- To take a second example, if you want to assign **Remote DND** to the key currently assigned **CO 2** key, click the key.

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- In the **Select Function Type** list box, select the option **SA Command**, as Remote DND is a System Administrator (SA) Command.

Functions to be Performed

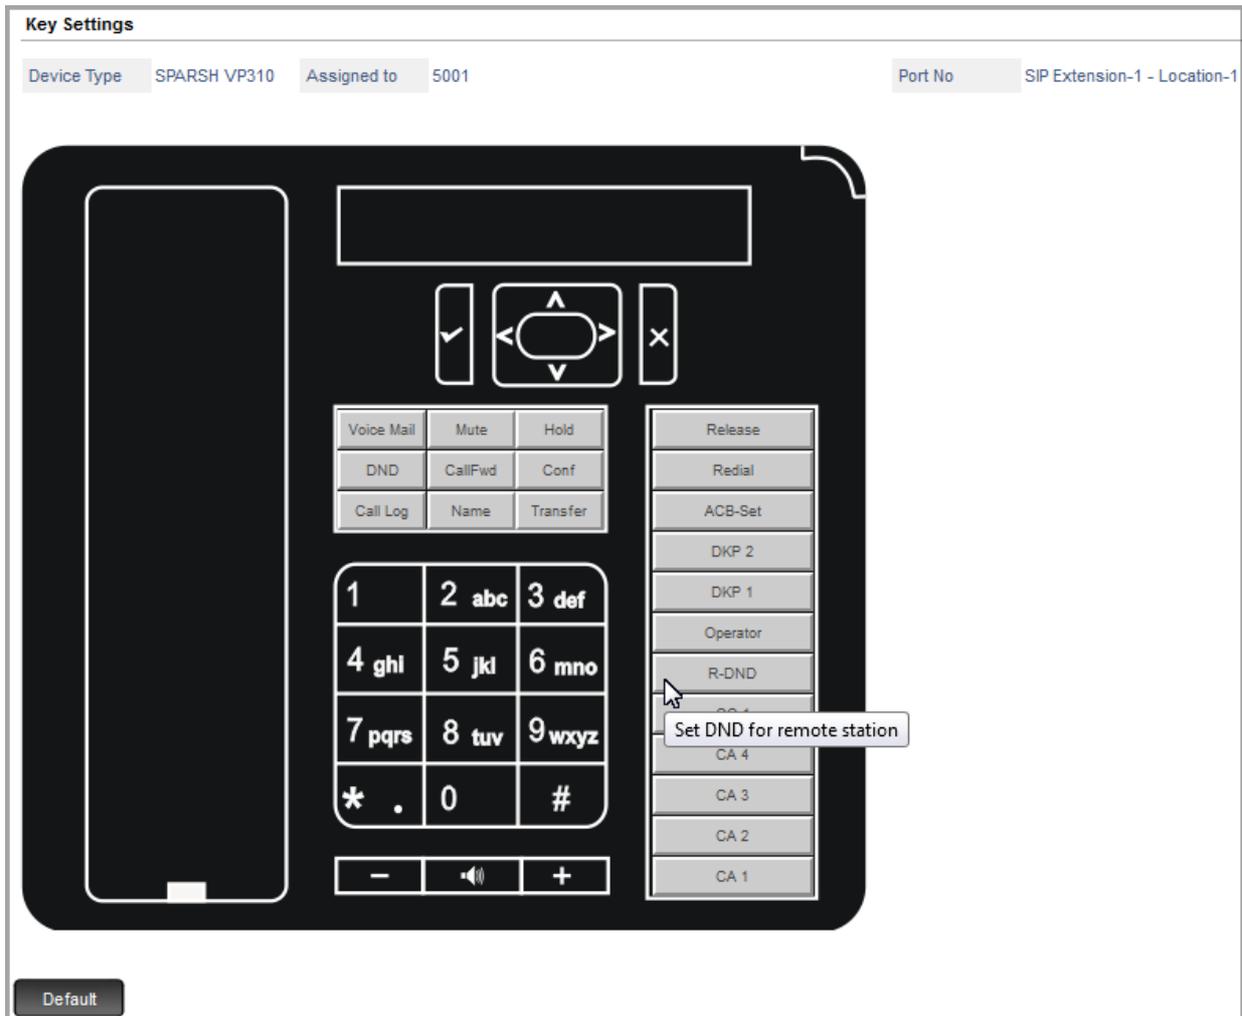

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- In the **Select Offset** box, select the option **Set DND for remote station**.

- Click **OK**. The box closes. Remote DND feature will appear in abbreviated form as *R-DND* on the key label.

- Follow the same instructions to assign features to other DSS keys. Selecting the appropriate Function Type and the Offset for each feature/function.

If you want assign a feature, select **FEATURE** as function type, and select the desired feature as Offset.

If you want to use the key to call a DKP or a SIP extension, select **DKP** or **SIP Extension** as Function Type and select the number of the extension as Offset.

To assign direct access to a Mobile Trunk, select **MOBILE** as Function Type and the desired port number **01** or any other trunk number as Offset.

To assign direct access to a SIP Trunk, select **SIP** as Function Type and the desired trunk number from **01** or any other trunk number as Offset.

Click **OK**, each time you select a Function Type and Offset in the dialog box.

You can reinstate default key assignment any time, by clicking the **Default** button at the bottom of the window.

- When you complete assigning functions to keys, close the window.

- If you assign/re-assign functions to the following keys, the Phone will restart:
 - Speaker
 - Headset
 - Ringer Acknowledge
 - Local Menu

Transport Mode and SRTP

- Select the protocol to be used to transport the SIP messages. You can select the **Transport Mode** as **TCP** or **TLS**.

If you select TCP, make sure the SIP Over TCP check box is selected in VoIP Parameters.

If you select TLS, make sure the SIP Over TLS check box is selected in VoIP Parameters.

- For secure conversations over SIP, select the **Enable SRTP?** check box. The SIP messages will be transported over SRTP only.

If you select this check box, make sure you have selected SRTP Mode as Forced or Optional in the General Parameters under SIP Extension Settings.

RTP Port

- Define **RTP Port**:
 - **RTP Listening Port**: This is the port on which the SPARSH VP310 listens for RTP messages over UDP. This port is also used as the source port for sending RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **SIP Quality of Service (QoS)** for SIP signaling as:
 - **SIP DiffServe/ToS**. Valid range is 00 to 63. Default: 26.
OR
 - **RTP DiffServe/ToS**. Valid range is 00 to 63. Default: 46.

NAT Keep Alive

- If the SPARSH VP310 is connected behind a NAT router, configure **NAT Keep Alive**.
 - Select the check box **Enable NAT Keep Alive** to send Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
 - Define as **Interval (sec)**, the time period, from 001 to 999 seconds, after which the phone should send Keep Alive message. Default: 120 seconds.

The time period you define should be less than the binding timer of the router.

Timers

- Set the following **Timers** to the desired value, where required:

- **SIP INVITE Timer (sec):** This is the time in seconds that the phone waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the phone terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
- **SIP Provisional Timer (sec):** This is the time in seconds that the phone waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the IP phone terminates the call process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds. Default: 60 seconds.
- **General Request Timer (sec):** This is the time in seconds for which the phone waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.

Debug

- To debug using Syslog Client supported by the SPARSH VP310, configure Debug parameters:
 - Select the **Enable Debug?** check box. Default: disabled.

When the Debug flag is enabled, the phone will send the debug messages to the Syslog Server IP address. Debug report can be viewed on the Syslog Server or any other application which can capture the Syslog messages/debug sent by the phone.

- Enter the IP Address and port of the remote Syslog Server and as **Syslog Server Address and Server Port**.

The address of the Listening Port of the Syslog Server is from 1025-65535;514. Default: 514. Syslog uses the UDP as transport protocol and listens on the port 514 (the default listening port).

- You may select the **Debug Level** from the following options, by selecting the respective check box:
 - SIP
 - System
 - Hardware
 - Call
 - Network
 - VoPP

You may select any or all of these debug levels. The Syslog Client will send only the debug messages for the selected level to the remote server on the IP network. For example, if the debug log of 'Call's is required, you can select this option, and disable all others.

- Click **Submit** to save settings.
- If you have completed the configuration of the SPARSH VP310 Settings at Location 1, follow the same steps as described above to configure the SPARSH VP310 at Location 2 and Location 3.

However, if you want to replicate the configuration of the SPARSH VP310 Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to [“Copy Parameter Values”](#).

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you only clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will restart automatically, if registered:

- Use SIP Extension
- SIP ID
- Authentication ID
- Authentication Password
- Registrar Server IP Address
- MAC Address
- Enable Device
- Device Type
- Key Map in the Key Template assigned to phone
- Call Progress Tone
- Date and Time
- Apply DST?
- Transport Mode and SRTP
- QoS
- RTP Ports
- NAT Keep Alive
- SIP Timers
- The SE Password of SARVAM UCS is changed
- Specific parameters in VoIP Parameters are changed
- Specific parameters in Network Port parameters are changed
- You restart the System
- Set the System to Default

Configuring Matrix SPARSH VP330

SPARSH VP330 is the proprietary Extended IP Phone with graphical touch-screen user interface, supplied by Matrix. The feature-rich SIP based phone support most of the features and functions of the proprietary digital key phones of SARVAM UCS. To know the list of features supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For detailed product information and operation instructions, refer to the *SPARSH VP330 User Guide*.

To be able to use SPARSH VP330¹⁴⁰ as SIP Extensions, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension Settings using Jeeves”](#)
- Extended Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#)
- Voice Mail Settings, if you want to provide mailbox facility to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings**.

SIP Extension Settings

SIP Extension: 1

General Parameters | Location-1 | Location-2 | Location-3

SIP Extension - 1

Use SIP Extension

Name

SIP ID

Authentication ID

Authentication Password **Generate**

HTTP Authentication Password (Third Party IP-Phone) **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/VP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.

140. SARVAM UCS supports only IPv4 Addresses for registering SPARSH VP330.

The parameters of the SIP Extension number you selected will appear on this page.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering Extended IP Phones.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default: disabled.
- In the **Name** field, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed.

You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see ["Assigning Access Codes to a Range of Extensions"](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 digits. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.

Make sure the User ID configured in ["Digest Authentication"](#) does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See ["Black List IP Address - SIP Extensions"](#) for more details. This activity will be logged in the ["System Activity Log"](#) as well as ["Simple Network Management Protocol \(SNMP\)"](#).

Make sure you note down or copy the Authentication Password in a confidential file.

- In **Call Appearances**, define the maximum number¹⁴¹ of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- Under **Auto Sign-In**, enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Email ID is used for various server features.

Auto Sign-In parameters — Send Configuration Mail and Mail Status, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.

*The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.*

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - **INVITE Request**
 - **SUBSCRIBE Request**

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.
 - **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks.

141. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic "[SIP Hardware Template](#)" to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The "[Station Basic Feature Template](#)" has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension ("[Class of Service \(COS\)](#)", "[Toll Control](#)", "[OG Trunk Bundle Group](#)", etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The "[Station Advanced Feature Template](#)" has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic "[Station Advanced Feature Template](#)" for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see "[Extension Voice Mail Settings](#)".

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters	Location-1 Location-2 Location-3
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see [“SMS/Email Group”](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required.

Call Pick Up allows the SIP Extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer [“Call Pick Up”](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to [“Call Pick Up”](#) and [“Class of Service \(COS\)”](#). Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See [“COSEC Integration”](#) for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic [“Abbreviated Dialing”](#) for instructions on programming the Personal Directory.

If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description "[Priority](#)".

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can register three Matrix Extended Phones/Soft Clients at three different locations as a single SIP Extension. You can connect the same or different types of Extended Phones/Soft Clients —SPARSH VP248, SPARSH VP310, SPARSH VP510, SPARSH VP330, Extended SPARSH VP710, SPARSH VP210, Matrix VARTA ADR100 Mobile UC Client, Matrix VARTA AMP100 Mobile UC Client or MATRIX VARTA WIN200 Desktop UC Client — at each location. In this case we assume that SPARSH VP330 is connected at Location 1, 2 and 3.

If you have connected SPARSH VP248 refer to "[Configuring Matrix Extended Phone Settings using Jeeves](#)" in *Configuring Matrix SPARSH VP248 as SIP Extensions*.

If you have connected SPARSH VP310 at any of the locations, refer to "[Configuring Matrix SPARSH VP310](#)".

If you have connected SPARSH VP510 at any of the locations, refer to "[Configuring Matrix SPARSH VP510](#)".

If you have connected Extended SPARSH VP710 at any of the locations, refer to "[Configuring Matrix Extended SPARSH VP710](#)".

If you have connected Extended SPARSH VP210 at any of the locations, refer to "[Configuring Matrix SPARSH VP210](#)".

If you have registered Matrix VARTA Mobile UC Clients in any of the locations, refer to "[Configuring Matrix VARTA ADR100/AMP100 UC Clients](#)".

If you have registered MATRIX VARTA WIN200 Desktop UC Client in any of the locations, refer to "[Configuring Matrix VARTA WIN200 UC Client](#)".

If you want to use more than one SPARSH VP330 Phones as a SIP Extension, configure their settings at **Location 1**, **Location 2** and **Location 3**.

- Click **Location 1**.

Submit
Default
Copy

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX SPARSH VP330** as the **Device Type** at this location.
- Enter the **MAC Address**¹⁴² of the SPARSH VP330 connected at this location in hexadecimal format: 00:1b:09:XX:XX:XX. Default: blank.

SARVAM UCS validates the SPARSH VP330 on the basis of the MAC Address, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed MAC address.

- Select the appropriate **Registrar Server Address** to register the SPARSH VP330 with the SIP Registrar of SARVAM UCS, according to your installation scenario:
 - If the SPARSH VP330 is connected on the WAN network, select **Use WAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP330 is connected on the LAN network, select **Use LAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP330 is connected in the Global Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as Registrar Server IP Address.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see "[Configuring Network Parameters](#)".

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Registrar Server IP Address.

By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.

- To set the call progress tone generation standards of the country where the SPARSH VP330 is installed, select the **Call Progress Tone - Region**. Default: Region 1.

See "[Call Progress Tones](#)" to know more.

- To display the Date and Time of the country where the SPARSH VP330 is installed, select the **Date and Time - Region**. Default: India.
- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to either **Manual** or **Scheduled** as per your requirement.

When you select **Scheduled** as the DST option, the Real Time Clock of SARVAM UCS is advanced and set backward automatically according to the DST convention of the country/region where the IP Phone is installed.

Scheduled DST Adjustment is useful in countries/regions where DST Time is fixed, such as in Europe, USA and Canada, without yearly variations.

SARVAM UCS supports 18 DST Types for Scheduled DST Adjustment. To know more, refer to "[Daylight Saving Time \(DST\)](#)". To know more about Scheduled DST assigned for the respective region, refer to *Time Zone* in "[Default Settings](#)".

142. MAC address is the address of the electronic hardware devices such as a computer, which is hard-coded into the device during manufacture and cannot be modified. No two devices can have similar MAC address and thus it uniquely identifies your phone. MAC address is assigned as per the IANA standard. The MAC Address of the phone will be used as source MAC address on all Ethernet frames.

When you select **Manual** as the DST option, the Real Time Clock of SARVAM UCS is advanced manually and set backward automatically according to the DST convention of the country/region where the IP Phone is installed.

Manual DST Adjustment is to be used in regions/countries that have no fixed DST Convention and where yearly variations in DST practices are likely.

When DST option is set as 'Manual', you must set the DST Start and the DST End time, that is, the time at which the clock is to be advanced and the time at which the clock is to be delayed. To do so,

- In **Time Offset**, enter the time you wish to forward or backward the DST start time with.
- In **DST Type**, select the desired option: **Date-Month Wise** OR **Day-Month Wise**.

If you select '**Date-Month Wise**' in **DST Type**, you should now select the desired options in each of the following to specify the **DST Start** details.

- **Date**: Select the date on which DST begins (1-31).
- **Month**: Select the month when DST begins (January-December).
- **Time (Hours)**: Select the time at which DST will begin to change. The time mode is of 24 hours ranging from 00 to 23 hours.
- **Time (Minutes)**: Select the time at which DST will begin to change. The time mode is of 60 minutes ranging from 00 to 59 minutes.

Similarly, in the **DST End** configure the desired DST End Time details.

If you select '**Day-Month Wise**' in **DST Type**, you should now select the desired options in each of the following to specify the **DST Start** details.

- **Ordinal**: Select the Ordinal number of the day of the month, that is, the 1st, 2nd, 3rd, 4th, 5th day, when DST begins.
- **Day**: Select the day of the month - Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday- when DST begins.
- **Month**: Select the month when DST begins (January-December).
- **Time (Hours)**: Select the time at which DST must begin to change. The duration is of 24 hours ranging from 00 to 23.
- **Time (Minutes)**: Select the time at which DST must begin to change. The duration is of 60 minutes ranging from 00 to 59.

Similarly, in **DST End** configure the DST End Time details.

Once the DST Ends, the time of the IP Phone is set back to the Standard time automatically.

When the DST of a particular country starts or ends on the Last Sunday or any other day, for example, the last Tuesday, last Friday of the month, always set the Ordinal Number as '5th'.

- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to Yes. Default: No. The Daylight Saving Time convention followed in the country/region you selected will be automatically applied. The IP phone will change its date and time settings according to the DST convention of the selected country/region.
- Select the **Language** for the SPARSH VP330. Default: English.

SARVAM UCS provides language support for English, French, German, Spanish, Portuguese, and Italian on the SPARSH VP330. When you select any of these languages, all the prompts and command strings will appear in the selected language.

SIP Extension users can change the language by accessing and navigating through the phone menu.

The SA can change the Language by logging into the SA Jeeves.

DSS Key Settings

- You can select the desired key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant, Guest or any other template you added. See [“Customizing Extended IP Phone Templates using Jeeves”](#) for more details.

OR

- You can personalize the key map of the SPARSH VP330 for this location. To do so,
 - Select **Personalized** as the **Key Template** option.
 - Click **Key Settings**.

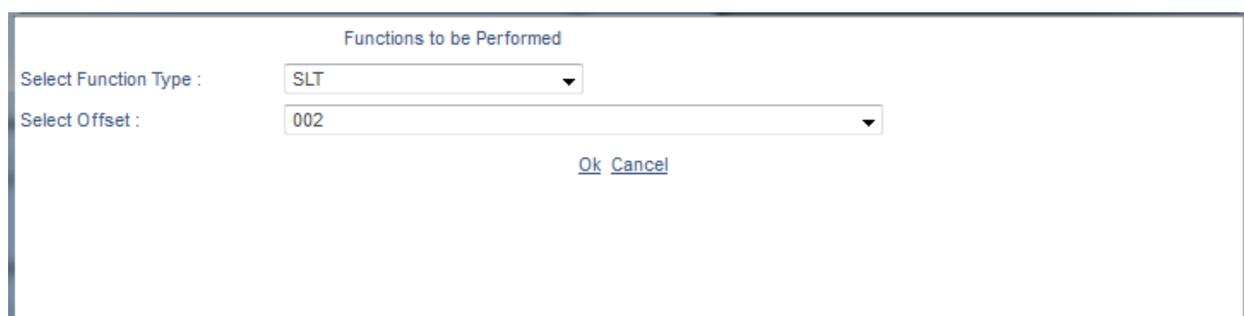

- The key map of the Extended Phone opens in a new window on your screen.

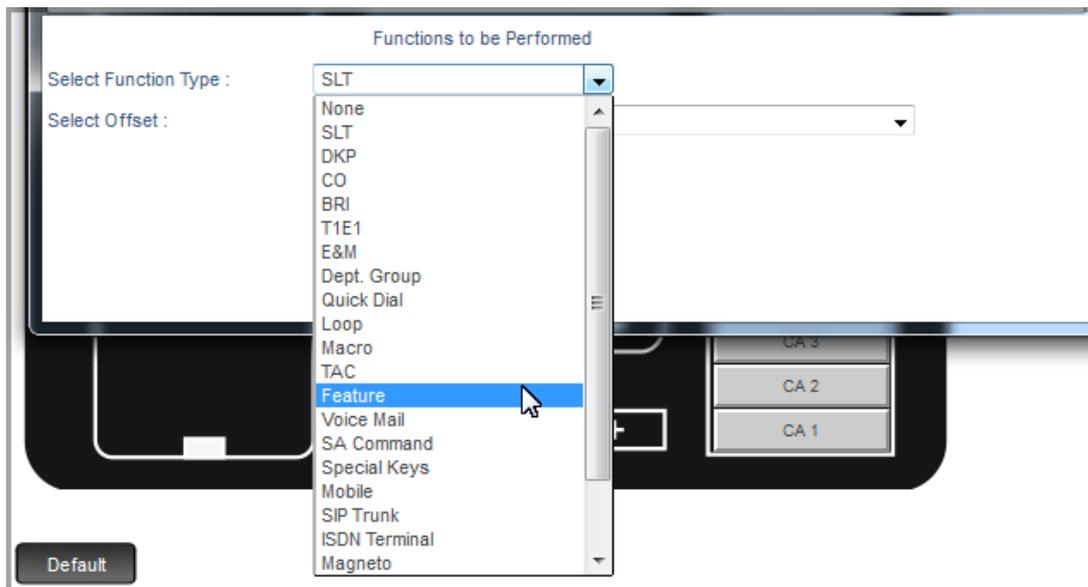

- Click the key you want to configure. For example, **SLT2**.

The **Functions to be Performed** by the key opens in a new window.

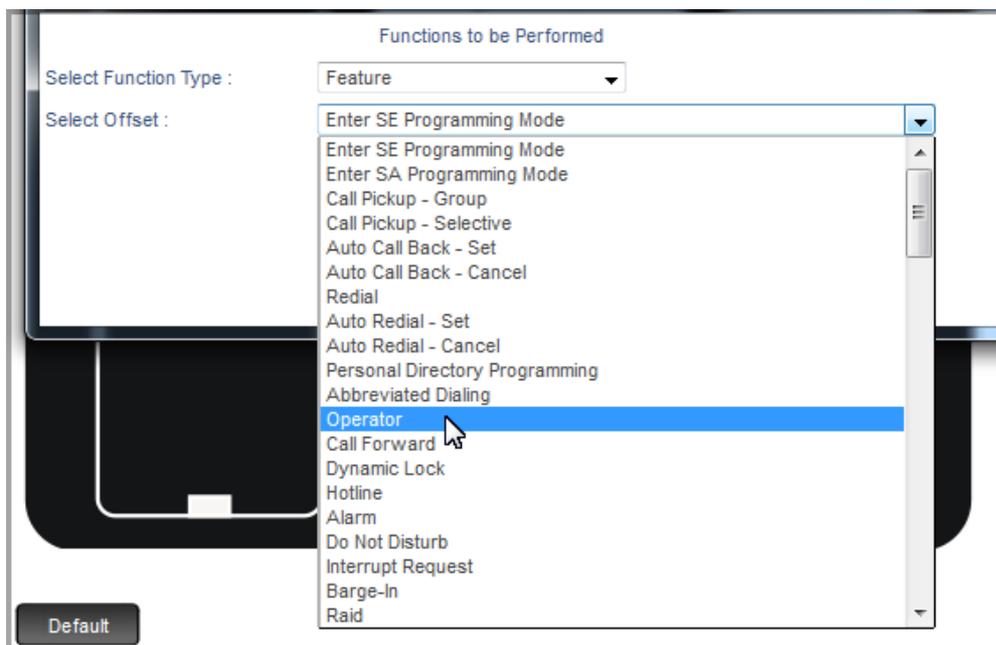

- In the **Select Function Type** list, select the function to be performed by the key. For example, you want to use the key to call the **Operator**.

The Operator function is a Feature, so select the option **FEATURE** from the **Select Function Type** list box.

From the **Select Offset** drop down list, all the features that can be assigned to keys are listed.

- Select **Operator** from the list of features in the **Select Offset** box.

- Click **OK**.

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

The *Operator* feature appears on the key label.

- Follow the same instructions to assign features to other DSS keys. Selecting the appropriate Function Type and the Offset for each feature/function.

If you want assign a feature, select **FEATURE** as function type, and select the desired feature as Offset.

If you want to use the key to call a DKP or a SIP extension, select **DKP** or **SIP Extension** as Function Type and select the number of the extension as Offset.

To assign direct access to a mobile trunk, select **MOBILE** as Function Type and the desired port number **1** or **2** as Offset.

To assign direct access to a SIP Trunk, select **SIP** as Function Type and the desired trunk number from **1 to 4** as Offset.

Click **OK**, each time you select a Function Type and Offset in the dialog box.

You can reinstate default key assignment any time, by clicking the **Default** button at the bottom of the window.

- When you complete assigning functions to keys, close the window.

The phone will enter the Auto Configuration mode, when you assign/re-assign certain features in the key maps. To know more, refer to the SPARSH VP330 User Guide.

Even if you assign keys for the following feature in the Key Templates, these features will not function:

Function Type	Offset
Macro	
SA Command	
Special Keys	Digit Pause
	Digit A
	Digit B
	Digit C
	Digit D
	Enter
	Local Menu
Feature	Enter SE Programming Mode
	Enter SA Programming Mode
	Personal Directory Programming
	Abbreviated Dialing
	Change Room Clean Status
	Guest Access Code
	Minibar Details
	Emergency Conference
	Self Ring Test
	SA Command Prefix
	PMS - User Defined Fields
	Department Group Call Forward

Transport Mode and SRTP

- Select the protocol to be used to transport the SIP messages. You can select the **Transport Mode** as **TCP** or **TLS**¹⁴³.

143. SPARSH VP330 supports TLS Version V1.0 only. To configure the TLS version, refer ["Advance Options"](#) in Security Settings.

If you select **TCP**, make sure the **SIP Over TCP** check box is selected in **VoIP Parameters**.
If you select **TLS**, make sure the **SIP Over TLS** check box is selected in **VoIP Parameters**.

- For secure conversations over SIP, select the **Enable SRTP?** check box. The SIP messages will be transported over SRTP only.

RTP Port

- Define **RTP Port**:
 - **RTP Listening Port**: This is the port on which the phone listens for RTP messages over UDP. This port is also used as the source port for sending RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **SIP Quality of Service (QoS)** for SIP signaling as:
 - **SIP DiffServe/ToS**. Valid range is 00 to 63. Default: 26.
OR
 - **RTP DiffServe/ToS**. Valid range is 00 to 63. Default: 46.

NAT Keep Alive

- If the SPARSH VP330 is connected behind a NAT router, configure **NAT Keep Alive**.
 - Select the check box **Enable NAT Keep Alive** to send Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
 - Define as **Interval (sec)**, the time period, from 001 to 999 seconds, after which the phone should send Keep Alive message. Default: 120 seconds.

The time period you define should be less than the binding timer of the router.

Timers

- Set the following **Timers** to the desired value, where required:
 - **SIP INVITE Timer (sec)**: This is the time in seconds that the phone waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the phone terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
 - **SIP Provisional Timer (sec)**: This is the time in seconds that the phone waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the IP phone terminates the call process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds. Default: 60 seconds.
 - **General Request Timer (sec)**: This is the time in seconds for which the phone waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a

response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.

- Click **Submit** to save settings.
- If you have completed the configuration of the SPARSH VP330 Phone Settings at Location 1, follow the same steps as described above to configure the SPARSH VP330 Phone at Location 2 and Location 3.

However, if you want to replicate the configuration of the SPARSH VP330 Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to "[Copy Parameter Values](#)".

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you only clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will go in Auto Configuration mode automatically, if registered:

- Use SIP Extension
- SIP ID
- Name
- Authentication ID
- Authentication Password
- Registrar Server IP Address
- MAC Address
- Enable Device
- Device Type
- Key Map in the Key Template assigned to phone
- Language
- Call Progress Tone
- Date and Time
- Apply DST?
- Transport Mode and SRTP
- QoS
- RTP Ports
- NAT Keep Alive
- SIP Timers
- Class of Service
- Trunk Access Code
- Emergency Numbers

The SIP Extension registered at Location 1, 2, 3, will also restart, if:

- The SE Password of SARVAM UCS is changed
- Specific parameters in Network Port parameters are changed
- Specific parameters in VoIP Parameters are changed
- You restart the System
- Set the System to Default

Configuring Matrix SPARSH VP510

SPARSH VP510, the Premium IP Phone is engineered to offer a contemporary design with crystal-clear audio and feature-rich capabilities at economical price. To know the list of features supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For instructions on how to use SPARSH VP510, refer to the *EON510_SPARSH VP510 User Guide*.

To be able to use SPARSH VP510¹⁴⁴ - Extended IP Phone, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension Settings using Jeeves”](#)
- Extended Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#)
- Voice Mail Settings, if you want to provide mailbox facility to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings**.

SIP Extension Settings

SIP Extension: 1

General Parameters | Location-1 | Location-2 | Location-3

SIP Extension - 1

Use SIP Extension

Name

SIP ID

Authentication ID

Authentication Password **Generate**

HTTP Authentication Password (Third Party IP-Phone) **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/VP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.
The parameters of the SIP Extension number you selected will appear on this page.

144. SARVAM UCS supports only IPv4 Addresses for registering SPARSH VP510.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering Extended IP Phones.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default: disabled.
- In the **Name** field, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed.

You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see ["Assigning Access Codes to a Range of Extensions"](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 alphanumeric characters. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.

Make sure the User ID configured in ["Digest Authentication"](#) does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See ["Black List IP Address - SIP Extensions"](#) for more details. This activity will be logged in the ["System Activity Log"](#) as well as ["Simple Network Management Protocol \(SNMP\)"](#).

Make sure you note down or copy the Authentication Password in a confidential file.

- In **Call Appearances**, define the maximum number¹⁴⁵ of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- During an on-going conversation, if there is a second incoming call, the system plays beeps to indicate the second incoming call. You can set the frequency of the **Call Waiting Tone (for SPARSH VP248/VP310/VP510)** beeps as per your requirement. You can select from the following options:
 - Off
 - Beep Once
 - Beep until Answered

Default: Beep Once

However, when an ongoing call is being taped or recorded, the call waiting tone for any new incoming call will not be played.

- Select the **Allow Standard SIP Registration** check box to allow the Standard SIP Extensions to get registered with the system. Default: Disabled.
- Under **Auto Sign-In**, enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Email ID is used for various server features.

Auto Sign-In parameters — Send Configuration Mail and Mail Status, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.

*The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.*

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - **INVITE Request**
 - **SUBSCRIBE Request**

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
- If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**.

¹⁴⁵. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

By default, AVP is selected as the SRTP Media Type.

- **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters.

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks. Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic [“SIP Hardware Template”](#) to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The [“Station Basic Feature Template”](#) has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension ([“Class of Service \(COS\)”](#), [“Toll Control”](#), [“OG Trunk Bundle Group”](#), etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.

- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The "[Station Advanced Feature Template](#)" has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic "[Station Advanced Feature Template](#)" for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see "[Extension Voice Mail Settings](#)".

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

- Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see ["SMS/Email Group"](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required. Default: 01

Call Pick Up allows the SIP Extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer ["Call Pick Up"](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of

Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to [“Call Pick Up”](#) and [“Class of Service \(COS\)”](#). Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See [“COSEC Integration”](#) for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic [“Abbreviated Dialing”](#) for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description [“Priority”](#).

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can register three Matrix Extended IP Phones/Soft Clients at three different locations as a single SIP Extension. You can connect/register the same or different types of Extended Phones/Soft Clients —SPARSH VP248, SPARSH VP310, SPARSH VP330, SPARSH VP510, SPARSH VP210, Matrix Extended SPARSH VP710, Matrix VARTA ADR100 Mobile UC Client, VARTA AMP100 Mobile UC Client or MATRIX VARTA WIN200 Desktop UC Client— at each location. In this case we assume that SPARSH VP510 is connected at Location 1, 2 and 3.

If you have connected SPARSH VP248 at any of the locations, refer to [“Configuring Matrix Extended Phone Settings using Jeeves”](#).

If you have connected SPARSH VP310 at any of the locations, refer to [“Configuring Matrix SPARSH VP310”](#).

If you have connected SPARSH VP330 at any of the locations, refer to [“Configuring Matrix SPARSH VP330”](#).

If you have connected Extended SPARSH VP710 at any of the locations, refer to [“Configuring Matrix Extended SPARSH VP710”](#).

If you have connected Extended SPARSH VP210 at any of the locations, refer to [“Configuring Matrix SPARSH VP210”](#).

If you have registered Matrix VARTA ADR100 and VARTA AMP100 Mobile UC Clients in any of the locations, refer to [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

If you have registered MATRIX VARTA WIN200 Desktop UC Client in any of the locations, refer to [“Configuring Matrix VARTA WIN200 UC Client”](#).

If you want to use more than one SPARSH VP510 Extended IP Phones as a SIP Extension, configure their settings at **Location 1**, **Location 2** and **Location 3**.

- Click **Location 1**.

SIP Extension Settings

SIP Extension: 1

General Parameters: [Location-1](#) [Location-2](#) [Location-3](#)

SIP Extension - 1

Use SIP Extension:

Name:

SIP ID:

Authentication ID:

Authentication Password: **Generate**

HTTP Authentication Password (Third Party IP-Phone): **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/VP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

- The settings of the phone at **Location 1** appear.

SIP Extension Settings

SIP Extension: 1

General Parameters | Location-1 | Location-2 | Location-3

SIP Extension - 1

Location-1

Enable Device:

Location Name:

Device Type: MATRIX SPARSH VP510

MAC Address:

Registrar Server Address: Use WAN Port IP Address

Call Progress Tone - Region: Region 1

Date and Time - Region: India (GMT+05:30)

Apply DST?: No

Submit | Default | Copy

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX SPARSH VP510** as the **Device Type** at this location.
- Enter the **MAC Address**¹⁴⁶ of the SPARSH VP510 connected at this location in hexadecimal format: 00:1b:09:XX:XX:XX. Default: Blank.

SARVAM UCS validates the Extended Phone on the basis of the MAC Address, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed MAC address.

- Select the appropriate **Registrar Server Address** to register the SPARSH VP510 with the SIP Registrar of SARVAM UCS, according to your installation scenario:
 - If the SPARSH VP510 is connected on the WAN network, select **Use WAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP510 is connected on the LAN network, select **Use LAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP510 is connected in the Global Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as Registrar Server IP Address.

146. MAC address is the address of the electronic hardware devices such as a computer, which is hard-coded into the device during manufacture and cannot be modified. No two devices can have similar MAC address and thus it uniquely identifies your phone. MAC address is assigned as per the IANA standard. The MAC Address of the phone will be used as source MAC address on all Ethernet frames.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see ["Configuring Network Parameters"](#).

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Registrar Server IP Address.

By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.

- To set the call progress tone generation standards of the country where the SPARSH VP510 is installed, select the **Call Progress Tone - Region**. Default: Region 1.

See ["Call Progress Tones"](#) to know more.

- To display the Date and Time of the country where the SPARSH VP510 is installed, select the **Date and Time - Region**. Default: India.
- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to either **Manual** or **Scheduled** as per your requirement.

When you select **Scheduled** as the DST option, the Real Time Clock of SARVAM UCS is advanced and set backward automatically according to the DST convention of the country/region where the IP Phone is installed.

Scheduled DST Adjustment is useful in countries/regions where DST Time is fixed, such as in Europe, USA and Canada, without yearly variations.

SARVAM UCS supports 18 DST Types for Scheduled DST Adjustment. To know more, refer to ["Daylight Saving Time \(DST\)"](#). To know more about Scheduled DST assigned for the respective region, refer to *Time Zone* in ["Default Settings"](#).

When you select **Manual** as the DST option, the Real Time Clock of SARVAM UCS is advanced manually and set backward automatically according to the DST convention of the country/region where the IP Phone is installed.

Manual DST Adjustment is to be used in regions/countries that have no fixed DST Convention and where yearly variations in DST practices are likely.

When DST option is set as 'Manual', you must set the DST Start and the DST End time, that is, the time at which the clock is to be advanced and the time at which the clock is to be delayed. To do so,

- In **Time Offset**, enter the time you wish to forward or backward the DST start time with.
- In **DST Type**, select the desired option: **Date-Month Wise** OR **Day-Month Wise**.

If you select '**Date-Month Wise**' in **DST Type**, you should now select the desired options in each of the following to specify the **DST Start** details.

- **Date**: Select the date on which DST begins (1-31).
- **Month**: Select the month when DST begins (January-December).
- **Time (Hours)**: Select the time at which DST will begin to change. The time mode is of 24 hours ranging from 00 to 23 hours.
- **Time (Minutes)**: Select the time at which DST will begin to change. The time mode is of 60 minutes ranging from 00 to 59 minutes.

Similarly, in the **DST End** configure the desired DST End Time details.

If you select '**Day-Month Wise**' in **DST Type**, you should now select the desired options in each of the following to specify the **DST Start** details.

- **Ordinal**: Select the Ordinal number of the day of the month, that is, the 1st, 2nd, 3rd, 4th, 5th day, when DST begins.
- **Day**: Select the day of the month - Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday- when DST begins.
- **Month**: Select the month when DST begins (January-December).
- **Time (Hours)**: Select the time at which DST must begin to change. The duration is of 24 hours ranging from 00 to 23.
- **Time (Minutes)**: Select the time at which DST must begin to change. The duration is of 60 minutes ranging from 00 to 59.

Similarly, in **DST End** configure the DST End Time details.

Once the DST Ends, the time of the IP Phone is set back to the Standard time automatically.

When the DST of a particular country starts or ends on the Last Sunday or any other day, for example, the last Tuesday, last Friday of the month, always set the Ordinal Number as '5th'.

- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to Yes. Default: No. The Daylight Saving Time convention followed in the country/region you selected will be automatically applied. The SPARSH VP510 will change its date and time settings according to the DST convention of the selected country/region.
- Select the **CO CLIP Pattern** for the SPARSH VP510. This is the type of Calling Line Presentation on the phone for incoming calls from trunks. You can select any of these options:
 - **Name Only** (only the name of the caller will be displayed).
 - **Number Only** (only the number of the caller will be displayed).
 - **Number + Name** (both the name and the number of the caller will be displayed).

Default: Number + Name.

- Select the **Language** for the SPARSH VP510. Default: English.

SARVAM UCS provides language support for English, French, German, Spanish, Portuguese, and Italian on the SPARSH VP510. When you select any of these languages, all the prompts and command strings will appear in the selected language.

SIP Extension users can change the language by accessing and navigating through the phone menu.

The SA can change the Language by logging into the SA Jeeves.

- Select a **Ringer Mode** for the phone from the four options:
 - Ring immediately (it rings immediately as a fresh calls lands on the phone).
 - Ring if idle (rings only if the phone is idle).
 - Ring after a delay (if the call is still not answered).
 - Silent.

Default: Ring Immediate.

- If you selected *Ring after a delay* as Ringer Mode, set the **Ring Delay Timer (sec)**, if required, to the desired value.

The Ring Delay Timer is the time in seconds the system waits on receiving a call before ringing on the phone. The range of this timer is 0 to 99 seconds. Default: 10 seconds.

- If you want to enable *Ringer Auto Acknowledge* mode, set the **Acknowledge Timer (sec)** to the desired value.

The Ringer Auto Acknowledge mode determines when to stop the ring on the phone. There are two options for Ringer Auto Acknowledge:

- Stop only when the call is answered.
- Stop after a delay.

To stop the ring on the phone after a delay, the Acknowledge Timer must be configured. The range of this timer is 01 to 99 seconds. Default: 00 seconds.

To stop the ring only when the Call is answered or manually acknowledged, the Acknowledge Timer must be set to '00'. By default, Ring Auto Acknowledge is turned OFF.

- To assign the Ring Destination for the SPARSH VP510, select the desired destination for **Play Ring on**. You may choose
 - **Speakerphone**: The ring will be played on the Speakerphone.
 - **Headset**: The ring will be played on the Headset.
 Default: Speakerphone.

When you select the Headset as the destination, make sure that you set the flag '*Headset Connected?*' to Yes, connect a Headset to the SPARSH VP510.

- Set the **Ringer Volume** to the desired level, from 0 to 7, according to your preference. Default: 4.

You can also set the Ringer Tune. For detailed instructions, refer to the EON510_SPARSH VP510 User Guide.

- To increase/decrease the volume of outgoing speech (Transmit Gain) on the handset of the SPARSH VP510, set the **Handset Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of incoming speech (Receive Gain) on the handset of the SPARSH VP510, set the **Handset Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of outgoing speech (Transmit Gain) on the headset of the SPARSH VP510, set the **Headset Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To increase/decrease the volume of outgoing speech (Receive Gain) on the headset of the SPARSH VP510, set the **Headset Receive Volume Level** to the desired level, from 0 to 7. Default: 4.
- To change the Transmit Gain of the Speakerphone MIC Volume, set **Speaker Transmit Volume Level** to the desired level, from 0 to 7. Default: 4.
- To change the Receive Gain of the Speakerphone MIC Volume, set **Speaker Receive Volume Level** to the desired level, from 0 to 7. Default: 4.

- To increase the volume of the incoming speech on the handset, select the **Handset High Gain Mode** check box. This is useful for individuals with hearing aids. Default: Disabled.
- To use a Headset with the SPARSH VP510, select the **Headset Connected?** check box. Default: Disabled.

Make sure that you connect a Headset to the SPARSH VP510, if you enable this option.

- Select the **Auto Answer** check box to enable this feature on the SPARSH VP510. Default: Disabled.

When you set the “[Auto Answer](#)” feature on the SPARSH VP510, the phone goes OFF-Hook automatically after a preset period of time, without the extension user having to pick up the handset or press the speaker or headset key. When you enable Auto Answer, you must configure the Auto Answer Timer.

- If you enabled Auto Answer on the phone, set the **Auto Answer Timer (sec)** to the desired value.

This timer defines the time in seconds that the SPARSH VP510 should wait before going OFF-Hook to auto answer a call. The range of this timer is 1 to 9 seconds. Default: 1 second.

- Adjust the Backlight brightness of the phone’s LCD display, by setting the **LCD Backlight Level** to the desired value, from 1 to 4. Default: 3.
- Set the **Back Light Off Timer (sec)** to the desired value, if required, from 000 to 999 seconds. Default: 10 seconds.
- Set the **LCD Contrast Level** to a level from 1 to 4 that is comfortable to you. Default: 3.

DSS Key Settings

- You can select the desired key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant, Guest or any other template you added. See “[Customizing Extended IP Phone Templates using Jeeves](#)” for more details.

OR

- You can personalize the key map of the SPARSH VP510 for this location. To do so,
 - Select **Personalized** as the **Key Template** option.
 - Click **Submit**.
 - Click **Key Settings**.

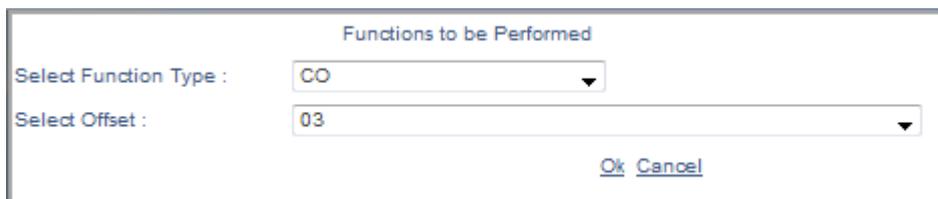

- The key map of the Extended Phone opens in a new window on your screen.

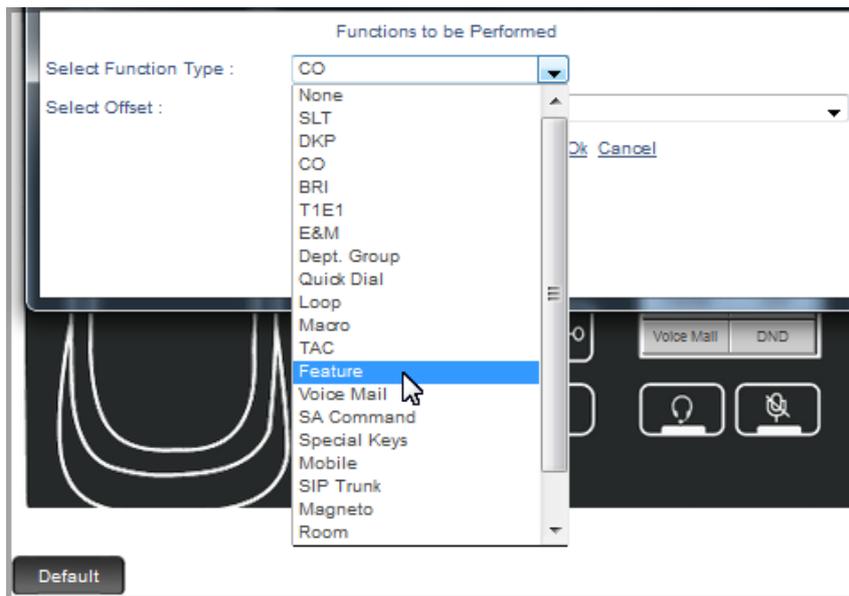

- Click the key you want to configure. For example, **CO3**.

The **Functions to be Performed** by the key opens in a new window.

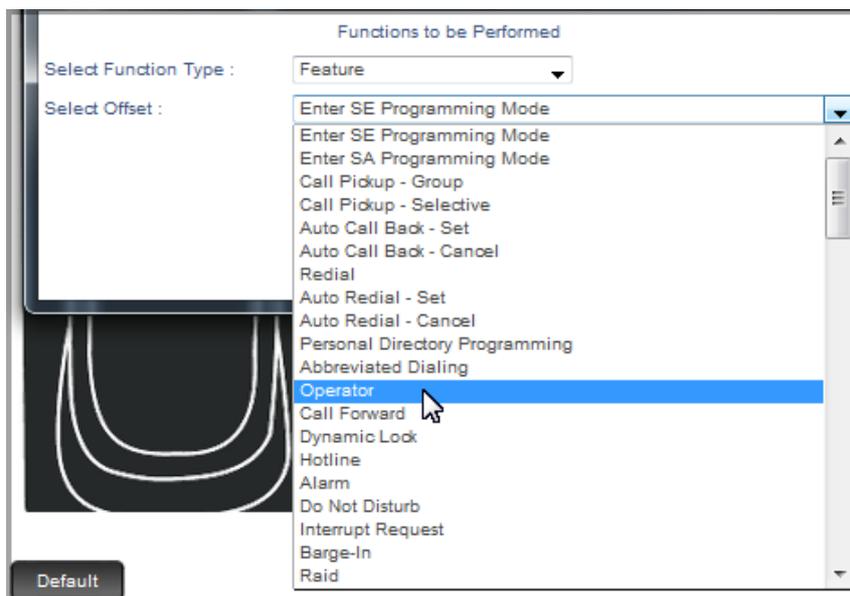

- In the **Select Function Type** list, select the function to be performed by the key. For example, you want to use the key to call the **Operator**.

The Operator function is a Feature, so select the option **FEATURE** from the **Select Function Type** list box.

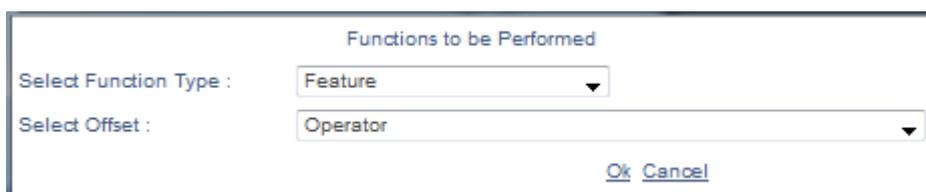

From the **Select Offset** drop down list, all the features that can be assigned to keys are listed.

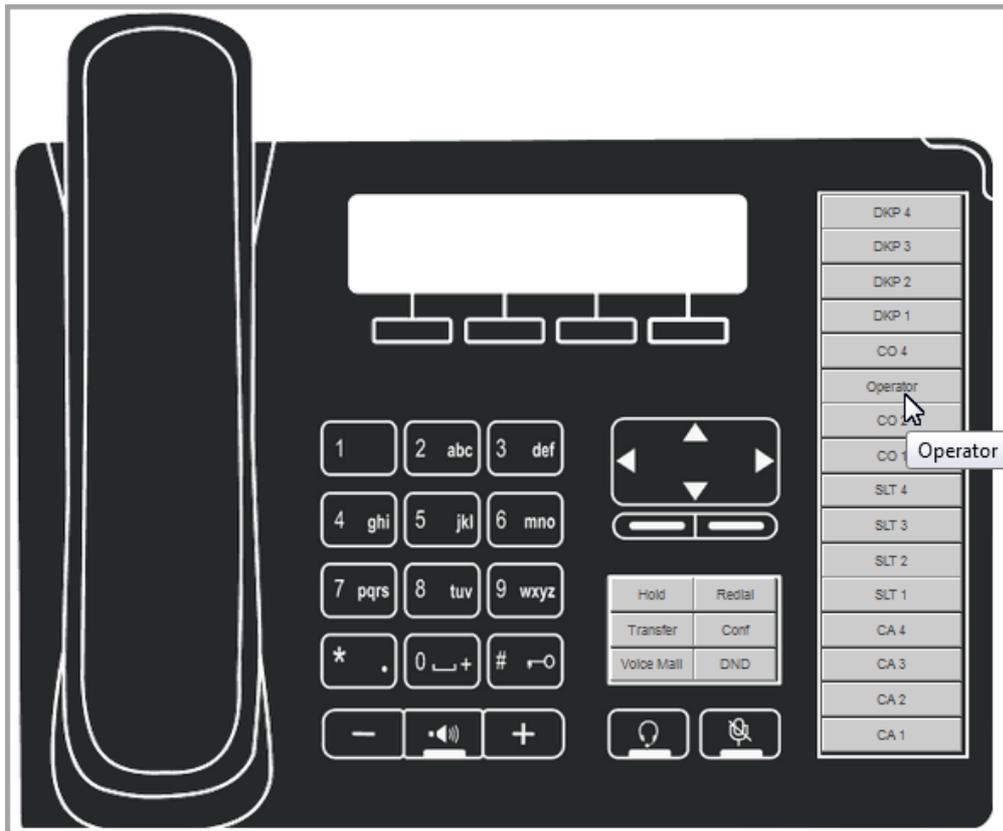

- Select **Operator** from the list of features in the **Select Offset** box.

- Click **OK**.

The *Operator* feature appears on the key label.

- To take a second example, if you want to assign **Remote DND** to the key currently assigned **CO 2** key, click the key.

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- In the **Select Function Type** list box, select the option **SA Command**, as Remote DND is a System Administrator (SA) Command.

Functions to be Performed

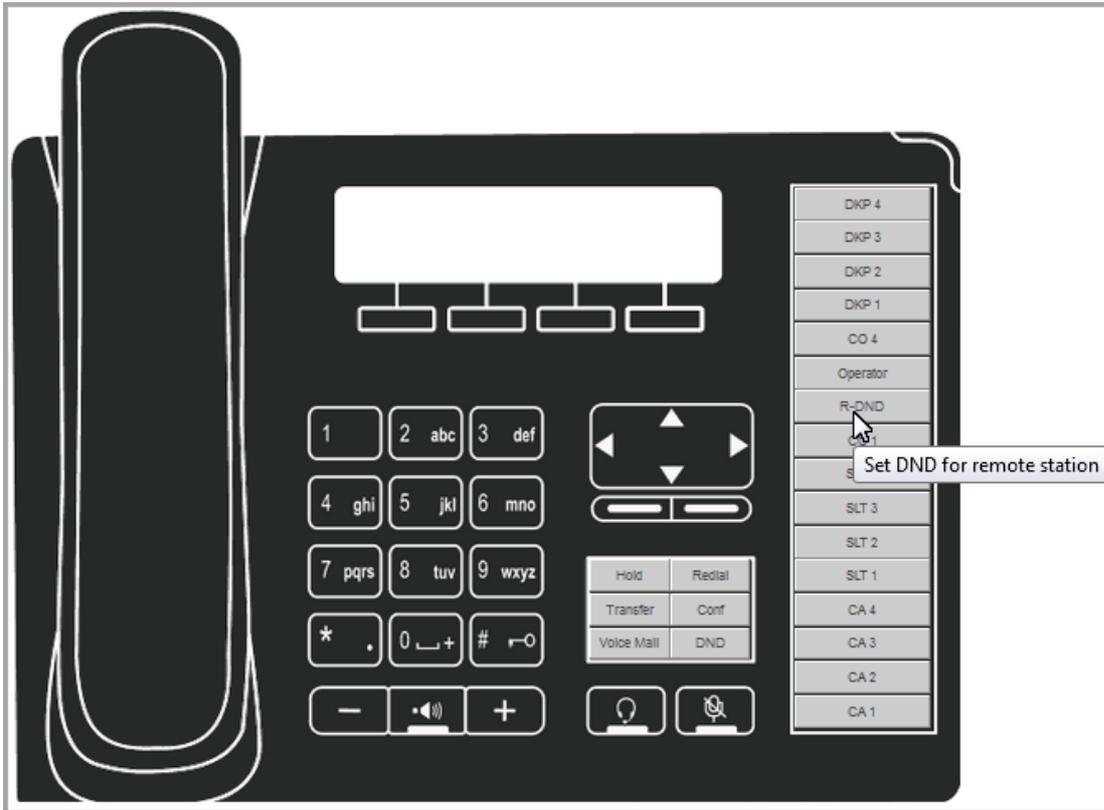

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- In the **Select Offset** box, select the option **Set DND for remote station**.

- Click **OK**. The box closes. Remote DND feature will appear in abbreviated form as *R-DND* on the key label.

- Follow the same instructions to assign features to other DSS keys. Selecting the appropriate Function Type and the Offset for each feature/function.

If you want assign a feature, select **FEATURE** as function type, and select the desired feature as Offset.

If you want to use the key to call a DKP or a SIP extension, select **DKP** or **SIP Extension** as Function Type and select the number of the extension as Offset.

To assign direct access to a Mobile Trunk, select **MOBILE** as Function Type and the desired port number **01** or any other trunk number as Offset.

To assign direct access to a SIP Trunk, select **SIP** as Function Type and the desired trunk number from **01** or any other trunk number as Offset.

Click **OK**, each time you select a Function Type and Offset in the dialog box.

You can reinstate default key assignment any time, by clicking the **Default** button at the bottom of the window.

- When you complete assigning functions to keys, close the window.
- If you assign/re-assign functions to the following keys, the Phone will restart:
 - Speaker
 - Headset
 - Ringer Acknowledge

- Local Menu
- You can also connect a DSS Console (DSS532) with SPARSH VP510. For instructions:
 - to install the DSS532 with SPARSH VP510, see [“Installing DSS532 with SPARSH VP510”](#).
 - to configure the DSS keys of the Console, see [“Configuring DSS Console Keys connected to SPARSH VP510”](#).

Transport Mode and SRTP

- Select the protocol to be used to transport the SIP messages. You can select the **Transport Mode** as **TCP** or **TLS**.

If you select TCP, make sure the SIP Over TCP check box is selected in VoIP Parameters.

If you select TLS, make sure the SIP Over TLS check box is selected in VoIP Parameters.

- For secure conversations over SIP, select the **Enable SRTP?** check box. The SIP messages will be transported over SRTP only.

If you select this check box, make sure you have selected SRTP Mode as Forced or Optional in the General Parameters under SIP Extension Settings.

RTP Port

- Define the RTP Port:
 - **RTP Listening Port:** This is the port on which the SPARSH VP510 listens for RTP messages over UDP. This port is also used as the source port for sending RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **SIP Quality of Service (QoS)** for SIP signaling as:
 - **SIP DiffServe/ToS.** Valid range is 00 to 63. Default: 26.
 - OR
 - **RTP DiffServe/ToS.** Valid range is 00 to 63. Default: 46.

NAT Keep Alive

- If the SPARSH VP510 is connected behind a NAT router, configure **NAT Keep Alive**.
 - Select the check box **Enable NAT Keep Alive** to send Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
 - Define as **Interval (sec)**, the time period, from 001 to 999 seconds, after which the phone should send Keep Alive message. Default: 120 seconds.

The time period you define should be less than the binding timer of the router.

Timers

- Set the following **Timers** to the desired value, where required:
 - **SIP INVITE Timer (sec):** This is the time in seconds that the phone waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the phone terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
 - **SIP Provisional Timer (sec):** This is the time in seconds that the phone waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the IP phone terminates the call process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds. Default: 60 seconds.
 - **General Request Timer (sec):** This is the time in seconds for which the phone waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.

Debug

- To debug using Syslog Client supported by the SPARSH VP510, configure Debug parameters:
 - Select the **Enable Debug?** check box. Default: disabled.

When the Debug flag is enabled, the phone will send the debug messages to the Syslog Server IP address. Debug report can be viewed on the Syslog Server or any other application which can capture the Syslog messages/debug sent by the phone.

- Enter the IP Address and port of the remote Syslog Server and as **Syslog Server Address and Server Port**.

The address of the Listening Port of the Syslog Server is from 1025-65535;514. Default: 514. Syslog uses the UDP as transport protocol and listens on the port 514 (the default listening port).

- You may select the **Debug Level** from the following options, by selecting the respective check box:
 - SIP
 - System
 - Hardware
 - Call
 - Network
 - VoPP

You may select any or all of these debug levels. The Syslog Client will send only the debug messages for the selected level to the remote server on the IP network. For example, if the debug log of 'Call's is required, you can select this option, and disable all others.

- Click **Submit** to save settings.

- If you have completed the configuration of the SPARSH VP510 Settings at Location 1, follow the same steps as described above to configure the SPARSH VP510 at Location 2 and Location 3.

However, if you want to replicate the configuration of SPARSH VP510 Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to [“Copy Parameter Values”](#).

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will restart automatically, if registered:

- Use SIP Extension
- SIP ID
- Authentication ID
- Authentication Password
- Registrar Server IP Address
- MAC Address
- Enable Device
- Device Type
- Key Map in the Key Template assigned to phone
- Call Progress Tone
- Date and Time
- Apply DST?
- Transport Mode and SRTP
- QoS
- RTP Ports
- NAT Keep Alive
- SIP Timers
- The SE Password of SARVAM UCS is changed
- Specific parameters in VoIP Parameters are changed
- Specific parameters in Network Port parameters are changed
- You restart the System
- Set the System to Default

Configuring Matrix SPARSH VP210

SPARSH VP210 is the proprietary Entry Level IP Phone by Matrix which is engineered to offer a contemporary design with clear audio and feature-rich capabilities at economical price. To know the list of features supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For detailed product information and operation instructions, refer to the *SPARSH VP210 (Extended) User Guide*.

To be able to use SPARSH VP210¹⁴⁷ as SIP Extensions, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension Settings using Jeeves”](#)
- Extended Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#)
- Voice Mail Settings, if you want to provide mailbox facility to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings**.

The screenshot shows the 'SIP Extension Settings' configuration page. The left sidebar contains a tree view with 'VoIP Configuration' expanded to 'SIP Extension Settings'. The main panel has a 'SIP Extension' dropdown set to '1'. Below it are tabs for 'General Parameters', 'Location-1', 'Location-2', and 'Location-3'. The 'SIP Extension - 1' section contains several input fields: 'Use SIP Extension' (checkbox), 'Name', 'SIP ID', 'Authentication ID', 'Authentication Password', and 'HTTP Authentication Password (Third Party IP-Phone)'. A 'Generate' button is located to the right of the 'Authentication Password' field. A note below the fields states: 'Note :- Authentication Password and HTTP Authentication Password must follow following requirements: • Minimum length must be 6 characters. • Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character. • Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, " and space.' Below the note are fields for 'Call Appearances' (dropdown set to 02), 'Call Waiting Tone (for SPARSH VP248/VP310/VP510)' (dropdown set to Beep Once), and 'Allow Standard SIP Registration' (checkbox). At the bottom of the panel are four buttons: 'Submit', 'Default', 'Advance', and 'Call Traffic'.

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.

The parameters of the SIP Extension number you selected will appear on this page.

147. SARVAM UCS supports only IPv4 Addresses for registering SPARSH VP210.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering Extended IP Phones.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default: disabled.
- In the **Name** field, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed.

You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see ["Assigning Access Codes to a Range of Extensions"](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 digits. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.

Make sure the User ID configured in ["Digest Authentication"](#) does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) and digits 0 to 9 are allowed.Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See ["Black List IP Address - SIP Extensions"](#) for more details. This activity will be logged in the ["System Activity Log"](#) as well as ["Simple Network Management Protocol \(SNMP\)"](#).

- In **Call Appearances**, define the maximum number¹⁴⁸ of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- Under **Auto Sign-In**, enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Email ID is used for various server features.

Auto Sign-In parameters — Send Configuration Mail and Mail Status, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.

The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - **INVITE Request**
 - **SUBSCRIBE Request**

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.
 - **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks.

Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

¹⁴⁸. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic "[SIP Hardware Template](#)" to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The "[Station Basic Feature Template](#)" has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension ("[Class of Service \(COS\)](#)", "[Toll Control](#)", "[OG Trunk Bundle Group](#)", etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The "[Station Advanced Feature Template](#)" has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic "[Station Advanced Feature Template](#)" for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see "[Extension Voice Mail Settings](#)".

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see ["SMS/Email Group"](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required.

Call Pick Up allows the SIP Extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer ["Call Pick Up"](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of

Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to [“Call Pick Up”](#) and [“Class of Service \(COS\)”](#). Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See [“COSEC Integration”](#) for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic [“Abbreviated Dialing”](#) for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description [“Priority”](#).

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can register three Matrix Extended Phones/Soft Clients at three different locations as a single SIP Extension. You can connect the same or different types of Extended Phones/Soft Clients —SPARSH VP210, SPARSH VP248, SPARSH VP310, SPARSH VP510, SPARSH VP330, Extended SPARSH VP710, Matrix VARTA ADR100 Mobile UC Client, Matrix VARTA AMP100 Mobile UC Client or MATRIX VARTA WIN200 Desktop UC Client — at each location. In this case we assume that SPARSH VP210 is connected at Location 1, 2 and 3.

If you have connected SPARSH VP248 at any of the locations, refer to [“Configuring Matrix Extended Phone Settings using Jeeves”](#).

If you have connected SPARSH VP310 at any of the locations, refer to “[Configuring Matrix SPARSH VP310](#)”.

If you have connected SPARSH VP330 at any of the locations, refer to “[Configuring Matrix SPARSH VP330](#)”.

If you have connected Extended SPARSH VP710 at any of the locations, refer to “[Configuring Matrix Extended SPARSH VP710](#)”.

If you have registered Matrix VARTA Mobile UC Clients in any of the locations, refer to “[Configuring Matrix VARTA ADR100/AMP100 UC Clients](#)”.

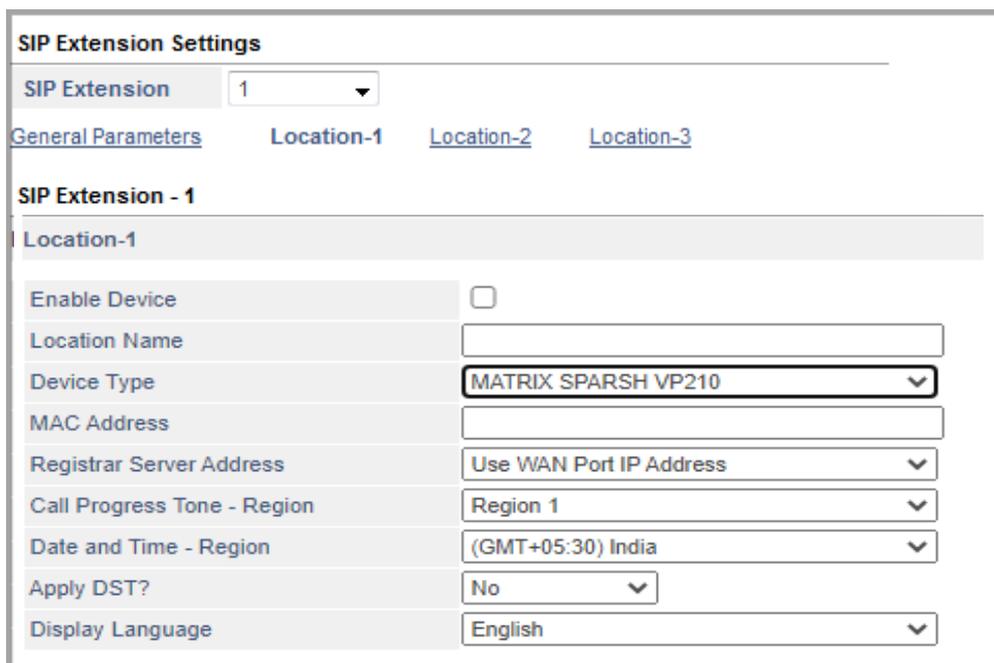

If you have registered MATRIX VARTA WIN200 Desktop UC Client in any of the locations, refer to “[Configuring Matrix VARTA WIN200 UC Client](#)”.

If you want to use more than one SPARSH VP210 Phones as a SIP Extension, configure their settings at **Location 1**, **Location 2** and **Location 3**.

- Click **Location 1**.

The screenshot shows the 'SIP Extension Settings' configuration page. On the left is a navigation menu with categories like 'Trunk Features Templates', 'Virtual Extensions', 'Voice Message Applications', 'VMS Configuration', and 'VoIP Configuration'. Under 'VoIP Configuration', 'SIP Extension Settings' is selected. The main content area is titled 'SIP Extension Settings' and has a dropdown menu for 'SIP Extension' set to '1'. Below this are three tabs: 'General Parameters', 'Location-1', 'Location-2', and 'Location-3'. The 'Location-1' tab is active, showing the 'SIP Extension - 1' configuration. It includes a 'Use SIP Extension' checkbox, and input fields for 'Name', 'SIP ID', 'Authentication ID', 'Authentication Password', and 'HTTP Authentication Password (Third Party IP-Phone)'. A 'Generate' button is next to the password fields. A note specifies requirements for the passwords: minimum length of 6 characters, must include at least one uppercase, one lowercase, one number, and one special character, and lists allowed characters. Below the note are fields for 'Call Appearances' (set to '02'), 'Call Waiting Tone (for SPARSH VP248/VP310/VP510)' (set to 'Beep Once'), and 'Allow Standard SIP Registration' checkbox. At the bottom are 'Submit', 'Default', 'Advance', and 'Call Traffic' buttons.

- The settings of the phone at **Location 1** appear.

SIP Extension Settings

SIP Extension: 1

General Parameters Location-1 Location-2 Location-3

SIP Extension - 1

Location-1

Enable Device	<input type="checkbox"/>
Location Name	<input type="text"/>
Device Type	MATRIX SPARSH VP210
MAC Address	<input type="text"/>
Registrar Server Address	Use WAN Port IP Address
Call Progress Tone - Region	Region 1
Date and Time - Region	(GMT+05:30) India
Apply DST?	No
Display Language	English

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX SPARSH VP210** as the **Device Type** at this location.
- Enter the **MAC Address**¹⁴⁹ of the SPARSH VP210 connected at this location in hexadecimal format: 00:1b:09:XX:XX:XX. Default: blank.

SARVAM UCS validates the SPARSH VP210 on the basis of the MAC Address, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed MAC address.

- Select the appropriate **Registrar Server Address** to register the SPARSH VP210 with the SIP Registrar of SARVAM UCS, according to your installation scenario:
 - If the SPARSH VP210 is connected on the WAN network, select **Use WAN Port IP Address** as Registrar Server IP Address.
 - If the SPARSH VP210 is connected on the LAN network, select **Use LAN Port IP Address** as Registrar Server IP Address.

149. MAC address is the address of the electronic hardware devices such as a computer, which is hard-coded into the device during manufacture and cannot be modified. No two devices can have similar MAC address and thus it uniquely identifies your phone. MAC address is assigned as per the IANA standard. The MAC Address of the phone will be used as source MAC address on all Ethernet frames.

- If the SPARSH VP210 is connected in the Global Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as Registrar Server IP Address.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see "[Configuring Network Parameters](#)".

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Registrar Server IP Address.

By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.

- To set the call progress tone generation standards of the country where the SPARSH VP210 is installed, select the **Call Progress Tone - Region**. Default: Region 1.

See "[Call Progress Tones](#)" to know more.

- To display the Date and Time of the country where the SPARSH VP210 is installed, select the **Date and Time - Region**. Default: India.
- If you want to enable Daylight Saving Time (DST) on the phone, set **Apply DST?** to Yes. Default: No. The Daylight Saving Time convention followed in the country/region you selected will be automatically applied. The IP phone will change its date and time settings according to the DST convention of the selected country/region.
- Select the **Display Language** for the SPARSH VP210. Default: English.

SARVAM UCS provides language support for English, French, German, Spanish, Portuguese, and Italian on the SPARSH VP210. When you select any of these languages, all the prompts and command strings will appear in the selected language.

SIP Extension users can change the language by accessing and navigating through the phone menu.

The SA can change the Language by logging into the SA Jeeves.

DSS Key Settings

- You can select the desired key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant, Guest or any other template you added. See "[Customizing Extended IP Phone Templates using Jeeves](#)" for more details.

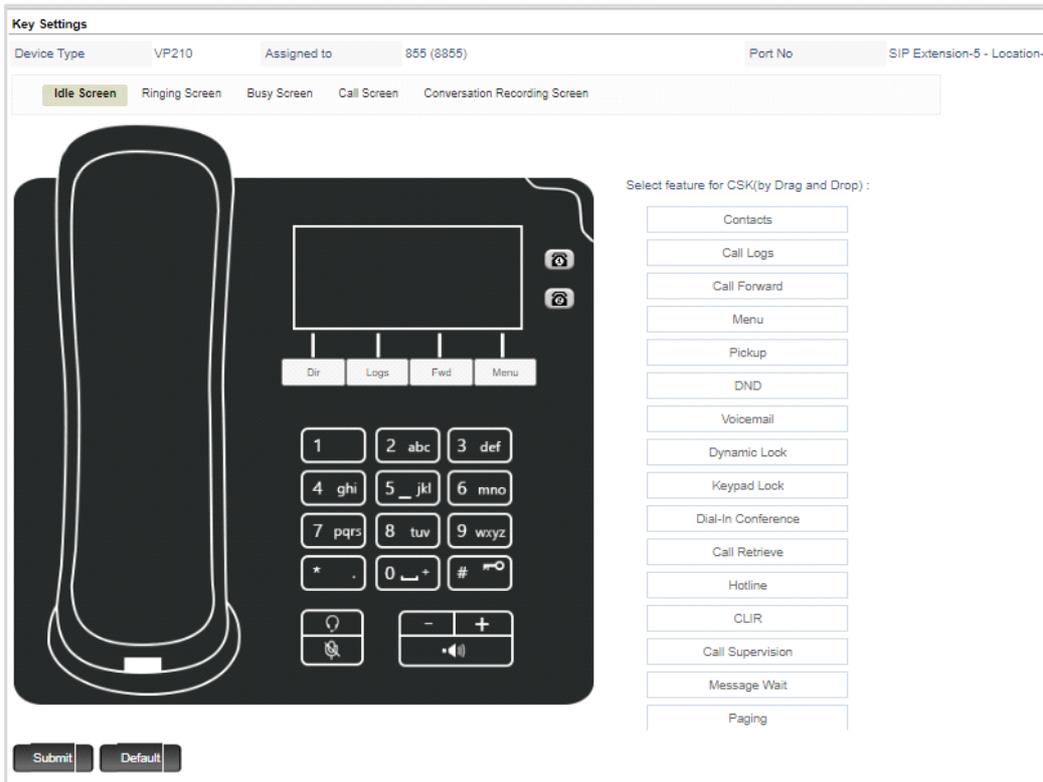

OR

- You can personalize the key map of the SPARSH VP210 for this location. To do so,
 - Select **Personalized** as the **Key Template** option.
 - Click **Submit**.

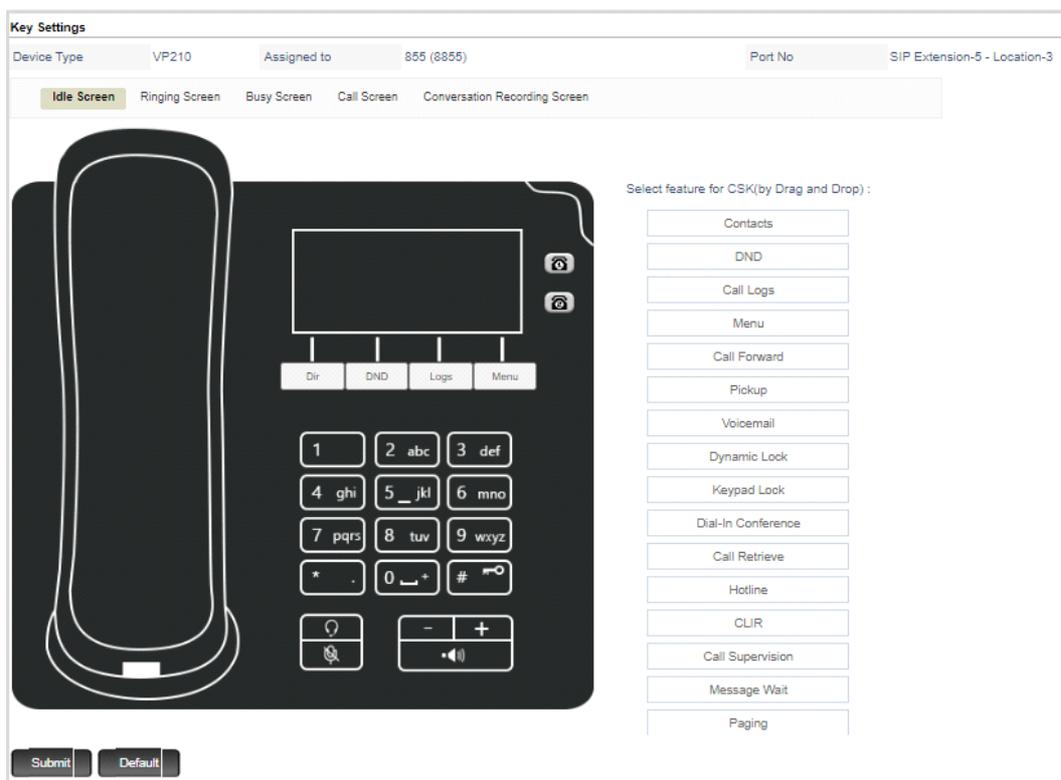

- Click **Key Settings**.

- The key map of the Extended Phone opens in a new window on your screen.

- Click **Idle Screen**.
- Each Context key, 1 to 4 can be assigned features.
- The feature assignment cum priority list appears on the right. You can change the feature assignments/priorities as per your preference.
- To set the priority, drag and drop the features in the order of your preference. This will have two implications — the Context Key will be assigned the desired feature as well it will set the priority.
- For example, if you wish to assign DND feature to Context Key 2, then drag and drop the DND feature at position 2 as below. Also make sure that the priority of Menu Key is kept as either of the four Context Keys.

- Click **Submit**.
- The key map will refresh and DND appears as Context Key 2.

Menu must be assigned to one of the first four Context Keys.

- Similarly, you can click **Ringling Screen**, **Busy Screen**, **Call Screen** or **Conversation Recording Screen** and can set the feature priorities as per your preference.

To assign features/set feature priorities for other Context Keys, follow the same instructions. You can reinstate default key assignment any time, by clicking the **Default** button at the bottom of the window.

- When you complete assigning functions/priorities to the keys, close the window.

Transport Mode and SRTP

- Select the protocol to be used to transport the SIP messages. You can select the **Transport Mode** as **TCP** or **TLS**.

*If you select TCP, make sure the SIP Over TCP check box is selected in VoIP Parameters.
If you select TLS, make sure the SIP Over TLS check box is selected in VoIP Parameters.*

- For secure conversations over SIP, select the **Enable SRTP?** check box. The SIP messages will be transported over SRTP only.

RTP Port

- Define **RTP Port**:
 - **RTP Listening Port**: This is the port on which the phone listens for RTP messages over UDP. This port is also used as the source port for sending RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **SIP Quality of Service (QoS)** for SIP signaling as:
 - **SIP DiffServe/ToS**. Valid range is 00 to 63. Default: 26.
OR
 - **RTP DiffServe/ToS**. Valid range is 00 to 63. Default: 46.

NAT Keep Alive

- If the SPARSH VP210 is connected behind a NAT router, configure **NAT Keep Alive**.
 - Select the check box **Enable NAT Keep Alive** to send Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
 - Define as **Interval (sec)**, the time period, from 001 to 999 seconds, after which the phone should send Keep Alive message. Default: 120 seconds.

The time period you define should be less than the binding timer of the router.

Timers

- Set the following **Timers** to the desired value, where required:
 - **SIP INVITE Timer (sec)**: This is the time in seconds that the phone waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the phone terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
 - **SIP Provisional Timer (sec)**: This is the time in seconds that the phone waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the IP phone terminates the call process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds. Default: 60 seconds.
 - **General Request Timer (sec)**: This is the time in seconds for which the phone waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.

Debug

- To debug using Syslog Client supported by the SPARSH VP210, configure Debug parameters:
 - Select the **Enable Debug?** check box. Default: disabled.

When the Debug flag is enabled, the phone will send the debug messages to the Syslog Server IP address. Debug report can be viewed on the Syslog Server or any other application which can capture the Syslog messages/debug sent by the phone.

- Enter the IP Address and port of the remote Syslog Server and as **Syslog Server Address and Server Port**.

The address of the Listening Port of the Syslog Server is from 1025-65535;514. Default: 514. Syslog uses the UDP as transport protocol and listens on the port 514 (the default listening port).

- You may select the **Debug Level** from the following options, by selecting the respective check box:
 - Debug Level 1
 - Debug Level 2
 - Debug Level 3

You may select any or all of these debug levels. The Syslog Client will send only the debug messages for the selected level to the remote server on the IP network.

- Click **Submit** to save settings.
- If you have completed the configuration of the SPARSH VP210 Phone Settings at Location 1, follow the same steps as described above to configure the SPARSH VP210 Phone at Location 2 and Location 3.

However, if you want to replicate the configuration of SPARSH VP210 Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to [“Copy Parameter Values”](#).

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will go in Auto Configuration mode automatically, if registered:

- Use SIP Extension
- SIP ID
- Name
- Authentication ID
- Authentication Password
- Registrar Server IP Address
- MAC Address
- Enable Device
- Device Type
- Key Map in the Key Template assigned to phone
- Language
- Call Progress Tone
- Date and Time

- Apply DST?
- Transport Mode and SRTP
- QoS
- RTP Ports
- NAT Keep Alive
- SIP Timers
- Class of Service
- Trunk Access Code
- Emergency Numbers

The SIP Extension registered at Location 1, 2, 3, will also restart, if:

- The SE Password of SARVAM UCS is changed
- Specific parameters in Network Port parameters are changed
- Specific parameters in VoIP Parameters are changed
- You restart the System
- Set the System to Default

Configuring Matrix Extended SPARSH VP710

Extended SPARSH VP710¹⁵⁰, the Smart Video IP Phone is engineered to offer a contemporary design with crystal-clear audio and feature-rich capabilities at economical price. This IP Phone is an integration of SPARSH VP710, android based deskphone with VARTA ADR100 application. To know the list of features supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For instructions on how to use Extended SPARSH VP710, refer to the *EXTENDED SPARSH VP710 User Guide*.

To be able to use Extended SPARSH VP710¹⁵¹, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension using Jeeves”](#).
- Extended Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#).
- Voice Mail Settings, if you want to provide mailbox facility to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings**.

SIP Extension Settings

SIP Extension: 1

General Parameters | Location-1 | Location-2 | Location-3

SIP Extension - 1

Use SIP Extension:

Name:

SIP ID:

Authentication ID:

Authentication Password: **Generate**

HTTP Authentication Password (Third Party IP-Phone): **Generate**

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances: 02

Call Waiting Tone (for SPARSH VP248/VP310/VP510): Beep Once

Submit **Default** **Advance** **Call Traffic** **Copy**

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.

150. Check for availability.

151. SARVAM UCS supports only IPv4 Addresses for registering Extended SPARSH VP710.

The parameters of the SIP Extension number you select will appear on this page.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering Extended IP Phones

- Select the **Use SIP Extension** check box to enable the SIP extension. By default, it is disabled.
- In the **Name** field, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed.

You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see [“Assigning Access Codes to a Range of Extensions”](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 alphanumeric characters. All ASCII characters except < > and “ (double quote) are allowed. Default: Blank.

Make sure the User ID configured in “[Digest Authentication](#)” does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) and digits 0 to 9 are allowed.Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP

Address list. See [“Black List IP Address - SIP Extensions”](#) for more details. This activity will be logged in the [“System Activity Log”](#) as well as [“Simple Network Management Protocol \(SNMP\)”](#).

Make sure you note down or copy the Authentication Password in a confidential file.

- In **Call Appearances**, define the maximum number¹⁵² of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- Under **Auto Sign-In**, enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Email ID is used for various server features.

Auto Sign-In parameters — Send Configuration Mail and Mail Status, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.

*The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.*

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - **INVITE Request**
 - **SUBSCRIBE Request**

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.
 - **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: Template 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters.

¹⁵². For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks. Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic "[SIP Hardware Template](#)" to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: Template 01. The "[Station Basic Feature Template](#)" has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension ("[Class of Service \(COS\)](#)", "[Toll Control](#)", "[OG Trunk Bundle Group](#)", etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The "[Station Advanced Feature Template](#)" has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic "[Station Advanced Feature Template](#)" for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see "[Extension Voice Mail Settings](#)".

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see [“SMS/Email Group”](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required. Default: 01

Call Pick Up allows the SIP Extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer [“Call Pick Up”](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to [“Call Pick Up”](#) and [“Class of Service \(COS\)”](#). Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See [“COSEC Integration”](#) for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic [“Abbreviated Dialing”](#) for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description [“Priority”](#).

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can register three Matrix Extended IP Phones/Soft Clients at three different locations as a single SIP Extension. You can connect/register the same or different types of Extended Phones/Soft Clients —SPARSH VP248, SPARSH VP310, SPARSH VP330, SPARSH VP510, SPARSH VP210, Extended SPARSH VP710, Matrix VARTA ADR100 Mobile UC Client, VARTA AMP100 Mobile UC Client or MATRIX VARTA WIN200 Desktop UC Client— at each location. In this case we assume that Extended SPARSH VP710 is connected at Location 1, 2 and 3.

If you want to use more than one Extended SPARSH VP710 IP Phone as a SIP Extension, configure their settings at **Location 1**, **Location 2** and **Location 3**.

If you have connected SPARSH VP248 at any of the locations, refer to [“Configuring Matrix SPARSH VP248”](#).

If you have connected SPARSH VP310 at any of the locations, refer to [“Configuring Matrix SPARSH VP310”](#).

If you have connected SPARSH VP330 at any of the locations, refer to [“Configuring Matrix SPARSH VP330”](#).

If you have connected SPARSH VP510 at any of the locations, refer to [“Configuring Matrix SPARSH VP510”](#).

If you have connected Extended SPARSH VP210 at any of the locations, refer to [“Configuring Matrix SPARSH VP210”](#).

If you have registered Matrix VARTA ADR100 and VARTA AMP100 Mobile UC Clients in any of the locations, refer to [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

If you have registered MATRIX VARTA WIN200 Desktop UC Client in any of the locations, refer to [“Configuring Matrix VARTA WIN200 UC Client”](#).

- Click **Location 1**.

SIP Extension Settings

SIP Extension:

General Parameters: [Location-1](#) | [Location-2](#) | [Location-3](#)

SIP Extension - 1

Use SIP Extension:

Name:

SIP ID:

Authentication ID:

Authentication Password:

HTTP Authentication Password (Third Party IP-Phone):

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances:

Call Waiting Tone (for SPARSH VP248/VP310/VP510):

- The settings of the phone at **Location 1** appear.

SIP Extension Settings

SIP Extension:

General Parameters: [Location-1](#) | [Location-2](#) | [Location-3](#)

SIP Extension - 1

Location-1

Enable Device:

Location Name:

Device Type:

Device ID:

Registrar Server Address:

Display Language:

Note: Please assign license to this SIP Extension from "VARTA License Management" page for working of Client.

Transport Mode and SPTD

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX SPARSH VP710 - Extended SIP** as the **Device Type** at this location.
- Enter the **MAC Address**¹⁵³ of the Extended SPARSH VP710 connected at this location in hexadecimal format: 00:1b:09:XX:XX:XX. Default: Blank.

SARVAM UCS validates the Extended Phone on the basis of the MAC Address, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed MAC address.

- Select the appropriate **Registrar Server Address** to register the Extended SPARSH VP710 with the SIP Registrar of SARVAM UCS, according to your installation scenario:
 - If the Extended SPARSH VP710 is connected on the WAN network, select **Use WAN Port IP Address** as Registrar Server IP Address.
 - If the Extended SPARSH VP710 is connected on the LAN network, select **Use LAN Port IP Address** as Registrar Server IP Address.
 - If the Extended SPARSH VP710 is connected in the Global Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as Registrar Server IP Address.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see "[Configuring Network Parameters](#)".

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Registrar Server IP Address.

By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.

- Select the **Language** for the Extended SPARSH VP710. Default: English.

SARVAM UCS provides language support for English, French, German, Spanish, Portuguese, and Italian on the Extended SPARSH VP710. When you select any of these languages, all the prompts and command strings will appear in the selected language.

SIP Extension users can change the language by accessing and navigating through the phone menu.

The SA can change the Language by logging into the SA Jeeves.

Transport Mode and SRTP

- Select the protocol to be used to transport the SIP messages. You can select the **Transport Mode** as **TCP** or **TLS**.

If you select TCP, make sure the SIP Over TCP check box is selected in VoIP Parameters.

If you select TLS, make sure the SIP Over TLS check box is selected in VoIP Parameters.

- For secure conversations over SIP, select the **Enable SRTP?** check box. The SIP messages will be transported over SRTP only.

153. MAC address is the address of the electronic hardware devices such as a computer, which is hard-coded into the device during manufacture and cannot be modified. No two devices can have similar MAC address and thus it uniquely identifies your phone. MAC address is assigned as per the IANA standard. The MAC Address of the phone will be used as source MAC address on all Ethernet frames.

If you select this check box, make sure you have selected SRTP Mode as Forced or Optional in the General Parameters under SIP Extension Settings.

SMS Over IP

- If you want Extended SPARSH VP710 users to send SMS to any extension user as well as receive IM from any extension user, select the Enable SMS Over IP check box. For detailed information, see [“SMS over IP”](#)

RTP Port

- Define the RTP Port:
RTP Listening Port: This is the port on which the Extended SPARSH VP710 listens for RTP messages over UDP. This port is also used as the source port for sending RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **SIP Quality of Service (QoS)** for SIP signaling as:
 - **SIP DiffServe/ToS.** Valid range is 00 to 63. Default: 26.
OR
 - **Voice DiffServe/ToS.** Valid range is 00 to 63. Default: 46.
OR
 - **Video DiffServe/ToS.** Valid range is 00 to 63. Default: 46.

NAT Keep Alive

- If Extended SPARSH VP710 is connected behind a NAT router, configure **NAT Keep Alive**.
- Select the check box **Enable NAT Keep Alive** to send Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
- Define as **Interval (sec)**, the time period, from 001 to 999 seconds, after which the phone should send Keep Alive message. Default: 120 seconds.

The time period you define should be less than the binding timer of the router.

Timers

- Set the following **Timers** to the desired value, where required:
 - **SIP INVITE Timer (sec):** This is the time in seconds that the phone waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the phone terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
 - **SIP Provisional Timer (sec):** This is the time in seconds that the phone waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the IP phone terminates the call

process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds.
Default: 60 seconds.

- **General Request Timer (sec):** This is the time in seconds for which the phone waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.
- Click **Submit** to save settings.
- If you have completed the configuration of the Extended SPARSH VP710 Settings at Location 1, follow the same steps as described above to configure the Extended SPARSH VP710 at Location 2 and Location 3.

However, if you want to replicate the configuration of Extended SPARSH VP710 Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to "[Copy Parameter Values](#)".

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will go in Auto Configuration mode automatically, if registered:

- Use SIP Extension
- SIP ID
- Authentication ID
- Authentication Password
- Registrar Server IP Address
- MAC Address
- Enable Device
- Device Type
- Transport Mode and SRTP
- QoS
- RTP Ports
- NAT Keep Alive
- SIP Timers
- The SE Password of SARVAM UCS is changed
- Specific parameters in VoIP Parameters are changed
- Specific parameters in Network Port parameters are changed
- You restart the System
- Set the System to Default

Configuring Matrix VARTA WIN200 UC Client

MATRIX VARTA WIN200, is a SIP (Session Initiation Protocol) based Unified Communication Desktop Client running on Windows OS, delivering full-array of the System features to the user on-the-go along with an added advantage of video calling. Through tight integration with the enterprise features of the System, UC Client provides advance call capabilities including Conferencing, Corporate Directory Access (Global Directory), Call Logs and Conversation Recording with one-touch access. Other than these you can take the advantage of using premium features like Presence subscription and notification, Corporate Voicemail access to enhance your overall mobile experience.

To use MATRIX VARTA WIN200 Desktop UC Client, make sure you have:

- Purchased and activated the VARTA Essential, VARTA Professional or VARTA Collaboration license. For more details, see [“License Management”](#).
- Assigned the desired license to the SIP Extension. For more details, see [“VARTA License Management”](#).

To know the list of featured supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For detailed product information and operation instructions, refer to the *MATRIX VARTA WIN200 User Guide*.

Configuring MATRIX VARTA WIN200 using Jeeves

To be able to register and use the Desktop Client, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension using Jeeves”](#).
- Extended Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#).
- Voice Mail Settings, if you want to provide Voice Mail to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **SIP Extension Settings**.

SIP Extension Settings

SIP Extension

General Parameters [Location-1](#) [Location-2](#) [Location-3](#)

SIP Extension - 1

Use SIP Extension

Name

SIP ID

Authentication ID

Authentication Password

HTTP Authentication Password (Third Party IP-Phone)

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances

Call Waiting Tone (for SPARSH VP248/VP310/MP510)

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.

The parameters of the SIP Extension number you selected will appear on this page.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering Extended IP Phones.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default: disabled.
- In **Name**, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed. You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see [“Assigning Access Codes to a Range of Extensions”](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 digits. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.

Make sure the User ID configured in "[Digest Authentication](#)" does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See "[Black List IP Address - SIP Extensions](#)" for more details. This activity will be logged in the "[System Activity Log](#)" as well as "[Simple Network Management Protocol \(SNMP\)](#)".

Make sure you note down or copy the Authentication Password in a confidential file.

- In **Call Appearances**, define the maximum number¹⁵⁴ of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- Under **Auto Sign-In**, enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Email ID is used for various server features.

Auto Sign-In parameters — Send Configuration Mail and Mail Status, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.

The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - INVITE Request
 - SUBSCRIBE Request

¹⁵⁴. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.
 - **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks.

Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic [“SIP Hardware Template”](#) to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The [“Station Basic Feature Template”](#) has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension (“[Class of Service \(COS\)](#)”, “[Toll Control](#)”, “[OG Trunk Bundle Group](#)”, etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic “[Station Basic Feature Template](#)” to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The “[Station Advanced Feature Template](#)” has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic “[Station Advanced Feature Template](#)” for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see “[Extension Voice Mail Settings](#)”.

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	<input type="text"/>
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see ["SMS/Email Group"](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required.

Call Pick Up allows the SIP Extension to 'pick up' (answer) calls ringing on any other extension, by using the respective icon from Client GUI, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer ["Call Pick Up"](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of

Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to “[Call Pick Up](#)” and “[Class of Service \(COS\)](#)”. Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See “[COSEC Integration](#)” for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features “[Abbreviated Dialing](#)” and “[Dial By Name](#)”.

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic “[Abbreviated Dialing](#)” for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description “[Priority](#)”.

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can register three Matrix Extended Phones/Soft Clients at three different locations as a single SIP Extension. You can connect the same or different types of Extended Phones/Soft Clients — SPARSH VP248, SPARSH VP330, SPARSH VP310, SPARSH VP510, SPARSH VP210, Matrix VARTA ADR100 Mobile UC Client, Matrix VARTA AMP100 Mobile UC Client or MATRIX VARTA WIN200 Desktop UC Client — at each location. In this case we assume that MATRIX VARTA WIN200 Desktop UC Client are registered at Location 1, 2 and 3.

If you have connected SPARSH VP248 refer to “[Configuring Matrix Extended Phone Settings using Jeeves](#)” in *Configuring Matrix SPARSH VP248 as SIP Extensions*.

If you have connected SPARSH VP310 at any of the locations, refer to [“Configuring Matrix SPARSH VP310”](#).

If you have connected SPARSH VP330 at any of the locations, refer to [“Configuring Matrix SPARSH VP330”](#).

If you have connected SPARSH VP510 at any of the locations, refer to [“Configuring Matrix SPARSH VP510”](#).

If you have connected Extended SPARSH VP710 at any of the locations, refer to [“Configuring Matrix Extended SPARSH VP710”](#).

If you have connected Extended SPARSH VP210 at any of the locations, refer to [“Configuring Matrix SPARSH VP210”](#).

If you have registered Matrix VARTA ADR100 and VARTA AMP100 Mobile UC Clients in any of the locations, refer to [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

If you want to use more than one UC Clients as a SIP Extension, configure their settings as **Location 1**, **Location 2** and **Location 3**.

*If you want to use the IM functionality in the UC Client, you must configure it at **Location-1** only.*

- Click **Location 1**.

SIP Extension Settings

SIP Extension:

General Parameters: [Location-1](#) [Location-2](#) [Location-3](#)

SIP Extension - 1

Use SIP Extension:

Name:

SIP ID:

Authentication ID:

Authentication Password:

HTTP Authentication Password (Third Party IP-Phone):

Note :- Authentication Password and HTTP Authentication Password must follow following requirements:

- Minimum length must be 6 characters.
- Password must include atleast 1 uppercase, 1 lowercase, 1 number and 1 special character.
- Allowed characters are 0-9, a-z, A-Z, all special characters except %, =, #, +, &, \, <, >, ", ' and space.

Call Appearances:

Call Waiting Tone (for SPARSH VP248/VP310/VP510):

- The settings of the phone at **Location 1** appear.

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX VARTA WIN200** as the **Device Type** at this location. Make sure you assign the desired license to this SIP extension. For details, see [“VARTA License Management”](#).
- In **MAC Address** enter the Device ID here. Default: blank.

SARVAM UCS validates the desktop/PC on which you have installed the UC Client on the basis of the Device ID, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed Device ID.

- Select the appropriate **Registrar Server Address** to register the UC Client with the SIP Registrar of SARVAM UCS, according to your installation scenario:
 - If you want the UC Client to register using the WAN network, select **Use WAN Port IP Address** as Registrar Server Address.
 - If you want the UC Client to register using the LAN network, select **Use LAN Port IP Address** as Registrar Server Address.
 - If the UC Client is registered in the Public (Global) Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as the Registrar Server Address.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see [“Configuring Network Parameters”](#).

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Registrar Server Address.

By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.

Transport Mode and SRTP

- Select the protocol to be used to transport the SIP messages. You can select the **Transport Mode** as **TCP** or **TLS**.

If you select TCP, make sure the SIP Over TCP check box is selected in VoIP Parameters.

If you select TLS, make sure the SIP Over TLS check box is selected in VoIP Parameters.

- For secure conversations over SIP, select the **Enable SRTP?** check box. The SIP messages will be transported over SRTP only.

The UC Client supports RTP Relay. For detailed description, see [“Configuring VoIP Parameters”](#).

SMS Over IP

- If you want UC Client users to send SMS to any extension user as well as receive IM from any extension user, select the **Enable SMS Over IP** check box. For detailed information, see [“SMS over IP”](#).

RTP Port

- Define the **RTP Port**. This is the port on which the client listens for RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **SIP Quality of Service (QoS)** for SIP signaling:
 - **SIP DiffServe/ToS:** The system sends all the SIP signaling messages with this QoS setting. This field defines the priority bits for SIP messages. The Valid *SIP DiffServe/ToS* range is from 00-63, default: 26.
 - **Voice DiffServe/ToS:** The system sends all the Voice packets with this QoS setting. This field defines the priority bits for Voice packet. It also improves the voice quality. The Valid *Voice DiffServe/ToS* range is from 00-63, default: 46.
 - **Video DiffServe/ToS:** The system sends all the Video packets with this QoS setting. This field defines the priority bits for Video packet. It also improves the video quality. The Valid *Video DiffServe/ToS* range is from 00-63, default: 46.

Configure any decimal value as per your requirement from the table mentioned below:

Traffic Type	DSCP Value (dec)
Best Effort	0
Background	8
Excellent Effort	40
AudioVideo	40
Voice	56
Control	56

NAT Keep Alive

- If the UC Client is connected behind a NAT router, configure **NAT Keep Alive**.
- Select the check box **Enable NAT Keep Alive** to send Keep Alive messages periodically to refresh the binding in the NAT router. Default: Disabled.
- Define as **Interval (sec)**, the time period, from 001 to 999 seconds, after which the phone should send Keep Alive message. Default: 120 seconds. The time period you define should be less than the binding timer of the router.

Timers

- Set the following **Timers** to the desired value, where required:
 - **SIP INVITE Timer (sec):** This is the time in seconds that the client waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the client terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
 - **SIP Provisional Timer (sec):** This is the time in seconds that the client waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the client terminates the call process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds. Default: 60 seconds.
 - **General Request Timer (sec):** This is the time in seconds for which the client waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.
- Click **Submit** to save settings.
- If you have completed the configuration of the MATRIX VARTA WIN200 at Location 1, follow the same steps as described above to configure the UC Client at Location 2 and Location 3.

However, if you want to replicate the configuration of the UC Client Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to [“Copy Parameter Values”](#).

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will go in Auto Configuration mode automatically, if registered:

- Use SIP Extension
- SIP ID
- Name
- Authentication ID
- Authentication Password
- Registrar Server Address
- MAC Address/IMEI/ESN Number
- Enable Device
- Device Type
- Transport Mode
- Enable SRTP
- QoS
- SIP/RTP Ports
- RTP Listening Port
- SMS over IP
- NAT Keep Alive
- SIP Timers
- Class of Service
- Trunk Access Code
- The SE Password of SARVAM UCS is changed
- Specific parameters in Network Port parameters are changed
- Specific parameters in VoIP Parameters are changed
- You restart the System
- Set the System to Default

Configuring Matrix VARTA ADR100/AMP100 UC Clients

Matrix offers the following Mobile UC Clients¹⁵⁵:

- MATRIX VARTA ADR100 for Android Smartphones/Tablets
- MATRIX VARTA AMP100 for iPhones

To use MATRIX VARTA UC Clients for Mobile, make sure you have:

- Purchased and activated the VARTA Essential, VARTA Professional or VARTA Collaboration license. For more details, see [“License Management”](#).
- Assigned the desired license to the SIP Extension. For more details, see [“VARTA License Management”](#).

To know the list of featured supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

For the VARTA Mobile Clients the system supports,

- automatic configuration and registration through Auto-Sign-In Configuration Mail. For this you must:
 - Configure the **Auto Sign-In Parameters**. For details, refer [“Configuring Auto-Sign-In Parameters”](#)
 - Configure the **General Parameters in SIP Extensions Settings**. For details, refer [“Configuring SIP Extension Settings using Jeeves”](#)
 - Make sure you send the **Auto Sign-In Configuration Mail**. For details, refer [“Configuring SIP Extension Settings using Jeeves”](#)

You can also view the status of Auto Sign-In Email in [“Viewing SIP Extension Status”](#)

- manual configuration and registration, follow the instructions in [“Configuring Mobile UC Clients using Jeeves”](#)

MATRIX VARTA ADR100

MATRIX VARTA ADR100 is a proprietary SIP (Session Initiation Protocol) based UC Client Application running on Android Phones/Tablets, delivering full-array of Matrix SARVAM UCS features to the user on-the-go along with an added advantage of UC features. Through tight integration with the enterprise mobility features of the SARVAM UCS, VARTA ADR100 provides advance call capabilities including Conferencing, Corporate Directory Access (Global Directory), Call Logs and Conversation Recording with one-touch access. Other than these you can take the advantage of using premium features like Video Calling, IM, IM to SMS, Presence notification and corporate Voicemail System access to enhance your overall mobile experience.

Mobile workers can use any Wi-Fi or cellular data networks to stay connected with business communications while working from office, home or travelling to any location. An innovative and easy to understand user interface delivers all productivity features at fingertips that enhance speed of communication and collaboration with office users and customers.

For detailed product information and operation instructions, refer to the *MATRIX VARTA ADR100 User Guide for Mobile/Tablet*.

155. SARVAM UCS supports only IPv4 Addresses for registering Mobile UC Clients.

MATRIX VARTA AMP100

MATRIX VARTA AMP100 is a proprietary SIP (Session Initiation Protocol) based UC Client Application running on iPhones, delivering full-array of Matrix SARVAM UCS features to the user on-the-go along with an added advantage of UC features. Through tight integration with the enterprise mobility features of the SARVAM UCS, VARTA AMP100 provides advanced call capabilities including Conferencing, Corporate Directory Access (Global Directory), Call Logs and Conversation Recording with one-touch access. Other than these, you can take the advantage of using premium features like Video Calling, IM, IM to SMS, Presence notification/subscription and corporate Voicemail access to enhance your overall mobile experience.

Mobile workers can use any Wi-Fi or cellular data networks to stay connected with business communications while working from office, home or traveling to any location. An innovative and easy to understand user interface delivers all productivity features at fingertips that enhances speed of communication and collaboration with office users and customers.

For detailed product information and operation instructions, refer to the *MATRIX VARTA AMP100 User Guide*.

Configuring Mobile UC Clients using Jeeves

To be able to register and use the Mobile Handsets/Tablets as Matrix VARTA Mobile UC Clients, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension Settings using Jeeves”](#).
- Extended Phone Settings, see [“Configuring Matrix Extended Phone Settings using Jeeves”](#).
- Voice Mail Settings, if you want to provide Voice Mail to the extension. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **SIP Extension Settings**.

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.

The parameters of the SIP Extension number you selected will appear on this page.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 Addresses only for registering Matrix UC Clients.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default: disabled.
- In the **Name** field, enter a name of SIP Extension, which may be the name of the person who will use the UC Client/SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed.

You cannot assign the same SIP ID to more than one extension.

To assign SIP IDs according to your preference and requirement to a range of SIP Extensions, see [“Assigning Access Codes to a Range of Extensions”](#).

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In the **Authentication ID** field, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 digits. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.

Make sure the User ID configured in "[Digest Authentication](#)" does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See "[Black List IP Address - SIP Extensions](#)" for more details. This activity will be logged in the "[System Activity Log](#)" as well as "[Simple Network Management Protocol \(SNMP\)](#)".

Make sure you note down or copy the Authentication Password in a confidential file.

- In **Call Appearances**, define the maximum number¹⁵⁶ of simultaneous incoming calls that the SIP Extension user should be allowed to receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can receive 2 calls at a time.

- Enter the **Email ID** of the extension user you wish to store. The Email ID can be a maximum of 64 characters. The Auto-Sign-In configuration mail will be sent to this ID.
- If you want the Mobile Clients to automatically configure and register with the Server, click the **Send** button adjacent to **Send Configuration Mail**.

The Auto Sign-In Configuration Mail will be sent to the VARTA user on the **Email ID** configured above.

156. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase. Make sure the NX DBM VOCODER64 module is installed for SIP calls.

The Auto Sign-In Mail button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.

Make sure the Auto-Sig-In parameters have been configured. For details, refer to [“Auto Sign-In Parameters”](#).

- The **Mail Status** will display either sent, failed or sending.
- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - INVITE Request
 - SUBSCRIBE Request

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.
 - **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The [“SIP Hardware Template”](#) contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks.

Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.

- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic "[SIP Hardware Template](#)" to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The "[Station Basic Feature Template](#)" has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension ("[Class of Service \(COS\)](#)", "[Toll Control](#)", "[OG Trunk Bundle Group](#)", etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The "[Station Advanced Feature Template](#)" has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.

- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic “[Station Advanced Feature Template](#)” for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see “[Extension Voice Mail Settings](#)”.

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	15
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Others	
Mobile Number	<input type="text"/>
SMS/Email Group Type	None
Call Pickup Group	01
Call Pick-up Notification (Only for SPARSH VP510)	<input type="checkbox"/>
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see “[SMS/Email Group](#)”.
- Assign the SIP Extension to a **Call Pick-up Group**, if required.

Call Pick Up allows the SIP Extension to 'pick up' (answer) calls ringing on any other extension, by using the respective icon from Client GUI, without physically going to the ringing extension. It also allows

incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer [“Call Pick Up”](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to [“Call Pick Up”](#) and [“Class of Service \(COS\)”](#). Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**. If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.
- You may assign a **Personal Directory** number to the SIP Extension. Default: 00. A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic [“Abbreviated Dialing”](#) for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description [“Priority”](#).

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Matrix Extended Phone Settings using Jeeves

You can connect the same or different types of Extended Phones/Soft Clients — SPARSH VP248, SPARSH VP330, SPARSH VP310, SPARSH VP510, SPARSH VP210, Matrix VARTA ADR100 Mobile UC Client, Matrix

VARTA AMP100 Mobile UC Client or MATRIX VARTA WIN200 Desktop UC Client — at each location. In this case we assume that Matrix VARTA Mobile UC Clients are registered at Location 1, 2 and 3.

If you have connected SPARSH VP248 refer to [“Configuring Matrix Extended Phone Settings using Jeeves”](#) in *Configuring Matrix SPARSH VP248 as SIP Extensions*.

If you have connected SPARSH VP310 at any of the locations, refer to [“Configuring Matrix SPARSH VP310”](#).

If you have connected SPARSH VP330 at any of the locations, refer to [“Configuring Matrix SPARSH VP330”](#).

If you have connected SPARSH VP510 at any of the locations, refer to [“Configuring Matrix SPARSH VP510”](#).

If you have connected Extended SPARSH VP710 at any of the locations, refer to [“Configuring Matrix Extended SPARSH VP710”](#).

If you have connected Extended SPARSH VP210 at any of the locations, refer to [“Configuring Matrix SPARSH VP210”](#).

If you have registered Matrix VARTA Mobile UC Clients in any of the locations, refer to [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

If you have registered MATRIX VARTA WIN200 Desktop UC Client in any of the locations, refer to [“Configuring Matrix VARTA WIN200 UC Client”](#).

If you want to use more than one Matrix UC Clients as a SIP Extension, configure their settings at **Location 1**, **Location 2** and **Location 3**.

*If you want to use the IM functionality in the MATRIX VARTA ADR100/AMP100, you must configure it at **Location-1** only.*

- Click **Location 1**.

- The settings of the phone at **Location 1** appear.

- Select the **Enable Device** check box. Default: Disabled.
- Enter the **Location Name** for the phone to identify the phone. Location name may be the place where the phone is located (e.g.: Head office, branch, residence). The Location Name may consist of 18 characters (maximum). Default: Blank.
- Select **MATRIX VARTA ADR100/AMP100** (for the Android/iPhone Application) as the **Device Type** at this location. Make sure you assign the desired license to this SIP extension. For details, see [“VARTA License Management”](#).
- Enter the **MAC Address/IMEI¹⁵⁷/ESN Number** of the phone/tablet on which you have installed the application.

If you are using an iPhone, enter the **Device ID** here. Default: blank.

SARVAM UCS validates the phone/tablet on which you have installed the application on the basis of the IMEI/ESN Number or Device ID, and provides configuration on validation.

As SARVAM UCS allows registration of the SIP Extension from three different locations, it identifies the SIP Extension in each location by the programmed IMEI/ESN Number/Device ID.

- Select the appropriate **Internal Registrar Server Address** to register the application with the SIP Registrar of SARVAM UCS within a private network. Select the appropriate option as per your installation scenario:
 - If you want the application to register using the WAN network, select **Use WAN Port IP Address** as the Internal Registrar Server Address.
 - If you want the application to register using the LAN network, select **Use LAN Port IP Address** as Registrar Server Address.

157. IMEI Number is the unique identification number of the GSM engine used in the Mobile handset.

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Internal Registrar Server Address.

By default, Use WAN Port IP Address is selected as the Internal Registrar Server Address.

- Select the appropriate **External Registrar Server Address** to register the application with the SIP Registrar of SARVAM UCS from a public network. Select the option according to your installation scenario:
 - If you want the application to register using the WAN network, select **Use WAN Port IP Address** as External Registrar Server Address.
 - If the application is connected in the Public Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as External Registrar Server Address.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see ["Configuring Network Parameters"](#).

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as External Registrar Server Address.

By default, Use WAN Port IP Address is selected as the External Registrar Server Address.

Transport Mode and SRTP

- Select the protocol to be used to transport the SIP messages. You can select the **Transport Mode** as **TCP** or **TLS**.

If you select TCP, make sure the SIP Over TCP check box is selected in VoIP Parameters.

If you select TLS, make sure the SIP Over TLS check box is selected in VoIP Parameters.

For secure conversations over SIP, select the **Enable SRTP?** check box. The SIP messages will be transported over SRTP only.

The application supports RTP Relay. For detailed description, see ["Configuring VoIP Parameters"](#).

SMS Over IP

- If you want the VARTA users to send SMS to any extension user as well as receive IM from any extension user, select the **Enable SMS Over IP** check box. For detailed information, see ["SMS over IP"](#).

RTP Port

- Define **RTP Port**:
 - **RTP Listening Port**: This is the port on which the phone listens for RTP packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. Default: 8000.

Quality of Service

- Set the **Quality of Service (QoS)** for SIP signaling:
 - **SIP DiffServe/ToS:** The system sends all the SIP signaling messages with this QoS setting. This field defines the priority bits for SIP messages. The Valid *DiffServe* range is from 00-63, default: 26.
 - **Voice DiffServe/ToS:** The system sends all the Voice packets with this QoS setting. This field defines the priority bits for Voice packet. It also improves the voice quality. The Valid *DiffServe* range is from 00-63, default: 46.
 - **Video DiffServe/ToS:** The system sends all the Video packets with this QoS setting. This field defines the priority bits for Video packet. It also improves the video quality. The Valid *DiffServe* range is from 00-63, default: 46.

Configure any decimal value as per your requirement from the table mentioned below:

DSCP <=> IP Precedence Conversion Table			
DSCP Name	DS Field Binary	Value Decimal	IP Precedence
CS ₀	000 000	0	0
CS ₁	001 000	8	1
AF ₁₁	001 010	10	1
AF ₁₂	001 100	12	1
AF ₁₃	001 110	14	1
CS ₂	010 000	16	2
AF ₂₁	010 010	18	2
AF ₂₂	010 100	20	2
AF ₂₃	010 110	22	2
CS ₃	011 000	24	2
AF ₃₁	011 010	26	3
AF ₃₂	011 100	28	3
AF ₃₃	011 110	30	3
CS ₄	100 000	32	4
AF ₄₁	100 010	34	4
AF ₄₂	100 100	36	4
AF ₄₃	100 110	38	4
C ₅₅	101 000	40	5
EF	101 110	46	5
CS ₆	110 000	48	6
CS ₇	111 000	56	7
CS Class Selector (RFC 2474)			
AF _{xy} Assured Forwarding (x=class, y=drop precedence) (RFC 2597)			
EF Expedited Forwarding (RFC 3246)			

Timers

- Set the following **Timers** to the desired value, where required:
 - **SIP INVITE Timer (sec):** This is the time in seconds that the phone waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the phone terminates the call process and gives an error tone to the user. The range of the SIP INVITE TIMER is 10-180 seconds. Default: 30 seconds.
 - **SIP Provisional Timer (sec):** This is the time in seconds that the phone waits for final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the IP phone terminates the call process and gives error tone to the user. The range of SIP Provisional Timer is 10-180 seconds. Default: 60 seconds.
 - **General Request Timer (sec):** This is the time in seconds for which the phone waits for response of a transaction request. This timer starts on initiating a transaction. This timer stops on receipt of a response for the request. On expiry of the timer, the phone clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.
- Click **Submit** to save settings.
- If you have completed the configuration at Location 1, follow the same steps as described above to configure the application at Location 2 and Location 3.

However, if you want to replicate the configuration of the MATRIX VARTA ADR100/AMP100 Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to [“Copy Parameter Values”](#).

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

When you change any of the parameters listed below in the SIP Extension at Location 1, 2, 3, the phone will go in Auto Configuration mode automatically, if registered:

- Use SIP Extension
- SIP ID
- Name
- Authentication ID
- Authentication Password
- Internal Registrar Server Address
- External Registrar Server Address
- MAC Address/IMEI/ESN Number
- Enable Matrix Extended Phone Mode
- Extended Phone Type
- Transport Mode
- Enable SRTP
- QoS
- SIP/RTP Ports

- SIP Timers
- Class of Service
- Trunk Access Code
- The SE Password of SARVAM UCS is changed
- Specific parameters in Network Port parameters are changed
- Specific parameters in VoIP Parameters are changed
- You restart the System
- Set the System to Default

Viewing SIP Extension Status

You can view the Status of SIP Extension using Jeeves. To do this,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Status**.

SIP Extension	Name	SIP ID	Auto Sign-In Email	Status
1				Not Registered
2				Not Registered
3				Not Registered
4				Not Registered
5				Not Registered
6				Not Registered
7				Not Registered
8				Not Registered

- The SIP Extension Status page will open and display the following for each SIP Extension,
 - SIP Extension number
 - Name of the SIP extension
 - SIP ID assigned to the SIP Extension
 - Auto Sign-In Email; whether the mail is sent, failed or sending.
 - REGISTRATION status; whether the SIP Extension is registered or not.
 - Contact 1 (for *MATRIX VARTA AMP100/ADR100*)

When the device is Registered - It will display the SIP ID, IP Address and the Registration Expiry Timer.

When the device is in the Background - It will display Registered and the time remaining for the expiry of the VARTA Client Inactivity Timer.

When Unregistered - The existing details will be cleared and it will be blank.

To know more, refer "[Apple Push Notification Service Support](#)" or "[Firebase Cloud Messaging \(FCM\) Support](#)".

- Contact 2 - same as above.
- Contact 3 - same as above.
- You may Log out of Jeeves.

*You can also view the SIP Extension Status from the **Status** link. To view, click the SIP Extension link under Status.*

Configuring SIP Extensions using Bulk Configuration

In today's competitive world, time is an important asset for all the modern organizations. So, most of the organizations demand for a system that accomplish most of its functionality at a click of a button. As, we know, SARVAM UCS supports 999¹⁵⁸ extensions and configuring these extensions one by one may be tedious and time consuming. So, to overcome this concern of the organizations, SARVAM UCS supports Bulk configuration.

Bulk configuration allows you to configure a large number of SIP Extensions by simply uploading a CSV File in the Server. Once the CSV File is uploaded, the extensions listed in the file are configured in the server.

You can also configure extensions one-by-one, to know more, refer to "[Configuring SIP Extension Settings as per the Extended Phone Type](#)".

How to works

- Firstly, you need to download the CSV Generator Template from Jeeves. To know more, refer to "[Download ing the CSV Generator Template](#)".
- Secondly, customize the CSV Generator Template as per your requirement. To know how to customize the template, refer to "[Preparing the CSV Generator Template](#)".
- After you have prepared the Template, you need to generate the CSV File. To know more, refer to "[Generating CSV File](#)". After generating the file, you must export the file. To know how to export the file, refer to "[Exporting the CSV File](#)".
- Once the CSV file is exported, now you need to upload the file. To know how to upload the CSV File, refer to "[Uploading the CSV File](#)". The Extensions listed in the CSV File are configured in the Server.

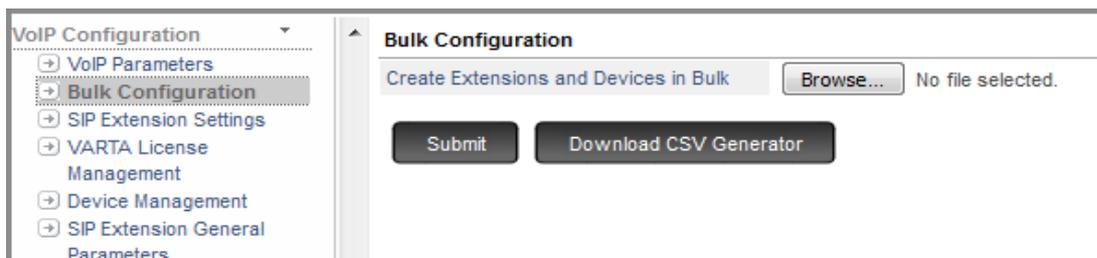

Before configuring the extensions using Bulk Configuration, make sure Microsoft Excel is installed on your PC.

How to configure

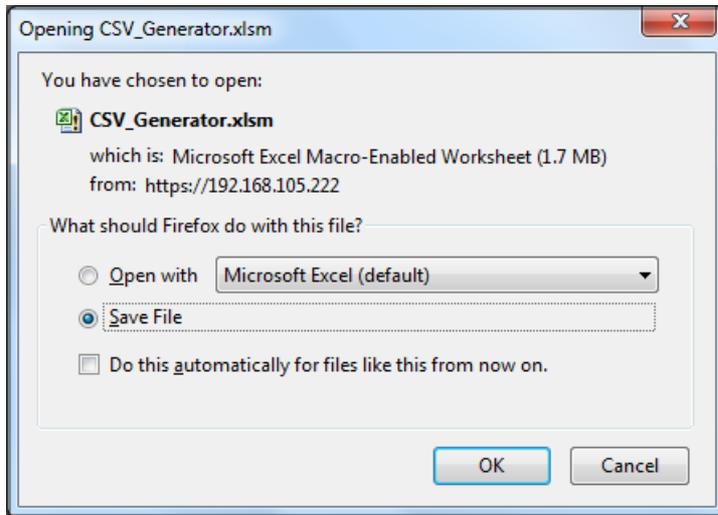

Downloading the CSV Generator Template

- Login as System Engineer.
- Under **VoIP Configuration**, click **Bulk configuration**.

158. ETERNITY LENX/MENX supports 2000 SIP Extensions.

- Click **Download CSV Generator** button to download the CSV Generator Template.
- The CSV_Generator.xlsm window opens.

- You can either open the CSV Generator Template or save the Template to a desired location on the local disk.

- *The above window display depends upon the browser you are using. Check the Download Settings of your browser and set the Download path accordingly.*
OR
- *If your browser does not ask you for the location you want to save your file, it saves it in the default location according to the download path specified for that browser.*

Preparing the CSV Generator Template

After downloading the CSV Generator Template, you can now customize the template as per your requirement. The parameters listed in the CSV Generator Template are explained below in detail:

Parameters	Description
Start Extension Number	Enter the Extension Number for the first extension. For example: If you configure Start Extension Number as 5001, the system will start creating the extensions with 5001 as the first extension number followed by 5002, 5003.....for other extensions.
Total Extensions	Enter the total number of extensions you want to configure. For example: You want to configure 100 extensions, then enter 100 as the Total Extensions.

Parameters	Description
Start S/W Port No.	<p>Enter the software port number from where you want to configure the first extension.</p> <p>For example: You want to configure the extensions from software port number 1, then enter 1 as the software port number.</p>
Use SIP Extension	<p>Select Yes to enable the SIP extensions. If you select No, the SIP extensions will not get registered with the server.</p>
SIP Hardware Template	<p>Enter the template number of the SIP Hardware Template you want to assign to the extensions. By default, the SIP Hardware Template number 01 is assigned.</p> <p>The SIP Hardware Template contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and related parameters.</p> <p>Check if the values in this template fulfills the requirements of the extensions. If the Template number 01 fulfills the feature requirements, retain the Template number 01.</p> <p>If a different set of SIP hardware features are to be allowed to the extensions, then prepare another template and enter that template number in this field.</p> <p>To know how to customize the template, refer to “SIP Hardware Template”.</p>
Station Basic Feature Template	<p>Enter the template number of the Station Basic Feature Template you want to assign to the extensions. By default, Station Basic Feature Template number 01 is assigned.</p> <p>The Station Basic Feature Template has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of Incoming and Outgoing Calls, Outgoing Trunk Bundle groups.</p> <p>Check if the values in this template fulfills the requirements of the extensions. If the Template number 01 fulfills the feature requirements, retain the Template number 01.</p> <p>If a different set of features are to be allowed to the extensions, then prepare another template and enter that template number in this field.</p> <p>To know how to customize the template, refer to “Station Basic Feature Template”.</p>

Parameters	Description
Station Advanced Feature Template	<p>Enter the template number of the Station Advanced Feature Template you want to assign to the extensions. By default, Station Advanced Feature Template number 01 is assigned.</p> <p>The Station Advanced Feature Template has a set of advanced features for the extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service and related parameters.</p> <p>Check if the values in this template fulfills the requirements of the extensions. If the Template number 01 fulfills the feature requirements, retain the Template number 01.</p> <p>If a different set of features are to be allowed to the extensions, then prepare another template and enter that template number in this field.</p> <p>To know how to customize the template, refer to “Station Advanced Feature Template”.</p>
Call Pickup Group	<p>Enter the Call Pickup Group number you want to assign to the extensions. By default, Call Pickup Group number 1 is assigned.</p> <p>Call Pick Up allows the extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allow incoming calls for the extension to be answered by the other extensions assigned the same Call Pick-Up group.</p> <p>For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'.</p> <p>Refer “Call Pick Up” for instructions on how to create groups.</p>
Station Type	<p>Select the Station Type — <i>Administration/ Guest</i> you want to assign to the extensions.</p>
Priority	<p>Select the Priority level for the extensions from 1 to 9. By default, 5-Normal is selected as the Priority level.</p> <p>Each extension is assigned a Priority Level starting from 1,2, 3....to 9, with '1' being the lowest Priority and '9' being the highest Priority.</p> <p>To know more about the feature, refer to “Priority”.</p>

You can connect/ register three Matrix Extended IP Phones / UC clients/ Standard SIP Phones at three different location as a single SIP extension. You can register the same or different types of Extended IP Phones/ UC clients/ Standard SIP Phones — at each location.

For Example: You can configure SPARSH VP330 at Location 1, 2 and 3. If you want to use more than one SPARSH VP330 Extended IP Phones as a SIP Extension, configure their settings at Location 1, Location 2 and Location 3.

For Auto Provisioning, you must configure the Standard SIP phones at Location1 only. To know more, refer to [“Configuring Standard SIP Phones”](#).

Location 1	Description
Enable Device	Select Yes to enable the SIP extension.
Device Type	Select the desired Device Type for location 1.
Registrar Server Address	<p>Select the appropriate Registrar Server Address to register the Extended IP Phones/ VARTA WIN200/ Standard SIP Phones with the SIP Registrar of SARVAM UCS, according to your installation scenario.</p> <p>If extensions are connected on the WAN network, select Use WAN Port IP Address as the Registrar Server IP Address.</p> <p>If extensions are connected on the LAN network, select Use LAN Port IP Address as the Registrar Server IP Address.</p> <p>If extensions are connected in the Global Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is configured, select Use Router/STUN's IP Address as the Registrar Server IP Address. Make sure you configure either the Router's Public IP Address or Simple Traversal of UDPs through NATs (STUN) in Network Parameters. For details, see "Configuring Network Parameters".</p> <p>If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as the Registrar Server IP Address.</p> <p>By default, Use WAN Port IP Address is selected as the Registrar Server IP Address.</p>
Internal Registrar Server Address	<p>Select the appropriate Internal Registrar Server Address to register the UC clients (VARTA ADR100/ VARTA AMP100) with the SIP Registrar of SARVAM UCS within a private network.</p> <p>Select the appropriate option as per your installation scenario:</p> <p>If you want the UC clients to register using the WAN network, select Use WAN Port IP Address as the Internal Registrar Server Address.</p> <p>If you want the UC clients to register using the LAN network, select Use LAN Port IP Address as the Internal Registrar Server Address.</p> <p>If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as the Internal Registrar Server Address.</p> <p>By default, Use WAN Port IP Address is selected as the Internal Registrar Server Address.</p>

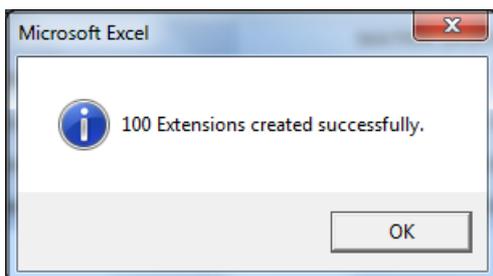

Location 1	Description
<p>External Registrar Server Address</p>	<p>Select the appropriate External Registrar Server Address to register the UC clients (VARTA ADR100/ VARTA AMP100) with the SIP Registrar of SARVAM UCS from a public network.</p> <p>Select the option according to your installation scenario:</p> <p>If you want the UC clients to register using the WAN network, select Use WAN Port IP Address as the External Registrar Server Address.</p> <p>If the UC clients is connected in the Public Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is configured, select Use Router/STUN's IP Address as External Registrar Server Address. Make sure you configure either the Router's Public IP Address or Simple Traversal of UDPs through NATs (STUN) in Network Parameters. For details, see "Configuring Network Parameters".</p> <p>If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as the External Registrar Server Address.</p> <p>By default, Use WAN Port IP Address is selected as the External Registrar Server Address.</p>

Similarly, you can configure the parameters listed in Location 2 and 3 as per your requirement.

Generating CSV File

After you have configured the required parameters in the CSV Generator Template, you can now generate the CSV File. To do so,

- Click the **Generate csv** button present at the bottom of the CSV Generator Template.
- A pop window opens specifying the number of extensions that are created successfully.

- Click **OK**.

- The CSV File will be generated.

	A	B	C	D	E	F	G	H	I	J
1										
2	<input type="button" value="Save CSV File"/>									
3										
4	Extension Number	S/W Port No.	Use SIP Extension	Name	Email ID	Mobile Number	Authentication Password	SIP Hardware Template	Station Basic Feature Template	Station Advanced Feature Template
5	5001	1	No				us!(VJ66	1	1	1
6	5002	2	No				d/Q26o(L	1	1	1
7	5003	3	No				vRC^79)h	1	1	1
8	5004	4	No).gY6i0	1	1	1
9	5005	5	No				DQ/S^2rq	1	1	1
10	5006	6	No				YQr8(-4	1	1	1
11	5007	7	No				(e)8G7pQ	1	1	1
12	5008	8	No				7-cLhMJ5	1	1	1

You can now modify the generated CSV File by adding the following details for each and every extension in the file as per your requirement.

- **Name:** Enter the name for the extensions listed in the file. The name you enter here will be displayed as the Caller ID of the extensions on the remote user’s phone, when the extension user makes calls.

It can be the name of the person who will use the extension or the name of a Department. You can configure a name of a maximum of 18 alphanumeric characters.

- **Email ID:** Enter the email address for the extensions listed in the file. The Email ID you enter here will be used to send the auto-sign email in Mobile UC clients — VARTA ADR100 and VARTA AMP100 applications. Refer “[Auto Sign-In Parameters](#)”, to know more. The Email ID is also used for various server features.

You can configure an Email ID of a maximum of 64 characters.

- **Mobile Number:** Enter the mobile number for the extensions listed in the file, if required. The mobile number can be a maximum of 16 digits.
- **Location Name:** Enter the location for the extension so as to identify the extension. Location Name may be the place where the extension is located (e.g: 2nd Floor/ Desk number -8, Head office, Branch office, residence).

The Location Name may consist of 18 characters (maximum).

- **MAC Address / Device ID:** Enter the MAC Address / Device ID of the extensions.

Similarly you can configure Location Name and MAC Address / Device ID in location 2 and location 3, if required.

You can also modify the CSV File by editing or deleting the values of the parameters as per your requirement.

- *Authentication ID is used by the system for user authentication of the SIP messages received from the extensions. This parameter is not listed in the CSV File and is automatically configured by the system in the SIP Extension Settings Page, when you upload the CSV File. The system will configure the **Authentication ID** same as the **Extension Number** configured in the CSV File for the extensions.*

You can change the Authentication ID, if required. The Authentication ID must be unique for each SIP extension. It may be a string of maximum 6 alphanumeric characters. All ASCII characters except < > and " (double quote) are allowed.

- *Corresponding to the Authentication ID, the system generates a random **Authentication Password** and assign to all the extensions listed in th CSV File. You can edit the authentication password for the extensions, if required. Make sure you note down or copy the Authentication Password in a confidential file.*

All the other parameters that are not listed in the CSV File but are present in the SIP Extension Settings Page will contain its default value. You can modify the values of these parameters, after the extensions are configured in the system. You can also use the copy button present at the bottom of the SIP Extension Settings Page to replicate the changes made in the configuration of an extension to all the other extensions configured in the system. To know more, refer to ["Copy Parameter Values"](#).

Exporting the CSV File

After modifying the CSV File, you can now export the file. To do so,

	A	B	C	D	E	F	G	H	I	J
1										
2										
3										
4	Extension Number	S/W Port No.	Use SIP Extension	Name	Email ID	Mobile Number	Authentication Password	SIP Hardware Template	Station Basic Feature Template	Station Advanced Feature Template
5	5001	1	No				us!(VJ66	1	1	1
6	5002	2	No				d/Q26o[L	1	1	1
7	5003	3	No				vRC"79)n	1	1	1
8	5004	4	No].g/Y6i0	1	1	1
9	5005	5	No				DQ!5"2rq	1	1	1
10	5006	6	No				tYDr8(-4	1	1	1
11	5007	7	No				(e)8G7pQ	1	1	1
12	5008	8	No				7-cLhM]5	1	1	1

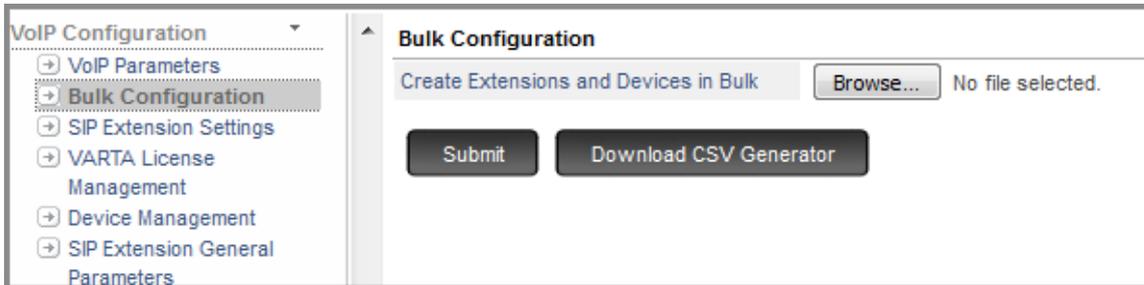

- Click the **Save CSV File** button present at the top of the CSV File.
- The CSV File with the name format **CSV-Exported-File-DD-Mmm-YYYY HH-MM-SS**, where **DD-Mmm-YYYY signifies** the current date and **HH-MM-SS** signifies the current time, will be exported on your desktop.

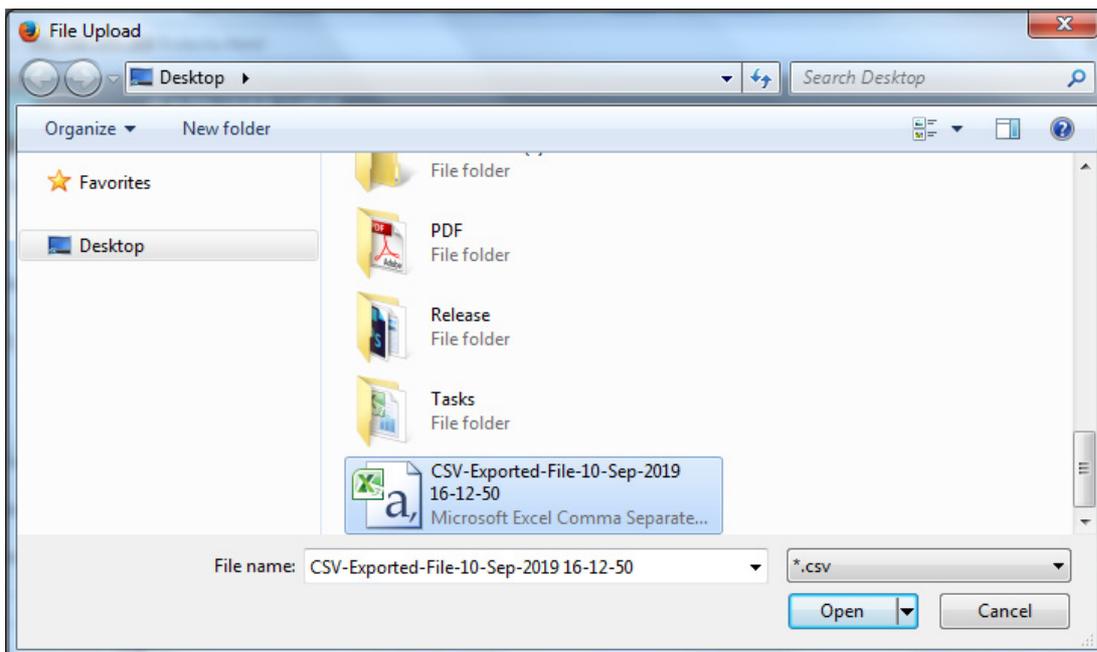

Uploading the CSV File

After you have exported the CSV File, you now have to upload the CSV File to create the extensions. To do so,

- Login as System Engineer.
- Under **VoIP Configuration**, click **Bulk configuration**.

- Click the **Browse** button to select the CSV File from the local disk on the computer.

- After selecting the required CSV File, click **Open**.

The system displays the name of the CSV File.

- Click **Submit** to upload the CSV File.

After you upload the CSV File, the following statuses will be displayed:

- **Successful:** The total number of extensions that are successful configured in the server.
- **Failed:** The total number of extensions that are not configured in the server. The list of extensions that are not configured are also displayed.

- Consider extension 5001 is already configured at a particular location in the system, say location 1 of S/W Port No 1. Another extension 5002 with different set of configuration is listed at the same location, that is, location 1 of S/W Port No 1 in the CSV File, then in this case, when the CSV file is uploaded, the configuration of the extension 5001 will be overwritten with the configuration of the extension 5002.
- In case, you keep the Extension Number for any extension listed in the CSV File as blank, then, the system will not create this extension. Moreover, the system will consider it as an end of the list and any extension/s listed after this blank Extension Number will not be created.
- The total number of extensions the system creates will depend on the number of extensions configured in System Pre-requisites. For an instance, if you have configured 100 as the **SIP Extensions in System Pre-requisites** and upload a CSV File with a configuration of 500 extensions, then the system will create only the first 100 extensions.
- Make sure the SIP ID and MAC/ Device ID is unique for all the extensions configured in the system. In case, the SIP ID or MAC /Device ID listed in the CSV File conflicts with the SIP ID or MAC /Device ID of an extension already configured in the system, then in this case, the extension with the duplicate SIP ID or MAC/ Device ID will not be created.
- It may take about 3 minutes to create all the 2000 extensions in the system.
- The system will not create an extension listed in the CSV File, if the Extension Number configured for this extension in the CSV File matches with any of the access codes configured in the system. To know the access codes that are configured in the system, refer to [“Access Codes”](#).
- Make sure you do not leave the mandatory parameters listed in the CSV Generator Template as blank, otherwise the system will not create these extensions. All the parameters listed in the CSV Generator Template are mandatory for creating the extensions.

To configure rest of the parameters which are not mentioned in the CSV File, refer to [“Configuring SIP Extension Settings as per the Extended Phone Type”](#).

Copy Parameter Values

Once you have created the extensions, you can now configure the parameters which are not mentioned in the CSV File as per your requirement.

After you have configured the required parameters for an extension, you can now copy the configuration of this extension to all the other extensions by simply using the **Copy** button present at the bottom of the SIP Extension Settings page.

For an instance, you can configure the parameters like *DSS Key Settings*, *Quality of Service (QoS)* for an extension and copy the configuration of this extension to other extensions. To do so,

- Click **Copy**.

SIP Extension Settings

SIP Extension: 1

General Parameters: [Location-1](#) [Location-2](#) [Location-3](#)

SIP Extension - 1

Use SIP Extension:

Name: Jessica

SIP ID: 5001

Authentication ID: 5001

Voice Mail Subscription:

Busy Lamp Field Subscription:

Presence Subscription:

- Select the check boxes against the parameters you want to copy to other extensions. If you want to copy all the parameters to the other extensions, select the check box **Select All**.

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

- Click **Next**. The Select Extensions window opens.

- The number and/or name of the current extension is displayed in **Copy from**. The extensions to which you can copy the current extension settings are displayed on the left side box arranged sequentially in the increasing order.
 - **To select a extension from the List,**
 - Select the desired extension and click > button. The selected extension will appear on the right side box.
 - **To select multiple extensions from the List,**
 - Select the desired extensions and click > button. The selected extensions will appear on the right side box.
 - **To select all the extensions from the List,**
 - Click >> button. All the extensions will appear on the right side box.

You can also de-select the selected extensions, if required.

- **To de-select a extension from the List,**
 - Select the desired extension and click < button. The selected extension will appear on the left side box.
- **To de-select multiple extensions from the List,**
 - Select the desired extensions and click < button. The selected extensions will appear on the left side box.
- **To select all the extensions from the List,**
 - Click << button. All the extensions will appear on the left side box.
- Click **Submit**. The settings of the current extension is copied to all the selected extensions.

Auto Sign-In Parameters

The system supports automatic configuration and registration of Mobile Clients — VARTA ADR100, VARTA AMP100 applications with the Server using Auto Sign-In.

Auto Sign-In enables Mobile Clients — VARTA ADR100, VARTA AMP100 applications — to configure and register with the server automatically at a click of a button.

For this you must:

- Configure the **Auto Sign-In Parameters**. For details, refer [“Configuring Auto-Sign-In Parameters”](#)
- Configure the **General Parameters** in **SIP Extensions Settings**. For details, refer [“Configuring SIP Extension Settings using Jeeves”](#)
- Make sure you send the **Auto Sign-In Configuration Mail**. For details, refer [“Configuring SIP Extension Settings using Jeeves”](#)

You can also view the status of Auto Sign-In Email in [“Viewing SIP Extension Status”](#)

How it Works

After you configure the required Auto Sign-In parameters and have sent the Auto Sign-In Mail to the Mobile Client users, they need to follow the instructions given below:

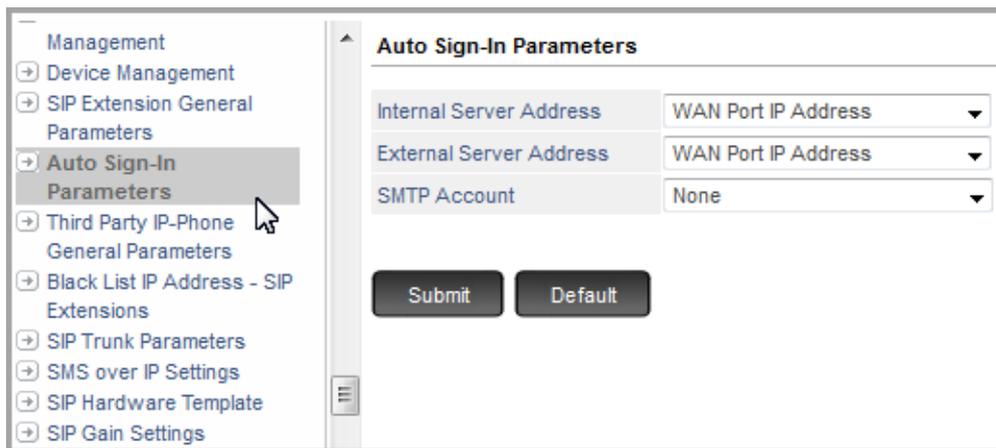

- The Auto Sign-In mail has an attachment that contains the necessary configuration details. The Mobile Client user must open the attachment in the Auto Sign-In mail using the VARTA ADR100 or VARTA AMP100 application. For more information refer to the respective User Guides.
- The Server will receive the request and process it. The client will get configured and registered automatically at any free Location1, 2 or 3 in SIP Extension Settings. If none of the Locations are free the request will not be served.
- You can check the Registration status in [“Viewing SIP Extension Status”](#).

Configuring Auto-Sign-In Parameters

The information you configure in Auto Sign-In Parameters will be sent in the mail to the Mobile Client user, when you click the **Send Auto Sign-In Configuration Mail** button.

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **Auto Sign-In Parameters**.

- Select the appropriate **Internal Server Address** to register the application with the SIP Registrar of SARVAM UCS within a private network. Select the appropriate option as per your installation scenario:
 - If you want the application to register using the WAN network, select **Use WAN Port IP Address** as the Internal Server Address.
 - If you want the application to register using the LAN network, select **Use LAN Port IP Address** as Internal Server Address.
 - If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as Internal Server Address.
 - If you do not want to configure the Internal Server Address, select **Don't Send**.

By default, Use WAN Port IP Address is selected as the Internal Server Address.

- Select the appropriate **External Server Address** to register the application with the SIP Registrar of SARVAM UCS from a public network. Select the option according to your installation scenario:
 - If you want the application to register using the WAN network, select **Use WAN Port IP Address** as External Server Address.
 - If the application is connected in the Public Network and SARVAM UCS is located behind a Router, or behind a NAT Router and STUN is programmed, select **Use Router/STUN's IP Address** as External Server Address.

Make sure you configure either the **Router's Public IP Address** or **Simple Traversal of UDPs through NATs (STUN)** in Network Parameters. For details, see "[Configuring Network Parameters](#)".

- If Dynamic DNS is configured in the Network Parameters, select **Use Dynamic DNS Host Name** as External Server Address.
- If you do not want to configure the External Server Address, select **Don't Send**.

By default, Use WAN Port IP Address is selected as the External Server Address.

- Select the **SMTP Account**¹⁵⁹ through which you want the email to be sent.

If you select **Don't Send** in both *Internal* as well as *External Server Address*, the server will send the Auto Sign-In mail but the VARTA Mobile Clients will not get registered.

159. Make sure that the SMTP settings are configured correctly. For more information, refer ["SMTP Settings"](#).

VARTA License Management

To view the VARTA License Status and to assign licenses to SIP Extensions,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **VARTA License Management**.

VARTA License Management

License Type	Total Available Licenses	Total Used Licenses
VARTA Essential	1000	0
VARTA Professional	1000	0

Submit

When Demo Mode is activated, VARTA Collaboration Users license is by default assigned to all SIP Extensions internally. You do not need to configure it manually.

VARTA License Management

The following information will be displayed for the license you activated (VARTA Essential/Professional/ Collaboration).

- **License Type:** This displays the name of the licenses — Essential, Professional or Collaboration.
- **Total Available Licenses:** This displays the total number of licenses activated.
- **Total Used Licenses:** This displays the total number of VARTA users registered as SIP extensions.

VARTA License Assignment

After registering and configuring MATRIX VARTA WIN200/VARTA ADR100/VARTA AMP100 as a SIP Extension, you must select the desired license in the **Assigned License** field below. You can also filter the SIP Extensions as per the license assigned.

- **Apply Filters:** By default you can view all the SIP Extensions, as all the filters are enabled.

- Clear the **VARTA Essential** check box, if you do not want to view the SIP Extensions that are assigned this license.
- Clear the **VARTA Professional** check box, if you do not want to view the SIP Extensions that are assigned this license.
- Clear the **VARTA Collaboration** check box, if you do not want to view the SIP Extensions that are assigned this license.
- Clear the **None** check box, if you do not want to view the SIP Extensions that are not assigned any license.
- **SIP Extension:** This displays the SIP Extension Number with which you can register the VARTA UC Clients.
- **SIP ID:** This displays the SIP ID assigned to the SIP Extension.
- **Assigned License:** Select the license you wish to assign to the SIP Extension and click **Submit**.
- **Location 1, 2, 3:** This displays the Device Type selected on the SIP Extension Location 1, 2 and 3.

Configuring Standard SIP Phones

You can connect any of the following as SIP Extensions of the SARVAM UCS:

- Matrix SPARSH VP248
- Matrix SPARSH VP110
- Matrix SPARSH VP710
- Matrix SPARSH VP210
- Any Standard SIP Phone
- Any SIP-enabled device including PC based Soft-phone
- Analog Phone Adapter

For detailed product information and operational instructions, refer to the product documentation supplied with the Standard SIP Phone/device.

SARVAM UCS supports two separate methods of Provisioning the Standard SIP Phones. These two methods are:

- **Manual Provisioning:** In Manual Provisioning, the user must configure the required parameters of the Standard SIP Phone manually. So, it is not a simple plug-and-play solution for mass deployment, as it requires intervention of authorized technical personnel for phone configuration. To configure Standard SIP Phones using this method, see [“Configuring Standard SIP Phones using Manual Provisioning”](#).

Auto Provisioning: In Auto Provisioning, the Standard SIP Phone gets configured automatically by retrieving the required configuration file from the SARVAM UCS. The configuration file contains pre-programmed values of necessary parameters required by the Standard SIP Phone. Thus, it eliminates the necessity of manually configuring the Standard SIP Phone parameters. When the Standard SIP Phone starts, it then gets configured automatically. Here, SARVAM UCS acts as the Auto Provisioning Server by providing the configuration file to the Standard SIP Phones. Auto Provisioning enables mass deployment of Standard SIP Phones and provides a plug-and-play solution for them. To configure Standard SIP Phones using this method, see [“Configuring Standard SIP Phones using Auto Provisioning”](#).

- *Auto Provisioning for Matrix SPARSH Phones and Third Party SIP Phones is supported only through the HTTP Port.*
- *For Auto Provisioning, you must configure the Standard SIP phones at **Location1** only. You will have to manually configure the Standard SIP phones at Location 2 and 3.*
- *If you have already configured the phones at Location 2 and 3 and you upgrade the firmware, the phones will not function as Auto Provisioning is not supported at these locations. You will have to configure these phones again manually.*

To be able to use Standard SIP Phones/Devices as SIP Extensions, you must configure the following:

- SIP Extension General Parameters, see [“Configuring SIP Extension General Parameters”](#).
- SIP Extension Settings, see [“Configuring SIP Extension Settings using Jeeves”](#).
- Standard SIP Authorization Profile, see [“Standard SIP Authorization Profile”](#).
- Voice Mail Settings, if you want to provide mailbox to the extensions. See [“Extension Voice Mail Settings”](#).

Configuring SIP Extension Settings using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **SIP Extension Settings**.

The page of SIP Extension 001 opens.

- You may select the **SIP Extension** number you want to configure.

For SARVAM UCS upto 999 SIP Extensions can be registered with the system. SARVAM UCS supports IPv4 and IPv6 Addresses for registering Standard SIP Phones.

- Select the **Use SIP Extension** check box to enable the SIP extension. Default: disabled.
- In the **Name** field, enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls.

The name may consist of a maximum of 18 alphanumeric characters.

If no name is assigned to the SIP Extension, the system will display the name received in the INVITE message from the SIP Extension user when making outgoing calls.

- Enter the **SIP ID** for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the system can call a SIP Extension by dialing the SIP ID assigned to the SIP Extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed.

You cannot assign the same SIP ID to more than one extension.

By default, the SIP IDs are Blank.

The SIP ID will be set to default value (blank), when you restore the default settings of the system.

- In **Authentication ID**, enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank and it must be unique for each SIP extension. The number may be a string of maximum 6 digits. All ASCII characters except < > and " (double quote) are allowed. Default: Blank.

Make sure the User ID configured in "Digest Authentication" does not conflict with the Authentication ID configured above.

- In **Authentication Password**, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, the password must:
 - be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.
 Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See "[Black List IP Address - SIP Extensions](#)" for more details. This activity will be logged in the "[System Activity Log](#)" as well as "[Simple Network Management Protocol \(SNMP\)](#)".

Make sure you note down or copy the Authentication Password in a confidential file.

- In **HTTP Authentication Password** (Third Party IP-Phone), enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the Standard SIP Phone connected to the system. SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password (Third Party IP-Phone) and provides configuration on validation.

To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. The password must:

- be of minimum 6 characters and can be a maximum of 12 characters.
 - include atleast one upper-case, one lower-case, one number and one special character.
 - all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.
- Default: Blank.

To provide additional security, when the HTTP Authentication fails 5 times consecutively within 10 minutes due to wrong Authentication ID / Authentication Password, the system will block the IP Address for configuration of this Standard SIP Phone. However, you can register again after 10 minutes. This activity will be logged in the "[System Activity Log](#)" as well as "[Simple Network Management Protocol \(SNMP\)](#)".

You are recommended to note down or copy the Authentication Password and HTTP Authentication Password in a confidential file.

Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.

- In **Call Appearances**, define the maximum number¹⁶⁰ of simultaneous calls that the SIP Extension should be allowed to make/receive. You can set up to 10 call appearances for a SIP Extension. Default: 2.

When Call Appearance is set to 2, the SIP Extension can make/receive 2 calls at a time.

Auto Sign-In parameters — Send Configuration Mail and Mail Status, are applicable only for Mobile Clients — VARTA ADR100, VARTA AMP100 applications.

The **Send Configuration Mail** button will appear only after you have enabled the SIP Extension and configured the SIP ID, Authentication ID and Password.

- Under **Authentication**, enable Authentication of any or all of the following SIP Message Options by selecting the respective check boxes:
 - **INVITE Request**
 - **SUBSCRIBE Request**

By default, the SIP Message Options INVITE and SUBSCRIBE are enabled.

Make sure that the Authentication ID for the SIP Extension has been programmed.

- If you are going to register this SIP Extension with the same SIP ID at more than one location¹⁶¹, you may enable the **Shared Call Appearance Subscription** check box on this SIP Extension. Default: Disabled.

Shared Call Appearance provides notification on call states to all the Standard SIP Phones with the same SIP ID at different locations. To know more about this feature, see [“Shared Call Appearance”](#).

- To provide voice mail facility to the SIP Extension, select the **Voice Mail Subscription** check box. Default: disabled.
- To allow the SIP Extension to monitor the status of another extension or Trunk, select the **Busy Lamp Field**¹⁶² **Subscription** check box. Default: disabled. See [“Busy Lamp Field for Trunks”](#) to know more.

When extension's state is changed from Ringing (early state as defined in BLF) to Mature (confirm state, as defined in BLF) state, because of implementation of SARVAM UCS, it will send 'Terminate' state while moving from ringing to mature state. The interpretation of terminate message will vary from terminal to terminal.

- To allow the SIP Extension to view the status of other SIP-enabled Terminals, whether they are available or not, select the **Presence Subscription** check box. Default: disabled.

The SIP Extension, for which you have enabled Presence Subscription, will be able to view Presence of only those SIP Extensions which have PUBLISH enabled.

160. For the calls that are routed through the CPU, the number of Vocoder channels that will be supported would be as per the license you purchase.

161. SARVAM UCS allows you to register SIP Extension with the same SIP ID at three different locations.

162. Busy Lamp Field (BLF), a typical feature supported by the system and Key Telephone Systems, is also supported on SIP Extensions.

In the system and Key Telephone Systems, this feature is typically used by the Operator to monitor the status of another extension, that is, whether it is available, ringing or busy. The status of the other extensions is indicated on the special function keys programmed on the Operator's console. This helps the Operator decide whether to place the call, or transfer the call to that extension, or pick up the call ringing on that extension. With BLF Subscription enabled on the SIP Extension, the user can monitor the status of another extension or trunk.

- To allow the SIP Extension to publish presence using the PUBLISH feature supported by the SIP Extension, select the **PUBLISH Enable** check box. Default: disabled.

By default, **Authentication** for PUBLISH message is enabled. You may disable if you do not want to use Authentication.

You must configure the Authentication ID, if you have enabled both Publish and Authentication.

- For secure conversations over SIP, enable **SRTP Mode**. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.
 - **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- **Key Templates** are not applicable to Standard SIP Phones registered with SARVAM UCS.
- Assign a **SIP Hardware Template** to the SIP Extension. Default: 01. The “[SIP Hardware Template](#)” contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and Fax-over-IP options and related parameters

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Extensions as well as to SIP Trunks.

Check if the values in this template fulfill requirements of the SIP Extension. If Template 01 fulfills the feature requirements, retain Template 01.

If a different set of SIP hardware features are to be allowed to this SIP Extensions, prepare another template and assign it to this extension. To do this,

- Under **VoIP Configuration**, click the **SIP Hardware Template** link.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 02 in the **SIP Hardware Template** field.

Also see the topic “[SIP Hardware Template](#)” to know more about customizing the templates and applying on the SIP Extensions.

- Assign a **Station Basic Feature Template** to the SIP Extension. Default: The “[Station Basic Feature Template](#)” has a set of features like Time Table, Class of Service, Toll Control, Operator, Storage of

Incoming and Outgoing Calls, Outgoing Trunk Bundle groups. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

If the default Station Basic Feature Template 01 fulfills the feature requirements of the SIP Extension (“[Class of Service \(COS\)](#)”, “[Toll Control](#)”, “[OG Trunk Bundle Group](#)”, etc.) retain this template, you may also customize this template. If you want to assign a different set of features to this SIP Extension, prepare a different Station Basic Feature Template and apply it to this extension. To do this,

- Under **Configuration**, click the **Station Basic Feature Template** link.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit**.
- Return to the **SIP Extension Settings** page.
- Select the number of the Template you customized, Template 05, in the **Station Basic Feature Template** field.
- Click **Submit** to save changes.

Also, see the topic “[Station Basic Feature Template](#)” to know more about customizing the templates and applying on extensions.

- Assign a **Station Advanced Feature Template** to the SIP Extension. Default: Template 01. The “[Station Advanced Feature Template](#)” has a set of advanced features for extensions such as Alarm Notification settings, Routing of Incoming Auto Attendant Calls, Call Duration Control, Floor Service, etc. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences.

Check if the default template fulfills the feature requirements of the SIP Extension by clicking the **Station Advanced Feature Template** link.

You may retain this template and customize it further, or customize another template if a different set of features are to be allowed to this SIP Extension. To customize/prepare another template,

- Under **Configuration**, click the **Station Advanced Feature Template** link.
- Select the Template number, for example 02, and customize this template.
- Click **Submit** and return to the 'SIP Extension Settings' page.
- In the **Station Advanced Feature Template** field, select the number of the template you customized.
- Click **Submit** to save changes.

Also see the topic “[Station Advanced Feature Template](#)” for instructions on customizing these templates and applying them on the extensions.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see “[Extension Voice Mail Settings](#)”.

The Voice Mail Settings link will be visible only if you have configured the respective SIP ID.

Click **Close** to close the window.

Advanced Configuration Parameters

- If you want to provide other features like Personal Directory, Priority, or assign a Station Type to the SIP Extension, click the **Advanced** button at the bottom of the page.

SIP Extension Settings	
SIP Extension	1
General Parameters Location-1 Location-2 Location-3	
Templates	
SIP Hardware Template	01
Station Basic Feature Template	01
Station Advanced Feature Template	01
Voice Mail Settings	
Others	
Mobile Number	
SMS/Email Group Type	None
Call Pickup Group	01
COSEC Door Group	00
Station Type	Administration
Personal Directory	00
Priority	5 - Normal
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Call Traffic"/> <input type="button" value="Copy"/>	

- Enter the **Mobile Number** of the extension user you wish to store. The Number can be a maximum of 16 digits.
- You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see ["SMS/Email Group"](#).
- Assign the SIP Extension to a **Call Pick-up Group**, if required.

Call Pick Up allows the SIP Extension to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. It also allows incoming calls for the SIP Extension to be answered by the other extensions assigned the same Call Pick-Up group.

For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer ["Call Pick Up"](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SIP Extension in this field.

- Select the **Call Pick-up Notification (Only for SPARSH VP510)** check box, if you want the Call Pick-up Notification to be displayed on the phone LCD. The Call Pick-up Notification will be displayed for internal as well as external calls. The notification will be displayed on SPARSH VP510 only if the ringing extension is in the same Call Pick-up Group. The notification will be displayed only when SPARSH VP510 is in idle or dial state. The notification will display the name/number of the Caller along with the name/number of the Called. For example, if the name and number of the Caller is ABC, 2001 and the name and number of

Called is XYZ, 1001, the LCD notification will be displayed as ABC -> XYZ. Along with the LCD display the phone back-light will also be lit.

For this to work, make sure you have enabled Call Pick-up in COS as well as assigned a Call Pick-up Group to the extension. Refer to “[Call Pick Up](#)” and “[Class of Service \(COS\)](#)”. Call Pick-up Notifications will be displayed for DKP, SLT as well as SIP Extensions and for calls landing through CO, SIP as well as T1E1 Trunks. For details of the Notification, refer to the EON510_SPARSH VP510 V2 User Guide.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See “[COSEC Integration](#)” for more information.
- If this is an Operator extension and you want the system to play beeps during a conference to the participants, to indicate the presence or absence of the Operator, select the **Station Type** as **Assistant**.

If you are using the system in the *Hotel Mode*, select the **Station Type** for the SIP Extension as **Administration/Assistant** or **Guest**. The system will consider the options Administrator and Assistant as same.

- You may assign a **Personal Directory** number to the SIP Extension. Default: 00.

A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ("Out Going Trunk Bundle Group Index"). The Personal Directory is necessary for using the features “[Abbreviated Dialing](#)” and “[Dial By Name](#)”.

When a Personal Directory is assigned to a SIP Extension, make sure you also configure this directory. The Personal Directory can be programmed by the SIP Extension users and by the System Engineer. Refer the topic “[Abbreviated Dialing](#)” for instructions on programming the Personal Directory. If Personal Directory is not to be assigned, enter 00 in this field.

- Select a **Priority** Level for the SIP Extension from 1 to 9. Default; 5-Normal.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description “[Priority](#)”.

If this SIP extension is assigned to Operator, you may want to set a higher priority for this extension.

- Click **Submit** to save your SIP Extension Settings.

Configuring Standard SIP Phones using Manual Provisioning

To be able to use Standard SIP Phones/devices with SARVAM UCS, you must configure the following:

- Configure the **SIP Extension Settings**. For details, see “[Configuring SIP Extension Settings using Jeeves](#)”.¹⁶³

163. Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected to the system.

- Configure specific parameters (for example, SIP ID/User Name, Authentication ID, Password, Server Address/Domain Name etc.) in the Standard SIP Phone/device which are required to register it with system. For more information, refer the product documentation supplied with the Standard SIP Phone/device you want to use.

Configuring Standard SIP Phones using Auto Provisioning

SARVAM UCS supports the following third party Standard SIP Phones for Auto Provisioning-

- Panasonic UTG200B
- Grandstream GXP110x
- Grandstream GXP2200
- Grandstream GXP21xx/116x/14xx
- Grandstream GXV3140/3175
- Yealink SIP-T19P/SIP-T21P/T22P/T26P/T28P/T4X
- Yealink SIP-T20P
- Yealink SIP-T3XG
- Cisco SPA50xG/51xG SIP Phone
- Cisco SPA525G SIP Phone
- Polycom IP Phone
- Snom IP Phone
- Htek 802
- Any Standard SIP Phone

Connecting the Standard SIP Phone

To be able to configure and register the Standard SIP Phone with SARVAM UCS using Auto Provisioning,

- Connect and reboot the Standard SIP Phone.
- Make sure that **DHCP** is selected as the *Connection Type* in the Standard SIP Phone.
- For Auto Provisioning, you must configure the Standard SIP phones at Location1 only.
- The phone will automatically fetch the configuration file(s) from SARVAM UCS and will get registered.

Using any third party DHCP Server in your LAN

You can use any third party DHCP Server in your LAN for assigning the 'Auto Provisioning Server Address' and 'Server Port' to the Standard SIP Phones.

- Make sure that the third party DHCP Server and your Standard SIP Phone, both are connected in the same subnet as that of the **LAN** Port of SARVAM UCS.
- Select **DHCP Option 66**, and configure **Data** type in that third party DHCP Server in the following format - **http://IP Address:SPARSH Port**.

If you are using Auto Provisioning and if the Standard SIP Phone has multiple SIP accounts, it is recommended to keep the first SIP account in default settings. After Auto Provisioning, the old configuration, if present for this account will be deleted automatically and it will get registered with the SARVAM UCS.

Configuring Panasonic Standard SIP Phones

You are recommended to complete the following steps before connecting **Panasonic UTG200B**:

- Decide the physical location of the Standard SIP Phone.
- Configure the settings in the third party DHCP Server. For instructions, see [“Using any third party DHCP Server in your LAN”](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see [“Configuring SIP Extension Settings using Jeeves”](#)¹⁶⁴
- Configure the device specific settings applicable to your **Panasonic UTG200B** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box.	Panasonic UTG200B
Location Name	Configure the Location Name to identify the phone. The Location Name can be a maximum of 18 characters. Default: Blank.	Panasonic UTG200B
Device Type	Select Device Type as Panasonic UTG200B.	Panasonic UTG200B
MAC Address	Enter the MAC Address of the Panasonic phone to be connected at this location. Default: Blank. SARVAM UCS validates the phone on the basis of the MAC Address and provides configuration on validation.	Panasonic UTG200B

¹⁶⁴. Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

Authenticate HTTP Provisioning request		<p>Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled.</p> <p>If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option.</p> <p>SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation.</p> <p>Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.</p>	Panasonic UTG200B
Registrar Server Address		Select the appropriate Registrar Server Address according to your installation scenario ^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address.	Panasonic UTG200B
Standard SIP Authorization Profile		Select the desired Standard SIP Authorization Profile from the list of profiles. Default: Panasonic	Panasonic UTG200B
Language		Displays the Standard SIP Phone language and it is non-editable.	Panasonic UTG200B
User Password		Configure the User Password ^b of the Standard SIP Phone. It can be a minimum of 6 characters to a maximum of 16 characters. Default: userpass	Panasonic UTG200B
Admin Password		Configure the Admin Password ^c of the Standard SIP Phone. It can be a minimum of 6 characters to a maximum of 16 characters. Default: adminpass	Panasonic UTG200B
Time Zone		Select the Time Zone of the region/country where the Standard SIP Phone is installed. Default: GMT + 05:30	Panasonic UTG200B
Daylight Saving Time	Enable DST	If DST is applicable, select the Enable DST check box. A list of DST parameters appear. Configure them as per your requirement. Default: Disabled.	Panasonic UTG200B
	DST Offset (min)	Configure the DST Offset in minutes. Valid Range: 0 to 720 minutes. Default: 60 minutes.	Panasonic UTG200B
	Start Day and Time of DST	To configure the time from when DST should be applied in the year, select the Month, Day, Week/Ordinal and Time (hh:mm) from the corresponding list boxes respectively.	Panasonic UTG200B
	End Day and Time of DST	To configure the time when DST should end, select the Month, Day, Week/Ordinal and Time (hh:mm) from the corresponding list boxes respectively.	Panasonic UTG200B
Primary NTP Server		Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the "Third Party IP-Phone General Parameters" .	Panasonic UTG200B

- a. If the Standard SIP phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.

If the Standard SIP phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address

If the Standard SIP Phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.

If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.

- b. To avoid unauthorized access, we recommend you to change the User Password regularly. Make sure it is strong and is kept confidential.
- c. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Grandstream Standard SIP Phones

You are recommended to complete the following steps before connecting any of the **Grandstream** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone.
- Configure the settings in the third party DHCP Server. For instructions, see [“Using any third party DHCP Server in your LAN”](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see [“Configuring SIP Extension Settings using Jeeves”](#)¹⁶⁵
- Configure the device specific settings applicable to your **Grandstream** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box.	1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Location Name	Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175

¹⁶⁵ Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

Device Type	Select Device Type as any of the desired Grandstream Standard SIP Phone you want to connect.	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
MAC Address	<p>Enter the MAC Address of the Grandstream phone to be connected at this location. Default: Blank.</p> <p>SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.</p>	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Authenticate HTTP Provisioning request	<p>Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled.</p> <p>If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option.</p> <p>SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation.</p> <p>Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.</p>	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Registrar Server Address	Select the appropriate Registrar Server Address according to your installation scenario ^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address.	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Standard SIP Authorization Profile	Select the desired Standard SIP Authorization Profile from the list of profiles. Default: Grandstream	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Language	Select the desired Standard SIP Phone language. Default: English	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Send Phone Book	Select the Send Phone Book check box to enable downloading of the Phone Book (consisting of Extension and Global Directory Contacts) from the SARVAM UCS.	<ol style="list-style-type: none"> 1. Grandstream GXP2200 2. Grandstream GXP21xx/116x/14xx 3. Grandstream GXV3140/3175
Phone Book Download interval (min)	Configure the Phone Book Download interval in minutes. Valid Range: 0 - 720 minutes. Default: 60 minutes	<ol style="list-style-type: none"> 1. Grandstream GXP2200 2. Grandstream GXP21xx/116x/14xx 3. Grandstream GXV3140/3175

User Password	Configure the User Password ^b of the Standard SIP Phone. It can be a minimum of 1 character to a maximum of 16 characters. Default: user	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Admin Password	Configure the Admin Password ^c of the Standard SIP Phone. It can be a minimum of 1 character to a maximum of 16 characters. Default: admin	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175
Time Zone	Select the Time Zone of the region/country where the Standard SIP Phone is installed. Default: GMT + 05:30	<ol style="list-style-type: none"> 1. Grandstream GXP2200 2. Grandstream GXP21xx/116x/14xx 3. Grandstream GXV3140/3175
Date Display Format	Select the Date Display Format for the Standard SIP Phone. Default: yyyy-mm-dd	<ol style="list-style-type: none"> 1. Grandstream GXP2200 2. Grandstream GXP21xx/116x/14xx 3. Grandstream GXV3140/3175

Primary NTP Server	Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the "Third Party IP-Phone General Parameters" .	<ol style="list-style-type: none"> 1. Grandstream GXP110x 2. Grandstream GXP2200 3. Grandstream GXP21xx/116x/14xx 4. Grandstream GXV3140/3175

- a. If the Standard SIP phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.
- If the Standard SIP phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address
- If the Standard SIP Phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.
- If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.
- b. To avoid unauthorized access, we recommend you to change the User Password regularly. Make sure it is strong and is kept confidential.
- c. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Yealink Standard SIP Phones

You are recommended to complete the following steps before connecting any of the **Yealink** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone. It must be connected in the same subnet as that of the LAN Port of SARVAM UCS.

- Configure the settings in the third party DHCP Server. For instructions, see [“Using any third party DHCP Server in your LAN”](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see [“Configuring SIP Extension Settings using Jeeves”](#)¹⁶⁶
- Configure the device specific settings applicable to your **Yealink** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box.	1. Yealink SIP-T19P/SIP-T21P/T22P/T26P/T28P/T4X 2. Yealink SIP-T20P 3. Yealink SIP-T3XG
Location Name	Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	1. Yealink SIP-T19P/SIP-T21P/T22P/T26P/T28P/T4X 2. Yealink SIP-T20P 3. Yealink SIP-T3XG
Device Type	Select Device Type as any of the desired Yealink Standard SIP Phone you want to connect.	1. Yealink SIP-T19P/SIP-T21P/T22P/T26P/T28P/T4X 2. Yealink SIP-T20P 3. Yealink SIP-T3XG
MAC Address	Enter the MAC Address of the Yealink phone to be connected at this location. Default: Blank. SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.	1. Yealink SIP-T19P/SIP-T21P/T22P/T26P/T28P/T4X 2. Yealink SIP-T20P 3. Yealink SIP-T3XG

¹⁶⁶. Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

Authenticate HTTP Provisioning request		<p>Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Time Display Format		Select the Time Display Format for the Standard SIP Phone. Default for T20P Phone: MM DD YY and for other phones WWW MMM DD	1. Yealink SIP-T19P/SIP-T21P/T22P/T26P/T28P/T4X 2. Yealink SIP-T20P 3. Yealink SIP-T3XG
Primary NTP Server		Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the “Third Party IP-Phone General Parameters” .	1. Yealink SIP-T19P/SIP-T21P/T22P/T26P/T28P/T4X 2. Yealink SIP-T20P 3. Yealink SIP-T3XG

- a. If the Standard SIP phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.

If the Standard SIP phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address

If the Standard SIP Phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.

If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.

- b. To avoid unauthorized access, we recommend you to change the User Password regularly. Make sure it is strong and is kept confidential.
- c. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Cisco Standard SIP Phones

You are recommended to complete the following steps before connecting any of the **Cisco** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone.
- Configure the settings in the third party DHCP Server. For instructions, see ["Using any third party DHCP Server in your LAN"](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see ["Configuring SIP Extension Settings using Jeeves"](#)¹⁶⁷
- Configure the device specific settings applicable to your **Cisco** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Location Name	Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone

¹⁶⁷. Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

Device Type		Select Device Type as any of the desired Cisco Phone you want to connect.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
MAC Address		Enter the MAC Address of the Cisco phone to be connected at this location. Default: Blank. SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Authenticate HTTP Provisioning request		Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled. If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option. SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation. Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Registrar Server Address		Select the appropriate Registrar Server Address according to your installation scenario ^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Standard SIP Authorization Profile		Select the desired Standard SIP Authorization Profile from the list of the profiles. Default: Cisco	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Send Phone Book		Select the Send Phone Book check box to enable downloading of the Phone Book (consisting of Extension and Global Directory Contacts) from the SARVAM UCS. Default: Enabled	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Phonebook Name		Configure the Name of the Phonebook. This name will be displayed on the Phone LCD. It can be of maximum 32 characters. Default: Corporate Directory	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
User Password		Configure the User Password ^b of the Standard SIP Phone. It can be a minimum of 1 character to a maximum of 16 characters. Default: Blank	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone

Admin Password		Configure the Admin Password ^c of the Cisco phone. It can be a minimum of 1 character to a maximum of 16 characters. Default: Blank	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Phone User Interface Language		Select the desired language in which the Standard SIP Phone's User Interface should be displayed. Default: English-US	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Language File Download Path		Select the path from which the Standard SIP Phone must fetch the Language files. Default: None. Make sure you configure the desired Path (Server Address/es) in the "Third Party IP-Phone General Parameters" .	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Time Zone		Select the Time Zone of the region/country where the Standard SIP Phone is installed. Default: GMT + 05:30	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Enable DST		If DST is applicable, select the Enable DST check box. A list of DST parameters appear. Configure them as per your requirement. Default: Disabled	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone

Daylight Saving Time	DST Start Day of Week	Select the Day of Week from when DST should be applied.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
	DST Start Day of Week Last in Month	Select the DST Start Day of Week Last in Month.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
	Start Hour of Day	Select the DST Start Hour of the Day.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
	DST Stop Month	Select the Month when DST should end.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
	DST Stop Day of Week	Select the Day of Week when DST should end.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
	DST Stop Day of Week Last in Month	Select the DST Stop Day of Week Last in Month.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
	End Hour of Day	Select the DST End Hour of the Day.	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Date Display Format		Select the Date Display Format for the Standard SIP Phone. Default: month/day	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Time Display Format		Select the Time Display Format for the Standard SIP Phone. Default: 12Hr	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Offset Timer(min)		Configure the DST Offset timer value in minutes. Valid Range:-300 to +300. Default: 000	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone
Primary NTP Server		Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the "Third Party IP-Phone General Parameters" .	1. Cisco SPA50xG/51xG SIP Phone 2. Cisco SPA525G SIP Phone

- a. If the Standard SIP phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.

If the Standard SIP phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address

If the Standard SIP Phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.

If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.

- b. To avoid unauthorized access, we recommend you to change the User Password regularly. Make sure it is strong and is kept confidential.
- c. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Polycom Standard SIP Phones

You are recommended to complete the following steps before connecting any of the **Polycom** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone.
- Configure the settings in the third party DHCP Server. For instructions, see ["Using any third party DHCP Server in your LAN"](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see ["Configuring SIP Extension Settings using Jeeves"](#)¹⁶⁸
- Configure the device specific settings applicable to your **Polycom** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box.	Polycom IP Phone
Location Name	Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	Polycom IP Phone
Device Type	Select Device Type as Polycom IP Phone.	Polycom IP Phone

¹⁶⁸. Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

MAC Address		<p>Enter the MAC Address of the Polycom phone to be connected at this location. Default: Blank.</p> <p>SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.</p>	Polycom IP Phone
Authenticate HTTP Provisioning request		<p>Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled.</p> <p>If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option.</p> <p>SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation.</p> <p>Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.</p>	Polycom IP Phone
Registrar Server Address		<p>Select the appropriate Registrar Server Address according to your installation scenario^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address</p>	Polycom IP Phone
Standard SIP Authorization Profile		<p>Select the desired Standard SIP Authorization Profile from the list of the profiles. Default: Polycom</p>	Polycom IP Phone
Send Phone Book		<p>Select the Send Phone Book check box to enable downloading of the Phone Book (consisting of Extension and Global Directory Contacts) from the SARVAM UCS. Default: Enabled</p>	Polycom IP Phone
User Password		<p>Configure the User Password^b of the Standard SIP Phone. It can be maximum of 16 characters long. Default: 123</p>	Polycom IP Phone
Admin Password		<p>Configure the Admin Password^c of the Standard SIP Phone. It can be a maximum of up to 16 characters. Default: 456</p>	Polycom IP Phone
Phone User Interface Language		<p>Select the desired language in which the Standard SIP Phone's User Interface should be displayed. Default: English Internal (en-in)</p>	Polycom IP Phone

Enable DST		If DST is applicable, select the Enable DST check box. A list of DST parameters appear. Configure them as per your requirement. Default: Disabled	Polycom IP Phone
DST Type		Select the DST Type that should be applied to the Standard SIP Phone, either DST by Date or DST by Week.	Polycom IP Phone
If DST Type = DST by Date	Start Month	Select the Month from when DST should be applied.	Polycom IP Phone
	Start Day	Select the Day from when DST should be applied.	Polycom IP Phone
	Start Hour	Select the Hour from when DST should be applied.	Polycom IP Phone
	End Month	Select the Month when DST should end.	Polycom IP Phone
	End Day	Select the Day when DST should end.	Polycom IP Phone
	End Hour	Select the Hour when DST should end.	Polycom IP Phone
If DST Type = DST by Week	DST Start Month	Select the Month from when DST should be applied.	Polycom IP Phone
	DST Start Day of Week	Select the Day of Week from when DST should be applied.	Polycom IP Phone
	DST Start Day of Week Last in Month	Select the DST Start Day of Week Last in Month.	Polycom IP Phone
	Start Hour of Day	Select the DST Start Hour of the Day.	Polycom IP Phone
	DST Stop Month	Select the Month when DST should end.	Polycom IP Phone
	DST Stop Day of Week	Select the Day of Week when DST should end.	Polycom IP Phone
	DST Stop Day of Week Last in Month	Select the DST Stop Day of Week Last in Month.	Polycom IP Phone
	End Hour of Day	Select the DST End Hour of the Day.	Polycom IP Phone
Date Display Format		Select the Date Display Format for the Standard SIP Phone. Default: 1 Jan, Mon	Polycom IP Phone
Time Display Format		Select the Time Display Format for the Standard SIP Phone. Default: 24Hr	Polycom IP Phone

Primary NTP Server		Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the “Third Party IP-Phone General Parameters” .	Polycom IP Phone
---------------------------	--	---	------------------

- a. If the Standard SIP phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.
- If the Standard SIP phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address
- If the Standard SIP Phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.
- If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.
- b. To avoid unauthorized access, we recommend you to change the User Password regularly. Make sure it is strong and is kept confidential.
- c. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Snom Standard SIP Phones

You are recommended to complete the following steps before connecting any of the **Snom** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone. It must be connected in the same subnet as that of the LAN Port of SARVAM UCS.
- Configure the settings in the third party DHCP Server. For instructions, see [“Using any third party DHCP Server in your LAN”](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see [“Configuring SIP Extension Settings using Jeeves”](#)¹⁶⁹
- Configure the device specific settings applicable to your **Snom** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box.	Snom IP Phone

¹⁶⁹. Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

Location Name	Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	Snom IP Phone
Device Type	Select Device Type as Snom IP Phone.	Snom IP Phone
MAC Address	Enter the MAC Address of the Snom phone to be connected at this location. Default: Blank. SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.	Snom IP Phone
Authenticate HTTP Provisioning request	Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled. If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option. SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation. Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.	Snom IP Phone
Registrar Server Address	Select the appropriate Registrar Server Address according to your installation scenario ^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address.	Snom IP Phone
Standard SIP Authorization Profile	Select the desired Standard SIP Authorization Profile from the list of the profiles. Default: Snom	Snom IP Phone
Send Phone Book	Select the Send Phone Book check box to enable downloading of the Phone Book (consisting of Extension and Global Directory Contacts) from the SARVAM UCS. Default: Enabled	Snom IP Phone
Web User Interface Language	Select the desired language in which the Web User Interface of the selected Standard SIP Phone should be displayed. Default: English	Snom IP Phone
Web User Language File Download Path	Select the path from which the Standard SIP Phone must fetch the Language files. Default: None. Make sure you configure the desired Path (Server Address/es) in the “Third Party IP-Phone General Parameters” .	Snom IP Phone
Phone User Interface Language	Select the desired language in which the Standard SIP Phone’s User Interface should be displayed. Default: English	Snom IP Phone

Phone User Language File Download Path	Select the path from which the Standard SIP Phone must fetch the Language files. Default: None. Make sure you configure the desired Path (Server Address/es) in the “Third Party IP-Phone General Parameters” .	Snom IP Phone
Time Zone	Select the Time Zone of the region/country where the Standard SIP Phone is installed. Default: India	Snom IP Phone
Date Display Format	Select the Date Display Format for the Standard SIP Phone. Default: mm/dd	Snom IP Phone
Time Display Format	Select the Time Display Format for the Standard SIP Phone. Default: 12Hr	Snom IP Phone
Call Progress Tone	Select the region to apply the Call Progress Tone prevailing there. Default: India.	Snom IP Phone
HTTP Server Login Username	Configure the HTTP Server Login User Name for web access. It can be a maximum of 16 characters. Default: Blank	Snom IP Phone
HTTP Server Login Password	Configure the HTTP Server Login Password ^b for web access. It can be a maximum of 16 characters. Default: Blank	Snom IP Phone
Admin Mode	Select Admin Mode check box to allow its access to the user. Default: Enabled	Snom IP Phone
Admin Mode Password	Configure the Admin Password ^c of the Standard SIP Phone. It can be a minimum of 1 character to a maximum of 16 characters. Default: 0000	Snom IP Phone
Primary NTP Server	Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the “Third Party IP-Phone General Parameters” .	Snom IP Phone

- a. If the phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.
- If the phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address
- If the phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.
- If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.
- b. To avoid unauthorized access, we recommend you to change the HTTP Server Login Password regularly. Make sure it is strong and is kept confidential.
- c. To avoid unauthorized access, we recommend you to change the Admin Mode Password regularly. Make sure it is strong and is kept confidential.

Configuring Matrix SPARSH VP110 Standard SIP Phone

You are recommended to complete the following steps before connecting any of the **Matrix SPARSH VP110** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone.
- Configure the settings in the third party DHCP Server. For instructions, see [“Using any third party DHCP Server in your LAN”](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see [“Configuring SIP Extension Settings using Jeeves”](#)¹⁷⁰
- Configure the device specific settings applicable to your **Matrix SPARSH VP110** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter		Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device		Select the Enable Device check box. Default: Disabled.	Matrix SPARSH VP110
Location Name		Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	Matrix SPARSH VP110
Device Type		Select Device Type as MATRIX SPARSH VP110.	Matrix SPARSH VP110
MAC Address		Enter the MAC Address of the SPARSH VP110 phone to be connected at this location. Default: Blank. SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.	Matrix SPARSH VP110

¹⁷⁰. Some of the parameters may not be applicable depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

Authenticate HTTP Provisioning request		<p>Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled.</p> <p>If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option.</p> <p>SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation.</p> <p>Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.</p>	Matrix SPARSH VP110
Registrar Server Address		<p>Select the appropriate Registrar Server Address according to your installation scenario^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address.</p>	Matrix SPARSH VP110
Standard SIP Authorization Profile		<p>Select the desired Standard SIP Authorization Profile from the list of profiles. Default: SPARSH VP110.</p>	Matrix SPARSH VP110
Send Key Settings		<p>Select the Send Phone Book check box to apply the Key Settings^b to the Phone. Default: Enabled</p>	Matrix SPARSH VP110
Dial Plan^c		<p>Select the desired Dial Plan. Default: 1</p> <p>The Phone will detect end of dialing as per the rules configured in the Dial Plan selected here.</p>	Matrix SPARSH VP110
Transport Mode		<p>Select the protocol to be used to transport the SIP messages. Default: UDP</p>	Matrix SPARSH VP110
Enable SRTP?		<p>Select the Enable SRTP? check box for secure conversations over SIP. Default: Disabled</p>	Matrix SPARSH VP110
SIP DiffServe/ ToS		<p>Enter the desired SIP DiffServe/ToS to set the Quality of Service (QoS) for SIP packets Default: 26</p>	Matrix SPARSH VP110
RTP DiffServe/ ToS		<p>Enter the desired RTP DiffServe/ToS to set the Quality of Service (QoS) for RTP packets. Default: 46</p>	Matrix SPARSH VP110
SIP Port		<p>Enter the port on which the phone will listen for SIP messages. This port is used as source port in SIP messages. This port is also used to send SIP messages to the remote peer. Default: 5060</p>	Matrix SPARSH VP110

Min RTP Port		To define a range of RTP ports, configure the minimum local RTP port. Default: 11780	Matrix SPARSH VP110
Max RTP Port		To define a range of RTP ports, configure the maximum local RTP port. Default: 11800	Matrix SPARSH VP110
Allow HTTP		Select the Allow HTTP check box to enable HTTP Web access. Default: Enabled	Matrix SPARSH VP110
HTTP Port		Enter the port number on which the HTTP access is to be given. Default: 80	Matrix SPARSH VP110
Allow HTTPS		Select the Allow HTTPS check box to enable HTTPS Web access. Default: Enabled	Matrix SPARSH VP110
HTTPS Port		Enter the port number on which the HTTPS access is to be given. Default: 443	Matrix SPARSH VP110
Local Phone Book^d		Select the type of contacts (Extension or/and Global Directory Contacts) the phone must download from the SARVAM UCS. These will be stored in the phone's Local Phone Book. Default: Do not send	Matrix SPARSH VP110
Remote Phone Book		Select the type of contacts (Extension or/and Global Directory Contacts) the phone must download from the SARVAM UCS. These will be stored in the phone's Remote Phone Book. Default: Send first Extension Numbers, remaining Global Directory Numbers	Matrix SPARSH VP110
Web User Interface Language		Select the desired language in which the Web User Interface should be displayed. Default: English	Matrix SPARSH VP110
Phone User Interface Language		Select the desired language in which the Phone's User Interface should be displayed. Default: English	Matrix SPARSH VP110
User Password		Configure the User Password ^e of the Standard SIP Phone. It can be maximum of 16 characters long. Default: user	Matrix SPARSH VP110
Admin Password		Configure the Admin Password ^f of the Standard SIP Phone. It can be a maximum of up to 16 characters. Default: admin	Matrix SPARSH VP110
Ringer Device for Headset		When in Headset mode, select the ring destination for the SPARSH VP110. Default: Use Speaker	Matrix SPARSH VP110

Enable Distinctive Ring		Select the Enable Distinctive Ring check box, to set different ringing patterns to distinguish between different types of call events. The following types of call events are supported: <ul style="list-style-type: none"> • Internal Call • Trunk Call • Auto Call Back • Auto Redial • Alarm • Emergency • Operator Alarm • Message Wait • Priority • Emergency Conference Default: Disabled	Matrix SPARSH VP110
Call Progress Tone		Select the region to apply the Call Progress Tone prevailing there. Default: Custom.	Matrix SPARSH VP110
Time Zone		Select the Time Zone of the region/country where the Standard SIP Phone is installed. Default: + 05:30 India (Calcutta)	Matrix SPARSH VP110
Daylight Saving Time Mode		Select the Daylight Saving Time Mode that should be applied to the selected Standard SIP Phone. Default: Automatic.	Matrix SPARSH VP110
DST Type		Select the DST Type that should be applied to the Standard SIP Phone, either DST by Date or DST by Week. Default: DST by Date	Matrix SPARSH VP110
If DST Type = DST by Date	Start Month	Select the Month from when DST should be applied.	Matrix SPARSH VP110
	Start Day	Select the Day from when DST should be applied.	Matrix SPARSH VP110
	Start Hour	Select the Hour from when DST should be applied.	Matrix SPARSH VP110
	End Month	Select the Month when DST should end.	Matrix SPARSH VP110
	End Day	Select the Day when DST should end.	Matrix SPARSH VP110
	End Hour	Select the Hour when DST should end.	Matrix SPARSH VP110
	Offset Timer (min)	Configure the DST Offset timer value in minutes. Valid Range:-300 to +300. Default: Blank	Matrix SPARSH VP110

If DST Type = DST by Week	DST Start Month	Select the Month from when DST should be applied.	Matrix SPARSH VP110
	DST Start Day of Week	Select the Day of Week from when DST should be applied.	Matrix SPARSH VP110
	DST Start Day of Week Last in Month	Select the DST Start Day of Week Last in Month.	Matrix SPARSH VP110
	Start Hour of Day	Select the DST Start Hour of the Day.	Matrix SPARSH VP110
	DST Stop Month	Select the Month when DST should end.	Matrix SPARSH VP110
	DST Stop Day of Week	Select the Day of Week when DST should end.	Matrix SPARSH VP110
	DST Stop Day of Week Last in Month	Select the DST Stop Day of Week Last in Month.	Matrix SPARSH VP110
	End Hour of Day	Select the DST End Hour of the Day.	Matrix SPARSH VP110
Date Display Format		Select the Date Display Format for the Standard SIP Phone. Default: WWW MMM DD	Matrix SPARSH VP110
Time Display Format		Select the Time Display Format for the Standard SIP Phone. Default: 24 Hr	Matrix SPARSH VP110
Primary NTP Server		Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the “Third Party IP-Phone General Parameters” .	Matrix SPARSH VP110

- a. If the Standard SIP phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.

If the Standard SIP phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address

If the Standard SIP Phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters. If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.

- b. To apply the desired Key Template:
 - i) Select the **Send Key Settings** check box.
 - ii) Click **Key Template** under **Configuration**.
 - iii) Click the desired key template - Operator/ Executive/ Hotel Attendant/Guest of VP110. Assign features facilities to the keys in this template as per your requirement.
For instructions, see [“Customizing Extended IP Phone Templates using Jeeves”](#)
 - iv) Click **SIP Extension Settings** under **VoIP Configuration**. Select the SIP Extension Number on which SPARSH VP110 is registered.
 - v) Under **General Parameters**, scroll to **Key Template** and select the template you configured as per your requirement.

The Personalized option of Key Template is not applicable for SPARSH VP110.

- c. If you want to apply the rules of the Dial Plan configured in SARVAM UCS, see [“Dial Plan for SIP Extension”](#). You can also configure rules for the Dial Plan from each phone. To do so, refer to the *SPARSH VP110 User Guide*.
- d. If an option other than "Do not send" is selected in Local Phone Book, it will overwrite all Local Phone Book's contacts of the phone.
- e. To avoid unauthorized access, we recommend you to change the User Password regularly. Make sure it is strong and is kept confidential.
- f. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Htek 802 Standard SIP Phones

You are recommended to complete the following steps before connecting the **Htek 802** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone.
- Configure the settings in the third party DHCP Server. For instructions, see “Using any third party DHCP Server in your LAN”.
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see “Configuring SIP Extension Settings using Jeeves”
- Configure the device specific settings applicable to **Htek** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box.	Htek 802 IP Phone
Location Name	Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	Htek 802 IP Phone
Device Type	Select Device Type as Htek 802.	Htek 802 IP Phone

MAC Address	<p>Enter the MAC Address of the Htek 802 phone to be connected at this location. Default: Blank.</p> <p>SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.</p>	Htek 802 IP Phone
Authenticate HTTP Provisioning request	<p>Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled.</p> <p>If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option.</p> <p>SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation.</p> <p>Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.</p>	Htek 802 IP Phone
Registrar Server Address	<p>Select the appropriate Registrar Server Address according to your installation scenario^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address.</p>	Htek 802 IP Phone
Standard SIP Authorization Profile	<p>Select the desired Standard SIP Authorization Profile from the list of profiles. Default: Htek</p>	Htek 802 IP Phone
Admin Password	<p>Configure the Admin Password^b of the Standard SIP Phone. It can be a maximum of up to 16 characters. Default: admin</p>	Htek 802 IP Phone
Assign Voice Mail Key	<p>Enable this check box to assign the first programmable key of the phone as Voice Mail.</p>	Htek 802 IP Phone
SIP Port	<p>Enter the port on which the phone will listen for SIP messages. This port is used as source port in SIP messages. This port is also used to send SIP messages to the remote peer. Default: 5060</p>	Htek 802 IP Phone
Min RTP Port	<p>To define a range of RTP ports, configure the minimum local RTP port. Default: 5004</p>	Htek 802 IP Phone
Max RTP Port	<p>To define a range of RTP ports, configure the maximum local RTP port. Default: 5014</p>	Htek 802 IP Phone
Apply System Time Zone	<p>Select this check box if you want to apply the System's Time Zone to the Standard SIP Phone.</p>	Htek 802 IP Phone
Time Zone	<p>Select the Time Zone of the region/country where the Standard SIP Phone is installed. Default: GMT + 05:30</p>	Htek 802 IP Phone

Primary NTP Server	Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the “Third Party IP-Phone General Parameters” .	Htek 802 IP Phone
Daylight Saving Time Mode	Select the Daylight Saving Time Mode that should be applied to the selected Standard SIP Phone. Default: Automatic.	Htek 802 IP Phone

- a. If the phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.
- If the phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address
- If the phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.
- If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.
- b. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Matrix SPARSH VP710 Standard SIP Phone

You are recommended to complete the following steps before connecting any of the **Matrix SPARSH VP710** Standard SIP Phones:

- Decide the physical location of the Standard SIP Phone. It must be connected in the same subnet as that of the LAN Port of SARVAM UCS.
- Configure the settings in the third party DHCP Server. For instructions, see [“Using any third party DHCP Server in your LAN”](#).
- Configure the **SIP Extension Settings** in SARVAM UCS. For details, see [“Configuring SIP Extension Settings using Jeeves”](#)
- Configure the device specific settings applicable to your **Matrix SPARSH VP710** at any one of the Location1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings** link.
 - Click **Location 1** and configure the following parameters.

Parameter		Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device		Select the Enable Device check box. Default: Disabled.	Matrix SPARSH VP710

Location Name		Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	Matrix SPARSH VP710
Device Type		Select Device Type as MATRIX SPARSH VP710 - Standard SIP.	Matrix SPARSH VP710
MAC Address		Enter the MAC Address of the SPARSH VP710 phone to be connected at this location. Default: Blank. SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.	Matrix SPARSH VP710
Authenticate HTTP Provisioning request		Select the Authenticate HTTP Provisioning request check box to authenticate HTTP request for security reason. Default: Disabled. If you are using the Standard SIP Phone from the Public IP Address, we recommend you to enable this option. SARVAM UCS validates the Standard SIP Phone on the basis of the SIP ID and HTTP Authentication Password and provides configuration on validation. Make sure, you have configured SIP ID as HTTP User Name and HTTP Authentication Password as HTTP Password in the Standard SIP Phone.	Matrix SPARSH VP710
Registrar Server Address		Select the appropriate Registrar Server Address according to your installation scenario ^a to register the Standard SIP Phone with the SIP Registrar of SARVAM UCS. Default: Use WAN Port IP Address.	Matrix SPARSH VP710
Standard SIP Authorization Profile		Select the desired Standard SIP Authorization Profile from the list of profiles. Default: SPARSH VP710	Matrix SPARSH VP710
Dial Plan^b		Select the desired Dial Plan. Default: 1 The Phone will detect end of dialing as per the rules configured in the Dial Plan selected here.	Matrix SPARSH VP710
Transport Mode		Select the protocol to be used to transport the SIP messages. Default: UDP	Matrix SPARSH VP710
Enable SRTP?		Select the Enable SRTP? check box for secure conversations over SIP. Default: Disabled	Matrix SPARSH VP710

DTMF Type		Select the appropriate DTMF Type to determine how the DTMF digits will be sent over the IP Network, when a DTMF digit is pressed.	Matrix SPARSH VP710
SIP DiffServe/ToS		Enter the desired SIP DiffServe/ToS to set the Quality of Service (QoS) for SIP packets Default: 26	Matrix SPARSH VP710
RTP DiffServe/ToS		Enter the desired RTP DiffServe/ToS to set the Quality of Service (QoS) for RTP packets. Default: 46	Matrix SPARSH VP710
SIP Port		Enter the port on which the phone will listen for SIP messages. This port is used as source port in SIP messages. This port is also used to send SIP messages to the remote peer. Default: 5060	Matrix SPARSH VP710
SIP TLS Port		Enter the port on which the phone will listen for SIP messages transported over TLS. This port is used as source port in SIP messages. This port is also used to send SIP messages to the remote peer. Default: 5061	Matrix SPARSH VP710
Min RTP Port		To define a range of RTP ports, configure the minimum local RTP port. Default: 11780	Matrix SPARSH VP710
Max RTP Port		To define a range of RTP ports, configure the maximum local RTP port. Default: 11800	Matrix SPARSH VP710
Allow HTTP		Select the Allow HTTP check box to enable HTTP Web access. Default: Enabled	Matrix SPARSH VP710
HTTP Port		Enter the port number on which the HTTP access is to be given. Default: 80	Matrix SPARSH VP710
Allow HTTPS		Select the Allow HTTPS check box to enable HTTPS Web access. Default: Enabled	Matrix SPARSH VP710
HTTPS Port		Enter the port number on which the HTTPS access is to be given. Default: 443	Matrix SPARSH VP710
Local Phone Book^c		Select the type of contacts (Extension or/and Global Directory Contacts) the phone must download from the SARVAM UCS. These will be stored in the phone's Local Phone Book. Default: Do not send	Matrix SPARSH VP710
Send Personal Directory		Enable this check box if you want to allow usage of Personal Directory. These contacts will be stored in the phone's Local phone Book.	Matrix SPARSH VP710

Remote Phone Book		Select the type of contacts (Extension or/and Global Directory Contacts) the phone must download from the SARVAM UCS. These will be stored in the phone's Remote Phone Book. Default: Send first Extension Numbers, remaining Global Directory Numbers	Matrix SPARSH VP710
Web User Interface Language		Select the desired language in which the Web User Interface should be displayed. Default: English	Matrix SPARSH VP710
Phone User Interface Language		Select the desired language in which the Phone's User Interface should be displayed. Default: English	Matrix SPARSH VP710
User Password		Configure the User Password ^d of the Standard SIP Phone. It can be maximum of 16 characters long. Default: user	Matrix SPARSH VP710
Admin Password		Configure the Admin Password ^e of the Standard SIP Phone. It can be a maximum of up to 16 characters. Default: admin	Matrix SPARSH VP710
Ringer Device for Headset		When in Headset mode, select the ring destination for the SPARSH VP710. Default: Use Speaker	Matrix SPARSH VP710
Enable Distinctive Ring		Select the Enable Distinctive Ring check box, to set different ringing patterns to distinguish between different types of call events. The following types of call events are supported: <ul style="list-style-type: none"> • Internal Call • Trunk Call • Auto Call Back • Auto Redial • Alarm • Emergency • Operator Alarm • Message Wait • Priority • Emergency Conference Default: Disabled	Matrix SPARSH VP710
Call Progress Tone		Select the region to apply the Call Progress Tone prevailing there. Default: Custom.	Matrix SPARSH VP710
Time Zone		Select the Time Zone of the region/country where the Standard SIP Phone is installed. Default: + 05:30 India (Calcutta)	Matrix SPARSH VP710
Daylight Saving Time Mode		Select the Daylight Saving Time Mode that should be applied to the selected Standard SIP Phone. Default: Automatic.	Matrix SPARSH VP710

DST Type		Select the DST Type that should be applied to the Standard SIP Phone, either DST by Date or DST by Week. Default: DST by Date	Matrix SPARSH VP710
If DST Type = DST by Date	Start Month	Select the Month from when DST should be applied.	Matrix SPARSH VP710
	Start Day	Select the Day from when DST should be applied.	Matrix SPARSH VP710
	Start Hour	Select the Hour from when DST should be applied.	Matrix SPARSH VP710
	End Month	Select the Month when DST should end.	Matrix SPARSH VP710
	End Day	Select the Day when DST should end.	Matrix SPARSH VP710
	End Hour	Select the Hour when DST should end.	Matrix SPARSH VP710
	Offset (minutes)	Configure the DST Offset timer value in minutes. Valid Range:-300 to +300. Default: Blank	Matrix SPARSH VP710
If DST Type = DST by Week	Offset (minutes)	Configure the DST Offset timer value in minutes. Valid Range:-300 to +300. Default: Blank	Matrix SPARSH VP710
	DST Start Month	Select the Month from when DST should be applied.	Matrix SPARSH VP710
	DST Start Day of Week	Select the Day of Week from when DST should be applied.	Matrix SPARSH VP710
	DST Start Day of Week Last in Month	Select the DST Start Day of Week Last in Month.	Matrix SPARSH VP710
	Start Hour of Day	Select the DST Start Hour of the Day.	Matrix SPARSH VP710
	DST Stop Month	Select the Month when DST should end.	Matrix SPARSH VP710
	DST Stop Day of Week	Select the Day of Week when DST should end.	Matrix SPARSH VP710
	DST Stop Day of Week Last in Month	Select the DST Stop Day of Week Last in Month.	Matrix SPARSH VP710
	End Hour of Day	Select the DST End Hour of the Day.	Matrix SPARSH VP710
Date Display Format		Select the Date Display Format for the Standard SIP Phone. Default: WWW MMM DD	Matrix SPARSH VP710
Time Display Format		Select the Time Display Format for the Standard SIP Phone. Default: 24 Hr	Matrix SPARSH VP710

Primary NTP Server		Select the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phone. Default: None. Make sure you configure the desired NTP Server Address/es in the “Third Party IP-Phone General Parameters” .	Matrix SPARSH VP710
---------------------------	--	---	---------------------

- a. If the Standard SIP phone is in the same network (LAN) as SARVAM UCS, select Use LAN Port IP Address as Registrar Server Address.

 If the Standard SIP phone is in the Global Network and SARVAM UCS is connected to Internet over WAN, select Use WAN Port IP Address as Registrar Server Address

 If the Standard SIP Phone is connected in the Global Network and SARVAM UCS is located behind a NAT Router, and STUN is programmed, select Use Router/STUN's IP Address as Registrar Server Address. Make sure the Router's Public IP Address is configured in the Network Parameters.

 If Dynamic DNS is configured in the Network Parameters, select Use Dynamic DNS Host Name as Registrar Server Address.
- b. If you want to apply the rules of the Dial Plan configured in SARVAM UCS, see [“Dial Plan for SIP Extension”](#). You can also configure rules for the Dial Plan from each phone. To do so, refer to the *SPARSH VP710 User Guide*.
- c. If an option other than "Do not send" is selected in Local Phone Book, it will overwrite all Local Phone Book's contacts of the phone.
- d. To avoid unauthorized access, we recommend you to change the User Password regularly. Make sure it is strong and is kept confidential.
- e. To avoid unauthorized access, we recommend you to change the Admin Password regularly. Make sure it is strong and is kept confidential.

Configuring Any Standard SIP Phone

You are recommended to complete the following steps before connecting Any Standard SIP Phone:

- Decide the physical location of the Standard SIP Phone.
- Configure the settings in the third party DHCP Server. For instructions, see [“Using any third party DHCP Server in your LAN”](#).
- Configure the SIP Extension Settings in SARVAM UCS. For details, see [“Configuring SIP Extension Settings using Jeeves”](#)¹⁷¹.
- Configure the device specific settings applicable to your Standard SIP Phone at any one of the Location 1, 2 or 3 on the SIP Extensions page. To do so,
 - Under **Configuration**, click **VoIP Configuration**.
 - Click **SIP Extension Settings**.

¹⁷¹. Some of the features may not be supported depending on the Standard SIP Phone you have connected. Please refer the specific Standard SIP Phone manufacturer's documentation for more details.

- Click **Location 1** and configure the following parameters.

Parameter	Description/Action to be Taken	Applicable Standard SIP Phone Variant
Enable Device	Select the Enable Device check box. Default: Disabled.	Any Standard SIP Phone
Location Name	Configure the Location Name to identify the Standard SIP Phone. The Location Name can be a maximum of 18 characters. Default: Blank.	Any Standard SIP Phone
Device Type	Select Device Type as Any Standard SIP Phone.	Any Standard SIP Phone
MAC Address	Enter the MAC Address of the Standard SIP phone to be connected at this location. Default: Blank. SARVAM UCS validates the phone on the basis of the MAC Address, and provides configuration on validation.	Any Standard SIP Phone
Standard SIP Authorization Profile	Select the desired Standard SIP Authorization Profile from the list of profiles. Default: None.	Any Standard SIP Phone

*If you select the Device Type as **Any Standard SIP**, then you are recommended to configure the **Standard SIP Authorization Profile** to prevent any unauthorized access and misuse of the system.*

If you want to replicate the configuration of the SIP Phone Settings same as Location 1 to Location 2 and Location 3, you can use the **Copy** button present at the bottom of the page. To know more, refer to [“Copy Parameter Values”](#).

If you wish to Copy only the configurations from a location to all other locations where the same IP Phone is connected, make sure you clear the Device Type check box.

If you wish to copy the Device Type as well as all the configurations from a location to all the SIP Extensions, make sure all the check boxes are selected.

Standard SIP Authorization Profile

The Standard SIP Authorization Profile contains the list of default profiles of various Standard SIP Phones supported by the system.

Each Profile consists of details which you must configure for successful registration of the phone. Thus, the Standard SIP Authorization Profile ensures that only authorized phones are used as extensions of the system.

Using the Standard SIP Authorization Profile, you can register

- Matrix SPARSH VP110
- Matrix SPARSH VP710
- Third-party Standard SIP Phone
- Any Standard SIP Phone

When you configure the Device Type in Location - 1/2/3 of **SIP Extension Settings**, the default Standard SIP Authorization Profile is assigned to the phone. However, you may change the profile by selecting the desired option in **Standard SIP Authorization Profile** drop down list. To know more, refer "[Configuring Standard SIP Phones](#)".

Any changes in the assigned Standard SIP Authorization Profile may unregister the phones thereby, causing drop of ongoing calls.

Configuring Standard SIP Authorization Profile using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **Standard SIP Authorization Profile**.

<input type="checkbox"/>	Profile Name	User Agent	MAC Address
<input type="checkbox"/>	Cisco	YES	NO
<input type="checkbox"/>	Grandstream	YES	NO
<input type="checkbox"/>	Htek	YES	NO
<input type="checkbox"/>	Panasonic	YES	NO
<input type="checkbox"/>	Polycom	YES	NO
<input type="checkbox"/>	Snom	YES	NO
<input type="checkbox"/>	SPARSH VP110	YES	YES
<input type="checkbox"/>	SPARSH VP710	YES	YES
<input type="checkbox"/>	Yealink	YES	NO

The list of default profiles supported by the system is displayed.

You can also add, edit, search or delete the Standard SIP Authorization Profiles according to your preference.

You cannot delete the default Standard SIP Authorization Profiles supported by the system.

Let us consider, that you want to register a Cisco Standard SIP Phone,

- Click **Cisco**.

Edit Standard SIP Authorization Profile	
Profile Name *	<input type="text" value="Cisco"/>
Validate User Agent	<input checked="" type="checkbox"/>
User Agent	<input type="text" value="Cisco"/>
Validate MAC Address	<input type="checkbox"/>
Fetch MAC Address From	<input type="text" value="User Agent"/>
Custom Header	<input type="text"/>
<input type="button" value="Submit"/> <input type="button" value="Close"/>	

The Standard SIP Authorization Profile details are displayed.

- **Profile Name** displays the name of the profile of the Standard SIP Phone.
- Select the **Validate User Agent** check box if you want the system to validate the User Agent received during phone registration request. Default: Enabled.
- In **User Agent**, enter the details which you want the system to match with the User Agent field received from the phone. This parameter is applicable only if you have enabled the **Validate User Agent** check box.
- Select the **Validate MAC Address** check box if you want the system to validate the MAC Address received during phone registration request.

*You are recommended to enable **Validate MAC Address** to prevent any unauthorized access and misuse of the system.*

- In **Fetch MAC Address From**, select the desired option - **User Agent** or **Custom Header**.

If you select **User Agent**, the system will fetch the MAC Address from the User Agent field received during phone registration request.

If you select **Custom Header**, the system will fetch the MAC Address from the configured Custom Header field during phone registration request.

- In **Custom Header**, enter the Header name from where the MAC Address is to be fetched. For example, MAC. This parameter is applicable only if you have selected the option Custom Header in Fetch MAC Address From.
- Click **Submit**.

Similarly, you can configure the **Standard SIP Authorization Profile** of any Standard SIP Phone.

Customizing Profile

To add a new Standard SIP Authorization Profile,

- Click  and enter the details as per your requirement.
- Click **Submit**.

The newly added Profile will get updated in the list.

To delete a Profile,

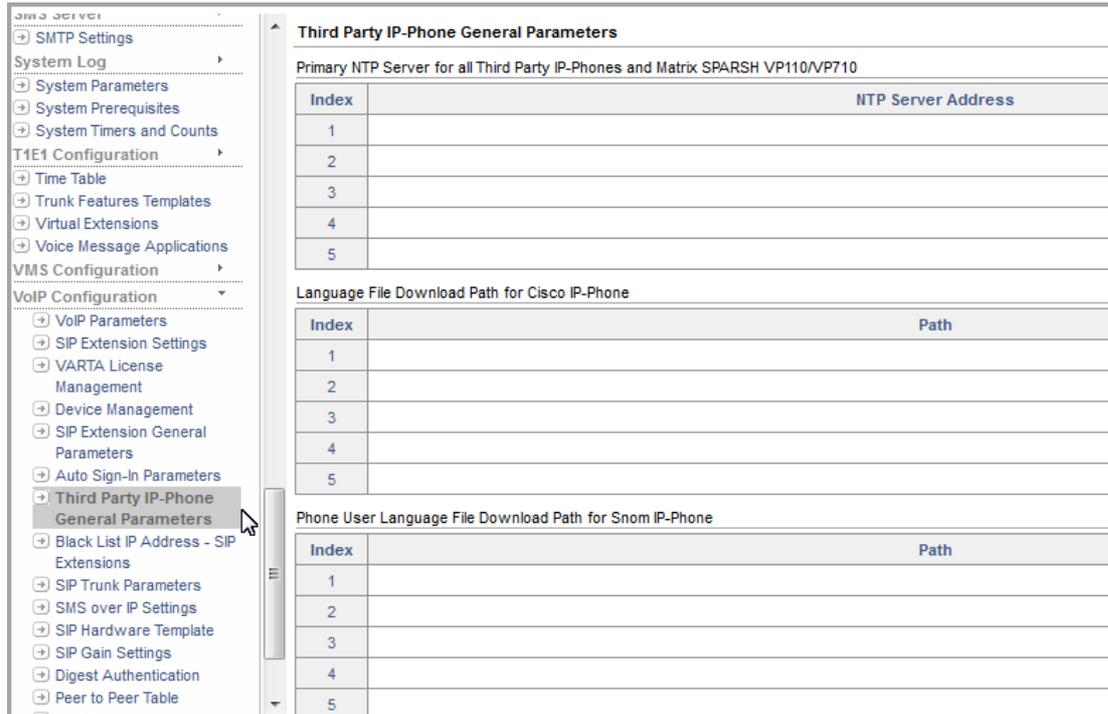

- Select the corresponding check box and click  .

Third Party IP-Phone General Parameters

To configure the Third Party IP-Phone General Parameters,

- Under **Configuration**, click **VoIP Configuration**.
- Click **Third Party IP-Phone General Parameters** link.

The Third Party IP-Phone General Parameters page opens.

Primary NTP Server for all Third Party IP-Phones and Matrix SPARSH VP110/VP710

- Under **NTP Server Address**, configure the Primary NTP Server Address with which you want to synchronize the Date and Time of the Standard SIP Phones. Default: Blank.

You may configure maximum 5 different Server Addresses.

Language File Download Path for Cisco IP-Phone

- Under **Path**, configure the path from which you want the Standard SIP Phone to fetch the Language files. Default: Blank.

You may configure maximum 5 different Paths.

Phone User Language File Download Path for Snom IP-Phone

- Under **Path**, configure the path from which you want the Standard SIP Phone to fetch the Language files for the Phone user. Default: Blank.

You may configure maximum 5 different Paths.

Web User Language File Download Path for Snom IP-Phone

- Under **Path**, configure the path from which you want the Standard SIP Phone to fetch the Language files for the Web user. Default: Blank.
You may configure maximum 5 different Paths.
- Click **Submit** to save changes.

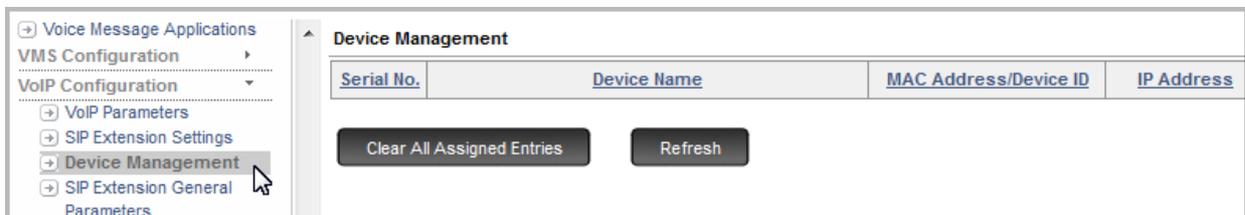

The Server Addresses/Path you configure on this page will appear in the Combo box of the respective parameter on the SIP Extension page.

Device Management

SARVAM UCS supports Auto Detection and Auto Provisioning of third party IP Phones as well as Extended Clients. Device Management is a touch-free, plug and play feature and is an ideal solution for a large deployment of phones. To use this feature you must plug all the IP phones in same network (recommended) and also make sure that these phones are registered as SIP Extensions at **Location 1** only. The system will support Auto Detection and provisioning of all these phones (third party IP Phones and Extended Clients).

Once you connect the phones the details will be displayed on the Device Management page. To use this feature,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **Device Management**.

- The following information will be displayed for each connected phone:
 - **Device Name:** It displays the name of the phone you connected/application you register.
 - **MAC Address / Device ID:** It displays the MAC or Device ID of the phone.
 - **IP Address:** It displays the IP Address of the phone.
 - **Last Seen:** It displays the date and time, when the system detects the connected phone.
 - **Assign:** If the phone is already configured, it displays the Name, Extension Number and Location Number. If you wish to edit the details, click on this detail link.

If the device is not configured, it displays 'Not Assigned'. If you wish to assign an extension to the phone, click on the **Not Assigned** link.

A new **Assign Extension** window opens. You can configure/edit the details:

- **Select SIP Extension:** Select the SIP Extension Number you want to assign to the phone.
- **Name:** Enter a name for the SIP Extension, which may be the name of the person who will use the SIP Extension or the name of a Department. The name you enter here will be displayed as the Caller ID of the SIP Extension on the remote user's phone, when the SIP Extension user makes calls. The name may consist of a maximum of 18 alphanumeric characters.
- **SIP ID:** Enter the SIP ID for the extension. The SIP ID is necessary for registering the SIP Extension with the Registrar of the system. It is the number with which you can call the SIP Extension. Any extension user of the SARVAM UCS can call a SIP Extension by dialing the SIP ID

assigned to the SIP extension. SIP ID of each SIP Extension must be a unique number string of a maximum of 6 digits. Any combination of digits from 0 to 9 and the characters * and # are allowed.

You cannot assign the same SIP ID to more than one extension.

- **Authentication ID:** Enter the number which you want the system to use for user authentication of the SIP messages received from the SIP Extension. You cannot keep this field blank. The number may be a string of maximum 6 alphanumeric characters. All ASCII characters except < > and “ (double quote) are allowed. Default: Blank.

You must configure the Authentication ID, if any of the SIP Message Authentication Options, namely INVITE or SUBSCRIBE or PUBLISH, is enabled.

- In the **Authentication Password** field, enter the password manually or click **Generate** to automatically generate a unique password. This password will be used by the system to authenticate the SIP messages received from the SIP Extension.

To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential. When you enter the password manually, it must:

- be of minimum 6 characters and can be a maximum of 12 characters.
- include atleast one upper-case, one lower-case, one number and one special character.
- all ASCII characters (except Percentage %, Hash #, Equal to =, Plus +, And &, Backslash \, Less than <, Greater than >, Apostrophe ', Double Quote " and **Space**) are allowed.

Default: Blank.

To provide additional security, when the Authentication fails 10 times consecutively due to wrong Authentication ID / Authentication Password, the system will blacklist the IP Address and Port for registration of this SIP Extension. However, you can remove the IP Address from the Blacklist IP Address list. See [“Black List IP Address - SIP Extensions”](#) for more details. This activity will be logged in the [“System Activity Log”](#) as well as [“Simple Network Management Protocol \(SNMP\)”](#).

- **Select Location:** Select the location 1, 2 or 3 on which you want the extension to register.
- **Location Name:** Enter the name that you want the system to display for the location you selected.
- **Registrar Server Address:** Select the appropriate Registrar Server Address to register the device with the SIP Registrar of SARVAM UCS, according to your installation scenario.
- Click **Submit**. The window closes and the details are displays on the Device Management page.
- **Reboot:** Click this button to reboot the phone remotely.

The phone will reboot only if it supports remote reboot.

For Grandstream, Snom and Polycom IP Phones reboot is not supported.

- Click **Clear All Assigned Entries**, to clear all the assignments.

Black List IP Address - SIP Extensions

Blacklist IP Address enables you to restrict unauthorized access to SARVAM UCS.

To use this feature, you must enable the *Allow SIP Extension Registration* check box and select the desired option for *Black List SIP Extension IP Address:Port on multiple Authentication Failure Attempts* in the [“Security Settings”](#). The SARVAM UCS blacklists the IP Address from which an unauthorized attempt is made for registration. When any user attempts to register as a SIP Extension using false credentials— Authentication ID or Authentication Password and the authentication attempt fails for 10 times consecutively within 10 minutes, SARVAM UCS blacklists the IP Address and port used for registration.

The blacklisted IP Address/es and ports are stored in the **Black List IP Address - SIP Extensions** table along with the date and time. This activity will also be logged in the [“System Activity Log”](#) as well as [“Simple Network Management Protocol \(SNMP\)”](#).

If you want to allow access of SARVAM UCS to such black listed IP Address, you must remove it from the **Black List IP Address - SIP Extensions** table. If this IP Address is a Trusted IP Address, you can configure it in the Trusted IP Address/es table to avoid further black listing. For details, see [“Security Settings”](#).

Blacklist IP Address table stores upto 500 entries. When the buffer is full, SARVAM UCS follows FIFO method to store further entries. You cannot edit any entries in this table. However, if required, you may remove a entry from this table.

To clear a entry from the **Black List IP Address - SIP Extensions** table,

- Log in as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click the **Black List IP Address - SIP Extensions** link.

Configuring DKP Extensions

The number of DKP extensions available to you for configuration depends on the number of DKP ports supported by SARVAM UCS and the number of DKP ports you have specified on the [“System Pre-requisites”](#) page.

If you have enabled 'On-Site Configuration', the system will provide you only those ports that are actually present in the system for configuration.

Configure **DKP port parameters** using Jeeves or by dialing commands from a Telephone.

Configuring DKP Parameters using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **DKP Configuration**.
- Click **DKP Parameters** to open the page.

Port No.	DKP H/w Slot - Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template	Call Capacity
1	02 - 01	3001		01	01	02
2	02 - 02	3002		01	01	02
3	03 - 01	3003		01	01	02
4	03 - 02	3004		01	01	02
5	03 - 03	3005		01	01	02
6	03 - 04	3006		01	01	02
7	03 - 05	3007		01	01	02
8	03 - 06	3008		01	01	02

The DKP Ports appear in tabs, with eight DKP Ports in each tab, 001-008, 009-016, 017-024, and so forth.

- For each DKP Port number, configure the following parameters:
 - **DKP H/w Slot - Port:** 'Slot' is the number of the Universal Slot in which the DKP Card is inserted. 'Port' is the number of the DKP hardware port on which the proprietary DKP EON is connected.

The SARVAM UCS can automatically detect and assign the hardware slot and port numbers automatically to the DKP software ports.

For example: if you have inserted the DKP8 Card in Slot number 03 and DKP16 Card in Slot number 04 of SARVAM UCS, the system will assign the hardware slot 03 and port numbers 01-08 to the DKP Software Ports from 001 to 008 respectively. The system will assign Slot 04 and port numbers 09-16 to the DKP Software Ports 009 to 024. Refer the topic [“Software Port and Hardware ID”](#) to know more.

However, if required, you may change the Hardware Slot and Port assigned to the DKP software port. In this case, enter the desired Hardware Slot and Port number in this field.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields.

- **Access Code:** Assign Station Access Codes to the DKP Port. Station Access Codes are commonly referred to as Extension Numbers. These may be a maximum of 6 digits, which are dialed to call the DKP port to which they are assigned.

All DKP ports are assigned the following Station Access Codes as default.

DKP (Software) Port No.	Access Codes
001	3001
002	3002
003	3003
:	:
:	:
128	3128

You may either apply the default Station Access Codes to the DKP ports or assign them according to your requirement and preferences.

To assign Station Access Codes according to your preference and requirement to a range of DKP Ports, see [“Assigning Access Codes to a Range of Extensions”](#).

If you decide to customize the Station Access Codes, make sure that the numbers do not clash with any other Access Code in the 'Dial' phase. Refer the topics [“Access Codes”](#) and [“Conflict Dialing”](#) to know more.

- **Name:** Assign a 'Name' to the DKP port. The name may be of the person who will use the DKP or the name of a department. This name will be displayed on the LCD of the DKP of the user and on other extension user's phones, provided these are also a model or EON or are equipped with Caller ID.

You can program a name of maximum 18 alphanumeric characters.

- **Station Basic Feature Template:** Assign a [“Station Basic Feature Template”](#) to the DKP.

A Station Basic Feature Template includes a set of features that completely define the behaviour of the Extension, such as Time Table, Operator access, Trunk Access, Class of Service, Toll Control, Call Budget, and Station Message Detail Records (storage of Incoming and Outgoing Call details).

By default, Station Basic Feature Template 01 is assigned to all extensions of the system that includes DKP ports as well as DKP ports, ISDN Terminals, E&M Lines with Station as Orientation Type, and SIP Extensions.

Check if the default template fulfills the feature requirements (like [“Class of Service \(COS\)”](#), [“Toll Control”](#), [“OG Trunk Bundle Group”](#), etc.) of the DKP.

If the default Template 01 fulfills the feature requirements and if the same features are to be allowed to all DKPs, retain Template 01.

If different sets of features are to be allowed to different DKPs, then prepare separate Station Basic Feature Templates and apply them on the ports. To do this,

- Under **Configuration**, click the link "[Station Basic Feature Template](#)" to open the page.
- Select a Template number, for example 11.
- Customize Template number 11 and click 'Submit' at the bottom of the page.
- Now go back to the **DKP Parameters** page.
- Enter the number of the Template you customized, Template 11, in the **Station Basic Feature Template** field of the DKP Port, for instance DKP-005, on which you want to apply this template. If you want to apply this template to other ports too, like DKP-006, 007, and 008, assign the Template 11 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another DKP port.

Also, refer the topic Station Basic Feature Templates to know more about customizing the templates and applying on the ports.

- **Station Advanced Feature Template:** Assign a Station Advanced Feature Template to the DKP. The Advanced Feature Template consists of a set of less commonly used features like Alarm Notification Type, Caller ID Presentation for Transferred Calls, DDI Incoming Call Routing, Storage of Internal Calls, Call Duration Control, Floor Service, Call Taping, etc.

By default Station Advanced Feature Template 01 is assigned to all extensions of the SARVAM UCS, which includes DKP Ports, SLT Ports, ISDN Terminals, E&M Lines configured as Stations, and SIP Extensions.

Check if this default template fulfills the feature requirements of the DKP Ports.

If the default Template 01 fulfills the feature requirements, and if the same features are to be allowed to all DKP ports, retain Template 01.

If different sets of features are to be allowed to different DKP Ports, then prepare separate Station Advanced Feature Templates and apply them on the ports.

To do this,

- Under **Configuration**, click **Station Advanced Feature Template** to open the page.
- Select a Template number, for example 02.
- Customize Template number 02.
- Click **Submit** at the bottom of the page.
- Now go back to the **DKP Parameters** page.
- Enter the number of the Template you customized, Template 02 in the **Station Advanced Feature Template** field of the DKP Port, for instance DKP-001, on which you want to apply this template. If you want to apply this template to other ports too, like DKP-002, 003, and 004, assign the Template 04 to all these ports.

- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another DKP port.

Also refer the topic [“Station Advanced Feature Template”](#) for instructions on customizing these templates and applying them on the ports.

- **Call Capacity:** Call Capacity is the number of Call Appearances (also referred to as 'call loops') assigned to a (DKP) extension. It is the ability of an Extension to handle multiple calls simultaneously. A Call Appearance allows an extension user to attend to more than one calling party at a time.

A minimum of two Call Appearances must be assigned to a DKP Extension - Operator extension or Executive extension - so that the Extension user can put one party on hold while talking to another. A third Call Appearance allows the extension user to put two calls on hold, make/attend a third call and toggle between three calls.

The higher the call capacity (the more the number of Call Appearances assigned to an extension), the more the number of calls the Extension user can handle.

The SARVAM UCS supports a maximum of 10 Call Appearances as Call Capacity of the DKP extensions.

DKP extensions for Executives are usually assigned 2 Call Appearances, while the Operator Extension is assigned 6 Call Appearances to handle 6 calls simultaneously. The default call capacity of the DKP ports is 02.

Now, select the number of Call Appearances you wish to assign to the DKP port in the column, 'Call Capacity'.

- **Call Waiting Tone:** During an on-going conversation, if there is a second incoming call, the system plays beeps to indicate the second incoming call. You can set the frequency of the beeps as per your requirement. You can select from the following options:
 - Off
 - Beep Once
 - Beep until Answered

Default: Beep Once

- **Key Map:** EON is designed to function as Operator, Executive, Hotel Attendant, and Hotel Guest extensions, providing default key settings (key maps) for all these functions. All you need to do is assign a Key Map Template according to the intended user of the DKP. For example, if the DKP is to be used by the Operator, select 'Operator's Template'. The DKP will be assigned the key template with the special features required by Operators, such as more DSS keys for Trunk Access and Call Appearances, a Call Release Key, etc.

Similarly, if the user of the DKP is a Hotel Attendant, select 'Hotel Attendant's Template'. The key map with the specific Front Desk User features such as Check-In, Check-Out, Guest In/Out, Change Room Clean Status, Room Shift, will be automatically assigned to the DKP.

The option 'Personalized' allows you to customize the key map of the DKP and assign functions to keys as per your requirement. Click **DSS Keys** to assign the features and facilities as per your requirement.

To know more about key maps, key templates and how to customize them, see [“DSS Keys Programming”](#).

- **Call Pick-Up Group:** Program this parameter if you want to assign the DKP to a particular “Call Pick Up” group.

Call Pick Up allows the DKP extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer [“Call Pick Up”](#) for instructions on how to create groups. You can create as many as 99 groups, numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this DKP in this field.

- You must assign the extension user to a **COSEC Door Group** for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See [“COSEC Integration”](#) for more information.
- **Station Type:** Make sure you select the option Assistant, if it is the Operator Extension. The system will play beeps during the conference to the participants to indicate the presence or absence of the Operator. To know more, see [“Conference-3 Party”](#), [“Conference-Multiparty”](#) and [“Conference Dial-In”](#).

For the Hotel Application of the SARVAM UCS, extensions are identified as — Administrator, Assistant or Guest extensions according to the intended user of the DKP. The system will consider the Administrator and Assistant options as same. When the Station Type is selected, the system will automatically assign the Guest and Administrator (Hotel Staff) features to the DKP. To know more, refer the *SARVAM UCS Hospitality System Manual*.

- **DSS Key Settings:** This parameter is to be configured if you wish to Personalize the phone Key Map or have attached a Direct Station Selection Console with the DKP.

To Personalize the phone Key Map, refer to [“Personalizing Key Maps”](#) in [“DSS Keys Programming”](#)

Matrix offers two models of DSS — DSS64, DSS532.

If you are using EON48/310 you can attach two DSS64 to increase the number of DSS keys for Direct Station Calling or for one touch feature access.

If you are using EON510 you can attach four DSS532 to increase the number of DSS keys for Direct Station Calling or for one touch feature access.

Refer the topic [“Installing DSS532 with EON510”](#) for installation instructions.

For instructions on configuring the DSS Keys of the Consoles, refer to [“Programming DSS Console Keys”](#) in [“DSS Keys Programming”](#).

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see [“Extension Voice Mail Settings”](#).

The Voice Mail Settings link will be visible only if you have configured the respective access codes.

Click **Close** to close the window.

Advanced Configuration

The above listed parameters fulfill the basic DKP extension port configuration requirements of most users. However, it is anticipated that some users may need to configure the more advanced features like Personal Directory, Language Selection, DKP Settings - Backlight Brightness and Contrast, Headset/Handset/Speaker Volume levels, Select a Ringer Tune, attach Direct Station Selection Consoles, user details etc. For such users, you may click the 'Advanced' button.

DKP Parameters				
Port No.	DKP H/w Slot - Port	Access Code	Name	Mobile Number
1	02 - 01	3001		
2	02 - 02	3002		
3	03 - 01	3003		
4	03 - 02	3004		
5	03 - 03	3005		
6	03 - 04	3006		
7	03 - 05	3007		
8	03 - 06	3008		

- Configure the following advanced DKP Parameters:
- **Mobile Number:** Enter the Mobile Number of the extension user you wish to store. The Number can be a maximum of 16 digits.
- **Email ID:** Enter the Email ID of the extension user you wish to store. The Email ID can be a maximum of 64 characters.
- **SMS/Email Group Type:** You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see ["SMS/Email Group"](#).
- **Personal Directory:** Enter the number of the "Personal Directory" that you want to assign to the DKP. A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes (["OG Trunk Bundle Group"](#)). The Personal Directory is necessary for using the features ["Abbreviated Dialing"](#) and ["Dial By Name"](#).

To be able to assign a Personal Directory to a DKP you must first program it. Refer the topic ["Abbreviated Dialing"](#) for instructions on programming the Personal Directory.

- **Priority:** Select a Priority Level for the DKP from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (DKP) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description ["Priority"](#).

By default, the Priority of all DKP ports is set to '5-Normal'.

- **CO CLIP Pattern:** This parameter allows you to select the type of Calling Line Presentation on the DKP for incoming calls from trunks. You can select any of the below options:
 - Name Only: only the name of the caller will be displayed.
 - Number Only: only the number of the caller will be displayed.
 - Number + Name: both the name and the number of the caller will be displayed.

By default, Number + Name is selected as the CO CLIP Pattern for all DKPs.

- **Language:** SARVAM UCS provides language support for English, French, German, Spanish, Portuguese, and Italian. When you select any of these languages, all the command strings and prompts will appear in the selected language. By default English is selected.

DKP users can change the language by accessing and navigating through the phone menu.

The SA can change the Language by logging into the SA Jeeves.

- **Ringer Mode:** You can select a Ringer mode for each DKP from the four options:
 - Ring immediately (it rings immediately as a fresh calls lands on the DKP).
 - Ring if idle (rings only if the DKP is idle).
 - Ring after a delay (if the call is still not answered).
 - Silent.

By default the Ringer Mode is set to 'Ring Immediately'. Change the Ringer Mode on the DKP as per the requirement and preferences of the DKP users.

- **Ring Delay Timer:** The Ring Delay Timer is the time in seconds the SARVAM UCS will wait to ring on receiving a call. This Timer needs to be set only if you have selected 'Ring after a delay' as the Ringer Mode for the DKP in the previous parameter.

By default, the Ringer Delay Timer is set to 10 seconds. You may change the Ring Delay Timer according to the preferences and requirements of the DKP user.

- **Acknowledge Timer:** This Timer is to be programmed to enable the Ringer Auto Acknowledge mode. This mode determines when to stop the ring on the DKP. There are two options for ringer auto acknowledge:
 - Stop only when the call is answered.
 - Stop after a delay.

To stop the ring on the DKP after a delay, the Acknowledge Timer must be programmed. The range of the timer is 01 to 99 seconds.

To stop the ring only when the Call is answered or manually acknowledged, the Acknowledge Timer must be set to '00'. By default, Ring Auto Acknowledge is turned OFF.

- **Play Ring ON:** With this parameter, you can assign the Ring Destination for the DKP; you can choose whether the Ring should be played on the Speakerphone or Headset of the DKP. Default: Speakerphone is selected.

When you select the Headset as the destination, ensure that you have enabled Headset Connectivity flag and have connected a Headset to the DKP.

The speech path of both, the Headset and the Handset is common. If the Headset is not connected and you have selected the Headset as the ring destination, the ring will be played on the speaker of the Handset.

- **Ring Tune:** You can select from different ringer tunes for each DKP according to your preferences and requirement. By default, Ringer Tune is set to 1.
- **Ring Volume:** You can select from different ringer volumes for each DKP according to your preferences and requirement. By default, Ringer Volume is set to 5.
- **Handset Transmit Volume Level:** This parameter is used for increasing or decreasing the volume of outgoing speech (Transmit Gain) on the Handset of the DKP. Select the desired Handset Tx Volume Level from 0 to 9. By default, Handset Tx Volume Level is 4.
- **Handset Receive Volume Level:** This parameter is used for increasing or decreasing the volume of incoming speech (Receive Gain) on the Handset of the DKP. Select the desired Handset Rx Volume Level from 0 to 9. By default, Handset Rx Volume Level is 4.
- **Headset Transmit Volume Level:** This parameter is used for increasing or decreasing the volume of outgoing speech (Transmit Gain) on the Headset port of the DKP. Select the desired Headset Tx Volume Level from 0 to 9. By default, Headset Tx Volume Level is 4.
- **Headset Receive Volume Level:** This parameter is used for increasing or decreasing the volume of incoming speech (Receive Gain) on the Headset port of the DKP. Select the desired Headset Rx Volume Level from 0 to 9. By default, Headset Rx Volume Level is 4.
- **Hands-free Transmit Volume Level:** With this parameter you may change the Volume level of Transmit Gain of the Speaker phone MIC volume from 0 to 9, as per your preference. This parameter is to be used for increasing or decreasing the volume levels of outgoing speech on the Speaker of the DKP. By default, Hands-free Tx volume level is 4.
- **Hands-free Receive Volume Level:** With this parameter you may change the Volume level of Receive Gain of the Speaker phone MIC volume from 0 to 9, as per your preference. This parameter is to be used for increasing or decreasing the volume levels of incoming speech on the Speaker of the DKP. By default, Hands-free Rx volume level is 4.
- **Handsfree Parameters (For EON510):** These parameters are applicable only when EON510 is connected to the DKP Port.
 - **High Gain Mode:** Select this check box if you want to increase the volume of incoming speech in Handsfree mode (Speaker). By default, this check box is disabled
 - **AGC:** This parameter can be configured only if High Gain Mode check box is disabled.

There may be disturbances during speech over CO Trunks, to resolve this you may select **ON for CO Ports** as the AGC option.

If there are disturbances during speech over any trunk, select **ON for all ports** as the AGC option.

By default, AGC is OFF.

Handsfree Parameters (For EON510) is supported in EON510 firmware version V3R2 onwards.

If Handsfree High gain Mode is enabled, then the two-way speech quality may get degraded.

- **Handset High Gain Mode:** Select the check box, if you wish to increase the incoming speech volume on the handset. By default, it is disabled. This is useful for individuals with hearing aids.

This is applicable for EON510 and SPARSH VP510.

This is feature can also be enabled for SPARSH VP210, for details refer to the SPARSH VP210 (Extended) User Guide.

- **Key Click Volume Level:** You may change the Key Click Volume (Key DTMF Side tone) of the DKP. Key Click Volume is the tone you hear as you press the dial pad keys of EON. Select the desired volume level from 0 to 9. By default, the volume level is set to 5.
- **DTMF Generation Flag:** This flag is used to enable or disable DTMF dialing on the DKP. By default, the flag is enabled. To disable the flag, click the check box.
- **DTMF Transmit Level:** You can select the desired Transmit Level from 0 to 9 for DTMF generation from the DKP. By default, the DTMF Transmit Level is set to 2.
- **Headset Connected?:** Enable this parameter by selecting the check box if you want to use a Headset with the DKP.

Make sure that you have also connected a Headset to the DKP.

- **Auto Answer:** Enable this parameter by selecting the check box if you want to set the [“Auto Answer”](#) feature on the DKP.
When this feature is set, the DKP goes OFF-Hook automatically after a preset period of time, without the user having to pick up the handset or press the speaker or headset key.
- **Auto Answer Timer (sec):** This parameter is to be programmed if you have enabled the [“Auto Answer”](#) feature on the DKP.

When the Auto Answer feature is enabled, the Auto Answer Timer must be programmed. This timer defines the time in seconds that the DKP should wait before going OFF-Hook. The range of this timer is 1 to 9 seconds. By default, the Auto Answer Timer is set to 1 second.

- **LCD Backlight Level:** You can change the LCD Backlight Brightness of EON. The intensity of the backlight brightness increases from 0 to 4, where '0' will cause the backlight to be turned OFF. '1' signifies minimum intensity, '4' signifies maximum intensity. Select any of the levels from 1 to 4 from the list.
- **LCD Backlight OFF Timer:** The backlight of the LCD display of EON can be kept switched ON continuously, or can be set to switch OFF automatically after a predefined period of time, known as the Backlight OFF Timer. The range of the Backlight OFF Timer is 000-999 seconds. By default it is set to switch OFF after 010 seconds.

- **LCD Contrast Level:** The EON offers 4-level contrast control for its LCD display. Level 1 signifies minimum and level 4 is the maximum. The contrast increases in steps of 1 to 4. By default the contrast is set to level 3. You may adjust it to the level comfortable to you. Select a level from 1-4.
- **Line Echo Cancellation (LEC):** Enable this parameter to cancel the echo generated on the other end.

You must also configure the **Line Echo Cancellation Start Timer**. When DKP users go Off-Hook to make/receive calls, the Line Echo Cancellation Timer starts. After the expiry of this timer the SARVAM UCS will start Line Echo Cancellation. To configure the Echo Cancellation Start Timer, see "[System Timers and Counts](#)".

- *You are recommended to enable Line Echo Cancellation only if you hear echo after you have set the AC Impedance value in the CO Hardware Template according to the Accurate Test conducted by you. For details see, "[AC Impedance Test](#)" and "[CO Hardware Template](#)".*
- *The Call Progress Tones heard by the DKP user may be affected, if you enable LEC.*
- *LEC is supported only in EON48D, Version V3R15 or later.*

- **CPLD Version:** This parameter displays the CPLD Version of the Digital Key Phone Card.

- The CPLD Version will be displayed only if supported by your DKP Card.

- **Current Firmware:** This parameter displays the current firmware of the Digital Key Phone connected to the DKP Port.
- **Upgrade Firmware:** Enable this parameter by selecting the check box, if you want to upgrade the firmware of the Digital Key Phone connected to the SARVAM UCS.

- *You can upgrade firmware of any two DKP phones at a time. Before upgrading, make sure both these phones are in idle state. You cannot use these phones while their upgradation is in process.*
- *You can view and Upgrade the current firmware of the DKP phone only from Jeeves.*

Configuring DKP Extensions using a Telephone

- Enter SE mode from a DKP/SLT.

To assign Hardware Slot and Port, dial:

- **1102-DKP-Slot-Port offset on the card**

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Slot is Slot number in which the DKP Card is inserted from 01 to 16

Port Offset is the number of the DKP Port on the card from 01 to 99.

To clear the hardware Slot and Port assigned to the DKP software port, dial:

- **1102-DKP-00-00**

To assign an Access Code to a DKP Port, dial:

- **3102-1-DKP-Access Code-#***

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Access Code is a number string of any combination of 1, 2, 3, 4, 5 or 6 digits. Terminate the command with **#*** if the number string has fewer than 6 digits.

To clear the Access codes assigned to the DKP, dial:

- **3102-1-DKP-#*** to clear the Access Code of a single DKP port.
- **3102-2-DKP-DKP-#*** to clear the Access Codes of a range of DKP ports.
- **3102-*-#*** to clear the Access Codes of all DKP Ports.

To assign default Station Access Codes to DKP, dial:

- **3152-1-DKP** to default Access Code of a single DKP Port.
- **3152-2-DKP-DKP** to default Access Codes of a range of DKP ports.
- **3152-*** to default Access Codes of all DKP ports.

To assign a Name to a DKP Port, dial:

- **5403-1-DKP-Name-#*** to assign a Name to a single DKP port.
- **5403-2-DKP-DKP-Name-#*** to assign the same Name to a range of DKP ports.
- **5403-*-Name-#*** to assign the same Name to all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Name is a string of a maximum of 18 alphanumeric characters. Terminate the commands with **#*** if the number string has fewer than 18 characters.

To clear the Name of the DKP Port, dial:

- **5403-1-DKP-#*** to clear the Name of a single DKP port.
- **5403-2-DKP-DKP-#*** to clear the Names of a range DKP ports.
- **5403-*-#*** to clear the Names of all DKP ports.

To assign a Station Basic Feature Template to a DKP Port, dial:

- **5504-1-DKP-Template Number** to assign a template to a single DKP port.
- **5504-2-DKP-DKP-Template Number** to assign the same template to a range of DKP ports.
- **5504-*-Template Number** to assign the same template to all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Template Number is the number of the Station Basic Feature Template, from 01 to 50. Default: 01

To assign a Station Advanced Feature Template to a DKP Port, dial:

- **5604-1-DKP-Template Number** to assign a template to a single DKP port.
- **5604-2-DKP-DKP-Template Number** to assign the same template to a range of DKP ports.
- **5604-*-Template Number** to assign the same template to all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Template Number is the number of the Station Advanced Feature Template, from 01 to 50. Default: 01

To define the Call Capacity of a DKP Port, dial:

- **1201-1-DKP-Call Capacity** to define the call capacity for a single DKP port.
- **1201-2-DKP-DKP- Call Capacity** to define the same call capacity for a range of DKP ports.
- **1201-*- Call Capacity** to define the same call capacity for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Call Capacity is from 02 to 10. Default: 02.

To assign a Key Map for a DKP Port, dial:

- **1221-1-DKP-DKP Key Template Number** to assign a Key Map to a single DKP port.

- **1221-2-DKP-DKP-DKP Key Template Number** to assign the same Key Map to a range of DKP ports.
- **1221-*-DKP Key Template Number** to assign the same Key Map to all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

DKP Key Template Number is

1 for Operator's Template

2 Executive1 Template

3 Hotel Attendant's Template

4 Guest's template.

5 Executive2 Template

6 Executive3 Template

Default: 1

To assign the DKP Port to a Call Pick-Up Group, dial:

- **3902-1-DKP-Call Pick-Up Group** to assign a single DKP port to a Call Pick-Up group.
- **3902-2-DKP-DKP-Call Pickup Group** to assign a range of DKP ports to the same Call Pick-Up group.
- **3902-*-Call Pickup Group** to assign all DKP ports to the same Call Pick-Up group.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Call Pickup Group is from 00 to 99. Default: 99.

To remove a DKP from a Call Pick Up group, dial:

- **3902-1-DKP-00** to remove a single DKP port from a Call Pick-Up group.
- **3902-2-DKP-DKP-00** to remove a range of DKP ports from a Call Pick-Up group.
- **3902-*-00** to remove all DKP ports from a Call Pick-Up group.

To select a Station Type for a DKP Port, refer the SARVAM UCS Hospitality System Manual.

- For Advanced Configuration of the DKP Ports, use the following commands:

To assign a Personal Directory to a DKP Port, dial:

- **1906-1-DKP-Personal Directory** to assign directory to a single DKP port.
- **1906-2-DKP-DKP- Personal Directory** to assign the same directory to a range of DKP ports.
- **1906-*-Personal Directory** to assign the same directory to all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Personal Directory number is from 01 to 50.

To clear the Personal Directory assigned to a DKP Port, dial:

- **1906-1-DKP-00** to clear the directory of a single DKP port.
- **1906-2-DKP-DKP-00** to clear the directory of a range of DKP ports.
- **1906-*-00** to clear the directory from all DKP ports.

To define the Priority for a DKP Port, dial:

- **3912-1-DKP-Priority** to define Priority for a single DKP port.
- **3912-2-DKP-DKP-Priority** to define the same Priority for a range of DKP ports.
- **3912-*-Priority** to define the same Priority for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Priority is from 1 to 9. Default: 5-Normal

To select CO CLIP Pattern for a DKP Port, dial:

- **1243-1-DKP-CO CLIP Pattern** to select the CLIP Pattern for a single DKP port.
- **1243-2-DKP-DKP-CO CLIP Pattern** to select the same CLIP Pattern for a range of DKP ports.
- **1243-*-CO CLIP Pattern** to select the same CLIP Pattern for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

CO CLIP Pattern is

1 for Name only

2 for Number only

3 for Number+Name

Default: Number+Name

To select Language for a DKP port, dial:

- **1224-1-DKP-Language** to select language for a single DKP port.
- **1224-2-DKP-DKP-Language** to select the same language for a range of DKP ports.
- **1224-*-Language** to select the same language for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Language is

1 for English

2 for Français

3 for Deutsch

4 for Español

5 for Português

6 for Italian

Default: English

To select Ringer Mode for a DKP Port, dial:

- **1204-1-DKP-Ringer Mode** to select Ringer mode for a single DKP port.
- **1204-2-DKP-DKP-Ringer Mode** to select Ringer mode for a range of DKP ports.
- **1204-*-Ringer Mode** to select Ringer mode for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Ringer Mode is

1 for Ring Immediate

2 for Ring if Idle

3 for Ring after Delay

4 for Ring OFF

Default: Ring Immediate

To select Ring Delay Timer for a DKP Port, dial:

- **1205-1-DKP-Ring Delay Timer** to select Delay Timer for a single DKP port.
- **1205-2-DKP-DKP- Ringer Delay Timer** to select Delay Timer for a range of DKP ports.
- **1205-*- Ringer Delay Timer** to select Delay Timer for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Ring Delay Timer is 01 to 99 seconds. Default: 10 seconds.

To set the Acknowledgement Mode, dial:

- **1206-1-DKP-Ringer Auto Acknowledge Mode** to select mode for a single DKP port.
- **1206-2-DKP-DKP-Ringer Auto Acknowledge Mode** to select the same mode for a range of DKP ports.
- **1206-*-Ringer Auto Acknowledge Mode** to select the same mode for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.
Ringer Auto Acknowledge Mode is
0 for OFF
1 for ON

To set the Ringer Auto Acknowledge Timer, dial:

- **1207-1-DKP-Ringer Auto Acknowledge Timer** to set Timer for a single DKP port.
- **1207-2-DKP-DKP-Ringer Auto Acknowledge Timer** to set the same Time for a range of DKP ports.
- **1207-*-Ringer Auto Acknowledge Timer** to set the same Time for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.
Ringer Auto Acknowledge Timer is from 01 to 99 seconds. Default: 00.

To select Destination for 'Play Ring ON' for a DKP Port, dial:

- **1220-1-DKP-Ring Destination** to select Play Ring ON destination for a single DKP port.
- **1220-2-DKP-DKP-Ring Destination** to select the same Play Ring ON destination for a range of DKP ports.
- **1220-*-Ring Destination** to select the same Play Ring ON destination for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.
Ring Destination is
1 for Play Ring on Speaker Phone
2 for Play Ring on Headset

To select Ring Tune for a DKP Port, dial:

- **1202-1-DKP-Ring Tune** to select a Tune for a single DKP port.
- **1202-2-DKP-DKP-Ring Tune** to select the same Tune for a range of DKP ports.
- **1202-*-Ring Tune** to select the same Tune for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.
Ringer Tune is from 0 to 9. Default: 1.

To set Ringer Volume for a DKP Port, dial:

- **1203-1-DKP-Ringer Volume** to set Ringer Volume for a single DKP port.
- **1203-2-DKP-DKP-Ringer Volume** to set the same volume level for a range of DKP ports.
- **1203-*-Ringer Volume** to set the same volume level for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.
Ringer Volume is from 0 to 9. Default: 5.

Setting Ringer Volume to '0' will cause the DKP volume to be turned OFF.

To set Handset Transmit (Tx) Volume Level for a DKP, dial:

- **1208-1-DKP-Handset MIC Volume Level** to set transmit volume for a single DKP port.
- **1208-2-DKP-DKP-Handset MIC Volume Level** to set the same transmit volume level for a range of DKP ports.
- **1208-*-Handset MIC Volume Level** to set the same transmit volume level for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.
Handset MIC Volume Level is from 0 to 9. Default: 5.

Setting volume level to '0' will cause the Handset MIC volume to be turned OFF.

To set Handset Receive (Rx) Volume Level for a DKP, dial:

- **1209-1-DKP-Handset Speaker Volume Level** to set receive volume for a single DKP port.
- **1209-2-DKP-DKP-Handset Speaker Volume Level** to set the same receive volume level for a range of DKP ports.
- **1209-*-Handset Speaker Volume Level** to set the same receive volume level for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Handset Speaker Volume Level from 0 to 9. Default: 5.

Setting volume level to '0' will cause the Handset Speaker volume to be turned OFF.

To set Right Handset Transmit (Tx) Volume Level for DKP Port, dial:

- **1225-1-DKP-Right Handset MIC Volume Level** to set transmit volume for a single DKP port.
- **1225-2-DKP-DKP-Right Handset MIC Volume Level** to set the same transmit volume level for a range of DKP ports.
- **1225-*-Right Handset MIC Volume Level** to set the same transmit volume level for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Handset Volume Level is from 0 to 9. Default: 5.

Setting volume level to '0' will cause the Handset Speaker volume to be turned OFF.

To set Right Handset Receive (Rx) Volume Level for a DKP, dial:

- **1226-1-DKP-Handset Speaker Volume Level** to set receive volume for a single DKP port.
- **1226-2-DKP-DKP-Handset Speaker Volume Level** to set the same receive volume level for a range of DKP ports.
- **1226-*-Handset Speaker Volume Level** to set the same receive volume level for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Handset Speaker Volume Level from 0 to 9. Default: 5.

Setting volume level to '0' will cause the Handset Speaker volume to be turned OFF.

To set Headset Transmit (Tx) Transmit Volume Level for a DKP, dial:

- **1222-1-DKP-Headset MIC Volume Level** to set receive volume for a single DKP port.
- **1222-2-DKP-DKP- Headset MIC Volume Level** to set the same receive volume level for a range of DKP ports.
- **1222-*- Headset MIC Volume Level** to set the same receive volume level for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Headset MIC Volume Level is from 0 to 9. Default: 5.

To set Headset Receive (Rx) Volume Level for a DKP, dial:

- **1223-1-DKP-Headset Speaker Volume Level** to set receive volume for a single DKP port.
- **1223-2-DKP-DKP- Headset Speaker Volume Level** to set the same receive volume level for a range of DKP ports.
- **1223-*- Headset Speaker Volume Level** to set the same receive volume level for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Headset Speaker Volume Level is from 0 to 9. Default: 5.

To set Hands-free Transmit (Tx) Volume Level for a DKP, dial:

- **1210-1-DKP-Speaker Phone MIC Volume Level** to set volume level for a single DKP port.

- **1210-2-DKP-DKP-Speaker Phone MIC Volume Level** to set the same volume level for a range of DKP ports.
- **1210-*-Speaker Phone MIC Volume Level** to set the same volume level for all DKP ports.
Where,
DKP is the Software Port number of the DKP port from 001 to 128.
Speaker Phone MIC Volume Level from 0 to 9. Default: 5.

Setting volume level to '0' will cause the Speaker Phone MIC volume to be turned OFF.

To set Hands-free Receive (Rx) Volume Level for a DKP, dial:

- **1211-1-DKP-Speaker Phone Speaker Volume Level** to set volume level for a single DKP port.
- **1211-2-DKP-DKP-Speaker Phone Speaker Volume Level** to set the same volume level for a range of DKP ports.
- **1211-*-Speaker Phone Speaker Volume Level** to set the same volume level for all DKP ports.
Where,
DKP is the Software Port number of the DKP port from 001 to 128.
Speaker Phone Speaker Volume is from 0 to 9. Default: 5.

To set Key Click Volume Level for a DKP, dial:

- **1212-1-DKP-Key Click Volume** to set volume level for a single DKP port.
- **1212-2-DKP-DKP-Key Click Volume** to set the same volume level for a range of DKP ports.
- **1212-*-Key Click Volume** to set the same volume level for all DKP ports.
Where,
DKP is the Software Port number of the DKP port from 001 to 128.
Key Click Volume Level is from 0 to 9. Default: 5.

To enable/disable DTMF Generation Flag for a DKP, dial:

- **1241-1-DKP-DTMF Generation** to enable/disable the flag for a single DKP port.
- **1241-2-DKP-DKP-DTMF Generation** to enable/disable the flag for a range of DKP ports.
- **1241-*-DTMF Generation** to enable/disable the flag for all DKP ports.
Where,
DKP is the Software Port number of the DKP port from 001 to 128.
DTMF Generation is
0 for Disable
1 for Enable
Default: Enable.

To set DTMF Transmit Level for a DKP, dial:

- **1218-1-DKP-DTMF Transmit Level** to set Transmit level for a single DKP port.
- **1218-2-DKP-DKP-DTMF Transmit Level** to set Transmit level for a range of DKP ports.
- **1218-*-DTMF Transmit Level** to set Transmit level for all DKP ports.
Where,
DKP is the Software Port number of the DKP port from 001 to 128.
DTMF Transmit Level is 0 to 9. Default: 2.

To enable/disable Headset Connectivity for a DKP, dial:

- **1213-1-DKP-Headset Connectivity Flag** to enable/disable the flag for a single DKP port.
- **1213-2-DKP-DKP-Headset Connectivity Flag** to enable/disable the flag for a range of DKP ports.
- **1213-*-Headset Connectivity Flag** to enable/disable the flag for all DKP ports.
Where,
DKP is the Software Port number of the DKP port from 001 to 128.
Headset Connectivity Flag is
0 for Disable

1 for Enable
Default: Disabled

To enable/disable Auto Answer for a DKP, dial:

- **1214-1-DKP-Auto Call Answer Mode** to enable/disable Auto Answer for a single DKP port.
- **1214-2-DKP-DKP-Auto Call Answer Mode** to enable/disable Auto Answer for a range of DKP ports.
- **1214-*-Auto Call Answer Mode** to enable/disable Auto Answer for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Auto Call Answer Mode is

1 for OFF (manual)

0 for ON (auto)

Default: OFF

To set Auto Answer Timer (sec) for a DKP, dial:

- **1215-1-DKP-Auto Call Answer Timer** to set Timer for a single DKP port.
- **1215-2-DKP-DKP-Auto Call Answer Timer** to set the same Timer duration for a range of DKP ports.
- **1215-*-Auto Call Answer Timer** to set the same Timer duration for all DKP ports.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Auto Call Answer Timer is from 1 to 9 seconds. Default: 3 seconds.

To set LCD Back Light Level of a DKP, dial:

- **1216-1-DKP-LCD Backlight Level** to set brightness of a single DKP.
- **1216-2-DKP-DKP-LCD Backlight Level** to set the same brightness level for a range of DKPs.
- **1216-*-LCD Backlight Level** to set the same brightness level for all DKPs.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Backlight Level is Brightness level from 1 to 4. Default: 3

To change LCD Backlight OFF Timer of a DKP, dial:

- **1219-1-DKP-LCD Backlight OFF Timer** to change the timer for a single DKP.
- **1219-2-DKP-DKP-LCD Backlight OFF Timer** to set the same timer duration for a range of DKPs.
- **1219-*-LCD Backlight OFF Timer** to set the same timer duration for all DKPs.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

Backlight OFF Timer is from 000-999 seconds. Default: 010 seconds.

To change LCD Contrast Level of a DKP, dial:

- **1217-1-DKP-LCD Contrast Level** to set the Contrast level for a single DKP
- **1217-2-DKP-DKP-LCD Contrast Level** to set the same Contrast level for a range of DKPs.
- **1217-*-LCD Contrast Level** to set the same Contrast level for all DKPs.

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

LCD Contrast Level is from 1 to 4. Default: 3.

To assign Hardware Slot-Port to DSS connected to a DKP, dial:

- **1103-DKP-DSS-Slot-Port offset on the card**

Where,

DKP is the Software Port number of the DKP port from 001 to 128.

DSS is 1 for the first DSS Console and 2 for the second DSS Console attached to the DKP

Slot is the number of the Universal Slot in which the DKP Card is located, to which the DSS Console is connected, from 01 to 16.

Port is the number of the hardware port on the card on which the DSS Console is connected.

To clear the hardware Slot-Port assigned to the DSS software port, dial:

- **1103-DKP-DSS-00-00**

- Exit SE mode.

DKP extension users can change several phone settings according their preferences and requirement. These are referred to as DKP Personal Settings and include:

- *Ringer Volume*
- *Ringer Tune*
- *Ringer Mode*
- *Ringer Acknowledge Mode*
- *Speech Volume (Transmit/Receive)*
- *User Status (Present/Absent)*
- *Keypad Security (Lock/Open)*
- *Call Answer Type - Manual/Auto*
- *Headset/Handset Connectivity option*

To be able change the DKP personal settings, the DKP users must access and navigate the phone menu. Refer "[Digital Key Phone-Operation](#)".

DSS Keys Programming

The DSS (Direct Station Selection) Keys when personalized, provides you quick access to Stations, Trunks, Features/Functions of the SARVAM UCS. A few DSS Keys are provided on the phone itself. The number of DSS Keys provided on the phone depends on the type of phone. For details, see [“Digital Key Phone-Operation”](#) and [“Extended IP Phone/VARTA UC Client - Operation”](#).

Matrix offers the DSS Consoles when attached to the phone, works as extensions to the phone. You can customize the DSS Console Keys as per your requirement by assigning the desired features/functions. For details, see [“Direct Station Selection Console”](#).

To configure the DSS Keys on the phone, refer [“Customizing Key Templates”](#) and [“Personalizing Key Maps”](#).

To configure the DSS Console Keys, refer [“Programming DSS Console Keys”](#).

Key Templates

EON, the proprietary digital key phone (DKP) of Matrix and SPARSH IP Phones of Matrix, can be the extension of the Operators and Executives in an enterprise, and in hotels, it can be the extension of the Front Desk Attendants and Guests.

Each of these groups of users may require a different set of features on their phones. For example, when EON/SPARSH is an Operator's extension, for efficient call management, more DSS keys may be required for Trunk Access, Call Appearances, Call Release, Direct Station Calling, than for accessing features.

When EON/SPARSH is an Executive's extension, more DSS keys may be required for single-touch access to features, and fewer keys for Trunk Access and Direct Station Calling.

Similarly, when EON/SPARSH is a Hotel Attendant's extension, keys are required for specific hotel functions such as Check-In/Check-Out, Changing Room Clean Status, Room Shift, etc. But, a different set of keys with special functions are required when EON/SPARSH is provided as a guest extension, because guests are allowed only a limited number of features of the SARVAM UCS, such as calling the Front Desk/Floor Service, setting Do Not Disturb, Wake-up Calls, Call Forward, and checking Voice Mail.

Given the varying requirements of these groups of extension users, SARVAM UCS provides programmable Templates of Key Maps for the Operator, Executive1, Executive2, Executive3, Hotel Attendant, and Hotel Guest.

The default Key Maps in these Templates can be customized to match the requirement of the intended user group. The default Key Maps of Executive1, 2 and 3 are the same.

The customized Template is assigned to the DKPs/SPARSH IP Phones. For example, you may customize the Key Template for the Operator and assign it to the Operator DKPs. Likewise, you may customize the Key Template for Executive and assign it to the Executive extensions.

The default Key Maps vary according to the models of the DKP/SPARSH IP Phone in use, as illustrated below.

In case of Extended IP Phones, you can customize the Templates for the Operator, Executive1, Executive2, Executive3, Hotel Attendant, and Hotel Guest as well as add new templates. You can add upto 64 templates. The new template you add, can be edited or remove as per your requirement. However you cannot remove the default Templates — Operator, Executive1, Executive2, Executive3, Hotel Attendant, and Hotel Guest. These can only be customized.

You can also Personalize the DKP/SPARSH IP Phone key maps, see [“Personalizing Key Maps”](#) for instructions.

The keys in the Key Templates are numbered only for the purpose of locating the keys when programming. Key numbers do not appear on the key labels on the phone body.

Default Key Maps

SPARSH VP248 Key Template (default)

Operator/Executive

Hotel Attendant

Guest

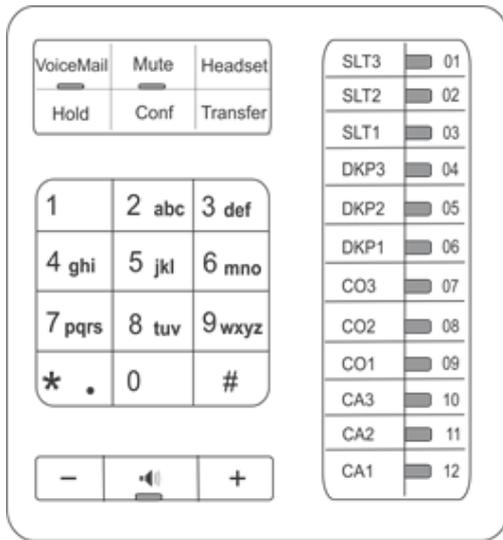

SPARSH VP310 Key Template (default)

Operator/Executive Key Map

Hotel Attendant Key Map

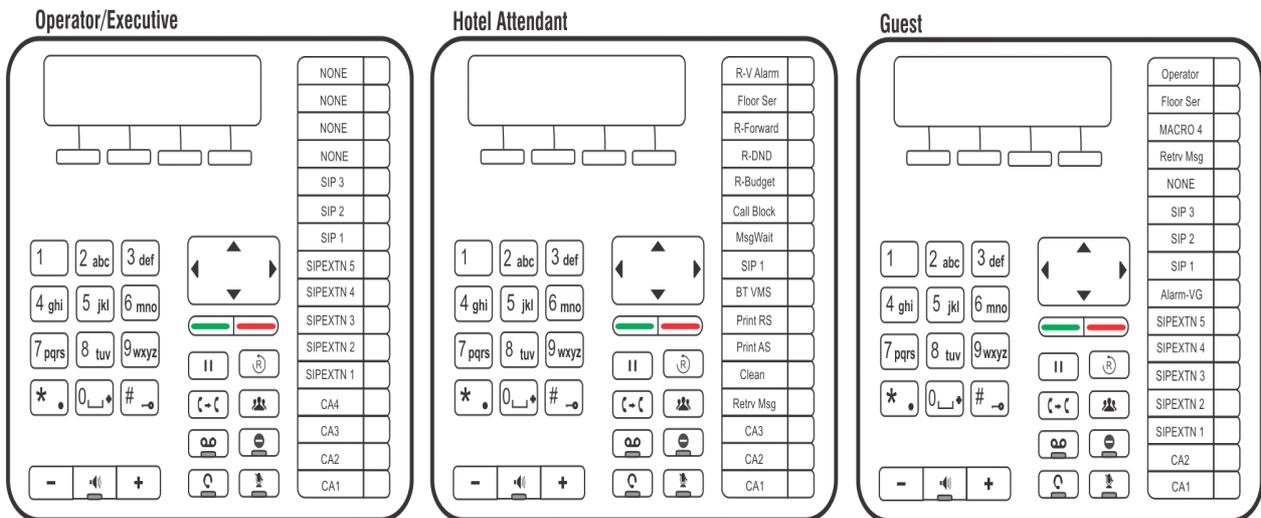

Guest Key Map

SPARSH VP330 Key Template (default)

The default Key Template is same for the Operator, Executive, Hotel Attendant and Guest.

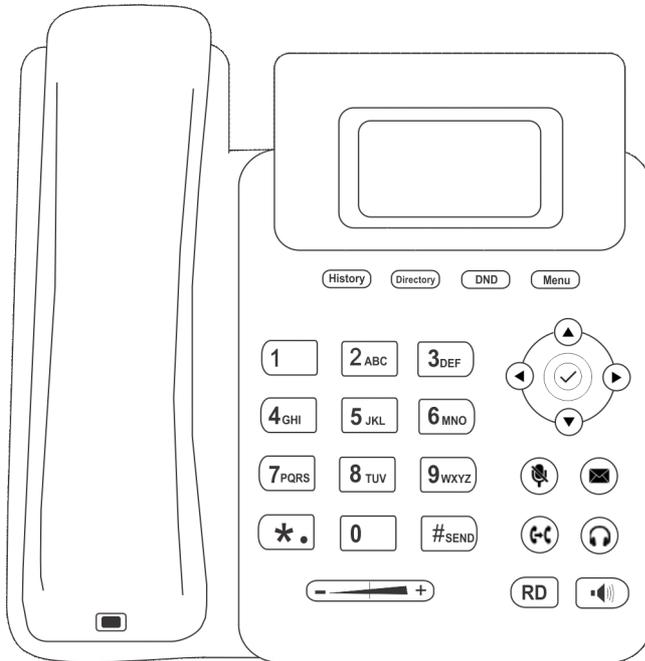

SPARSH VP510 Key Template (default)

SPARSH VP110

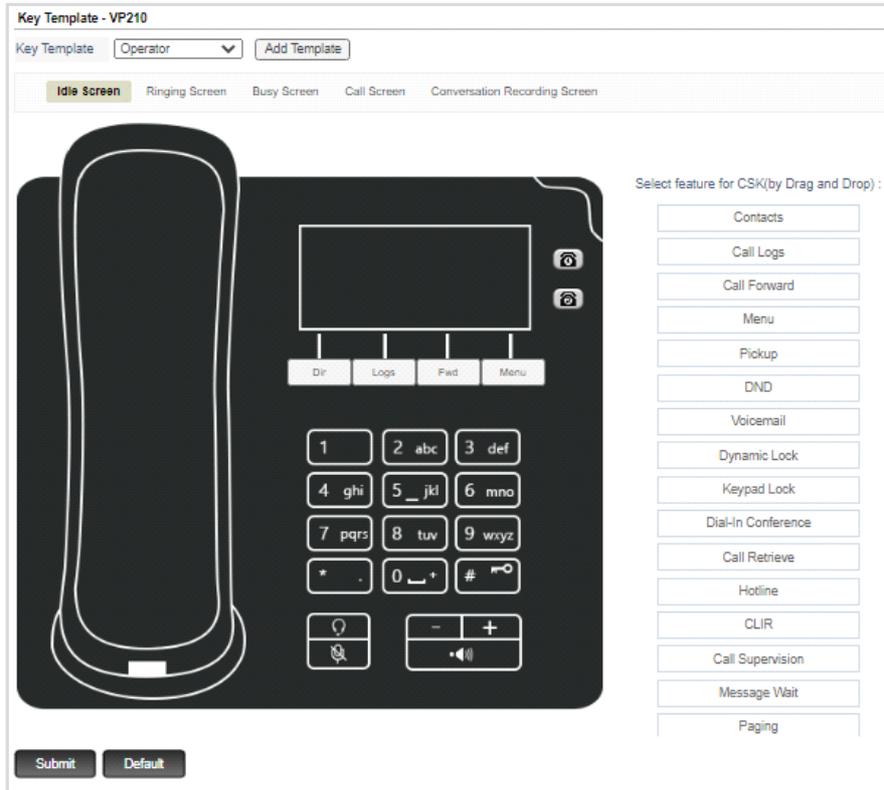

All the default templates are same for SPARSH VP110.

You can customize the following keys only — History, Directory, DND, Menu, Up, Down, Right, Left, OK, Mute and Transfer.

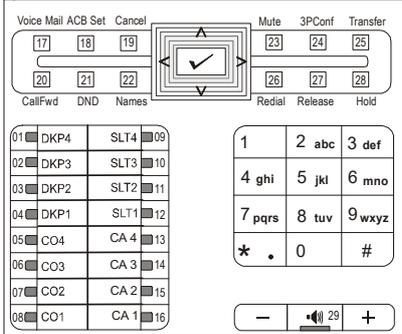

SPARSH VP210 (Default)

All the default templates are same for SPARSH VP210. You can customize the Context keys only.

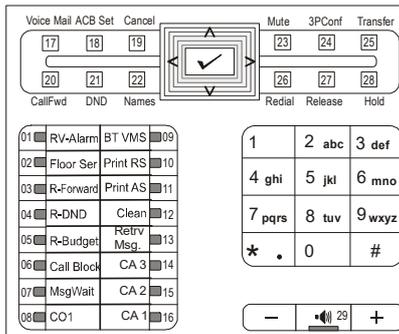

EON48 Key Templates (default)

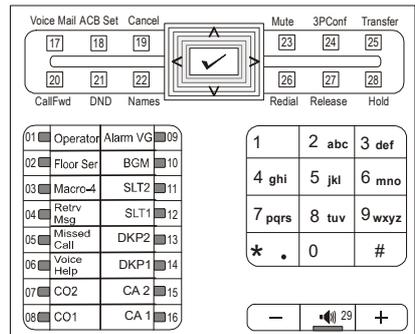

Operator/Executive

Hotel Attendant

Guest

There is no LED on the following key numbers:

- 19 (Cancel)
- 22 (Names)
- 24 (Conference)
- 25 (Transfer)
- 26 (Redial)
- 27 (Release)
- 28 (Hold)

By using Key Templates you can prepare and assign common key maps to all or as many DKPs and SPARSH IP Phones as you want, at one go.

SARVAM UCS also offers the flexibility to personalize the Key Maps of each DKP/SPARSH IP Phone, instead of using the Key Templates. For example, if you have assigned a common Executive Key Template to 12 DKPs, but you want to reassign some of the keys on two of these DKPs, SARVAM UCS allows you to selectively personalize the key maps of these two DKPs. To personalize the key maps for DKPs, see [“Personalizing Key Maps”](#) for instructions.

Customizing Key Templates

You can customize the Key Templates for:

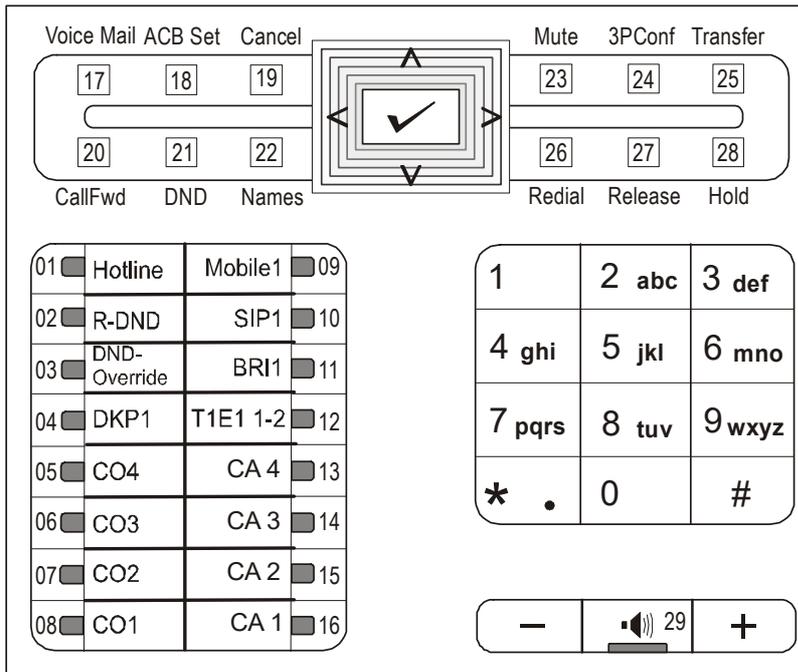

- EON48 using Jeeves as well as a Telephone.
- EON310 using Jeeves only.
- EON510 using Jeeves only.
- SPARSH VP248 using Jeeves as well as a Telephone.
- SPARSH VP330 using Jeeves only.
- SPARSH VP310 using Jeeves only.
- SPASH VP110 using Jeeves only.
- SPARSH VP210 using Jeeves only.
- EONSOFT using Jeeves as well as a Telephone.

- *Before you begin programming the keys,*
 - *List the features/facilities that you want to change in each of the existing (default) Key Templates of Operator, Executive, Hotel Attendant, and Guest.*
 - *Create customized Key Templates on sheets of paper.*

- For each template, decide the keys that will be reassigned the features you listed.
- You may use the key templates printed above to decide the position of keys.
- For each template that you customize, list down the DKPs which will be assigned the template, along with their Software port numbers and their corresponding Hardware Slot and Port Offset. Similarly list SPARSH IP Phones along with their Software port numbers (SIP Extension numbers).
- Similarly, list the DKPs and the SPARSH IP Phones which are to be assigned personalized Key Maps, along with their Software port numbers and their corresponding Hardware Slot and Port Offset.

Illustrated below is an example of a customized Operator's Template for the EON48 model:

This customized Template is to be applied on 2 Operator DKPs:

- DKP-001, connected on H/w Slot-Port - 17-01
- DKP-002, connected on H/w Slot-Port - 17-02

You can customize the key template and assign it to DKPs using Jeeves or a Telephone.

EON48 and SPARSH VP248 have 12 Touch-sense feature keys. While you can reassign the features on these keys, you cannot re-label the keys. Avoid reassigning features on touch-sense keys.

EON310 has 9 feature keys, displaying feature icons as labels. While you can reassign the features on these keys, you cannot re-label the keys. Avoid reassigning features on these keys.

EON510 has 8 feature keys, displaying feature icons as labels. While you can reassign the features on these keys (except Headset and Mute key), you cannot re-label the keys. Avoid reassigning features on these keys.

Customizing Digital Key Phone Templates using Jeeves

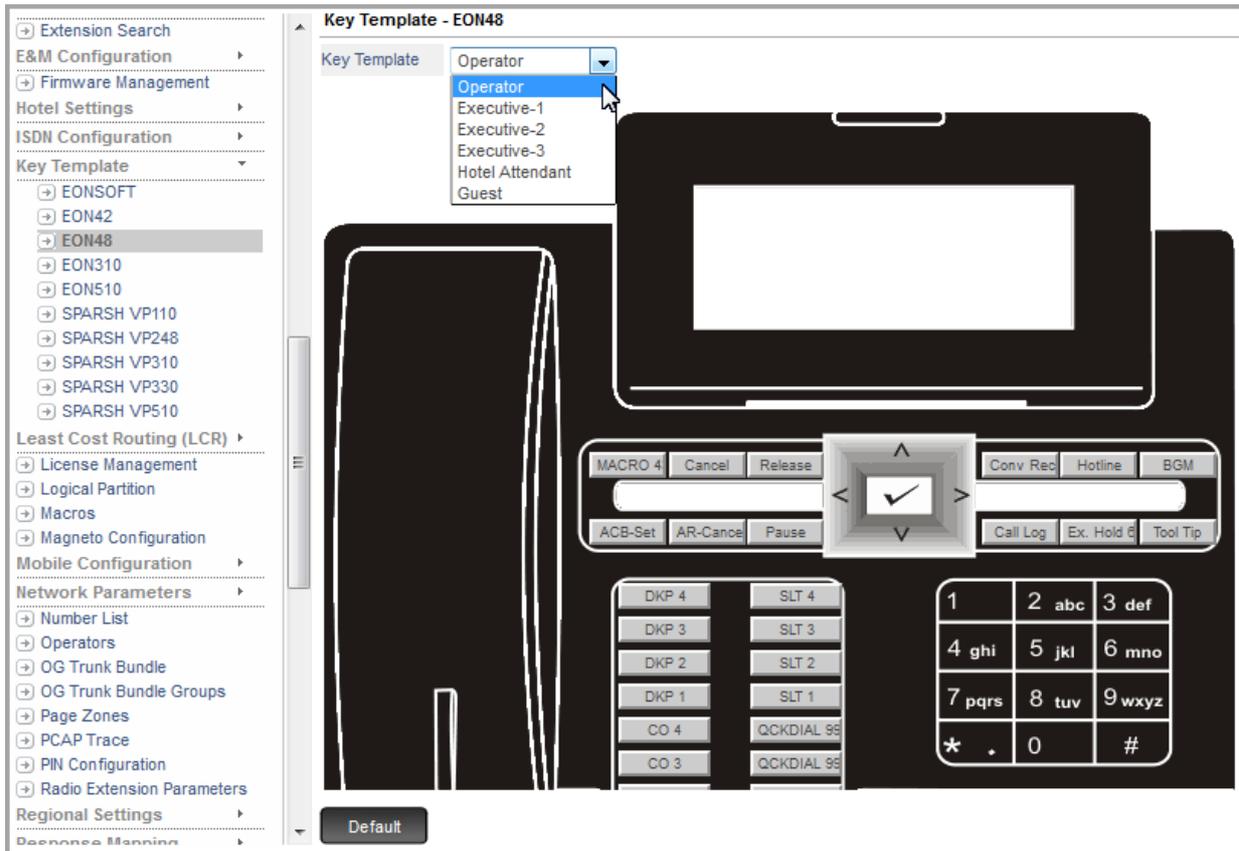

To customize key templates for EONSoft, EON42, EON310, EON510 follow the instructions given below.

- Log in as System Engineer.

- Under **Configuration**, click **Key Template** to open the page.
- There are separate links for each model of EON/IP Phone. Click the desired phone model. The respective phone model is displayed.
- Click **Key Template** to select the default key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant and Guests — you want to customize.

Let us attempt to program the sample Operator template we customized earlier for EON48.

- Click **EON48** to open the page. Select **Operator** as the **Key Template**.

- The Operator Key template for EON48 appears.
- Refer the key template we customized on paper. As per the customized template the keys that need to be reassigned features are as follows:

Existing function on the key	To be replaced by
DKP4	Hotline
DKP3	SA Command for "Remote DND"
DKP2	DND-Override
SLT4	Mobile Trunk 1 (MOBILE1)
SLT3	SIP Trunk 1 (SIP1)

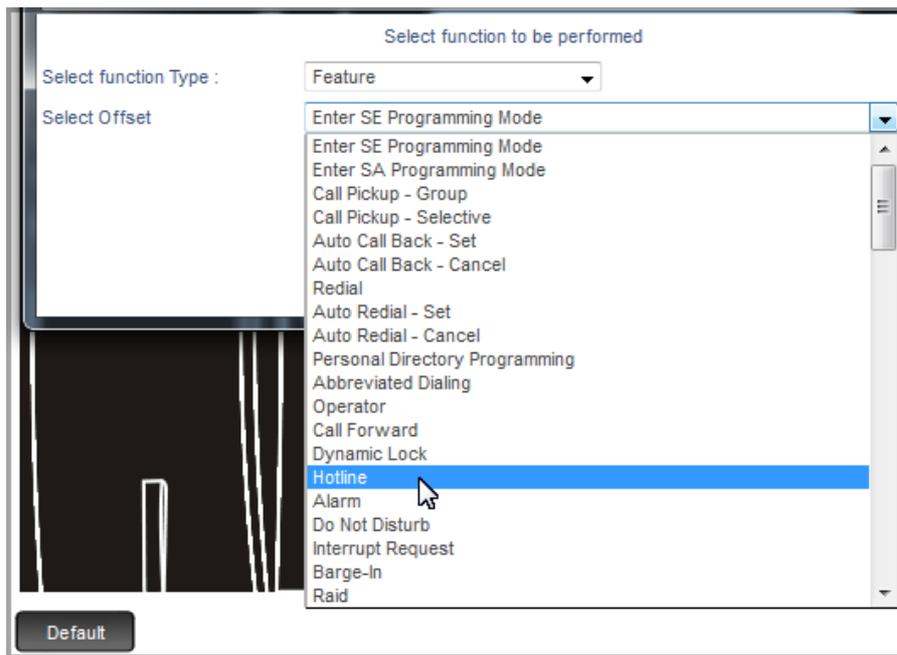

Existing function on the key	To be replaced by
SLT2	BRI Trunk 1 (BRI 1)
SLT1	T1E1 Channel Number 2 of T1E1 Trunk 1

- To assign Hotline, click the DKP4 key. A new window opens.

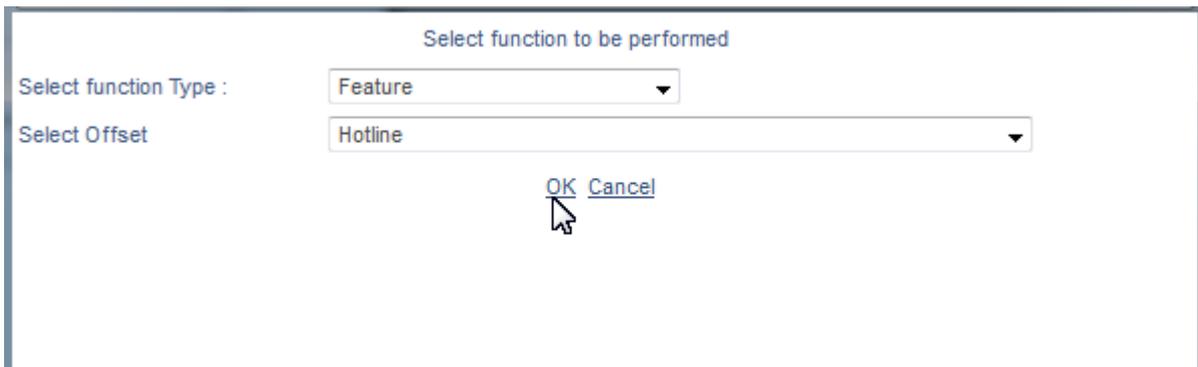

- As Hotline is a feature, in the **Select Function Type** list, click **Feature**.

All features that can be assigned to keys will appear in the **Select Offset** list.

- In the **Select Offset** list, click **Hotline**.

- Click on **OK** in the dialog box. The box will close.

- The **Hotline** feature will appear on the key label.

- To assign Remote DND, click DKP3 key.

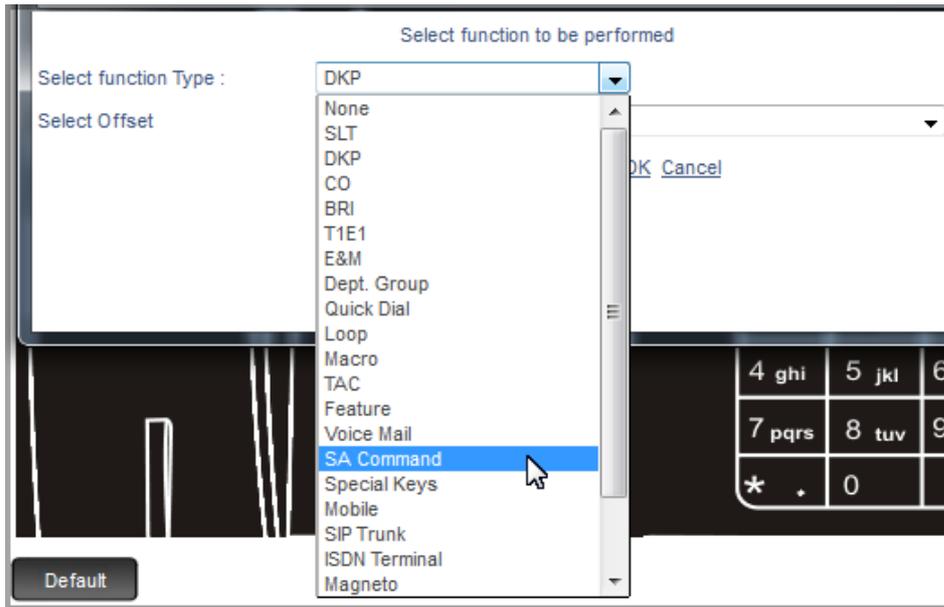

Select function to be performed

Select function Type :

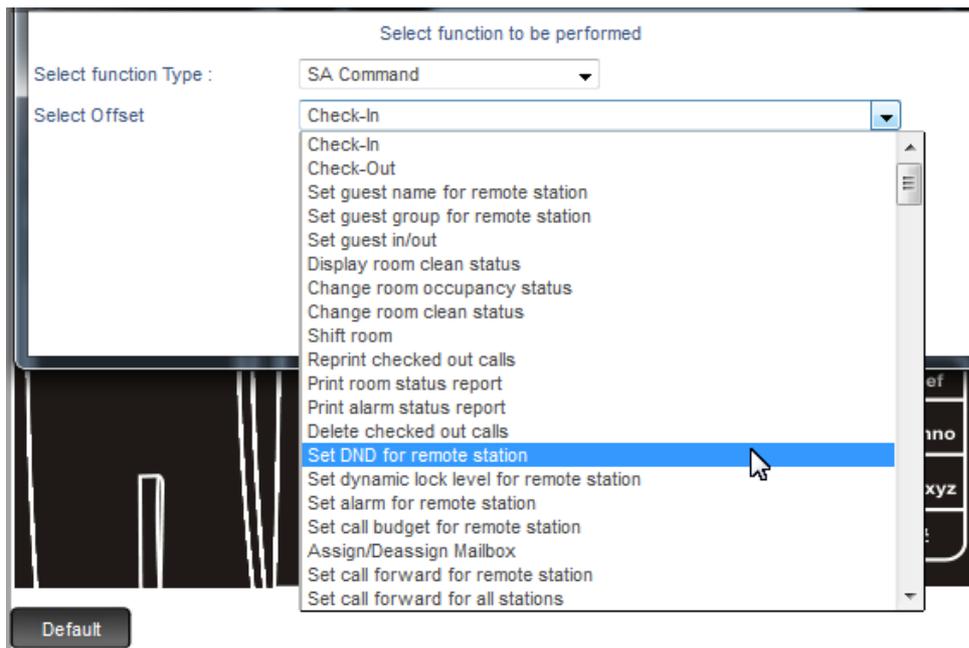

Select Offset :

[OK](#) [Cancel](#)

- As Remote DND is an SA Command, select the option **SA Command** in the **Select Function Type** list.

- In the **Select Offset** list, click **Set DND for remote station**.

- Click **OK**. The window closes. The Remote DND feature appears in abbreviated form as **R-DND** on the key label.

- Repeat these steps to reassign other keys, selecting the appropriate Function Type and the Offset for each feature/function.

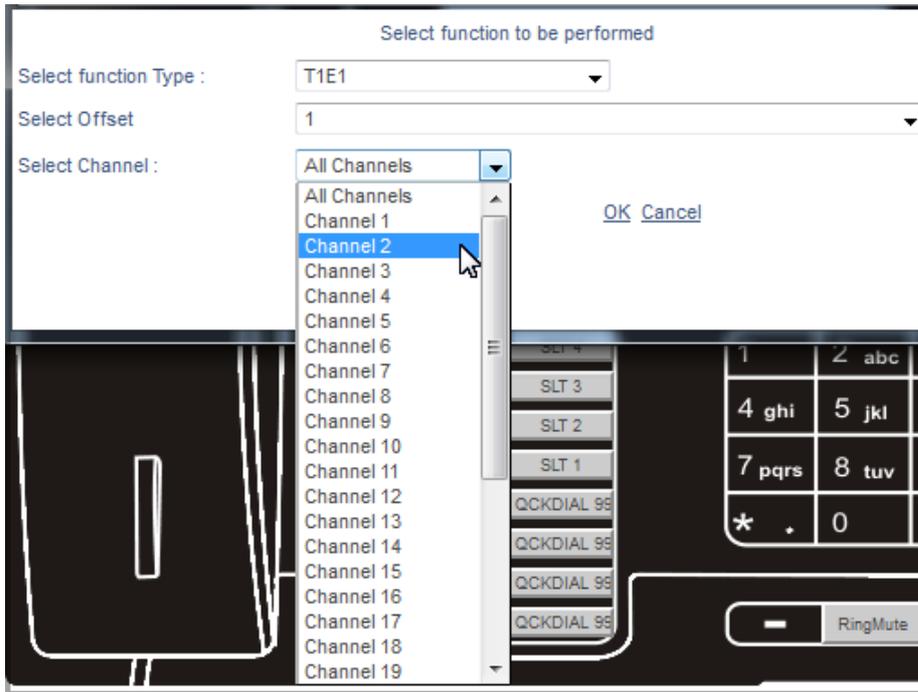

For example, DND-Override is a feature, so select 'Feature' as the function type.

To assign direct access to Mobile Trunk 1, select "Mobile" as function type and '01' as Offset.

To assign direct access to SIP Trunk 1, select "SIP" as function type and '01' as Offset.

To assign direct access to BRI Trunk 1, select "BRI" as function type and '01' as Offset. When you select BRI as function type, you will be asked to 'Select Channel'. Since you do not want to assign direct access to any particular BRI channel of this trunk, retain the option 'All Channels' for 'Select Channel'.

To assign direct access to Channel Number 2 of T1E1 Trunk 1, select 'T1E1' as function type, '01' as Offset.

When you select T1E1, as function type, you will be given the 'Select Channel' option. Since you want to assign direct access to Channel 2 of T1E1 Trunk 1, select the option 'Channel 2' in the 'Select Channel' list.

Always click **OK** when you select a Function Type and Offset.

- When you have completed assigning functions to keys, click **Submit** at the bottom of the page to save your settings.
- Follow the same steps to program the other Key Templates.
- Assign the key templates you created to the respective DKPs.

To take the above example further, the Operator key template customized for EON48 is to be assigned to the DKPs 001 and 002. To do this,

- Click the **DKP Parameters** link to open the page.
- Scroll with the horizontal bar to reach the parameter **Key Map** of this DKP 001.

- Select **Operator** as the Key Map.

Port No.	Station Basic Features Template	Station Advance Features Template	Call Capacity	Call Waiting Tone	Key Map
1	01	01	02	Beep Once	Personalized
2	01	01	02	Beep Once	Operator
3	01	01	02	Beep Once	Personalized
4	01	01	02	Beep Once	Executive-1
5	01	01	02	Beep Once	Executive-2
6	01	01	02	Beep Once	Executive-3
7	01	01	02	Beep Once	Hotel Attendant
8	01	01	02	Beep Once	Guest

- Similarly, for DKP-002, select **Operator** as the Key Map.
- Click **Submit**.
- Also refer the topic [“Configuring DKP Parameters using Jeeves”](#) for instructions on assigning the Key Map in the DKP Parameters.

Customizing Extended IP Phone Templates using Jeeves

You can:

- customize the existing key templates — Operator, Executive1, Executive2, Executive3, Hotel Attendant and Guests.
- add new key templates.

Customizing Existing Key Templates

To customize existing key templates for SPARSH VP248, SPARSH VP330, SPARSH VP310, SPARSH VP510 and SPARSH VP110 follow the instructions given below.

To customize existing key templates for SPARSH VP210, refer to [“Customizing Existing Key Templates - SPARSH VP210”](#).

- Log in as System Engineer.
- Under **Configuration**, click **Key Template** to open the page.
- There are separate links for each model of IP Phone. Click the desired phone model. The respective phone model is displayed.
- Click **Key Template** to select the desired key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant and Guests — you want to customize.

Let us attempt to configure the sample Operator template for VP248.

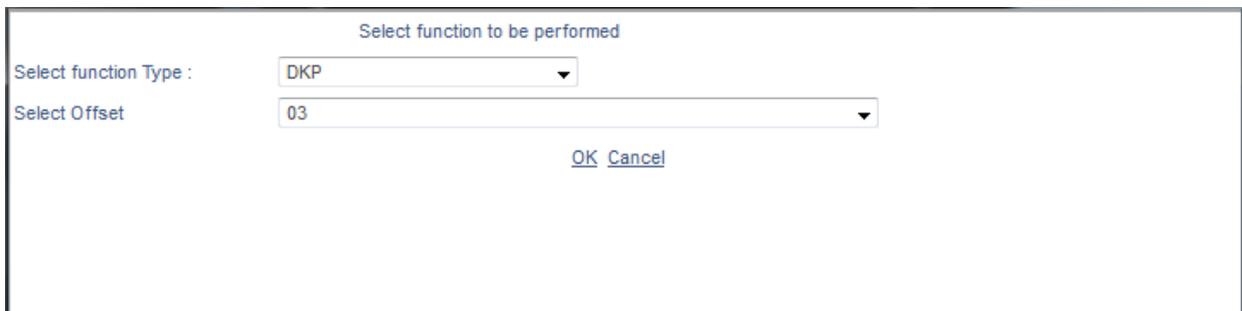

Click **VP248** to open the page. Select **Operator** as the **Key Template**.

For example, to customize the key template the keys that need to be reassigned features are as follows:

Existing function on the key	To be replaced by
DKP3	Hotline
SLT3	SIP Trunk 1 (SIP1)

- To assign Hotline, click the DKP3 key. A new window opens.

- As Hotline is a feature, in the **Select Function Type** list, click **Feature**.

All features that can be assigned to keys will appear in the **Select Offset** list.

- In the **Select Offset** list, click **Hotline**.

- Click on **OK** in the dialog box. The box will close.

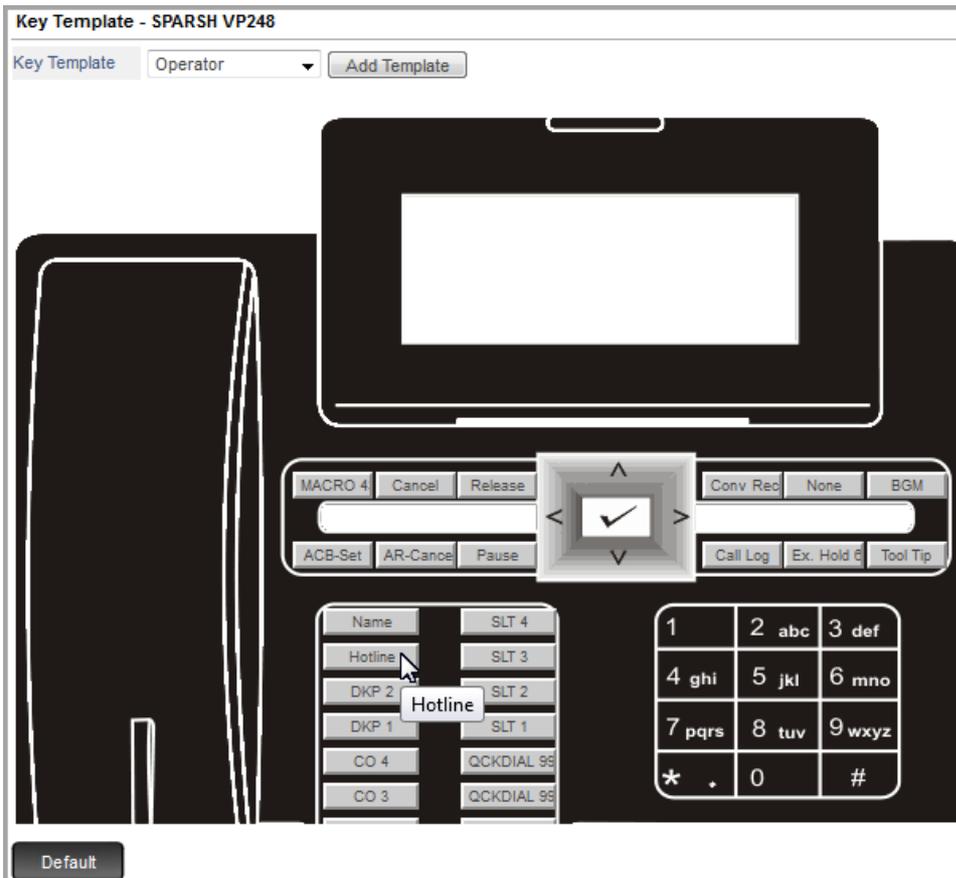

Select function to be performed

Select function Type :

Select Offset

[OK](#) [Cancel](#)

- The **Hotline** feature will appear on the key label.

- To assign direct access to SIP Trunk 1, click SLT3 key.

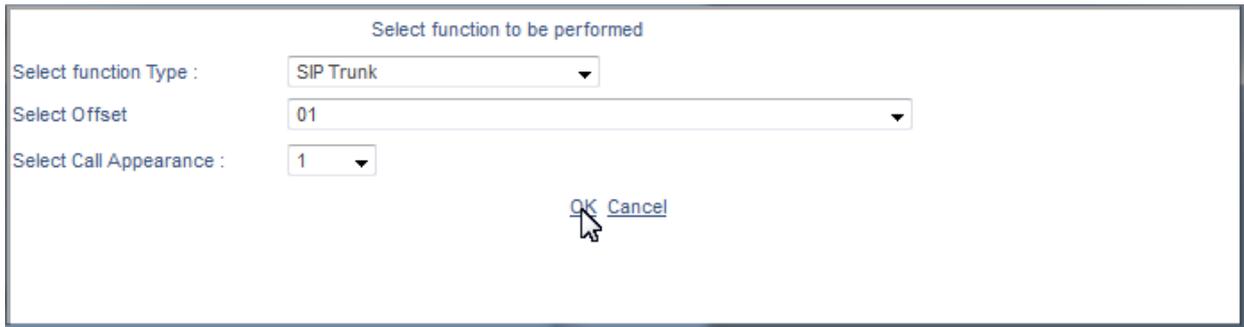

Select function to be performed

Select function Type :

Select Offset

[OK](#) [Cancel](#)

Select **SIP Trunk** as function type and **01** as Offset.

Select function to be performed

Select function Type : SIP Trunk

Select Offset : 01

Select Call Appearance : 1

OK Cancel

SIP 1-1 appears as the key label.

When you have completed assigning functions to keys, click submit to save the settings.

Similarly, you can customize the other templates — Executive, Hotel Attendant, Guest.

To customize the templates for other phone models, follow the instructions as given above.

You can also add new templates. To do so, refer [“Add, Edit or Remove Key Templates”](#).

Customizing Existing Key Templates - SPARSH VP210

SPARSH VP210 has the provision to program the four Context Keys. These keys enable you to access the most frequently used functions/features at the press of a single button.

The screens — Idle Screen, Ringing Screen, Busy Screen, Call Screen, Conversation Recording Screen, all have different set of features that can be accessed. SPARSH VP210, enables you to customize these by allowing you to set the priorities of the features in each type of screen as per your preference. You can assign the features to the Context Keys depending on the state of the call.

- In the Idle Screen you can assign the desired feature/function to the Context Keys as well as set their priorities as per your requirement.
- In the other Screens you can only set the priorities of the features.

Refer to the details mentioned below for Default Key Assignment and the Feature Key Assignment/Feature Priority Assignment as per the different Call States:

Idle Screen

Default Key Assignment

Parameter	Default Key Assigned
Context Key 1	Dir
Context Key 2	Logs
Context Key 3	Fwd
Context Key 4	Menu

Feature Key Assignment/Feature Priority Assignment

Type of Screen	Feature Priority Selection List
Idle Screen	Contacts
	Call Logs
	Call Forward
	Menu
	Pickup
	DND
	Voicemail
	Dynamic Lock
	Keypad Lock
	Dial-In Conference
	Call Retrieve
	Hotline
	CLIR
	Call Supervision
	Message Wait
	Paging
	Meet Me Paging
	Room Monitoring
	Intercom
	Follow Me
Walk-In

Context Key 1	Mute
Context Key 2	Hold
Context Key 3	Transfer
Context Key 4	Next

Feature Priority Assignment

Conversation Recording Screen	Feature Priority Selection List
	Mute
	Hold
	Transfer
	Conference
	VMS Blind Transfer
	Global Hold
	Call Chaining
	Stop Recording
	Release
	End Call

To customize existing key templates for SPARSH VP210, follow the instructions given below.

- Log in as System Engineer.
- Under **Configuration**, click **Key Template** to open the page.
- There are separate links for each model of IP Phone. Click **VP210**.
- Click **Key Template** to select the desired key template — Operator, Executive1, Executive2, Executive3, Hotel Attendant and Guests — you want to customize.

Let us attempt to configure the sample Operator template for VP210.

Click **VP210** to open the page. Select **Operator** as the **Key Template**.

- Click **Idle Screen**.
- Each Context key, 1 to 4 can be assigned features.
- The feature assignment cum priority list appears on the right. You can change the feature assignments/priorities as per your preference.
- To set the priority, drag and drop the features in the order of your preference. This will have two implications — the Context Key will be assigned the desired feature as well it will set the priority.
- Click **Submit**.
- The key map will refresh and the name of the Feature you selected (first four) will appear in abbreviated form as the key labels.

Menu must be assigned to one of the first four Context Keys.

- Similarly, you can click **Ringling Screen, Busy Screen, Call Screen** or **Conversation Recording Screen** and can set the feature priorities as per your preference.

In these screens only priorities can be set and the 4th Context Key will always be assigned to **More >** feature. The first three Context keys will display the features assigned priorities 1, 2 and 3. To access other features press **More >**. The features will be displayed as per their set priorities.

Similarly, you can customize the other templates — Executive, Hotel Attendant, Guest.

You can also add new templates. To do so, refer [“Add, Edit or Remove Key Templates”](#).

Add, Edit or Remove Key Templates

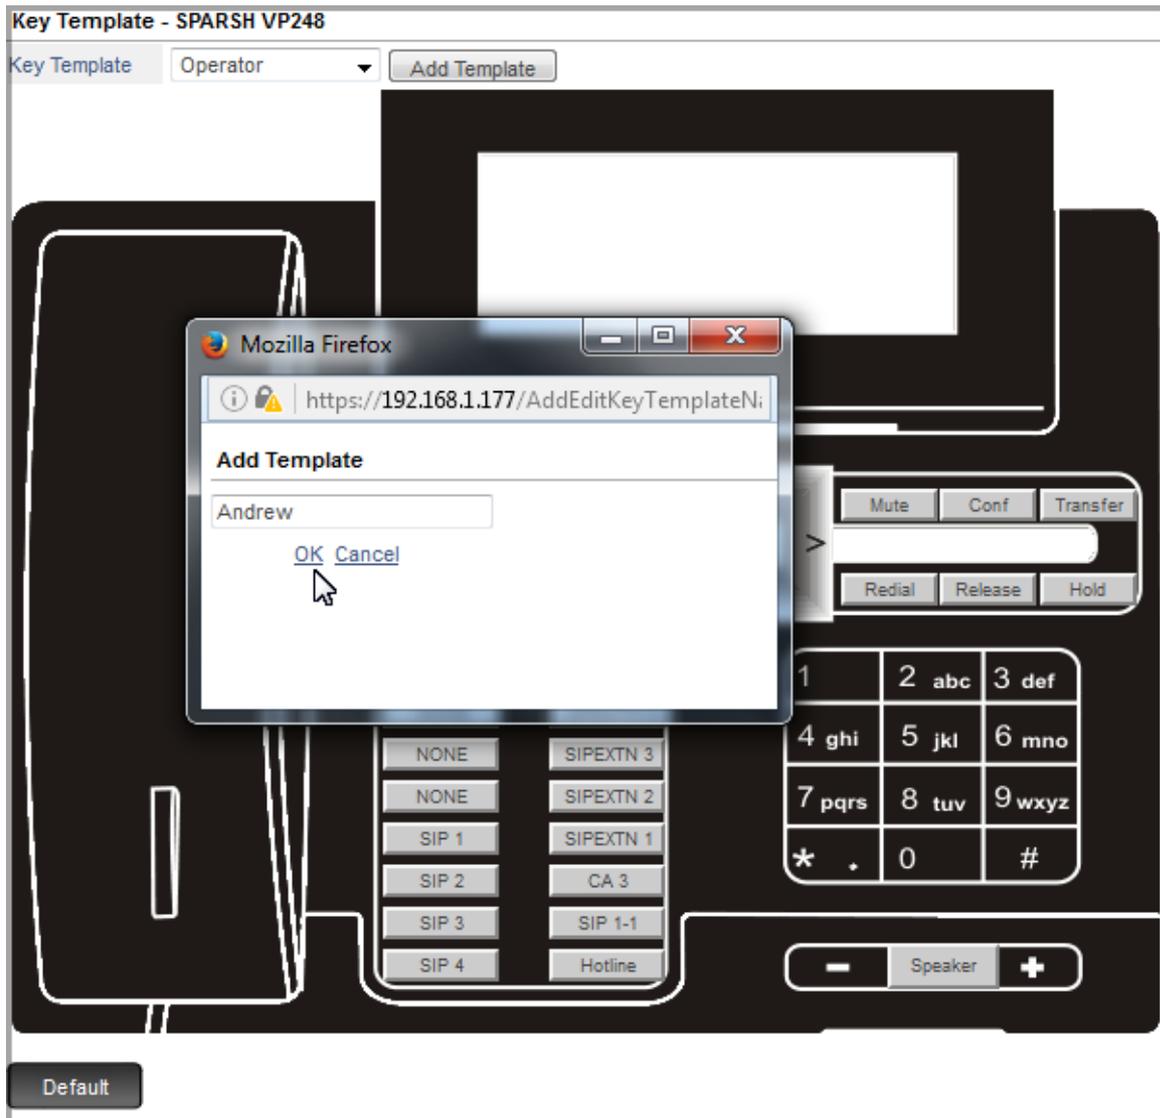

If you do not wish to customize any existing template, you can add new templates. By default, the Operator Template will be displayed as the phone key map. You can customize the key map as per your requirement or add a new template.

You can add upto 64 new templates for each phone model.

To add a template,

- Log in as System Engineer.
- Under **Configuration**, click **Key Template** to open the page.
- There are separate links for each model of IP Phone. Click the desired phone model. The respective phone model is displayed.

- Click **Add Template**. The Add Template window opens.

- Assign a name to the template. This template appears as one of the Key Template options.
 - To customize the key template to match the requirement, click Andrew as the Key Template option.
- Follow the instructions given under [“Customizing Key Templates”](#).
- When you have completed assigning functions to keys, follow the same steps if you wish to add other Key Templates.
 - To assign the key templates you created to the respective SIP Extension location using Jeeves. Refer to [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP248”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP310”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP330”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP510”](#) and [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP210”](#) for instructions
 - To Edit the template name, click **Edit Template**.
 - To delete the template, click **Remove Template**.

Customizing Key Templates using a Telephone

EON310 / SPARSH VP110 / SPARSH VP210 Key Templates can be customized using Jeeves only.

When customizing key templates using a Telephone, two attributes of a key must be programmed, namely:

- a. **Location** - the physical location of the key on the phone body.
- b. **Function** - the function that the key should perform, that is, as direct access to a feature or an extension, a trunk type, an SA command, etc.

Follow the numbering of keys on the default Key Maps illustrated earlier in this topic.

- Enter SE mode from a DKP/SLT.

To assign a feature to a key in a Template, dial:

- **1261-1-Key Template-Terminal Type-Key Number-Function Type-Function Number-Channel**

To assign the same feature to the same key number in a range of templates, dial:

- **1261-2-Key Template-Key Template-Terminal Type-Key Number-Function Type-Function Number-Channel**

To assign the same feature to the same key number in all the templates, dial:

- **1261-*-Terminal Type-Key Number-Function Type-Function Number-Channel**

Where,

Key Template is

1 for Operator

2 for Executive1

3 for Hotel Attendant

4 for Guest

5 for Executive2

6 for Executive3

Terminal Type is

1 for EON45/EONSOFT

2 for EON42

3 for EON48

4 for SPARSH VP248

6 for EON310

7 for SPARSH VP330

Key Number is the number of the key which is to be reassigned the feature.

Key Numbers on EONSOFT are from 01 to 25

Key Numbers on EON42 are from 01 to 25

Key Numbers on EON48 are from 01 to 29.

Key Numbers on SPARSH VP248 are from 01 to 29.

Key Numbers on EON310 are from 01 to 21.

Key Numbers on SPARSH VP330 are from 01 to 15.

For numbering of the keys, refer the default Key Maps illustrated at the beginning of this topic.

Function Type is the function to be performed by the key, from 00 to 34.

Function Number defines the exact function under each Function Type selected for the key.

Channel is the number of the channel in the BRI or PRI Line to be accessed.

Channel number for BRI Line is

01 for Channel 1

02 for Channel 2

00 for both Channels

Channel number for PRI Line is

01 to 30 for Channels 1 to 30 respectively.

00 for all Channels

Channel number for all function types other than BRI and PRI is **00**

Refer the tables below for the complete list of function types and function numbers, and channel numbers.

Table: Function Types and Function Numbers

Function Type	Meaning	Function Number	Meaning
00	None	-	-
01	SLT (Direct Station Call)	001 to 512	Number of the SLT (software) port which is to be called when the key is pressed.
02	DKP (Direct Station Call)	001 to 128	Number of the DKP (software) which is to be called when the key is pressed.
03	CO (Direct Trunk Access)	001 to 128	Number of the CO (software) port which is to be called when the key is pressed.
04	BRI (Direct Trunk Access and Direct BRI Channel Access)	001 to 032	<p>Number of the BRI (software) port which is to be called when the key is pressed.</p> <p>Number of the Channel in the BRI Line, which is to be accessed when the key is pressed.</p> <p>Channel numbers are:</p> <p>01 for BRI Channel 1 02 for BRI Channel 2 00 for both Channels</p>

Function Type	Meaning	Function Number	Meaning
05	T1E1 (Direct Trunk Access and Direct PRI Channel Access)	001 to 008	<p>Number of the T1E1 (software) port which is to be called when the key is pressed.</p> <p>Number of the Channel in the PRI Line which is to be accessed when the key is pressed.</p> <p>Channel numbers are:</p> <p>01 for T1E1 Channel 1 02 for T1E1 Channel 2 03 for T1E1 Channel 3 : : 30 for T1E1 Channel 30 00 for all Channels</p>
06	E&M (Direct Trunk/ Station Access)	001 to 128	Number of the E&M (software) port which is to be called when the key is pressed.
11	Dept. Group (Direct Station Call)	01 to 24	Number of the Department Group which is to be called when the key is pressed.
12	Quick Dial (Abbreviated Dialing)	001 to 999	The Global Directory Index number on which the External Number is stored. Call will be made to that External Number when this key is pressed
13	LOOP (Loop Count or Call Capacity)	01 to 10	The number of Call Appearance/Call Loop which will be accessed when the key is pressed.
14	MACRO	01 to 25	The number string of the Key Board Macro which will be dialed when the key is pressed. Refer " Macros "
15	TAC (Direct Trunk Access)	1 to 6	The Trunk Access Code that will be dialed when the key is pressed.
18	FEATURE (Direct Feature Access)	01 to 87	The feature that will be invoked when the key is pressed. For a complete list of features, refer the " Table: "Function Type 18: Features" ".
21	Voice Mail	1	The Voice Mail System Port to be dialed when the key is pressed.
22	SA Command (Direct Dialing of SA Command)	001 to 173	The SA Command to be invoked when the key is pressed. For a complete list of SA Commands, refer the " Table: "Function Type 22: SA Commands" ".
24	Special Keys	01 to 15	The Special Digits to be dialed when the key is pressed. For a complete list of Special Keys, refer the " Table: "Function Type 24: Special Keys" ".
25	MOBILE (Direct Trunk Access)	01 to 32	The number of the Mobile Port to be accessed when the key is pressed.
26	SIP (Direct Trunk Access)	01 to 32	The number of the SIP Trunk to be accessed when the key is pressed
28	ISDN Terminal (Direct Station Call)	01 to 64	The number of the ISDN Terminal (software) port which is to be dialed when the key is pressed.

Function Type	Meaning	Function Number	Meaning
29	Magneto (Direct Station Call)	001 to 128	The number of the Magneto (software) port to be dialed when the key is pressed.
31	ROOM (Direct Station Call)	001 to 512	The number of the Hotel Room to be dialed when the key is pressed.
34	SIP Extension (Direct Access)	001 to 999	The number of the SIP Extension to be dialed when the key is pressed.
36	Virtual Ext.	01 to 64	The number of the Virtual Extension to be dialed when the key is pressed.
37	General Orbit	2 to 9	The number of General Orbit where the call should be parked/retrieved from when the key is pressed.

Examples:

Let us attempt to program the same sample Operator Template we customized earlier for EON48 using a telephone. For this, we need to know the location of the key, that is, the key number.

Existing function on the key	To be replaced by	Location of the key on the Key Map
DKP4	Hotline	Key No. 01
DKP3	SA Command for “Remote DND”	Key No. 02
DKP2	DND-Override	Key No. 03
SLT4	Mobile Trunk 1 (MOBILE1)	Key No. 09
SLT3	SIP Trunk 1 (SIP1)	Key No. 10
SLT2	BRI Trunk 1 (BRI 1)	Key No. 11

Existing function on the key	To be replaced by	Location of the key on the Key Map
SLT1	T1E1 Channel Number 2 of T1E1 Trunk 1	Key No. 12

To assign Hotline to the key currently assigned to DKP4 key (key 01) in the Operator Template, dial:

- **1261-1-1-3-01-18-15-00**

Where,

- 1 is Operator Template
- 3 is for EON48 Terminal
- 01 is the Key Number
- 18 is Function Type for Features
- 15 is Function Number for Hotline feature.
- 00 is Channel.

To assign Mobile Trunk 1 in place of SLT4 on DSS key 09 on the Operator Template, dial:

- **1261-1-1-3-09-25-01-00**

Where,

- 1 is Operator Template
- 3 is for EON48 Terminal
- 09 is the Key Number
- 25 is Function Type for Mobile Trunks
- 01 is Function Number, that is, the port offset of the Mobile Port.
- 00 is Channel

To assign BRI Trunk 1 in place of SLT2 on DSS Key 11 on the Operator Template, dial:

- **1261-1-1-3-11-04-01-00**

Where,

- 1 is Operator Template
- 3 is for EON48 Terminal
- 11 is the Key Number
- 04 is Function Type for BRI Trunks
- 01 is Function Number, that is, number of the BRI port.
- 00 is Channel number.

To assign Channel 2 of T1E1 Trunk 1 in place of SLT1 on DSS Key 12 on Operator Template, dial:

- **1261-1-1-3-12-05-01-02**

Where,

- 1 is Operator Template
- 3 is for EON48 Terminal
- 12 is the Key Number
- 05 is Function Type for T1E1 Trunks.
- 01 is Function Number, that is, number of the T1E1 port.
- 02 is Channel number.

To assign a DKP Key template to a DKP, dial:

- **1221-1-DKP-DKP Key Template** to assign the template to a single DKP.
- **1221-2-DKP-DKP-DKP Key Template** to assign the same template to a range of DKPs
- **1221-*-DKP Key Template** to assign the same template to all DKPs

Where,

- DKP is number of the Software Port of the DKP to which the Template is to be assigned, from 001 to 128.
- DKP Key Template is
- 0 for Personalized key map

- 1 for Operator Template
- 2 for Executive's Template
- 3 for Hotel Attendant's Template
- 4 for Guest Template.

For example, to assign the customized Operator Template to DKP 001 and DKP002, you may dial:

- **1221-1-001-1** to assign the template to DKP001
 - **1221-1-002-1** to assign the template to DKP002
 - OR
 - **1221-2-001-002-1** to assign the same template to both DKPs at one go.
- Exit SE Mode.

Personalizing Key Maps

You can personalize the Key Maps of individual DKPs (EON) and SPARSH IP Phones, instead of using the Key Templates.

When you personalize the Key Map of a DKP, make sure 'Personalized' option is selected as the *Key Map* in the *DKP Parameters* of the DKP.

Similarly, when you personalize the Key Map of an SPARSH IP phone, make sure 'Personalized' option as the *Key Template* in the *SIP Extension Settings - Location* of the phone.

The Personalized option is not applicable for SPARSH VP110.

Personalizing Key Map using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **DKP Parameters**.
- Go to the DKP you want to assign a personalized key map, for example, DKP001.

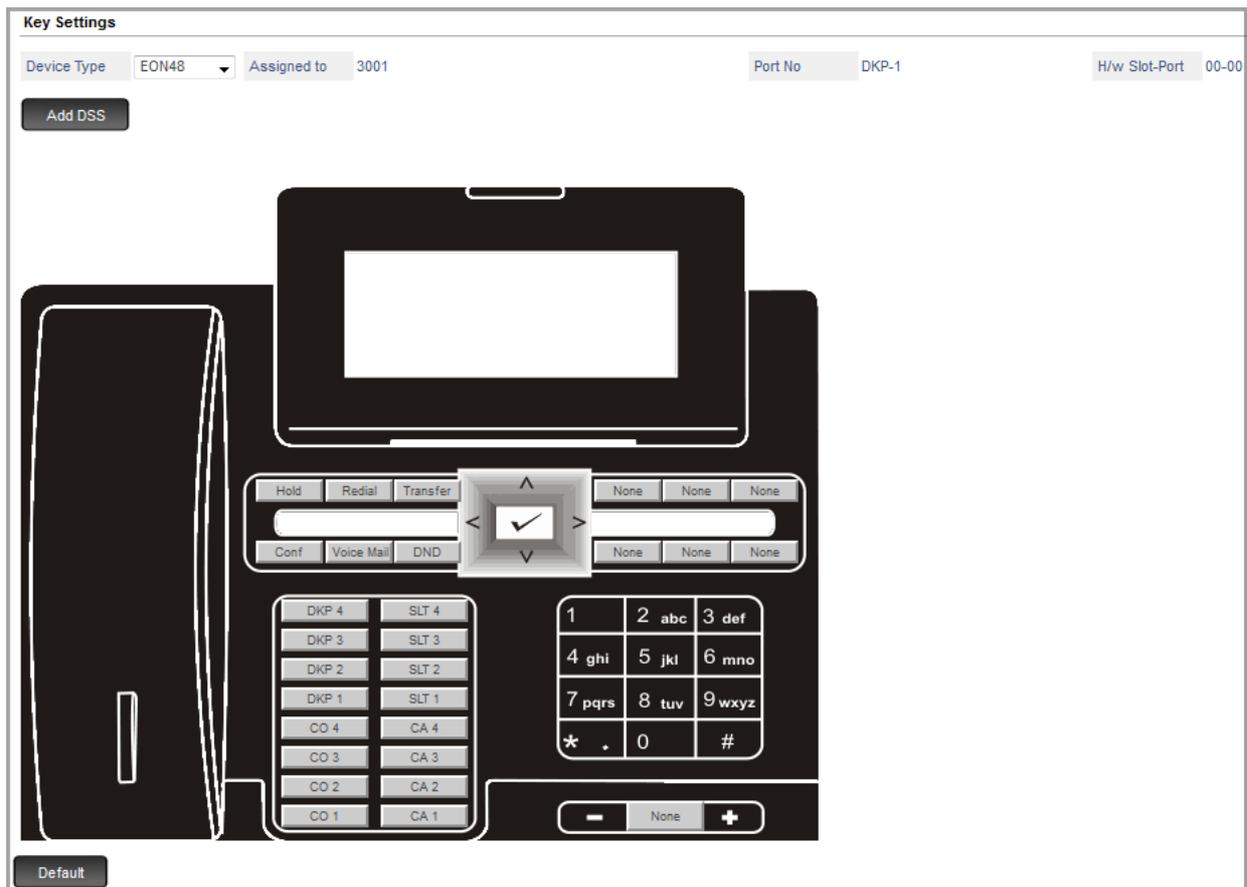

Port No.	Key Map	Call Pickup Group	COSEC Door Group	Station Type	DSS Key Settings
1	Personalized	01	00	Administration	Key Settings
2	Personalized	01	00	Administration	Key Settings
3	Operator	01	00	Administration	Key Settings
4	Executive-1	01	00	Administration	Key Settings
5	Executive-2	01	00	Administration	Key Settings
6	Executive-3	01	00	Administration	Key Settings
7	Hotel Attendant	01	00	Administration	Key Settings
8	Guest	01	00	Administration	Key Settings

- Select **Personalized** as the **Key Map** option for the DKP.
- Click **Submit** to save Key Map selection.
- Click the **Key Settings** link under **DSS Key Settings**.

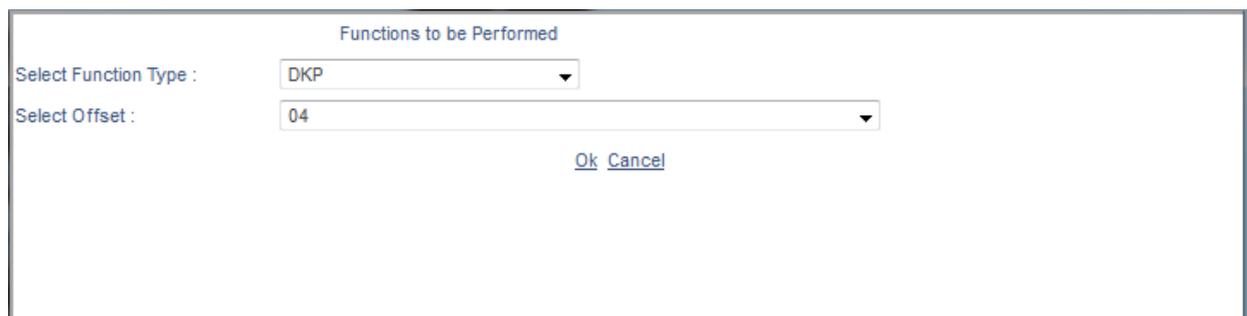

01-08 09-16 17-24 25-32 33-40 41-48 49-56 57-64 65-72 73-80 81-88 89-96						
DKP Parameters						
Port No.	Key Map	Call Pickup Group	COSEC Door Group	Station Type	DSS Key Settings	
1	Personalized	01	00	Administration	Key Settings	
2	Personalized	01	00	Administration	Key Settings	
3	Personalized	01	00	Administration	Key Settings	
4	Personalized	01	00	Administration	Key Settings

6	Personalized	01	00	Administration	Key Settings	
7	Personalized	01	00	Administration	Key Settings	
8	Personalized	01	00	Administration	Key Settings	

Submit Default Default One Advance Clear Access Code Call Traffic

- The current Key Map of the DKP opens.

- To assign features to keys, follow the same steps as you did for customizing the key templates.
- Click the key you want to assign the function. For example, you want **Barge-In** on the key assigned to **DKP4**, click this key.
- The options for the Functions to be Performed by the key will open in a new window.

- Click the option **Feature** in the **Function Type** list.
- Click the option **Barge-In** in the **Select Offset** list.

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- Click **OK**. The window will close. The new label will appear on the key.

- Repeat the same steps to program another key on this key map.
- When you have completed personalizing the key map, close the window.
- Click **Submit** to save.
- Follow the same steps to personalize the key map of another DKP.

For instructions on personalizing the Key Map of the Extended IP Phone, see [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP330”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP248”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP310”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP210”](#) and [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP510”](#). The Personalized option is not applicable for SPARSH VP110.

Personalizing Key Maps using a Telephone

- Enter SE mode.

To assign a Personalized Key map to a DKP, dial:

- **1221-1-DKP-0** to assign personalized key map to a single DKP.
- **1221-2-DKP-DKP-0** to assign the personalized key map to a range of DKPs.
- **1221-*-0** to assign personalized key map to all DKPs.

Where,

DKP is number of the Software Port of the DKP to which the Template is to be assigned, from 001 to 128.

0 is for Personalized key map.

For example, to assign the personalized Key map to DKP 003, dial: 1221-1-003-0

To assign a function to a DKP key in a personalized key map, dial:

- **1252-1-DKP-Key Number-Function Type-Function Number-Channel** to assign a function to a DKP Key on a single DKP.
- **1252-2-DKP-DKP-Key Number-Function Type-Function Number-Channel** to assign the same function on the same key number on a range of DKPs.
- **1252-*-Key Number-Function Type-Function Number-Channel** to assign the same function on the same key number on all DKPs

Where,

DKP is the number of the Software Port of the DKP from 001 to 128.

Key Number is the number of the key which is to be assigned the function/feature. The Key numbers vary according to the EON Terminal Type being used.

Key Numbers on EONSOFTE are from 01 to 25.

Key Numbers on EON42SR are from 01 to 25.

Key Numbers on EON48 are from 01 to 29.

For numbering of the keys, refer the default Key Maps illustrated at the beginning of this topic.

Function Type is the function to be performed by the key, from 00 to 34.

Function Number defines the exact function under each Function Type selected for the key. Refer the tables above for the complete list of function types and function numbers.

Channel is the number of the channel in the BRI or T1E1 PRI Line to be accessed.

Channel number for BRI Line is

01 for Channel 1

02 for Channel 2

00 for both Channels

Channel number for T1E1 PRI Line is

01 to 30 for Channels 1 to 30 respectively.

00 for all Channels

Channel number for all function types other than BRI and PRI is **00**

For example, you want Barge-In on key number 04 of DKP-003, dial:

- **1252-1-003-04-18-19-00**

Where,

003 is DKP-003

04 is the Key Number on DKP-003
18 is the Function Type for Features
19 is the Function Number for Barge-In
00 is Channel number

- Exit SE Mode.

After you have finished assigning key templates and key maps, test the functioning of the keys.

Programming DSS Console Keys

Direct Station Selection (DSS) Consoles are devices that function as extensional buttons for EON/SPARSH VP510 Phones, providing more buttons for single-touch Direct Station Calling and feature access.

You can attach two DSS64 Consoles to a single EON48/310 and four DSS532 Consoles to a single EON510/VP510 to further increase the number of keys. Refer [“Direct Station Selection Console”](#) to know more.

For installation instructions, refer the topics Installing EON, Installing DSS Consoles, under [“Installing ETERNITY LENX”](#), [“Installing ETERNITY MENX”](#), [“Installing ETERNITY GENX”](#) and [“Installing ETERNITY PENX”](#).

For instructions:

- to install the DSS532 with SPARSH VP510, see [“Installing DSS532 with SPARSH VP510”](#).
- to install the DSS64/DSS532 with EON, see [“Installing DSS Consoles”](#).

- *The system supports two soft embedded DSS Consoles for EONSOFT. These will not be displayed in DSS Status.*

Programming DSS Console Keys using Jeeves

You can configure the DSS Console either offline, that is before you have connected the DSS Console or after you have connected the Console.

To configure DSS Console keys:

- refer to [“Configuring DSS Console Keys connected to DKP Phones \(EON\)”](#), if the console is connected to a DKP.
- refer to [“Configuring DSS Console Keys connected to SPARSH VP510”](#), if the console is connected to SPARSH VP510.

Configuring DSS Console Keys connected to DKP Phones (EON)

Configuring DSS Console Keys Offline,

- Log into Jeeves as System Engineer
- Under **Configuration**, click **DKP Parameters**.
- Go to the DKP Port number to which you wish to attach the DSS Console.
- Using the horizontal scroll bar on the page, scroll to **DSS Key Settings**.
- Click **Key Settings**.

Submit Default Default One Advance Clear Access Code Call Traffic

The **Key Settings** page opens.

Key Settings

Device Type: EON310 Assigned to: 3001 Port No: DKP-1 H/w Slot-Port: 00-00

Add DSS

Default

- In **Device Type** select the type of DKP — EON48, EON310, EON510 — you wish to connect to this port.
- Click **ADD DSS**.

- If you have selected Device Type as EON48 or EON310, the **ADD DSS** window opens.

In **H/w Slot-Port**, enter the Hardware slot and port on which you wish to connect the DSS Console.

The Hardware slot port assigned now cannot be changed from Jeeves later.

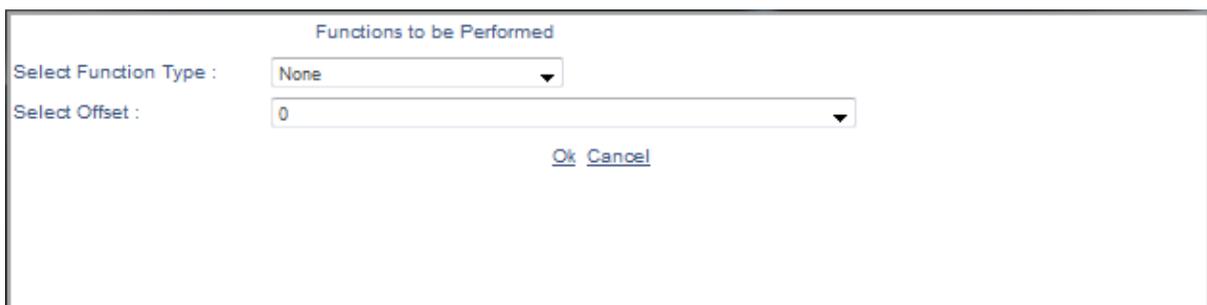

Click **Submit**. The ADD DSS window closes.

The default key map of DSS64 appears on your screen.

- For **EON510** as the Device Type, click on **ADD DSS** to add a DSS532 to the default key map of the phone.

- To add a DSS, click **ADD DSS**.
- By default **None** is assigned to all the DSS keys, you can now personalize the DSS Key map as per your requirement.
- Click the key on which you want to assign a feature/function.
- The options for the **Functions to be Performed** by the key will open in a new window.

- Select the desired **Function Type** to be assigned to the key and the desired **Offset** for the Function Type.

Functions to be Performed

Select Function Type : Special Keys ▼

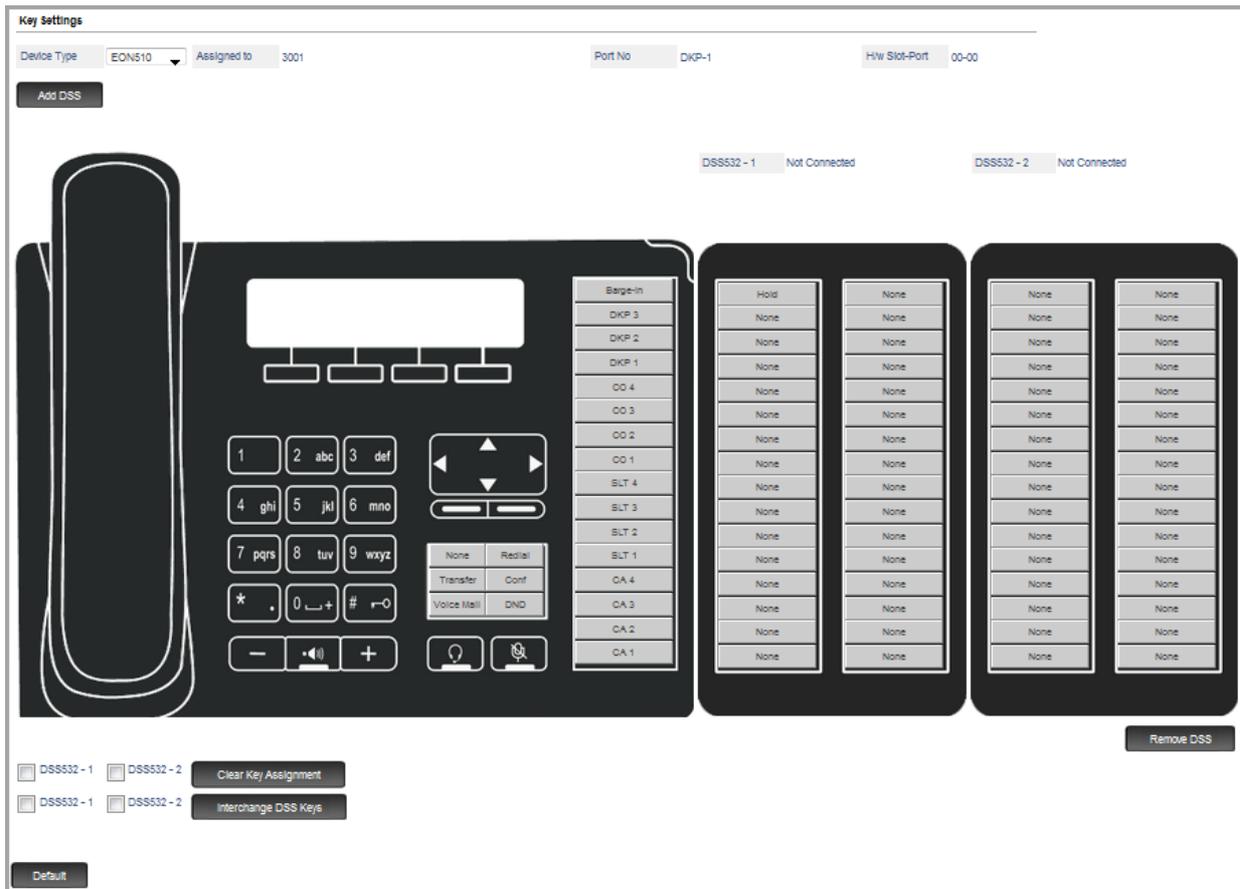

Select Offset : Hold ▼

[Ok](#) [Cancel](#)

- Click **OK**.
- The function you selected will appear as the key label.

- Similarly, add another DSS and configure the keys.

- If you wish to clear all the key assignments, click the respective DSS Console check box and then click **Clear Key Assignment**.
- If you wish to interchange the key assignments of the DSS, click the check boxes of the respective DSS Consoles whose keys you wish to swap and then click **Interchange DSS Keys**.

The option Interchange DSS Keys is applicable only for DSS532.

- If you wish to remove a DSS Console, click **Remove DSS**.
- To view the status of all the DSS Consoles, click **“DSS Status”**.

Configuring DSS Console Keys after you have connected the phone as well as the Console,

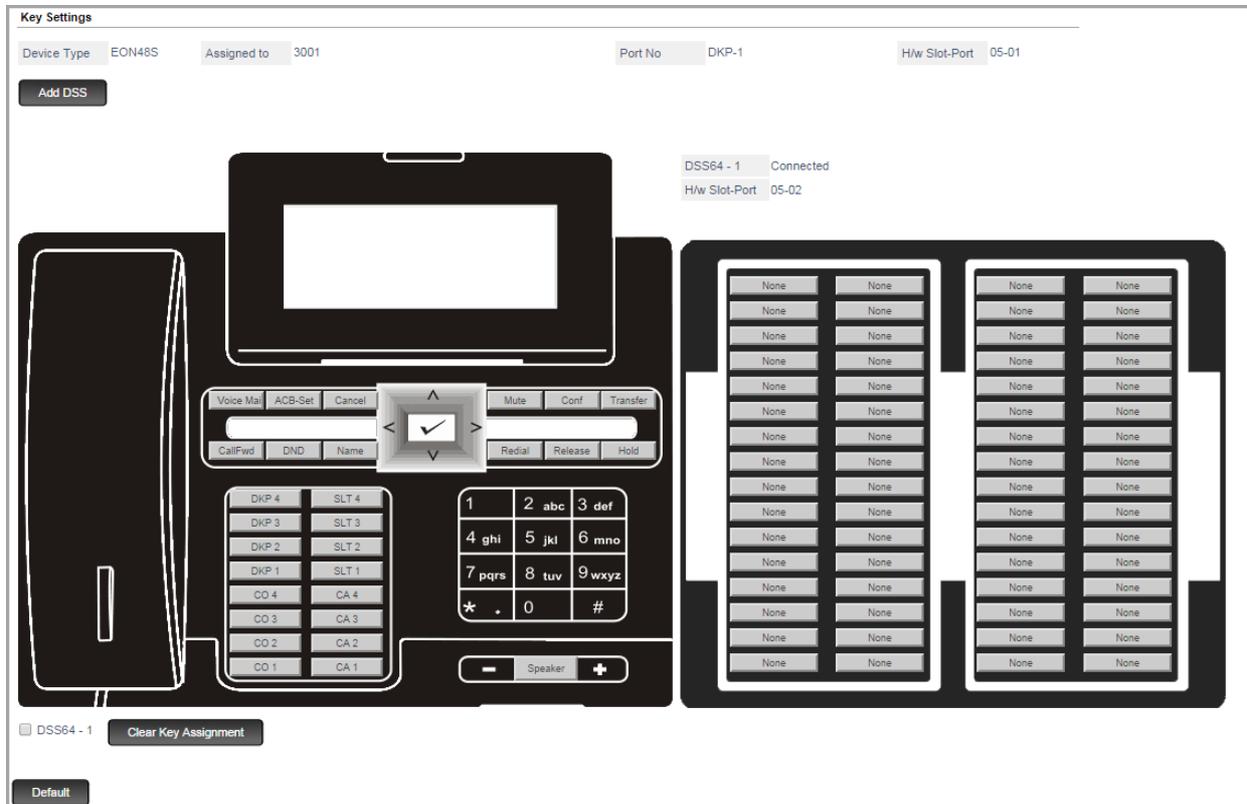

If you have connected the phone and the DSS Consoles, the system automatically detects them.

In case of DSS64 the connected DSS Console appears under **Unassigned DSS64** in **DSS Status**. You must first assign the DSS Console to a DKP Port and then you will be able to configure the DSS Keys. For instructions, see **“DSS Status”**.

If DSS532 is connected the default key map of the DSS Console will automatically appear on the screen and you will be able to configure the DSS Keys.

- Under **Configuration**, click **DKP Parameters**.

- Go to the DKP number to which DSS Console has been connected.
- Using the horizontal scroll bar on the page, scroll to **DSS Key Settings**.
- Click **Key Settings**. The **Key Settings** page opens.

The page displays the following:

Phone Details

- **Device Type** displays the model of EON connected — EON48, EON310 or EON510.
- **Assigned to** displays the Extension number assigned to the phone.
- **Port No** displays the software port assigned to the phone.
- **H/w Slot-Port** displays the Hardware slot and port on which the phone is connected.

DSS Console Details

- Type of DSS Console connected along with the number and Status, that is, DSS64/DSS532 - 1 Connected or Not Connected.
- **H/w Slot-Port** displays the Hardware slot and port on which the Console is connected.

Hardware Slot-Port is applicable for DSS64 only.

- By default **None** is assigned to all the DSS keys, you can now personalize the DSS Key map as per your requirement.
- Click the key on which you want to assign a feature/function.

- The options for the **Functions to be Performed** by the key will open in a new window.

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- Select the desired **Function Type** to be assigned to the key and the desired **Offset** for the Function Type.
- Click **OK**.
- The function you selected will appear as the key label.
- Similarly, configure other keys.
- If you wish to clear all the key assignments, click the respective DSS Console check box and then click **Clear Key Assignment**.
- If you wish to interchange the key assignments of the DSS, click the check boxes of the respective DSS Consoles whose keys you wish to swap and then click **Interchange DSS Keys**.

The option Interchange DSS Keys is applicable only for DSS532.

- To add another DSS Console, click **ADD DSS**.
- To view the status of all the DSS Consoles, click "[DSS Status](#)".

Configuring DSS Console Keys connected to SPARSH VP510

You can connect DSS532 to SPARSH VP510 for quick access to Stations, Trunks, Features/Functions of the ETERNITY or at the touch of a single key, making call operations easy.

You can configure the DSS Console keys offline, that is before connecting the console or after you have connected the Console. If you have connected the DSS Console the system will automatically detect the same.

- Log into Jeeves as System Engineer
- Under **VoIP Configuration**, click **SIP Extension Settings**.
- Select the desired SIP Extension Number, click the desired Location 1 or 2 or 3.
- On the Location Page make sure you have selected SPARSH VP510 as the Device Type. Scroll to **DSS Key Settings**.

- Click **Key Settings**. The **Key Settings** page opens.

Phone Details

- **Device Type** displays SPARSH VP510.
- **Assigned to** displays the Extension number assigned to the phone.
- **Port No** displays the software port number as well as the Location, for example: SIP Extension -1 - Location - 1.
- Click **ADD DSS**.

*If the DSS Consoles are connected the default Key maps will be displayed automatically. Click **ADD DSS** if you wish to add another DSS Console.*

- The default key map of DSS532 appears on your screen.
- By default **None** is assigned to all the DSS keys, you can now personalize the DSS Key map as per your requirement.
- Click the key on which you want to assign a feature/function.

- The options for the **Functions to be Performed** by the key will open in a new window.

Functions to be Performed

Select Function Type :

Select Offset :

[Ok](#) [Cancel](#)

- Select the desired **Function Type** to be assigned to the key and the desired **Offset** for the Function Type.
- Click **OK**.
- The function you selected will appear as the key label.
- Similarly, configure other keys.

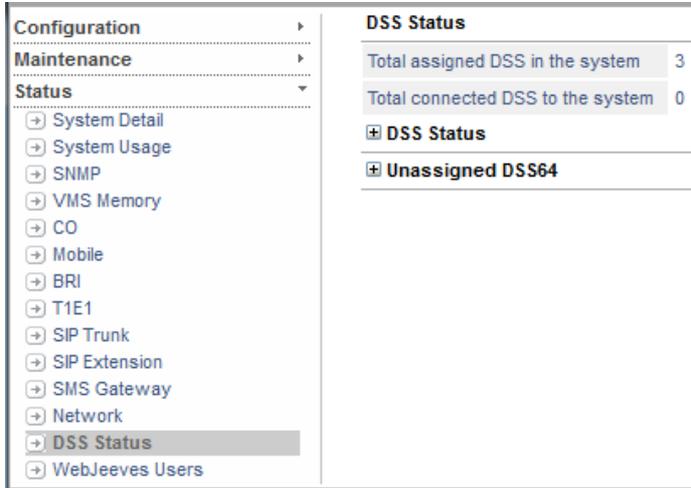

The following features cannot be assigned to DSS Keys:

- *Headset*
- *Speaker*
- *Ringer Acknowledge Key*
- *Local Menu*
- If you wish to clear all the key assignments, click the respective DSS Console check box and then click **Clear Key Assignment**.
- If you wish to interchange the key assignments of the DSS, click the check boxes of the respective DSS Consoles whose keys you wish to swap and then click **Interchange DSS Keys**.
- If you wish to remove a DSS Console, click **Remove DSS**.
- Click **ADD DSS** again to add another Console.
- To view the status of all the DSS Consoles, click "[DSS Status](#)".

DSS Status

To know the details of the DSS Consoles at a glance,

- Under **Status**, click **DSS Status**.

The following details are displayed:

- Total assigned DSS in the system**
- Total connected DSS to the system**
- Click **DSS Status** to expand.

DSS Status						
Total assigned DSS in the system		3				
Total connected DSS to the system		0				
<input checked="" type="checkbox"/> DSS Status						
Serial No.	Assigned to	Device Type	DSS532	DSS64	DSS Key Settings	
1	3001	EON510	A=2, C=0	A=0, C=0	Key Settings	
2	3002	EON48S	A=0, C=0	A=1, C=0	Key Settings	
Total assigned and connected DSS			A=2, C=0	A=1, C=0		
A=Assigned, C=Connected						
<input checked="" type="checkbox"/> Unassigned DSS64						

The following information is displayed:

- Serial Number**
- Assigned to** displays the extension number to which the DSS Console is connected.
- Device Type** displays the model of EON — EON48, EON310, EON510, SPARSH VP510 — to which the DSS Console is connected.
- DSS532** displays the status of the console, that is Assigned or Connected.
- DSS64** displays the status of the console, that is Assigned or Connected.
- DSS Key Settings** provides the link to **Key Settings**. Click this link if you wish to configure the DSS Keys.

- Click **Unassigned DSS64** to expand.

Unassigned DSS64		
Serial No.	H/w Slot - Port	Assign DSS
1	05-02	Assign

If have connected any DSS64, you must assign it to a particular DKP Port and only then will you be able to configure the DSS Console Keys. You can view all unassigned DSS Consoles here.

For each unassigned console the following is displayed:

- **Serial Number**
- **H/w Slot - Port** is the Hardware Slot Port assigned to the DSS Console.
- **Assign DSS** displays a link **Assign**. To assign the DSS Console to a DKP Port click the link.
 - The **Assign DSS** window opens.

Assign DSS

Select DKP Extension

- In **Select DKP Extension**, select the DKP Port number to which to wish to assign the console.
- Click **Submit**.
- After you have assigned the DSS Console, under **Configuration** click **DKP Configuration**.
- Click **DKP Parameters**. Go to the DKP Port to which you assigned the DSS Console.
- Scroll to **DSS Key Settings** and click **Key Settings**.
- The DSS Console you assigned to this DKP Port appears on the screen. You can now personalize the DSS Key map as per your requirement.

Configuring ISDN Terminals

Depending on the number of BRI ports available to you and the type of Point-to-Multipoint Configuration (Short or Extended Passive Bus), a maximum of 64 ISDN Terminals can be connected to the SARVAM UCS.

The number of ISDN Terminal extensions available to you for configuration also depends on the number of ISDN Terminals you have specified on the [“System Pre-requisites”](#) page.

If you have enabled **On-Site Configuration**, the system will provide you only those ISDN terminal ports that are actually present in the system for configuration.

Configure **ISDN Terminal Parameters** using Jeeves or by dialing commands from a Telephone.

Configuring ISDN Terminals using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **ISDN Configuration**.
- Click **ISDN Terminal Parameters** to open the page.

ISDN Terminal	BRI Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template	Station Type
1	00			01	01	Administration
2	00			01	01	Administration
3	00			01	01	Administration
4	00			01	01	Administration
5	00			01	01	Administration
6	00			01	01	Administration
7	00			01	01	Administration
8	00			01	01	Administration
9	00			01	01	Administration
10	00			01	01	Administration
11	00			01	01	Administration
12	00			01	01	Administration
13	00			01	01	Administration
14	00			01	01	Administration
15	00			01	01	Administration
16	00			01	01	Administration

Buttons: Submit, Default, Default One, Advance, Clear Access Code, Call Traffic

- Configure the following parameters for each ISDN Terminal on this page:
 - **ISDN Terminal:** This non-editable field is the number of the software port of the ISDN Terminal.
 - **BRI Port:** This is the number of the BRI Software port to which the ISDN Terminal is connected on a Short/Extended Passive Bus line.

- **Access Code:** Assign Station Access codes to the ISDN Terminal. Station Access codes are commonly referred to as Extension Numbers. These may be a combination of a maximum of 6 digits, which are dialed to call the ISDN Terminal to which they are assigned.

A maximum of 6 digits are allowed in an Access Code. By default, the Station Access Codes are blank for all ISDN Terminal ports.

To assign Station Access Codes according to your preference and requirement to a range of ISDN Terminals, see [“Assigning Access Codes to a Range of Extensions”](#).

If you decide to customize the Station Access Codes, make sure that the numbers do not clash with any other Access Code in the 'Dial' phase. Refer the topics [“Access Codes”](#) and [“Conflict Dialing”](#) to know more.

- **Name:** Assign a 'Name' to the ISDN Terminal. The name may be of the person who will use the ISDN Terminal or the name of a department. This name will be displayed to the called extension.

You can program a name of maximum 18 alphanumeric characters.

- **Station Basic Feature Template:** Assign a [“Station Basic Feature Template”](#) to the ISDN Terminal.

A Station Basic Feature Template includes a set of features that completely define the behaviour of the Extension, such as Time Table, Operator access, Trunk Access, Class of Service, Toll Control, Call Budget, and Station Message Detail Records (storage of Incoming and Outgoing Call details).

By default, Station Basic Feature Template 01 is assigned to all extensions of the system that also includes SLT ports, ISDN ports and E&M Lines with Station as Orientation Type.

Check if the default template fulfills the feature requirements (like [“Class of Service \(COS\)”](#), [“Toll Control”](#), [“OG Trunk Bundle Group”](#), etc.) of the ISDN Terminal.

If the default Template 01 fulfills the feature requirements and if the same features are to be allowed to all ISDN Terminals, retain Template 01.

If different sets of features are to be allowed to different ISDN Terminals, then prepare separate Station Basic Feature Templates and apply them on the ports. To do this,

- Under **Configuration**, click **Station Basic Feature Template** to open the page.
- Select a Template number, for example Template number 12.
- Customize Template number 12 and click 'Submit' at the bottom of the page.
- Now go back to the **ISDN Terminal Parameters** page.
- Enter the number of the Template you customized, Template 12, in the **Station Basic Feature Template** field of the ISDN Terminal, for instance, ISDN-01, on which you want to apply this template. If you want to apply this template to other terminals too, like ISDN-02, 03, and 04, assign the Template 12 to all them.
- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another ISDN Terminal.

Also, refer the topic [“Station Basic Feature Template”](#) to know more about customizing the templates and applying on extension ports.

- **Station Advanced Feature Template:** Assign a Station Advanced Feature Template to the ISDN Terminal. The Advanced Feature Template consists of a set of less commonly used features like Alarm Notification Type, Caller ID Presentation for Transferred Calls, DDI Incoming Call Routing, Storage of Internal Calls, Call Duration Control, Floor Service, Call Taping, etc.

By default Station Advanced Feature Template 01 is assigned to all extensions of the SARVAM UCS, which includes ISDN ports, SLT ports, DKP Ports and E&M Lines configured as Stations.

Check if this default template fulfills the feature requirements of the ISDN Terminal by clicking the 'Station Advanced Feature Template' link.

If the default Template 01 fulfills the feature requirements, and if the same features are to be allowed to all ISDN Terminals, retain Template 01.

If different sets of features are to be allowed to different ISDN Terminals, then prepare separate Station Advanced Feature Templates and apply them on the ports.

To do this,

- Under **Configuration**, click **Station Advanced Feature Template** to open the page.
- Select a Template number, for example 04.
- Customize Template number 04.
- Click **Submit** at the bottom of the page.
- Now go back to the **ISDN Terminal Parameters'** page.
- Enter the number of the Template you customized, Template 04 in the **Station Advanced Feature Template** field of the ISDN Terminal, for instance, ISDN-01, on which you want to apply this template. If you want to apply this template to other terminals too, like ISDN-01, 02, and 03, assign the Template 04 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another ISDN Terminal.

Also refer the topic [“Station Advanced Feature Template”](#) for instructions on customizing these templates and applying them on the extension ports.

- **Station Type:** Make sure you select the option Assistant, if it is the Operator Extension. The system will play beeps during the conference to the participants to indicate the presence or absence of the Operator. To know more, see [“Conference-3 Party”](#), [“Conference-Multiparty”](#) and [“Conference Dial-In”](#).

For the Hotel Application of the SARVAM UCS, extensions are identified as — Administrator, Assistant or Guest extensions according to the intended user of the ISDN Terminal. The system will consider the Administrator and Assistant options as same. When the Station Type is selected, the system will automatically assign the Guest and Administrator (Hotel Staff) features to the ISDN Terminal. To know more, refer the *SARVAM UCS Hospitality System Manual*.

Advanced features

The above listed parameters fulfill the ISDN Terminal configuration requirements of most users. If you need to use other features like Personal Directory, Call Pick-Up Groups, user details, you may click the **Advance** button.

ISDN Terminal Parameters					
ISDN Terminal	BRI Port	Access Code	Name	Mobile Number	Email Id
1	00	▼			
2	00	▼			
3	00	▼			
4	00	▼			
5	00	▼			
6	00	▼			
7	00	▼			
8	00	▼			
9	00	▼			
10	00	▼			
11	00	▼			
12	00	▼			
13	00	▼			
14	00	▼			
15	00	▼			
16	00	▼			

Configure the following parameters:

- **Mobile Number:** Enter the Mobile Number of the extension user you wish to store. The Number can be a maximum of 16 digits.
- **Email ID:** Enter the Email ID of the extension user you wish to store. The Email ID can be a maximum of 64 characters.
- **SMS/Email Group Type:** You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see [“SMS/Email Group”](#).
- **Personal Directory:** Enter the number of the “Personal Directory” that you want to assign to the ISDN Terminal. A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ([“OG Trunk Bundle Group”](#)). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

The Personal Directory number that you assign to an ISDN Terminal must also be programmed either by you, the System Engineer, or by the ISDN Terminal user. Refer the topic [“Abbreviated Dialing”](#) for instructions on programming the Personal Directory.

- **Priority:** Select a Priority Level for the ISDN Terminal from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (ISDN Terminal) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description "[Priority](#)".

By default, the Priority of all ISDN Terminals is set to '5-Normal'.

- **Call Pick-Up Group:** Configure this parameter if you want to assign the ISDN Terminal to a particular "[Call Pick Up](#)" group.

Call Pick Up allows the ISDN Terminal user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension. For this to work, both the ringing extension and the extension picking up the call must be in the same 'Call Pick Up Group'. Refer "[Call Pick Up](#)" for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this ISDN Terminal in this field.

- Repeat the same steps to configure other ISDN Terminals.
- If you have completed configuration of all the above listed ISDN Terminal Parameters, click 'Submit' at the bottom of the page to save your changes.

Configuring ISDN Terminals using a Telephone

- Enter SE mode using a DKP/SLT.

To assign BRI Software Port to an ISDN Terminal, dial:

- **7301-1-ISDN Terminal-BRI** to assign BRI Software Port to a single ISDN Terminal.
- **7301-2-ISDN Terminal-ISDN Terminal-BRI** to assign the same BRI Software Port to a range of ISDN Terminals.
- **7301-*-BRI** to assign the same BRI Software Port to all ISDN Terminals.

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

BRI is the number of the BRI Software Port to which the ISDN Terminal is connected, from 01 to 32.

5. Default: No port is assigned, 00.

To de-assign ISDN Terminal from a BRI Software Port, dial:

- **7301-1-ISDN Terminal-00** to de-assign a single Terminal from a BRI port.
- **7301-2-ISDN Terminal-ISDN Terminal-00** to de-assign a range of Terminals from a BRI port.
- **7301-*-00** to de-assign all Terminals from a BRI port.

To assign Access Code to an ISDN Terminal, dial:

- **3103-1- ISDN Terminal -Access Code-#***

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

Access Code is a number string of any combination of a maximum of 6 digits. Terminate the command with #* if the number string has fewer than 6 digits. (0 to 9, #, * are allowed)

To clear the Access codes assigned to the ISDN Terminal, dial:

- **3103-1-ISDN Terminal-#*** to clear the Access Code of a single terminal.
- **3103-2-ISDN Terminal-ISDN Terminal-#*** to clear the Access Code of a range of terminals.
- **3103-*-#*** to clear the Access Codes of all terminals.

To assign default Station Access Codes to ISDN Terminal, dial:

- **3153-1-*ISDN Terminal*** to default Access Code of a single terminal.
- **3153-2-*ISDN Terminal-*ISDN Terminal**** to default Access Codes of a range of terminals.
- **3153-*** to default Access Codes of all terminals.

To assign a Name to an ISDN Terminal, dial:

- **5409-1-*ISDN Terminal-Name-#**** to assign a Name to a single terminal.
- **5409-2-*ISDN Terminal-*ISDN Terminal-Name-#***** to assign the same Name to a range of terminals.
- **5409-*.*Name-#**** to assign the same Name to all terminals.

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

Name is a string of a maximum of 18 alphanumeric characters. Terminate the commands with **#*** if the number string has fewer than 18 characters.

To clear the Name of the ISDN Terminal, dial:

- **5409-1-*ISDN Terminal-#**** to clear the Name of a single terminal.
- **5409-2-*ISDN Terminal-*ISDN Terminal-#***** to clear the Names of a range terminals.
- **5409-*.*#**** to clear the Names of all terminals.

To assign a Station Basic Feature Template to an ISDN Terminal, dial:

- **5507-1-*ISDN Terminal-Template Number*** to assign a template to a single terminal.
- **5507-2-*ISDN Terminal-*ISDN Terminal-Template Number**** to assign the same template to a range of terminals.
- **5507-*.*Template Number*** to assign the same template to all terminals.

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

Template Number is the number of the Station Basic Feature Template, from 01 to 50. Default: 01

To assign a Station Advanced Feature Template to an ISDN Terminal, dial:

- **5607-1-*ISDN Terminal-Template Number*** to assign a template to a single terminal.
- **5607-2-*ISDN Terminal-*ISDN Terminal-Template Number**** to assign the same template to a range of terminals.
- **5607-*.*Template Number*** to assign the same template to all terminals.

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

Template Number is the number of the Station Advanced Feature Template, from 01 to 50. Default: 01

To select a Station Type for an ISDN Terminal, refer the SARVAM UCS Hospitality System Manual.

For Configuration of Advanced Features, use the following commands:

To assign a Personal Directory to an ISDN Terminal, dial:

- **1907-1-*ISDN Terminal-Personal Directory*** to assign directory to a single terminal.
- **1907-2-*ISDN Terminal-*ISDN Terminal-Personal Directory**** to assign the same directory to a range of terminals.
- **1907-*.*Personal Directory*** to assign the same directory to all terminals.

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

Personal Directory number is from 01 to 50.

To clear the Personal Directory assigned to an ISDN Terminal, dial:

- **1907-1-*ISDN Terminal-00*** to clear the directory of a single terminal.
- **1907-2-*ISDN Terminal-*ISDN Terminal-00**** to clear the directory of a range of terminals.
- **1907-*** to clear the directory from all terminals.

To define the Priority for an ISDN Terminal, dial:

- **3913-1-ISDN Terminal-Priority** to define Priority for a single terminal.
- **3913-2-ISDN Terminal-ISDN Terminal-Priority** to define the same Priority for a range of terminals.
- **3913-*-Priority** to define the same Priority for all terminals.

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

Priority is from 1 to 9. Default: 5-Normal

To assign an ISDN Terminal to a Call Pick-Up Group, dial:

- **3903-1-ISDN Terminal-Call Pick-Up Group** to assign a single terminal to a Call Pick-Up group.
- **3903-2-ISDN Terminal-ISDN Terminal-Call Pickup Group** to assign a range of terminals to the same Call Pick-Up group.
- **3903-*-Call Pickup Group** to assign all terminals to the same Call Pick-Up group.

Where,

ISDN Terminal is the Software Port number of the Terminal from 01 to 64.

Call Pickup Group is from 00 to 99. Default: 99.

To remove an ISDN Terminal from a Call Pick-Up Group, dial:

- **3903-1-ISDN Terminal-00** to remove a single terminal from a Call Pick-Up group.
- **3903-2-ISDN Terminal-ISDN Terminal-00** to remove a range of terminals from a Call Pick-Up group.
- **3903-*-00** to remove all terminals from a Call Pick-Up group.

- Exit SE mode.

Configuring SLT Extensions

The number of SLT extensions available to you for configuration depends on the number of SLT ports supported by SARVAM UCS and the number of SLT ports you have specified on the “[System Pre-requisites](#)” page.

If you have enabled **On-Site Configuration**, the system will provide you only those ports that are actually present in the system for configuration.

Configure **SLT port parameters** using Jeeves or by dialing commands from a Telephone. If you have installed a Voice Mail module in SARVAM UCS, you may provide voice mail facility to all or selected SLT extensions. To provide voice mail to extensions, configure **VMS Settings**.

Configuring SLT Parameters using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **SLT Configuration**.
- Click **SLT Parameters** to open the page.

Port No.	H/w Slot - Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template	SLT Hardware Template	Call Pickup Group	COSEC Door Group	Station Type	Voice Mail Settings
1	12 - 07	2001		01	01	02	01	00	Administration	Voice Mail Settings
2	12 - 08	2002		01	01	02	01	00	Administration	Voice Mail Settings
3	12 - 09	2003		01	01	02	01	00	Administration	Voice Mail Settings
4	12 - 10	2004		01	01	02	01	00	Administration	Voice Mail Settings
5	12 - 11	2005		01	01	02	01	00	Administration	Voice Mail Settings
6	12 - 12	2006		01	01	02	01	00	Administration	Voice Mail Settings
7	12 - 13	2007		01	01	02	01	00	Administration	Voice Mail Settings
8	12 - 14	2008		01	01	02	01	00	Administration	Voice Mail Settings

- Configure the following parameters for each SLT port on this page:
 - **SLT Port No.:** This non-editable field is the number of the software port of the SLT port.
 - **Hardware Slot - Port:** 'Slot' is the number of the Universal Slot in which the SLT Card is inserted. 'Port' is the number of the SLT hardware port on which the telephone instrument is connected.

The SARVAM UCS can automatically detect and assign the hardware slot and port numbers automatically to the SLT software ports.

For example: if you have inserted the SLT8 Card in Slot number 02 and SLT16 Card in Slot number 03 of SARVAM UCS, the system will assign the hardware slot 02 and port numbers 01-08 to the SLT Software Ports from 001 to 008 respectively. The system will assign Slot 03 and port numbers 09-24 to the SLT Software Ports 009 to 024. Refer the topic “[Software Port and Hardware ID](#)” to know more.

However, if required, you may change the Hardware Slot and Port assigned to the SLT software port. In this case, enter the desired Hardware Slot and Port number in this field.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields.

- **Access Code:** Assign Station Access Codes to the SLT Port¹⁷². Station Access Codes are commonly referred to as Extension Numbers. These may be a maximum of 6 digits, which are dialed to call the SLT port to which they are assigned.

All SLT ports are assigned the following Station Access Codes as default.

SLT Software Port	Access Codes
001	2001
002	2002
003	2003
:	:
:	:
512	2512

You may either apply the default Station Access Codes to the SLT ports or assign them according to your requirement and preferences.

To assign Station Access Codes according to your preference and requirement to a range of SLT Ports, see [“Assigning Access Codes to a Range of Extensions”](#).

If you decide to customize the Station Access Codes, make sure that the numbers do not clash with any other Access Code in the 'Dial' phase. Refer the topics [“Access Codes”](#) and [“Conflict Dialing”](#) to know more.

- **Name:** Assign a 'Name' to the SLT port. The name may be of the person who will use the SLT or the name of a department. This name will be displayed on the LCD of the remote user's phone, if it is equipped with Caller ID.

You can program a name of a maximum of 18 alphanumeric characters.

- **Station Basic Feature Template:** Assign a [“Station Basic Feature Template”](#) to the SLT. A Station Basic Feature Template includes a set of features that completely define the behaviour of the extension port, such as Time Table, Operator access, Trunk Access, Class of Service, Toll Control, Call Budget, and Station Message Detail Records (storage of Incoming and Outgoing Call details).

By default, Station Basic Feature Template 01 is assigned to all extensions of the system that includes DKP ports, ISDN Terminals, SIP extensions, and E&M Lines with Station as Orientation Type. Check if the default template fulfills the feature requirements (like [“Class of Service \(COS\)”](#), [“Toll Control”](#), [“OG Trunk Bundle Group”](#), etc.) of the SLT extension user.

If the default Template 01 fulfills the feature requirements and if the same features are to be allowed to all SLTs, retain Template 01.

If different sets of features are to be allowed to different SLTs, then prepare separate Station Basic Feature Templates and apply them on the ports. To do this,

- Under **Configuration**, click **Station Basic Feature Template** to open the page.

¹⁷². The number of SLT ports vary according to the variant of SARVAM UCS.

- Select a Template number, for example 10.
- Customize Template number 10 and click **Submit** at the bottom of the page.
- Now go back to the **SLT Parameters** page.
- Enter the number of the Template you customized, Template 10 in the **Station Basic Feature Template** field of the SLT Port, for instance SLT-003, on which you want to apply this template.
- Click 'Submit' at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another SLT port.

Also, refer the topic [“Station Basic Feature Template”](#) to know more about customizing the templates and applying on the ports.

- **Station Advanced Feature Template:** Assign a Station Advanced Feature Template to the SLT. The Advanced Feature Template consists of a set of less commonly used features like Alarm Notification Type, Caller ID Presentation for Transferred Calls, DDI Incoming Call Routing, Storage of Internal Calls, Call Duration Control, Floor Service, Call Taping, etc.

By default Station Advanced Feature Template 01 is assigned to all extensions of the SARVAM UCS, which includes DKP Ports, SLT Ports, ISDN Terminals, SIP Extensions, and E&M Lines configured as Stations.

Check if this default template fulfills the feature requirements of the SLT extension users by clicking the link **Station Advanced Feature Template**.

If the default Template 01 fulfills the feature requirements, and if the same features are to be allowed to all SLT ports, retain Template 01.

If different sets of features are to be allowed to different SLT Ports, then prepare separate Station Advanced Feature Templates and apply them on the ports.

To do this,

- Under **Configuration**, click **Station Advanced Feature Template** to open the page.
- Select a Template number, for example 02.
- Customize Template number 02.
- Click **Submit** to save changes.
- Return to **SLT Parameters** page.
- Enter the number of the Template you customized, template 02, in the **Station Advanced Feature Template** field of the SLT Ports on which you want to apply this template.
- Click **Submit** to save changes.
- Repeat the same steps to customize and assign a different Template to another SLT port.

Also refer the topic [“Station Advanced Feature Template”](#) for instructions on customizing these templates and applying them on the ports.

- **SLT Hardware Template:** Assign an SLT Hardware Template to the SLT port. An SLT Hardware Template is a set of features that define the behavior of the SLT hardware port. The SLT Hardware Template allows you to configure according to user requirements a common set of features for all SLT Hardware Ports, like Caller ID Presentation (DTMF, FSK), Digit Pad Count, Ring Type, AC Impedance, Answer Signaling type, Speech Transmit and Receive Gains, Open Loop Disconnect, Loop Current, and Fax connectivity.

There are 50 SLT Hardware Templates that can be customized and assigned to the SLT ports. By default SLT Hardware Template Number 01 is assigned to all the SLTs. This template has default values fulfilling the common requirements of a very broad user base. Check if the values in this template fulfill your requirements.

If the default SLT Hardware Template 01 fulfills the feature requirements and if the same features are to be allowed to all SLTs, retain Template 01.

If different sets of hardware features are to be allowed to different SLTs, then prepare separate SLT Hardware Templates and apply them on the ports. To do this,

- Under **Configuration**, click **SLT Configuration**.
- Click **SLT Hardware Template** to open the page.
- Select a Template number, for example 02.
- Customize Template number 02 and click **Submit** at the bottom of the page.
- Now go back to the **SLT Parameters** page.
- Enter the number of the Template you customized, template 02, in the **SLT Hardware Template** field of the SLT Ports on which you want to apply this template.
- Click **Submit** to save changes.
- Repeat the same steps to customize and assign a different SLT Hardware Template to another SLT port.

Also, refer the topic [“SLT Hardware Template”](#) to know more about customizing the templates and applying on the SLT ports.

- **Call Pick-Up Group:** Configure this parameter if you want to assign the SLT to a particular [“Call Pick Up”](#) group.

Call Pick Up allows the SLT extension user to 'pick up' (answer) calls ringing on any other extension, by dialing a feature code, without physically going to the ringing extension.

For this to work, both extensions, the ringing extension and the extension picking up the call, must be in the same Call Pick Up Group. Refer [“Call Pick Up”](#) for instructions on how to create groups. You can create as many as 99 groups numbered from 01 to 99.

Enter the number of the Call Pick-Up Group you created for this SLT in this field.

- **COSEC Door Group:** You must assign the extension user to a COSEC Door Group for COSEC Integration. The users in the same group must be assigned the same group. You can create as many as 50 groups numbered from 00 to 50. Users who are assigned COSEC Door Group '00' are not a part of any group. See "[COSEC Integration](#)" for more information.
- **Station Type:** Make sure you select the option Assistant, if it is the Operator Extension. The system will play beeps during the conference to the participants to indicate the presence or absence of the Operator. To know more, see "[Conference-3 Party](#)", "[Conference-Multiparty](#)" and "[Conference Dial-In](#)".

For the Hotel Application of the SARVAM UCS, extensions are identified as — Administrator, Assistant or Guest extensions according to the intended user of the SLT. The system will consider the Administrator and Assistant options as same. When the Station Type is selected, the system will automatically assign the Guest and Administrator (Hotel Staff) features to the SLT. To know more, refer the *SARVAM UCS Hospitality System Manual*.

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see "[Extension Voice Mail Settings](#)".

The Voice Mail Settings link will be visible only if you have configured the respective access codes.

Click **Close** to close the window.

Advanced Configuration

For extension users who need to be provided features like Personal Directory or assigned a Priority, as well as to enter the user details, you may click the **Advance** button at the bottom of the page and program the following parameters:

SLT Parameters					
Port No.	H/w Slot - Port	Access Code	Name	Mobile Number	Email Id
1	02 - 07	2001			
2	02 - 08	2002			
3	02 - 09	2003			
4	02 - 10	2004			
5	02 - 11	2005			
6	02 - 12	2006			
7	02 - 13	2007			
8	02 - 14	2008			
9	02 - 05	2009			
10	02 - 06	2010			
11	02 - 15	2011			
12	02 - 16	2012			
13	02 - 17	2013			
14	02 - 18	2014			
15	02 - 19	2015			
16	02 - 20	2016			

Submit Default Default One Clear Access Code Call Traffic

- **Mobile Number:** Enter the Mobile Number of the extension user you wish to store. The Number can be a maximum of 16 digits.
- **Email ID:** Enter the Email ID of the extension user you wish to store. The Email ID can be a maximum of 64 characters.
- **SMS/Email Group Type:** You can assign the extension user to a Group. Select the desired **SMS/Email Group Type** from the list. The system clubs together extension users assigned the same Group. Default: None. For details, see [“SMS/Email Group”](#).
- **Personal Directory:** Enter the number of the Personal Directory that you want to assign to this SLT. A Personal Directory is a list of 25 frequently dialed numbers, each of which are stored by Index number (location code), Name and Trunk Access Codes ([“OG Trunk Bundle Group”](#)). The Personal Directory is necessary for using the features [“Abbreviated Dialing”](#) and [“Dial By Name”](#).

When a Personal Directory is assigned to an SLT, it must also be configured. The Personal Directory can be configured by the SLT users and by the System Engineer. Refer the topic [“Abbreviated Dialing”](#) for instructions on configuring the Personal Directory.

- **Priority:** Select a Priority Level for the SLT.

Each extension of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension phone with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description [“Priority”](#).

By default, the Priority of all SLT ports is set to '5-Normal'. So, decide what Priority Level you will assign to each of the SLTs and set the desired level for each port.

- If you have completed configuring SLT parameters, click **Submit** at the bottom of the page to save your settings.

It is possible to default all the parameters by clicking the **Default** button. You can also restore default values of the parameters of a single SLT by clicking the **Default One** button and specifying the SLT you want to set to default.

Configuring SLT Parameters using a Telephone¹⁷³

- Enter SE mode from a DKP/SLT.

To assign Hardware Slot-Port to an SLT Port, dial:

- **1101-SLT-Slot-Port offset on the card**

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Slot is Slot number in which the SLT Card is inserted from 01 to 16

Port Offset is the number of the SLT Port on the card from 01 to 99.

To de-assign the hardware slot and the hardware port of an SLT port, dial:

- **1101-SLT-00-00**

To assign Access Code to an SLT Port, dial:

- **3101-1-SLT-Access Code-#***

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Access Code is a number string of any combination of 1, 2, 3 or 4 digits. Terminate the command with #* if the number string has fewer than 4 digits.

To clear the Access codes assigned to the SLT, dial:

- **3101-1-SLT-#*** to clear the Access Codes of a single SLT port.
- **3101-2-SLT-SLT-#*** to clear the Access Codes of a range of SLT ports.
- **3101-*-#*** to clear the Access Codes of all SLT ports.

To assign default Access Codes assigned to SLT, dial:

- **3151-1-SLT** to default Access Codes of a single SLT port.
- **3151-2-SLT-SLT** to default Access Codes of a range of SLT ports.
- **3151-*** to default Access Codes of all SLT ports.

To assign a Name to an SLT, dial:

- **5402-1-SLT-Name-#*** to assign a Name to a single SLT port.
- **5402-2-SLT-SLT-Name-#*** to assign the same Name to a range of SLT ports.
- **5402-*-Name-#*** to assign the same Name to all SLT ports.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Name is a string of a maximum 18 alphanumeric characters. Terminate the commands with #* if the number string has fewer than 18 characters.

173. Using commands you can configure upto 999 ports in ETERNITY LENX. The remaining ports can be configured from Jeeves only.

To clear the name of the SLT, dial:

- **5402-1-SLT-#*** to clear the Name of a single SLT port.
- **5402-2-SLT-SLT-#*** to clear the Names of a range of SLT ports.
- **5402-*-#*** to clear the Names of all SLT ports.

To assign an SLT Hardware Template to an SLT port, dial:

- **5703-1-SLT-Template Number** to assign a hardware template to a single SLT port.
- **5703-2-SLT-SLT-Template Number** to assign a hardware template to a range of SLT ports.
- **5703-*-Template Number** to assign a hardware template to all SLT ports.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Template Number is the number of the SLT Hardware Template, from 01 to 50. Default: 01.

To assign a Station Basic Feature Template to an SLT Port, dial:

- **5503-1-SLT-Template Number** to assign a Template to a single SLT port.
- **5503-2-SLT-SLT-Template Number** to assign the same Template to a range of SLT ports.
- **5503-*-Template Number** to assign the same Template to all SLT ports.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Template is the Station Basic Feature Template from 01 to 50. Default: 01.

To assign a Station Advanced Feature Template to an SLT Port, dial:

- **5603-1-SLT-Template Number** to assign a Template to a single SLT port
- **5603-2-SLT-SLT-Template Number** to assign the same Template to a range of SLT ports.
- **5603-*-Template Number** to assign the same Template to all SLT ports.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Template is the Station Advanced Feature Template from 01 to 50. Default: 01.

To assign a Call Pick-Up Group to an SLT Port, dial:

- **3901-1-SLT-Call Pickup Group** to assign a single SLT port to a Call Pick-Up Group.
- **3901-2-SLT-SLT-Call Pickup Group** to assign a range of SLT ports to the same Call Pick-Up Group.
- **3901-*-Call Pickup Group** to assign all SLT ports to the same Call Pick-Up Group.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Call Pickup Group is from 00 to 99. Default: 99.

To remove an SLT from a Call Pick Up group, dial:

- **3901-1-SLT-00** to remove a single SLT port from a group.
- **3901-2-SLT-SLT-00** to remove a range of SLT ports from a group.
- **3901-*** to remove all SLT ports from a group.

To define the Station Type for an SLT Port, Refer SARVAM UCS Hospitality System Manual.

To assign a Personal Directory to an SLT Port, dial:

- **1905-1-SLT-Personal Directory** to assign a Personal Directory to a single SLT port.
- **1905-2-SLT-SLT-Personal Directory** to assign the same Personal Directory to a range of SLT ports.
- **1905-*-Personal Directory** to assign the same Personal Director to all SLT ports.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Personal Directory Number is from 01 to 50.

To clear the Personal Directory assigned to the SLT, dial:

- **1905-1-SLT-00** to clear the Personal Directory of a single SLT port.
- **1905-2-SLT-SLT-00** to clear the Personal Directory of a range of SLT ports.
- **1905-*** to clear the Personal Directory of all SLT ports.

To define the Priority for an SLT Port, dial:

- **3911-1-SLT-Priority** to define Priority for a single SLT port.
- **3911-2-SLT-SLT-Priority** to define the same Priority for a range of SLT ports.
- **3911-*-Priority** to define the same Priority for all SLT ports.

Where,

SLT is the Software Port number of the SLT port from 001 to 512.

Priority is from 1 to 9. Default: 5-Normal

- Exit SE mode.

Configuring Radio Interface

The Radio Card acts as an interface between the system and the Radio devices such as Radio Phones, Radio Repeaters, to add two-way radio functionality in SARVAM UCS. In Two-way radio, the speech can be transmitted as well as received by the radio devices. Radio devices are also called Radio Transceivers /Combat-Net Radio devices. The Two-way radio works on High Frequency (HF), Very High Frequency (VHF) or Ultra High Frequency (UHF).

A Radio Transceiver offers the following interfaces:

- Frequency tuner to set the frequency for receiving and sending audio messages
- Speaker to playback the audio received
- Microphone to send the audio message
- Push-to-Talk (PTT) button to activate radio transmission

Generally, the Radio Transceivers remain in the receiving (Rx) mode, so that the broadcasted audio messages can be heard. To transmit speech, you must press the PTT button on the Radio Transceiver.

Additional interfaces are also supported on Radio Transceivers, like Dial Pad, to dial out the DTMF digits as audio message. Such interfaces can be used where the Radio Transceivers are interfaced with the system, which allows you to dial the DTMF digits.

The Radio Interface is supported on SARVAM UCS. A maximum of 16 Radio Ports are supported.

Matrix does not supply Radio Transceivers.

How the Radio Interface works

The Radio Port of SARVAM UCS works as a Station.

Making a Call from the Radio Port

An extension user dials the Radio Port Access Code to call a Radio device.

- The Radio Port transmits the audio signal to the Radio device and the extension user gets Ring Back Tone for 3 seconds.
- Since the Radio Port is always in the receiving mode, the system connects the speech path between the Radio device user (connected to the Radio Port) and the extension user.
- The extension user (caller) can now converse with the Radio device user.
- When the Radio device user wants to talk, s/he must press the PTT button of the Radio device and talk. The extension user can now listen to the Radio device user.
- When the extension user wants talk to the Radio device user, s/he must press the '#' key. Similarly to listen to the Radio device user the extension user must press '#' key again.

*To connect/disconnect speech path using the '#' key, make sure the option **Using '#' key** is selected as PTT Activation in Radio Extension Parameter.*

- The extension user can disconnect the call by going On-hook.

If the Radio port is busy, the extension user will hear the Busy Tone.

The Radio extension user (3000) dials another Radio extension user (3001).

- Audio signal is detected on the Radio port (3001) and the Radio extension user (3000) gets Ring Back Tone for 3 seconds.
- Since the Radio Port (3001) is always in the receiving mode, the system connects the speech path between both the Radio extension users.
- Both users must press the PTT button of their Radio device to talk. At a time only one user can speak.
- If the system detects silence for the duration of the Radio Port Inactivity Timer, then the system releases the radio port and disconnects the call.

If the Radio port is busy, the extension user will hear the Busy Tone.

You must configure the Radio parameters so as to use the Radio functionality in the SARVAM UCS.

Configuring Radio Parameters using Jeeves

The following parameters are programmable using Jeeves only.

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Radio Extension Parameters** to open the page.

Port No.	Enable Port	HW Slot-Port	Access Code	Name	On Detecting Voice
1	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
2	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
3	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
4	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
5	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
6	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
7	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
8	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
9	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
10	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
11	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
12	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
13	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
14	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
15	<input checked="" type="checkbox"/>	00 - 00			Route to Operator
16	<input checked="" type="checkbox"/>	00 - 00			Route to Operator

- Configure the following parameters.
 - **Enable Port:** This flag is for enabling or disabling a Radio port. When a Radio port is disabled, neither incoming nor outgoing calls can be made from that port.

By default, the port is enabled. Clear the check box to disable the ports.

- **Hardware Slot and Port:** 'Slot' is the number of the Universal Slot in which the Radio Card has been inserted. 'Port' is the number of the hardware port on the card to which the Radio device is connected. By default the SARVAM UCS can detect and assign the hardware slot and port numbers automatically to the Radio (software) ports. However, you may change the Hardware Slot and Port assigned to the Radio software port. If required, enter the desired Hardware Slot and Port number in this field.

If you want to de-assign the Hardware Slot and Port, enter '00' in both fields.

- **Access Code:** Assign Station Access Codes to the Radio Port. Station Access Codes are commonly referred to as Extension Numbers. These may be number strings of a maximum 6 digits, which are to be dialed to call the Radio port to which they are assigned.

To assign Station Access Codes according to your preference and requirement to a range of Radio Ports, see ["Assigning Access Codes to a Range of Extensions"](#).

By default, the Station Access Codes are blank for all Radio ports.

- *If you decide to customize the Station Access Codes, make sure that the numbers do not clash with any other Access Code in the 'Dial' phase. Refer the topics ["Access Codes"](#) and ["Conflict Dialing"](#) to know more.*

- **Name:** Assign a 'Name' to the Radio port. The name may be of the person who will use the Radio device or the name of the department or location of the device. This name will be displayed on the LCD of the Operator/extension user's phone, if it is equipped with Caller ID.

You can program a name of maximum 18 alphanumeric characters.

- **On Detecting Voice:** Select **Route to Operator**, to route incoming calls on the Radio Port to the Operator.

Select **Greet to Dial**, if you want the callers to dial the desired extension number. The call will be routed to the dialed number. This option must be selected only when you have a Dial Pad connected to the Radio Device. You can customize the message played to the callers, if required. For detailed instructions, see ["Voice Message Applications"](#).

If you select Greet to Dial, the parameter **Time Between Consecutive PTT** will be un-editable and the parameter **PTT Count to Place a call** will be set to 1 and will be un-editable.

- **Station Basic Feature Template:** As the Radio Port functions as a station, assign a ["Station Basic Feature Template"](#) to the Radio port.

Only the following features of the Station Basic Feature Template are applied on the Radio Port:

- Time Table
- Operator
- Class of Service (Only Global Directory Part 1, 2 and 3, Basic Features and Privacy from Built-In Auto Attendant)
- Call Budget
- Call Privilege
- Toll Control-Call Budget consumed
- Outgoing Trunk Bundle Group (WH, BH and NH)
- Store Outgoing Calls
- Store Incoming Calls

By default, Station Basic Feature Template number 01 is also applied on Radio ports.

Check if the default settings of the features applied on the Radio ports (Time Table, Operator, Class of Service, Storage of Outgoing and Incoming Calls etc) match your requirements for the Radio ports. If yes, retain the default Station Basic Feature Template 01.

If you want to change any of the feature settings in for the Radio Ports, you may prepare a different Template¹⁷⁴, for example, Template 14 and apply it on the Radio Ports.

Also, if different feature settings are to be applied on different Radio Ports prepare separate Station Basic Feature Templates and apply them on the ports. To do this,

- Click the **Station Basic Feature Template** link to open the page.
- Select a Template number, for example 14.
- Customize the Radio Port related features (listed above) in Template number 14 and click **Submit** to save.
- Now go back to the **Radio Parameters** page.
- Enter the number of the Template you customized, Template 14 in the 'Station Basic Feature Template' field of the Radio Port, for example: Port 1, on which you want to apply this template. If you want to apply this template to other ports too, like 2, 3, and 4, assign the Template 14 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- If required, repeat the same steps to customize and assign a different Template to another Radio port.

Refer the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on the ports.

- **Station Advance Feature Template:** Assign a Station Advanced Feature Template to the Radio Port.

Only the following features in Station Advance Feature Templates are applied on Radio Ports.

- DDI IC Routing
- Send DDI Number as CLI?
- Internal Calls Storage
- CDC Table
- Call Tapping
- Caller Category

By default Station Advanced Feature Template 01 is assigned to all the Radio ports. Check if the default settings of the features applied on the Radio ports (Internal Call Storage flag and Call Forward Ring Timer) fulfill the feature requirements of the Radio ports, by opening the 'Station Advanced Feature Template' link.

If the default template fulfills your requirement, retain the default Station Basic Feature Template 01 for the Radio ports.

¹⁷⁴. This is recommended because changing the values of the default Template will be applied on all other extension types to which the Template is assigned.

However, if you want to change any of the feature settings in for the Radio Ports, you may prepare a different Template¹⁷⁵, for example, Template 05 and apply it on the Radio Ports. To do this,

- Click the **Station Advanced Feature Template** link to open the page.
- Select a Template number, for example 05.
- Customize Template number 05.
- Click **Submit** at the bottom of the page.
- Now go back to the **Radio Parameters** page.
- Enter the number of the Template you customized, Template 05 in the 'Station Advanced Feature Template' field of the Radio Port, for example, 1, on which you want to apply this template. If you want to apply this template to other terminals too, like 2, 3, and 4, assign the Template 05 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another Radio Port.

Also refer the topic "[Station Advanced Feature Template](#)" for instructions on customizing these templates and applying them on the station ports.

- **Priority:** Select a Priority Level for the Radio Port from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (Radio Port) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description "[Priority](#)".

By default, the Priority of all Radio ports is set to '5-Normal'.

Advanced Configuration

The above listed parameters fulfill the basic Radio extension port configuration requirements of most users. However, it is anticipated that some users may need to configure the more advanced features like Radio VAD

¹⁷⁵. This is recommended because changing the values of the default Template will be applied on all other extension types to which the Template is assigned.

Threshold Level, Minimum Silence Time for valid IC call (msec), Minimum Speech Time to activate PTT (msec) etc. For such users, you may click the 'Advance' button.

Radio Extension Parameters								
Port No.	Enable Port	H/W Slot-Port	Access Code	Name	On Detecting Voice	Station Basic Feature Template	Station Advance Feature Template	Priority
1	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
2	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
3	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
4	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
5	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
6	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
7	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
8	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
9	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
10	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
11	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
12	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
13	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
14	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
15	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal
16	<input checked="" type="checkbox"/>	00 - 00			Route to Operator	01	01	5 - Normal

- Scroll with the horizontal bar, and configure the following advanced Radio Parameters:

Radio Extension Parameters							
Port No.	PTT Activation	Radio VAD Threshold Level for Valid IC Call	Radio VAD Threshold Level to activate PTT	VAD Hang Timer (msec)	Minimum Speech Time for valid IC call (msec)	Minimum Silence Time for valid IC call (msec)	Minimum Sample Value for Speech Detection
1	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
2	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
3	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
4	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
5	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
6	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
7	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
8	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
9	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
10	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
11	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
12	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
13	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
14	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
15	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300
16	On Speech Detection	-15(dBm)	-15(dBm)	00500	300	200	300

- **PTT Activation:** Select the desired option to activate PTT. You can select:
 - On Speech Detection
 - Using '# Key

If you select On Speech Detection, the PTT activation/deactivation will be done automatically. It will depend on the values of **Minimum Speech Time to activate PTT (msec)** and **Minimum Silence Time to deactivate PTT (msec)**.

If you select Using '# Key, the user must press the '#' key to activate as well as deactivate PTT. It is not depend on the values of **Minimum Speech Time to activate PTT (msec)** and **Minimum Silence Time to deactivate PTT (msec)**.

- **Radio VAD Threshold Level for Valid IC Call:** This parameter defines the level below which the Radio port would not validate the audio signal as valid speech packet for incoming call. Set the Radio VAD Threshold Level for Valid IC Call to the desired value. The range of this level is 0 to -96 dBm. By default, it is -15 dBm.
- **Radio VAD Threshold Level to activate PTT:** This parameter defines the level below which the Radio port would not validate the audio signal as valid speech packet to activate PTT. Set the Radio VAD Threshold Level to activate PTT to the desired value. The range of this level is 0 to -96 dBm. By default, it is -20 dBm.
- **VAD Hang Timer (msec):** This timer is applicable after the Minimum Silence Time for valid IC call (msec). The system will wait for the duration of this timer to expire after the expiry Minimum Silence Time for valid IC call (msec) timer to treat silence as valid silence before speech packets. The range is 50 - 10000. By default, it is 500 msec.
- **Minimum Speech Time for valid IC call (msec):** Set the duration for which the system must receive speech packets for a valid incoming call. The range is 100 to 9999 msec. By default, it is 500 msec.
- **Minimum Silence Time for valid IC call (msec):** Set the duration for which the system may detect and accept silence before actual speech packets, to treat this silence as a valid incoming call. The range is 100 to 9999 msec. By default, it is 1200 msec.
- **Minimum Sample Value for Speech Detection:** This parameter defines the minimum value for detecting speech on the Radio Port be considered by the system. The valid range is 100 to 900. By default, it is 300.
- **Time Between Consecutive PTT (msec):** This parameter defines the maximum Time Between Consecutive PTT. The valid range is 2000 to 6000 msec. By default, it is 4000 msec.

*This parameter is applicable only if you have selected **Route to Operator** as the **On Detecting Voice** option.*

- **PTT Count to Place call:** This parameter defines the count after which the system will place the call. The valid range is 1 to 5. By default, it is 3.

*This parameter is applicable only if you have selected **Route to Operator** as the **On Detecting Voice** option.*

- **Minimum Speech Time to activate PTT (msec):** Set this timer to ensure continuous communication, once the call matures. As per the set time, the PTT will be activated and speech will be transmitted. The range is 100 to 9999 msec. By default, it is 700 msec.
 - **Minimum Silence Time to deactivate PTT (msec):** Set the duration of silence after which the system must deactivate PTT to disconnect the call. The range is 100 to 9999 msec. By default, it is 2000 msec.
 - **Play Error Tone after Routing or Speech:** This flag is for enabling or disabling the tone to be played by the system. If you want the system to play error tone after routing the call or after disconnecting the speech select the check box to enable. By default, it is disabled.
- Click **Submit** to save changes.

Configuring Radio Port Inactivity Timer

When the Radio Port is in speech with another port and if no activity is detected to and from the Radio Port for the set duration, then SARVAM UCS releases the Radio Port and disconnects the call. The Radio Port Inactivity Timer can be configured using Jeeves only.

- Under **Configuration**, click **System Timers and Counts**.
- Scroll to reach **Other Features**.

Global Hold Retrieval Timer (sec)	120
Exclusive Hold Retrieval Timer (min)	002
RCOC Record Delete Timer (min)	999
Release Conference if Idle for more than (min)	002
Line Echo Cancellation Start Timer (sec)	045
Retry counts for Authority Code	003
Emergency Reporting Call - Ring Timer (min)	010
Held Call Disconnection Timer (min)	005
Conference - Assistant Present Beep Interval (sec)	005
Radio Port Inactivity Timer (sec)	60

- Set the **Radio Port Inactivity Timer (sec)** to the desired duration. Default: 60 seconds
- Click **Submit** to save your settings.

Configuring DTMF Detection on Radio

The DTMF Detection and Generation parameters are applicable only when there are Dial Pads connected to the Radio devices. These parameters are configurable using Jeeves only.

- Under **Configuration**, click **System Parameters**.
- Click **Radio** to expand.

DTMF Detection - Minimum Level (dB)	-10.5
DTMF Detection - Minimum ON Time (msec)	17
DTMF Detection - Minimum OFF Time (msec)	17
DTMF Generation - DTMF ON Time (msec)	102
DTMF Generation - Inter Digit Pause Time (msec)	102

- Configure the following parameters:
 - **DTMF Detection - Minimum Level (dB)**: This parameter signifies the minimum level (dB) of the DTMF digit to be considered as valid. By default, Minimum levels set to -10.5dB.

- **DTMF Detection - Minimum ON Time (msec):** This parameter signifies the minimum time period for which the DTMF signal should be present in order to be detected. The valid range of this time is 17 to 204 milliseconds. By default, Minimum ON Time is set to 17 milliseconds.
- **DTMF Detection - Minimum OFF Time (msec):** This parameter signifies the minimum time period between successive DTMF digits. The valid range of this time is 17 to 204 milliseconds. By default, Minimum OFF Time is set to 17 milliseconds.
- **DTMF Generation - DTMF ON Time (msec):** It is the width of DTMF digit to be dialed out by the Radio port. By default the ON Time is set to 102 milliseconds.
- **DTMF Generation - Inter Digit Pause Time (msec):** When the Radio port dials out the DTMF digits, it waits for the Inter Digit Pause Timer, while dialing the DTMF digits. By default the timer is set to 102 milliseconds.
- Click **Submit**.

Configuring Radio Parameters using a Telephone

The following parameters are configurable using commands only.

Maximum Noise Suppression: This parameter identifies how much background noise can be suppressed. For example, if the background noise is -50dBm and you have set Maximum Noise Suppression as 12 dB, the background noise is reduced to -62 dBm.

Maximum Noise Suppression range is from 0 to 95dBm. Default value should be 25dBm.

- Enter SE mode from a DKP/SLT.
 - **4601-1-Radio-Maximum Noise Suppression** to assign the value to a single Radio port.
 - **4601-2-Radio-Radio-Maximum Noise Suppression** to assign the same value to a range of Radio ports.
 - **4601-*-Maximum Noise Suppression** to assign the same value to all the Radio ports.
- Where,
Radio is the Software Port number of the Radio port from 01 to 16.
Maximum Noise Suppression is from 0 to 95. Default: 25

VAD Noise Floor Threshold (in -dBm): This parameter specifies threshold above which VAD (Voice activity detection) decides that voice activity is present or below which VAD decides that only noise is present.

VAD Noise Floor Threshold range is from 0 to -96dBm. Default value should be -15dBm.

- Enter SE mode from a DKP/SLT.
 - **4602-1-Radio-VAD Noise Floor Threshold** to assign the value to a single Radio port.
 - **4602-2-Radio-Radio-VAD Noise Floor Threshold** to assign the same value to a range of Radio ports.
 - **4602-*-VAD Noise Floor Threshold** to assign the same value to all the Radio ports.
- Where,
Radio is the Software Port number of the Radio port from 01 to 16.
VAD Noise Floor Threshold is from 00 to 96. Default: 15

AGC Target Power In: This field identifies the target power level for speech output. Speech input power levels below or above this value will be raised or lowered as needed, towards this value.

AGC Target Power In range is from 0 to -20dBm. Default value should be -20dBm.

- Enter SE mode from a DKP/SLT.
 - **4603-1-Radio-AGC Target Power In** to assign the value to a single Radio port.
 - **4603-2-Radio-Radio-AGC Target Power In** to assign the same value to a range of Radio ports.
 - **4603-*-AGC Target Power In** to assign the same value to all the Radio ports.
- Where,
Radio is the Software Port number of the Radio port from 01 to 16.
AGC Target Power In is from 00 to 20. Default: 20

AGC Max Loss Limit In (in -dBm): This field identifies how much the speech input can be reduced by when the input is above the Target Power level.

AGC Max Loss Limit In range is from 0 to -23dBm. Default value should be -3dBm.

- Enter SE mode from a DKP/SLT.
 - **4604-1-Radio-AGC Max Loss Limit In** to assign the value to a single Radio port.
 - **4604-2-Radio-Radio-AGC Max Loss Limit In** to assign the same value to a range of Radio ports.
 - **4604-*-AGC Max Loss Limit In** to assign the same value to all the Radio ports.
- Where,
Radio is the Software Port number of the Radio port from 01 to 16.
AGC Max Loss Limit In is from 00 to 23. Default:03

AGC Max Gain Limit In: This field identifies how much the speech input can be increased by when the input is below the Target Power level.

AGC Max Gain Limit In range is from 0 to 23dBm. Default value should be 09dBm.

- Enter SE mode from a DKP/SLT.
 - **4605-1-Radio-AGC Max Gain Limit In** to assign the value to a single Radio port.
 - **4605-2-Radio-Radio-AGC Max Gain Limit In** to assign the same value to a range of Radio ports.
 - **4605-*-AGC Max Gain Limit In** to assign the same value to all the Radio ports.
- Where,
Radio is the Software Port number of the Radio port from 01 to 16.
AGC Max Loss Limit In is from 00 to 23. Default:03

To print the Radio Port parameters (only new parameters mentioned above) as debug:

- Enter SE mode from a DKP/SLT.
 - **4698-1-Radio** to print the parameters of a single Radio port.
 - **4698-2-Radio-Radio** to print the parameters of a range of Radio ports.
 - **4698-*** to print the parameters of all the Radio ports.
- Where,
Radio is the Software Port number of the Radio port from 01 to 16.

To default the configuration of Radio Port parameters (only new parameters mentioned above):

- Enter SE mode from a DKP/SLT.
 - 4699-1-Radio to set the parameters of a single Radio port to default.
 - 4699-2-Radio-Radio to set the parameters of a range of Radio ports to default.
 - 4699-* to set the parameters of all the Radio ports to default.

Where,

Radio is the Software Port number of the Radio port from 01 to 16.

When you default the Radio Parameter Page (one or all) or when you Default the system, all the Radio parameters configured through Jeeves or Telephone will be set to default values.

Configuring Magneto Interface

A magneto telephone is a local battery telephone set, in which signaling current is provided by a hand generator, usually a magneto. The hand generator, commonly referred to as 'crank', is located on the right hand side of the telephone set and is turned to produce energy to ring other phones.

Tip and Ring wires of the magneto phone are dry, that is, they do not carry battery voltage when idle or in speech. This means the wires carry only AC voice signals and not the DC voltage of the battery.

The Battery is used to power the microphone only and ringing generator is used to provide ring voltage to alert the other phone.

Magneto Telephones are widely used by defense establishments as field phones in front lines, and by other establishments such as railroad companies (signaling emergencies, crossings, etc.), electric utilities, pipeline companies, who need to have their networks at places that are too remote to be serviced by public telephone networks.

SARVAM UCS supports the Magneto Interface. A maximum of 16 ports are supported in SARVAM UCS. The availability of ports depends on the number of Magneto Cards installed in the system.

Matrix does not supply Magneto Telephones.

How the Magneto Interface works

The Magneto port of SARVAM UCS works as a Station.

Making a Call to the Magneto Port

An extension user (SLT/DKP/ISDN Terminal) dials the Magneto Port Access Code to call a Magneto Field Telephone.

- Ring is played on the Magneto Field Telephone connected to the Magneto Port.
- The extension user gets Ring Back Tone for the duration of the Ring Back Tone Timer.
- The extension user must press # or the Magneto Ring Enable (MRE) Key (on the DKP) before the expiry of the Ring Back Tone Timer (programmable; default: 45 seconds) to check if the Magneto User has answered the call¹⁷⁶.
- The system considers pressing of the # or MRE Key as call maturity and connects the speech path between the Magneto Field Telephone (connected to the Magneto Port) and the extension phone.
- If the Magneto User has answered the call, the extension user may start speech on hearing the Magneto User's voice.
- If there is a period of silence, the extension user may press the # or MRE Key again to generate Ring on the Magneto Telephone, and press the # and MRE Key once again during the Ring Back Tone Timer to check speech with the Magneto User.

¹⁷⁶. As there is no Answer Signaling or Call Disconnect feature on the Magneto line, there is no way for the Extension user to know whether speech has been established with the Magneto User, but to wait to hear the Magneto User's voice.

- Either party can disconnect the call:
 - The extension user either goes ON-Hook while in speech. Error Tone will be played to the Magneto user for the duration of the Error Tone Timer and the system releases the Magneto Port.
 - The Magneto User cranks the hand generator (Ring Down Signal) while in speech to disconnect the call. The system detects the Ring Current and releases the Magneto Port.

- *If the Magneto port is busy, the extension user will hear the Busy Tone.*
- *If the extension user goes ON-Hook while the Magneto Phone is ringing, the system will stop the ring on the Magneto phone.*

Making a Call from the Magneto Port

- The Magneto Field Telephone user cranks the hand generator to generate ringing current.
- The system detects the ringing current. If the ring current is present for more than 500msec, the system treats it as a Call request from the Magneto Port.
- The system rings the Operator extension assigned to the Magneto Port for the duration of the Ring Back Tone Timer and plays Ring Back Tone to the Magneto Telephone user.
- If the Operator goes OFF-Hook, before the expiry of the Ring Back Tone Timer, speech is established between the Operator and the Magneto User.
- The Operator can now transfer the call to another extension or external number.
- Either party can disconnect the call:
 - The Operator can go ON-Hook while in speech to disconnect. Error Tone will be played to the Magneto user.

OR

 - The Magneto User can cranks the hand generator again (Ring Down Signal) while in speech to disconnect the call.
- The system releases the Magneto Port and the port with which the Magneto User is in speech.
- If neither the Operator nor any of the two Magneto station users in speech disconnects the call, the system will automatically disconnect the call if silence (no speech) is detected for more than a specified duration of time.
- For this, the flag 'Enable Silence Detection on Magneto' must be enabled in the System Parameters and the 'Magneto Silence Disconnection Timer (default: 60 seconds) must be programmed. When Silence Disconnection is enabled on Magneto port, the system will start the Magneto Silence Disconnection Timer as soon as it detects silence. If the continuous silence is detected till the expiry of the timer the system considers the conversation as over and releases the Magneto stations. The call is disconnected. However, if speech is detected during this timer, the timer will be stopped.
- The call can be disconnected also using Forced Release by any extension user (Operator or any other extension user) having the feature 'Forced Release' in its Class of Service.

- If the Operator is busy, Busy Tone is played to the Magneto user.
- The Magneto user may crank the hand generator again to send Ring Current on the expiry of the Ring Back Tone Timer. However, if the Magneto user sends the Ring Current again during the Ring Back Tone Timer, the system will treat it as a call disconnect event. It will stop ringing the Operator's extension and release the Magneto Port.
- The Magneto Ring Enable (MRE) Key should be programmed on the DKP extensions that are to be allowed access to call Magneto ports.
- On SLT extensions and ISDN Terminals, the # key will serve the function of the MRE key.

Configuring Magneto Ports using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Magneto Configuration**.

Port No.	H/w Slot - Port	Enable Port	Access Code	Name	Station Basic Feature Template
1	04 - 01	<input checked="" type="checkbox"/>			01
2	04 - 02	<input checked="" type="checkbox"/>			01
3	04 - 03	<input checked="" type="checkbox"/>			01
4	04 - 04	<input checked="" type="checkbox"/>			01
5	00 - 00	<input checked="" type="checkbox"/>			01
6	00 - 00	<input checked="" type="checkbox"/>			01
7	00 - 00	<input checked="" type="checkbox"/>			01
8	00 - 00	<input checked="" type="checkbox"/>			01
9	00 - 00	<input checked="" type="checkbox"/>			01
10	00 - 00	<input checked="" type="checkbox"/>			01
11	00 - 00	<input checked="" type="checkbox"/>			01

Configure the following Magneto port parameters:

- **Magneto No.:** This non-editable field is the number of the software port of the Magneto port.
- **HW Slot-Port:** 'Slot' is the number of the Universal Slot in which the Magneto Card is inserted. 'Port' is the number of the Magneto hardware port on which the Magneto Field telephone instrument is connected.

The SARVAM UCS can automatically detect and assign the hardware slot and port numbers automatically to the Magneto software ports.

However, if required, you may change the Hardware Slot and Port assigned to the Magneto software port. In this case, enter the desired Hardware Slot and Port number in this field.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields.

- **Enable Port:** This flag is for enabling or disabling a Magneto port. When a Magneto port is disabled, neither incoming nor outgoing calls can be made from that port.

By default, the port is enabled. You may disable ports that are not functioning by selecting the check box.

- **Access Code:** Assign Station Access Codes to the Magneto Port. Station Access Codes are commonly referred to as Extension Numbers. These may be number strings of a maximum 6 digits, which are to be dialed to call the Magneto port to which they are assigned.

A maximum of 6 digits are allowed in an Access Code. By default, the Station Access Codes are blank for all Magneto ports.

To assign Station Access Codes according to your preference and requirement to a range of Magneto Ports, see [“Assigning Access Codes to a Range of Extensions”](#).

If you decide to customize the Station Access Codes, make sure that the numbers do not clash with any other Access Code in the 'Dial' phase. Refer the topics [“Access Codes”](#) and [“Conflict Dialing”](#) to know more.

- **Name:** Assign a 'Name' to the Magneto port. The name may be of the person who will use the Magneto telephone or the name of the department or location of the telephone. This name will be displayed on the LCD of the Operator/extension user's phone, if it is equipped with Caller ID.

You can program a name of a maximum of 18 alphanumeric characters.

- **Station Basic Feature Template:** As the Magneto Port functions as a station, assign a [“Station Basic Feature Template”](#) to the Magneto port.

Only the following features of the Station Basic Feature Template are applied on the Magneto Port:

- Time Table
- Operator
- Class of Service
- Store Outgoing Calls
- Store Incoming Calls

By default, Station Basic Feature Template number 01 is assigned to all extension types of the SARVAM UCS (SLT, DKP, ISDN Terminals, E&M Lines with Station as Orientation Type). Template 01 is also applied on Magneto ports by default.

Check if the default settings of the features applied on the Magneto ports (Time Table, Operator, Class of Service, Storage of Outgoing and Incoming Calls) match your requirements for the Magneto ports. If yes, retain the default Station Basic Feature Template 01.

If you want to change any of the feature settings in for the Magneto Ports, you may prepare a different Template¹⁷⁷, for example, Template 14 and apply it on the Magneto Ports.

Also, if different feature settings are to be applied on different Magneto Ports prepare separate Station Basic Feature Templates and apply them on the ports. To do this,

- Click the **Station Basic Feature Template** link to open the page.

¹⁷⁷. This is recommended because changing the values of the default Template will be applied on all other extension types to which the Template is assigned.

- Select a Template number, for example 14.
- Customize the Magneto Port related features (listed above) in Template number 14 and click **Submit** to save.
- Now go back to the **Magneto Parameters** page.
- Enter the number of the Template you customized, Template 14 in the 'Station Basic Feature Template' field of the Magneto Port, for example: MAG-001, on which you want to apply this template. If you want to apply this template to other ports too, like MAG-002, 003, and 004, assign the Template 14 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- If required, repeat the same steps to customize and assign a different Template to another Magneto port.

Refer the topic "[Station Basic Feature Template](#)" to know more about customizing the templates and applying on the ports.

- **Station Advance Feature Template:** Assign a Station Advanced Feature Template to the Magneto Port.

Only the following features in Station Advance Feature Templates are applied on Magneto Ports.

- Internal Calls Storage
- Call Forward Ring Timer

By default Station Advanced Feature Template 01 is assigned to all extensions of the SARVAM UCS, which also includes DKP ports, SLT ports, ISDN Terminals and E&M Lines configured as Stations. Check if this default template fulfills the feature requirements of the Magneto Ports by opening the link 'Station Advanced Feature Template'.

Check if the default settings of the features applied on the Magneto ports (Internal Call Storage flag and Call Forward Ring Timer) fulfill the feature requirements of the Magneto ports, by opening the 'Station Advanced Feature Template' link.

If the default template fulfills your requirement, retain the default Station Basic Feature Template 01 for the Magneto ports.

However, if you want to change any of the feature settings in for the Magneto Ports, you may prepare a different Template¹⁷⁸, for example, Template 05 and apply it on the Magneto Ports. To do this,

- Click the **Station Advanced Feature Template** link to open the page.
- Select a Template number, for example 05.
- Customize Template number 05.
- Click **Submit** at the bottom of the page.
- Now go back to the **Magneto Parameters** page.

¹⁷⁸. This is recommended because changing the values of the default Template will be applied on all other extension types to which the Template is assigned.

- Enter the number of the Template you customized, Template 05 in the 'Station Advanced Feature Template' field of the Magneto Port, for example, MAG-001, on which you want to apply this template. If you want to apply this template to other terminals too, like MAG-002, 003, and 004, assign the Template 05 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another Magneto Port.

Also refer the topic "[Station Advanced Feature Template](#)" for instructions on customizing these templates and applying them on the station ports.

- **Priority:** Assign a Priority Level from 1 to 9 to the Magneto Port, with '1' being lowest Priority and '9' being highest Priority. Whenever a Magneto Port with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description "[Priority](#)".

By default, the Priority of all Magneto Ports is set to '5-Normal'.

- If you have completed configuration of the desired Magneto Ports, click **Submit** at the bottom of the page to save your settings.
- Now, configure the Magneto Ring Enable (MRE) Key for DKP extensions.

Configuring MRE Key for DKPs

The Magneto Ring Enable (MRE) Key is to be configured on DKP extensions that will allow calls to be made to the Magneto Ports.

Any DSS key may be configured as MRE Key. There are two ways to do this:

- Assign the MRE Key function in the DKP Key Template assigned to the DKPs, by customizing a template and assigning it to the DKPs.

OR

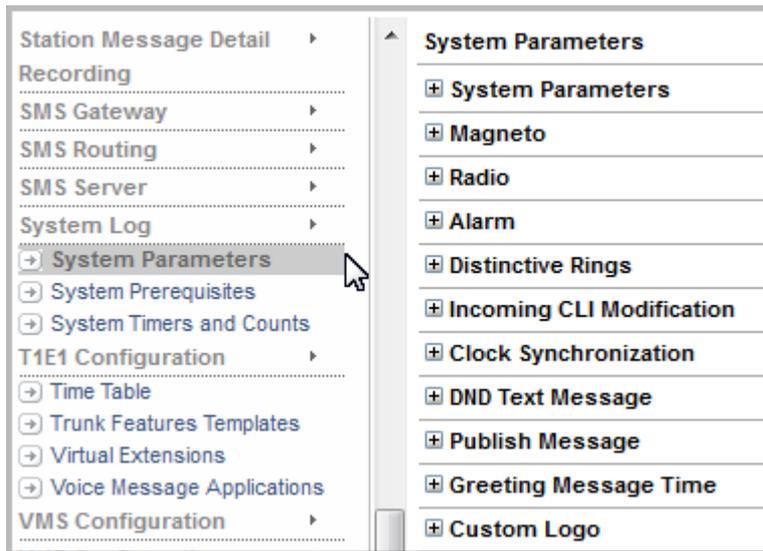

- Assign the MRE Key function individually in each DKP, by selecting 'Personalized' Key map for each DKP.

For detailed information and instructions, see "[DSS Keys Programming](#)".

Configuring Silence Detection on Magneto

If you want calls from Magneto ports to be disconnected automatically, if silence is detected, you must enable the **Silence Detection on Magneto** flag and program the **Magneto Silence Disconnection Timer**, if required.

- Under **Configuration**, click **System Parameters**.

- Click the **Magneto** sub-link to expand.
 - **Enable Silence Detection on Magneto:** By default this flag is enabled. If not, select the check box to enable this flag.
 - **Magneto Silence Disconnection Timer:** Set the timer to the desired value. The range of this timer is from 001 to 255 seconds. By default it is set to 30 seconds.
 - **Magneto VAD Threshold Level:** Set the level to the desired value. The range of this level of the 0 to -96 dBm. By default it is -25 dBm.
- Click **Submit** at the bottom of the page to save your settings.
- Log out of Jeeves or continue with configuration tasks, as desired.

Configuring Magneto Parameters using a Telephone

- Enter SE mode from a DKP/SLT.

To assign Slot-Port Assignment to a Magneto Port, dial:

- **1110-Magneto Trunk-Slot-Port Offset on the Card**

Where,

Magneto is the Software Port number of the Magneto port from 001 to 128.

Slot is Slot number in which the Magneto Card is inserted from 01 to 16

Port Offset is the number of the Magneto Port on the card from 00, 01 to 08.

Default: Hardware Slot and Port Offset is automatically assigned.

To enable/disable Magneto Port, dial:

- **6801-1-Magneto-Code** to enable/disable a single Magneto port.
- **6801-2-Magneto-Magneto-Code** to enable/disable a range of Magneto ports.
- **6801-*-Code** to enable/disable all Magneto ports.

Where,

Magneto is the Software Port number of the Magneto port from 001 to 128.

Code is

1 for Enable
2 for Disable
Default: Enable.

To program Access Code for Magneto Port, dial:

- **3107-1-Magneto-Access Code-#***

Where,

Magneto is the Software Port number of the Magneto port from 001 to 128.

Access Code is a number string of any combination of up to 6 characters, including the digits from 0 to 9, and the characters #, *, A, B, C, D, F, P, and Blank space.

Terminate the command with #* if the number string has fewer than 6 digits.

Default: Blank.

To clear the Access Code assigned to the Magneto port, dial:

- **3107-1-Magneto-#*** to clear Access Code assigned to a single Magneto port.
- **3107-2-Magneto-Magneto-#*** to clear Access Code assigned to a range of Magneto ports.
- **3107-*-#*** to clear the Access Codes assigned to all Magneto ports.

Where,

Magneto is from 001 to 128.

To assign default Access Codes to Magneto Port, dial:

- **3156-1-Magneto** to default Access Codes of a single Magneto port.
- **3156-2-Magneto-Magneto** to default Access Codes of a range of Magneto ports.
- **3156-*** to default Access Codes of all Magneto ports.

To assign a Name to the Magneto Port, dial:

- **5411-1-Magneto-Name-#*** to assign Name to a single Magneto port.
- **5411-2-Magneto-Magneto-Name-#*** to assign the same to a range of Magneto ports.
- **5411-*-Name-#*** to assign the same name to all Magneto ports.

Where,

Magneto is the Software Port number of the Magneto port from 001 to 128.

Name is an alphanumeric string of Maximum 18 characters. Terminate the command with #* if fewer than 18 characters are to be used as name.

To clear the Name of the Magneto Port, dial:

- **5411-1-Magneto-#*** to clear the name of a single Magneto port.
- **5411-2-Magneto-Magneto-#*** to clear the name of a range of Magneto ports.
- **5411-*-#*** to clear the names of all Magneto ports

To assign Priority level of a Magneto Port, dial:

- **3919-1-Magneto-Priority** to assign Priority Level to a single Magneto port.
- **3919-2-Magneto-Magneto-Priority** to assign the same Priority Level to a range of Magneto ports.
- **3919-*-Priority** to assign the same Priority Level to all Magneto ports.

Where,

Magneto is the Software Port number of the Magneto port from 001 to 128.

Priority is from 1 to 9.

Default: 5-Normal.

To assign a Station Basic Feature Template to Magneto Port, dial:

- **5511-1-Magneto-Station Basic Feature Template Number** to assign a template to a single Magneto port.
- **5511-2-Magneto-Magneto- Station Basic Feature Template Number** to assign the same template to a range of Magneto ports.

- **5511-*- Station Basic Feature Template Number** to assign the same template to all Magneto ports.
Where,
Magneto is the Software Port number of the Magneto port from 001 to 128.
Station Basic Feature Template is from 01 to 50.
Default: Station Basic Feature Template Number 01.

To assign a Station Advanced Feature Template for Magneto Port, dial:

- **5611-1-Magneto-Station Advanced Feature Template Number** to assign a template to a single Magneto port.
- **5611-2-Magneto-Magneto- Station Advanced Feature Template Number** to assign the same template to a range of Magneto ports.
- **5611-*- Station Advanced Feature Template Number** to assign the same template to all Magneto ports.
Where,
Magneto is the Software Port number of the Magneto port from 001 to 128.
Station Advanced Feature Template is from 01 to 50.
Default: Station Advanced Feature Template Number 01.

To enable or disable the "Enable Silence Detection on Magneto?" flag, dial:

- **5357-Flag**
Where,
Flag is
1 for Enable
0 for Disable
By default, the flag is enabled.

To set Magneto-Silence Detection Timer, dial:

- **5356-Silence Detection Timer**
Where,
Silence detection timer value range is from 001 to 255 seconds.
By default, the Timer is set to 30 seconds.

To set the Magneto Threshold Level, dial:

- **5358 - Magneto VAD Threshold Level**
Where,
The value of the Level is from 0 to -96.
By default, the value of the Level is -25 dBm

- Exit SE mode.

Configuring 'Operator'

Users understand the term 'Operator' as a person who handles multiple simultaneous calls and functions as the link between callers and called parties.

For the system however, an 'Operator' is a Routing Group; a group of extensions to which calls made by extensions by dialing '9' are to be landed. This also includes Auto Attendant calls on trunks during which the caller dials '9'.

Depending on the size of the Enterprise and the amount of call traffic to be managed, more than one Operator may be employed. Also, it is not uncommon to have different Operator extensions according to the time of the day. For instance, during working hours calls may be handled by the Receptionists or Front Desk Personnel, whereas during non-working hours, calls may be handled by the Security Personnel.

To meet this requirement, SARVAM UCS offers configuration of up to 20 different Operators (Routing Group). However, at a time, only one Operator can be assigned to the extensions and trunks.

Each 'Operator' is assigned a Routing Group for the Time Zones - Working Hours, Break Hours and Non-Working Hours.

Each 'Operator' is assigned a Time Table, which defines the Working Hours, Break Hours and Non-working Hours for a week. The system follows this Time Table to assign a Routing Group as 'Operator' according to the current Time Zone.

Configuration of 'Operator' involves the following steps:

1. **Configuring Routing Groups as 'Operator':** A routing group may be made up of one or more than one extensions, depending on user requirement. If the user requires only one extension as 'Operator', include only one extension as member in the Routing Group for Operator. If the user requires five extensions as 'Operator', create a Routing Group of the five desired extensions to be used as 'Operator'.

If the user requires Time-Zone based 'Operator', then prepare a different routing group for each Time Zone. If the user requires the same Operator for all Time Zones, use the same Routing Group number in all Time Zones.

2. **Configuring a Time Table for Operator:** This is applicable only when Operator extensions are different for different Time Zones.

Define the Time Table to be followed for the Operator selection. The Time Table may be the same as the Time Tables assigned to trunks and extensions of the SARVAM UCS or may be configured to match with the timings of the persons who work as Operators. For example if Operators in the Enterprise are working in shifts, the Time Table can be configured to match their timings.

3. **Assignment of 'Operator' to Extensions:** SIP Users, UC Clients, SLT, DKP, ISDN Terminals and Virtual Extensions of the SARVAM UCS can be assigned to an 'Operator' in their Station Basic Feature Template.

All extensions may be assigned to the same Operator, or different groups of extensions may be assigned to different Operators, so that call management is more efficient.

Operator 1 is the default in the Station Basic Feature Templates. If you want to assign different extensions to different Operators, you must program separate Station Basic Feature Templates with a different Operator for each extension group.

- Assignment of 'Operator' to Trunks:** Trunks are also assigned an 'Operator', so that when a caller dials '9' using Built-In Auto Attendant, the call is routed to the Routing Group defined as Operator for the trunk for a particular Time Zone. For example, the during working hours, a caller on trunk 001 dials '9', the call lands on 3001; when a caller on trunk 001 dials '9' during non-working hours the call lands on 3003 and when the caller dials '9' during break hours the call lands on 3002.

Similarly, it is also possible to assign different Operators to different trunks.

Decide the number of Operators to be configured on the basis of the user's requirement.

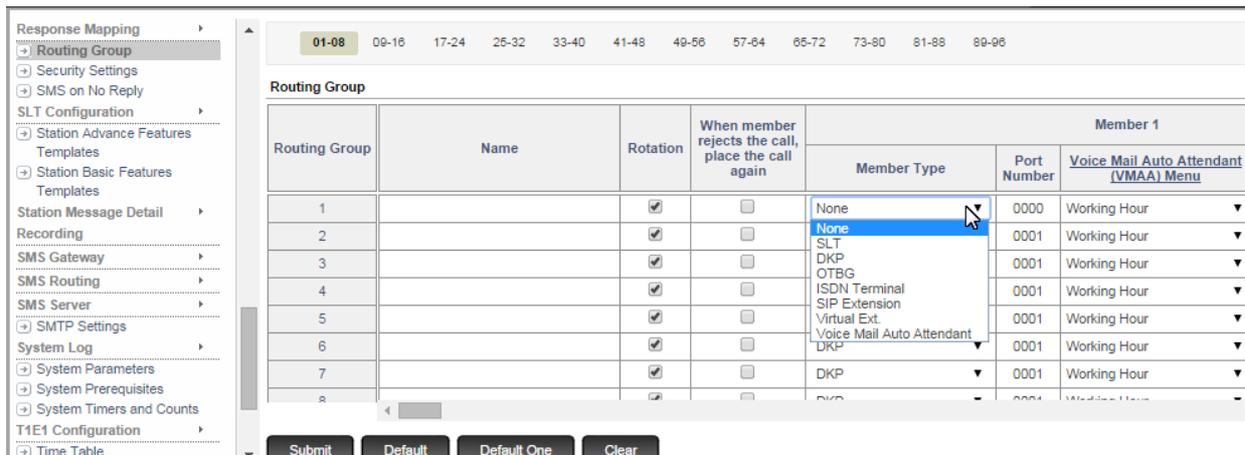

Configuring Operator using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **Routing Group** to open the page.

Routing Group	Name	Rotation	When member rejects the call, place the call again	Member 1		
				Member Type	Port Number	Voice Mail Auto Attendant (VMAA) Menu
1		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour
2		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour
3		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour
4		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour
5		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour
6		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour
7		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour
8		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour

- Select a Routing Group you want to program for Operator. By default, Routing Group 32 is assigned to Operator. You may configure this group, or select another one.
- Select the type of extension to be included in the group as **Member Type**. The extension may be a DKP, an SLT, an ISDN terminal, an OTBG, a SIP Extension, a Virtual Extension or a Voice Mail Auto Attendant.
- Enter the **Port Number** (software port number) to which the SLT/DKP/ISDN Terminal/SIP extension is connected. If a Virtual Extension is selected as the Member Type, enter the Port number of the Landing Destination here. You can program as many as 32 members in the Routing Group. If the user requires only one extension as Operator, configure the first Member and disable all other 'members' of the routing group by setting **Member Type** to **None**.
- Assign the desired **Voice Mail Auto Attendant (VMAA) Menu**, if you have selected the Voice Mail Auto Attendant as the Port Type.

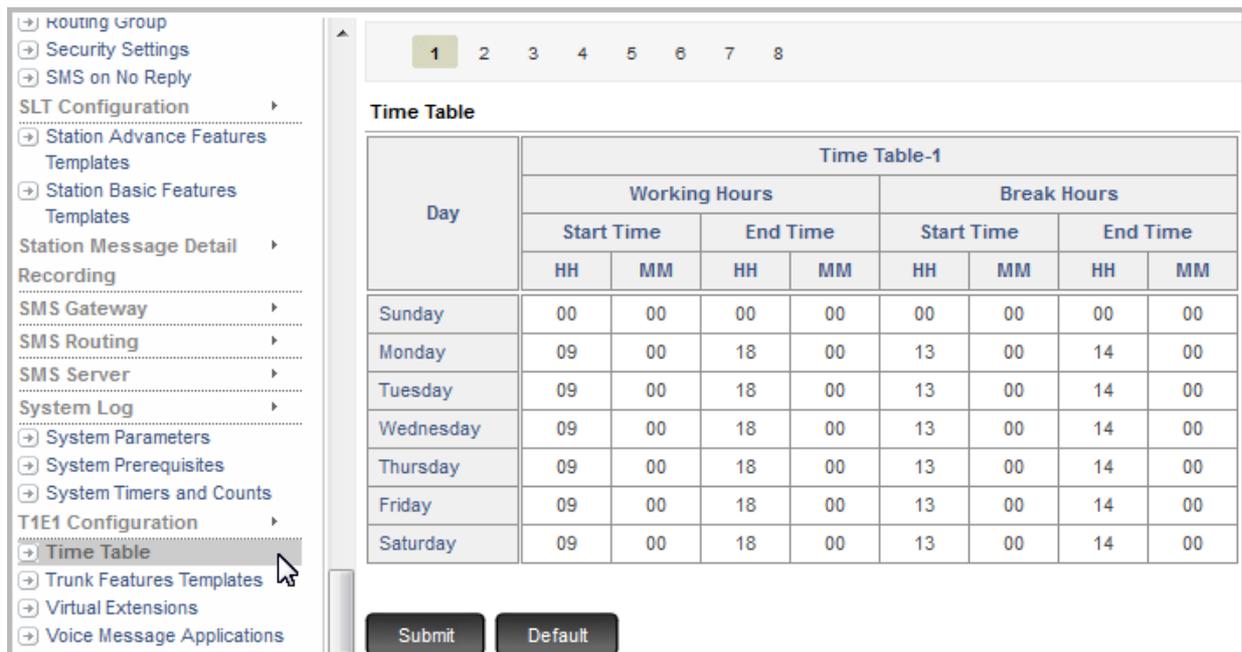

You may click the *Voice Mail Auto Attendant (VMAA) Menu* link to edit the parameters of the desired VMAA Menu. For details, see "[Voice Mail Auto-Attendant Menu](#)".

- Click **Submit** to save your changes.
- Repeat the same steps to configure another Routing Group.

If you have finished configuring Routing Groups for Operator, configure the Time Table for Operator.

- Under **Configuration**, click **Time Table** to open the page.

- By default Time Table 1 is assigned to all Operators. If this time table meets your requirement, retain it. If not, select another Time Table. Customize it by defining the Working Hours, Break Hours and Non-Working Hours for the week.
- Click **Submit** to save your changes.
- If you want to assign different Time Tables to different Operators, repeat the above steps to prepare the other Time Tables.

If you have completed configuring the Time Table,

- Under **Configuration**, click **Operators** to open the page.

Operator	Time Table	Routing Group		
		WH	BH	NH
1	1	32	32	32
2	1	32	32	32
3	1	32	32	32
4	1	32	32	32
5	1	32	32	32
6	1	32	32	32
7	1	32	32	32
8	1	32	32	32
9	1	32	32	32
10	1	32	32	32
11	1	32	32	32
12	1	32	32	32
13	1	32	32	32
14	1	32	32	32
15	1	32	32	32

- Select the Operator number you want to configure. By default Operator 1 is assigned to all extensions and trunks.
- Select the number of the Time Table you prepared for the selected Operator.
- Enter the number of the Routing Group you prepared for the selected Operator for Working Hours, for Break Hours and for Non-Working hours. If the same Routing Group is to be kept for all Time Zones, enter the same number in fields of all three time zones.
- Click **Submit** to save your changes.
- Repeat the above steps to configure another Operator.

Now, you may assign the 'Operator' groups you have configured to the SLT, DKP, ISDN Terminal, and SIP extensions by configuring the number of the Operator (1-20) in the ["Station Basic Feature Template"](#) applied on these extensions.

Similarly, you may assign the 'Operator' groups you have configured to the trunks in the ["Trunk Feature Template"](#) applied on these Trunks.

Configuring Operator using a Telephone

Prepare the required Routing Groups and Time Table first. Refer the topics [“Routing Group”](#) and [“Time Tables”](#) for SE commands.

- Enter SE mode from a DKP/SLT.

To assign a Time Table to an Operator, dial:

- **1602-1-Operator-Time Table** to assign a time table to a single Operator.
- **1602-2-Operator-Operator-Time Table** to assign the same time table to a range of Operators.
- **1602-*-Time Table** to assign the same time table to all Operators.

Where,

Operator is from 1 to 20.

Time Table is from 1 to 8. Enter the number of the Time Table you customized for Operator.

To define an Operator for Working Hours, dial:

- **1611-1-Operator-Routing Group**

Where,

Operator is from 1 to 20.

Routing Group is from 01 to 96. Enter the number of the Routing Group you prepared for Operator for working hours. Default: Routing Group is 32.

To define an Operator for Break Hours:

- **1612-1-Operator-Routing Group**

Operator is from 1 to 20.

Routing Group is from 01 to 96. Enter the number of the Routing Group you prepared for Operator for Break Hours. Default: Routing Group is 32.

To define an Operator for Non-working Hours, dial:

- **1613-1-Operator-Routing Group**

Operator is from 1 to 20.

Routing Group is from 01 to 96. Enter the number of the Routing Group you prepared for Operator for Break Hours. Default: Routing Group is 32.

For SE commands to assign an operator to extensions and trunks, refer the topics [“Customizing Station Basic Feature Template using a Telephone”](#) and [“Customizing Trunk Feature Template using a Telephone”](#).

To default an Operator, dial:

- **1601-1-Operator** to restore default values of a single Operator.
- **1601-2-Operator-Operator** to restore default values of a range of Operators.
- **1601-*** to restore default values of all Operators.

Where,

Operator is from 1 to 20.

On issuing this command, Timetable 1 is assigned to Operator and Routing Group 32 is assigned to Operator for all Time Zones.

- Exit SE mode.

Extension Search

Using Extension Search, you can search for the extensions configured by you as well as find out the Software ports that are not assigned Extension Numbers.

You can search for any extension by:

- H/w Slot Port
- Extension Number
- Extension Name
- Software Ports not assigned Extension Numbers

- *The number of extensions that the system will search for depends on the total extensions programmed in System Pre-requisites.*
- *If you are searching using H/W Slot-Port, the search is valid only for those extensions that are connected to the port.*
- *If you are searching using Extension Name, make sure you enter the name as configured in the system.*

Configuring Extension Search using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Extension Search**.

The screenshot shows the Jeeves configuration interface. On the left is a navigation menu with the following items: DISA - CLI Authentication, DKP Configuration, E1-Data Settings, Emergency, Extension Search (highlighted with a mouse cursor), E&M Configuration, Firmware Upgrade, Hotel Settings, ISDN Configuration, and Key Template. The main content area is titled 'Extension Search' and contains four radio button options: 'H/w Slot Port' (with two input boxes), 'Extension Number' (with one input box), 'Extension Name' (with one input box), and 'S/w Ports which are not assigned Extension Number' (with a dropdown menu showing 'SLT'). A 'Search' button is located at the bottom of the form.

- Select the desired **Extension Search** option from the following:
 - **H/w Slot Port:** If you select this option, enter the *H/w Slot Port* of the extension you want to search. The system will perform the search for the active ports only.
 - **Extension Number:** If you select this option, enter the *Number* of the extension you want to search.
 - **Extension Name:** If you select this option, enter the *Name* of the extension you want to search.
 - **Software Ports not assigned Extension Numbers:** If you select this option, select the type of extension—SLT, DKP, Department Group, Magneto, SIP Extension, Virtual Extension, Extension Over Q-SIG, Radio Port—for which software ports are not assigned any extension numbers.
- Click **Search**. The search result appears on the screen.

Configuring Trunks

The SARVAM UCS supports the following types of trunk ports:

- SIP Trunks
- ISDN T1E1 PRI Lines
- ISDN BRI Lines
- Mobile Trunks
- CO/ Two-Wire Trunks
- E&M Lines

Templates for Configuring Trunk Lines

SARVAM UCS offers the following Hardware and Software Feature Templates to make the configuration of Trunks easy.

- SIP Hardware Template (for SIP Trunks and SIP Extensions)
- CO Hardware Template (for CO Trunk Lines).
- E&M Feature Template (for E&M Lines and T1E1PRI Lines that use E&M signaling)
- Trunk Feature Template (for All Trunk Types)

Using these templates, you can configure all Trunks that are to be assigned the same set of hardware and software features at one go, instead of configuring each trunk individually.

SIP Hardware Template

The SIP Hardware Template contains a set voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and, Fax-over-IP options and related parameters

A SIP Hardware Template must be assigned to all SIP Trunks as well as SIP Extensions. Using the SIP Hardware Template, you can configure SIP Trunks and Extensions the same set of features at one go.

SARVAM UCS offers 32 SIP Hardware Templates, which can be customized as per the requirement and applied on SIP Trunks and Extensions.

SIP Hardware Template Parameters

Each of the SIP Hardware Template parameters is described below in brief.

- **Vocoder Preference:** Vocoder are the various voice codecs used to compress the data in RTP packets for optimum use of bandwidth and for ensuring voice quality. You can set 7 Vocoder options in the order of preference for a SIP trunk.

The Vocoder supported by SARVAM UCS in the order of preference, from 1st to 7th, by default are: G.723, G.729AB, GSM FR, iLBC - 30 ms, iLBC - 20 ms, G. 711 μ -Law and G. 711 A-Law.

- *If you do not want to select any Vocoder, you can select the option 'None' in the Template. However, if all Vocoder Preferences from 1 to 7 are set to 'None', incoming and outgoing calls will be blocked.*
- *The eighth option in Vocoder, G.722 is applicable only when RTP Mode is set as RTP Relay or Direct RTP in ["Configuring VoIP Parameters"](#).*

- **G.723 Bit Rate (kbps):** You can select the Bit Rate for G.723 codec as 5.3 kbps or 6.3 kbps. When G.723 is negotiated, the selected Bit Rate will be applied only when sending the RTP packets. When receiving RTP packets from the remote end, both Bit Rates of G.723 will be accepted. The default G.723 Bit Rate is 6.3kbps.
- **Silence Suppression:** This parameter suppresses the 'Silence' packets, allowing only the Voice packets through. SARVAM UCS supports Silence Suppression for all Vocoders except GSM FR. Default: Disabled.

Silence Suppression must be disabled if you have selected 'Pass Through' as the "Fax Type".

- **Send Silence Suppression Attribute:** By default this is flag is enabled, that is, the system will include the "silencesupp" media attribute in the SDP body.

If you do not want the system to include the "silencesupp" media attribute in the SDP body, clear the flag.

Silence Suppression Attribute is not dependent on the Silence Suppression option set.

- **SIP Gain Settings Template:** You can increase or decrease the level of Incoming Speech (Receive Gain) and Outgoing Speech (Transmit Gain) on the SIP Trunks/Extensions by changing the Rx Gain and Tx Gain to the desired level. Different levels can be set for each port type in the SIP Gain Settings Template. By default, SIP Gain Template 1 is assigned to all the SIP Hardware Templates. If you want to assign a different Template, you must customize the SIP Gain Settings Template first and then assign the number of the SIP Gain Settings Template in this Template. To customize the SIP Gain Settings, see "[Gain Settings](#)".
- **DTMF Type:** This parameter will determine how the DTMF digits will be sent over the IP Network, when a DTMF digit is pressed. The SARVAM UCS supports three DTMF options: i) RTP (RFC 2833), ii) SIP Info, and iii) In-Band. You may select the appropriate option. By default RTP (RFC 2833) is selected.
- **RFC2833 Payload Type:** If you have selected RTP (RFC 2833) as the DTMF Type, you must configure the value of RFC2833 Payload Type. The RTP packets will be tagged as DTMF as per the set value. The value of RFC2833 Payload Type can be set from 96 to 127.
- **Call Hold Method:** You can select RFC 2543 or RFC 3264, as per your requirement.

If you select RFC 3264, the following information will be sent in the SDP:

- Connection Information: IP Address as used in Contact
- Media attribute (a) : sendonly

If you select RFC 2543, the following information will be sent in the SDP:

- Connection Information: 0.0.0.0
- Media attribute (a) : sendonly

By default RFC 3264 is selected.

- **Echo Cancellation:** SARVAM UCS supports Echo Cancellation for SIP to CO trunk calls and SIP to Digital Trunks (BRI, T1E1, Mobile, SIP) and Extensions (DKP, ISDN Terminals). If you want to apply Echo Cancellation, you must enable configure the following parameters.
 - **Enable:** This flag is to be enabled to apply Echo Cancellation on SIP to CO and SIP to Digital Trunks/Extensions. By default Echo Cancellation is enabled.
 - **Tail Length (msec) for CO:** Echo Cancellation Tail Length for SIP to CO trunks can be 32/64/128 milliseconds. By default, Echo Cancellation Tail Length for CO is set to 128 milliseconds.

- **Tail Length (msec) for Stations and Digital Trunks:** Echo Cancellation Tail Length for SIP to Digital Trunks/Extensions can be 32/64/128 milliseconds. By default, Echo Cancellation Tail Length for Digital Trunks/Extensions is set to 32 milliseconds.
- **Jitter Buffer:** The speed at which voice packets travel through a network depends on the condition of the network. All voice packets may not come at the same speed. This variation in the delay in receiving packets, known as Jitter, affects voice quality. Jitter Buffer helps overcome the delay in receiving voice packets and improves voice quality. Jitter Buffer receives voice packets, stores them and sends it to the DSP to process it at evenly spaced intervals, thus improving voice quality.

SARVAM UCS supports two types of Jitter Buffer: Static and Dynamic. Static Jitter Buffer's internal delay is static, whereas, the Dynamic Jitter Buffer's internal delay adapts itself to the jitter in the network.

- **Type:** Select the type of Jitter Buffer - Static or Dynamic - you want to use. If you selected Static Jitter Buffer, you may set the 'Minimum Delay'. The value configured in the Minimum Delay determines the size of the Static Jitter buffer.
If you selected Dynamic Jitter Buffer, configure the 'Optimization Factor' and 'Minimum Delay'. The minimum size of the Dynamic Jitter buffer depends on the 'Minimum Delay' you configured. The Optimization Factor determines the rate of adaptation of the Dynamic Jitter Buffer to the jitter in the network.
- **Minimum Delay (msec):** This parameter is to be configured for both Static and Dynamic Jitter Buffer. The Minimum Delay determines the size of the Static Jitter Buffer and When Jitter Buffer type is selected as Static, the Minimum Delay defines the size of the Static Jitter Buffer. The Static Jitter Buffer will store each received voice packets for the time you set and then it will send it to DSP for voice processing.

When Jitter Buffer type is Dynamic, the Minimum Delay specifies the minimum time for which the Dynamic Jitter Buffer will store the received voice packet before sending it to the DSP for voice processing. 'Minimum Delay' can be from 10 to 280 milliseconds. By default Minimum Delay is set to 10 milliseconds.

- **Fax Type:** This parameter allows you to select the protocol of Fax over IP (FoIP). You can send/receive Fax from a Fax machine connected to the SLT port of the SARVAM UCS.

The SARVAM UCS supports the fax options: None, T.38 (UDPTL), T.38 (RTP), and Pass Through.

If you select None, the server will not detect the fax tone.

If you select any other option both, calls and fax tone will be detected.

- *'Pass Through' and 'T.38' will work only if the peer devices also support the same option.*
- *If you select 'Pass through' as Fax type, you must disable 'Silence Suppression'.*
- *If the fax sent using T.38 is rejected, SARVAM UCS will use Pass Through for sending the Fax.*
- **T.38 Fax Parameters:** This parameter is relevant only if you have selected T.38 as the Fax Type for Fax over IP. Receiving a good quality fax over SIP trunk depends on high 'Eye Quality Monitor' (EQM). The higher the Eye Quality Monitor, the better the Fax quality. To improve the quality of T.38 fax reception, you may configure the below parameters.
- **Version:** Configure this parameter as supported by the Remote Peer, which may be a Proxy Server or a SIP Device. While sending a fax, the Version will be sent in the re-INVITE Message to the Remote

Peer. While receiving a fax SARVAM UCS will accept a Version equal to or less than the configured Version.

A different Version can be configured for each SIP Trunk. This is useful when you have proxy SIP Trunks registered with different service providers supporting different versions.

The valid range for the Version is from 0 to 3. By default Version when Fax Type is T.38 (UDPTL) is 0 and when Fax Type is T.38 (RTP) it is 1.

- **Max Rate (Kbps):** This parameter controls the Fax image transfer speed. As EQM is inversely proportional to Fax Max Rate, if you receive poor quality fax, the Fax Max Rate should be reduced. The default Max rate is 14.4 kbps.
- **Image Redundancy Level:** The Fax Image Level is redundancy level for output Image, which can be None, 1 or 2.

Fax Image transfer speed is inversely proportional to this parameter. If this parameter is low then fax is transferred faster. EQM is directly proportional to this parameter. If this parameter is high, good quality fax can be achieved.

Increase the Fax Image Level, if the quality of fax does not improve with Fax Max Rate.

Level None means no redundancy. By default Image Redundancy level is set to 2.

- **Data Redundancy Level:** This is a redundancy level for T.30 control data. Fax Data Level can be set as None, 1 or 2. Level None means no redundancy. The higher the Redundancy level, the slower would be the fax transmission.

EQM is directly proportional to this parameter. The higher the Fax Data Redundancy Level, the better the EQM. By default, Data Redundancy Level is set to None.

- **Pass Through FAX Codec:** When the Fax option is selected as Pass Through, you must configure the Pass Through FAX Codec as supported by the Remote Peer. The Remote Peer may be a Proxy Server or a SIP Device.

You may select the Codec as G.711 A-law or G.711 μ -Law. While sending a fax this Codec is sent in the re-INVITE message to the Remote Peer, but while receiving a fax SARVAM UCS will accept the fax with any Codec.

Customizing SIP Hardware Template

You can customize 32 SIP Hardware Templates using Jeeves or by dialing SE commands from a Telephone. By default, SIP Hardware Template 01 is assigned to all SIP Trunks as well as SIP Extensions.

If the default SIP Hardware Template 01 fulfills the user requirements, retain Template 01. If you want to change the values of certain SIP Hardware Parameters, but apply the same parameter values to all SIP Trunks and Extensions, simply customize the desired parameters in Template 01.

If different hardware parameters are to be applied to different SIP Trunks and SIP Extensions, customize different the SIP Hardware Templates using Jeeves or a Telephone and apply them to the SIP Trunks and SIP Extensions as appropriate.

Customizing SIP Hardware Template using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Hardware Template**.

The screenshot shows the 'SIP Hardware Template' configuration page in the Jeeves web interface. The left sidebar contains a navigation menu with 'SIP Hardware Template' selected. The main content area displays a table with 8 rows, each representing a template. Each row has columns for '1st Preference', '2nd Preference', '3rd Preference', and '4th Preference'. The values in the table are: 1: G.723, G.729 AB, GSM FR, iLBC-30ms; 2: G.723, G.729 AB, GSM FR, iLBC-30ms; 3: G.723, G.729 AB, GSM FR, iLBC-30ms; 4: G.723, G.729 AB, GSM FR, iLBC-30ms; 5: G.723, G.729 AB, GSM FR, iLBC-30ms; 6: G.723, G.729 AB, GSM FR, iLBC-30ms; 7: G.723, G.729 AB, GSM FR, iLBC-30ms; 8: G.723, G.729 AB, GSM FR, iLBC-30ms. Below the table are buttons for 'Submit', 'Default', and 'Default One'.

- Select a Template number you wish to customize, for example Template 02.
- Change the values of the SIP Hardware Template parameters as desired.
- Click **Submit** to save your changes.
- Now, apply this Template 02 on the SIP Trunks and SIP Extensions.

To apply the customized template on SIP Trunks,

- Under **VoIP Configuration**, click **SIP Trunk Parameters**.
- Go to the SIP Trunks to which this Template is to be assigned, for example SIP Trunk 02, 03 and 04.
- Enter the number of the Template you customized, 02, in the field **SIP Hardware Template** of each of these SIP Trunks.
- Click **Submit** to save your template.

To apply the customized template on SIP Extensions,

- Under **VoIP Configuration**, click **SIP Extension Settings**.
- Go to the SIP Extension software ports to which the Template is to be assigned, for example SIP Extensions-005 to 008.

- Enter the number of the Template you customized, 02, in the field **SIP Hardware Template** of each of these SIP Extensions.
- Click **Submit** to save your settings.
- Repeat the same steps to customize another template and apply it on the SIP Trunks and Extensions.

CO Hardware Template

The CO Hardware Template contains a set of features, such as AC Termination Impedance, Pulse-Tone Dialing, Answer Supervision, Disconnect Supervision, DTMF detection, etc. that define the behavior of the hardware of the CO ports of the SARVAM UCS.

A CO Hardware template must be assigned to all the CO trunk ports. Using the CO templates, you can configure CO ports which are to be assigned the same set of features at one go, instead of configuring port-by-port.

The SARVAM UCS offers 50 CO Hardware Templates. These templates have commonly used values, but can be customized per the requirement and applied on the extensions.

SARVAM UCS supports only 'Loop Start' on CO Interface.

CO Hardware Template Parameters

The following is an overview of the parameters of these templates and a brief description of each.

- **Trunk Type:** Three types of Trunks can be interfaced to a CO port of the SARVAM UCS:
 - **Normal Dial type:** This is the conventional CO trunk available from the PSTN.
 - **Hotline type:** The CO trunk connecting two destinations immediately on grabbing the trunk.
 - **Delayed Hotline:** A special CO trunk available from the PSTN, which works as a normal dial type for some time and works as a hotline thereafter.

By default all the CO ports are set as Normal Dial type. You may select the CO Dial Type you want to assign to the CO port.

- **Dial Type:** You can select the Dialing method as **Pulse** or **Tone** (with configurable Pulse Ratio and DTMF ON-OFF period) according to the Dialing method supported by the CO network to which the CO port is connected.

By default, Tone is selected as the Dial Type.

- **Pulse Dial Ratio:** This parameter is to be configured if you have selected **Pulse** as the **Dial Type** in the previous parameter. The system supports the six different Pulse Dialing Ratios on CO ports. Select the appropriate Pulse Dial Ratio from the following according to the type of Pulse Dialing Ratio supported by your CO Network:
 - 10PPS, 1:2
 - 10PPS, 2:3
 - 10PPS, 1:1
 - 20PPS, 1:2
 - 20PPS, 2:3
 - 20PPS, 1:1

By default, 10PPS, 1:2 is selected as the Pulse Dial Ratio.

- **Rx CLI Type:** SARVAM UCS detects the CLI sent by the CO network and sends this information to the landing extension/operator with the ringing signal. You must select the CLI Type supported by your CO network from the following options:
 - Any ETSI DTMF format
 - Any FSK V.23 format
 - Any FSK Bellcore format
 - 1st Ring, ETSI DTMF, 2nd Ring
 - Polarity Reversal, ETSI DTMF, 1st Ring
 - 1st Ring, FSK, 2nd Ring
 - DT-AS, FSK, 1st Ring
 - RP-AS, FSK, 1st Ring
 - Polarity Reversal DT-AS, FSK, 1st Ring
 - Any DTMF Format (without Start/Stop Code)

By default, Any ETSI DTMF format is selected as the Rx CLI Type.

- **AC Impedance:** The AC Termination Impedance of the CO port must match with the AC Termination Impedance supported by the PSTN network. The system supports the following AC Termination Impedance:
 - 600Ω
 - 900Ω
 - 270Ω + (750Ω || 150 nF)
 - 220Ω + (820Ω || 115 nF)
 - 370Ω + (620Ω || 310 nF)
 - 320Ω + (1050Ω || 230 nF)
 - 370Ω + (820Ω || 110 nF)
 - 275Ω + (780Ω || 115 nF)
 - 120Ω + (820Ω || 110 nF)
 - 350Ω + (1000Ω || 210 nF)
 - 200Ω + (680Ω || 100 nF)
 - 600Ω + 2.16 μF
 - 900Ω + 1 μF
 - 900Ω + 2.16 μF
 - 600Ω + 1 μF
 - Global complex impedance

By default, the AC Termination Impedance is set as per the “[Region](#)” you have selected.

- **CO Termination:** This parameter allows you to increase near-end echo cancellation on the CO trunk. Near-end echo is primarily caused by the mismatch between AC Termination Impedance (presented by CO port of SARVAM UCS to the line) and CO Termination (Impedance presented by the Central Office to the line), and to some extent by the transmit and receive signal path.

By correcting the line impedance mismatch, you can increase near-end echo cancellation. This is done by selecting the AC Termination Impedance and CO Termination, and selecting a Line Type that most closely models the line that connects the CO port of SARVAM UCS to the Central Office.

In the **CO Termination** list, select the appropriate line impedance match. This would depend on the region where SARVAM UCS is deployed. For example, if AC Termination Impedance in your location is 600Ω and the CO Termination impedance is 900Ω in series with 2.16μF, select AC Impedance as 600Ω and CO Termination as 900Ω + 2.16μF. By default, None is selected.

Now, select the line model to be used from the CO Line Type list.

You are recommended to conduct the AC Impedance Test for the line connected to the CO Trunk port on which you will apply this template. The AC Impedance Test will help you determine the most appropriate values for the AC impedance, CO Termination and the CO Line Type. For more information see the topic [“AC Impedance Test”](#)

- **CO Line Type:** This parameter allows you to select the Line model for the CO Termination you have selected. You need to select a line type that most closely models the line connecting SARVAM UCS to the Central Office. In the **CO Line Type** list, you may select a specific EIA line model from the eight options (EIA-0 to EIA-7) or a specific wire gauge and length (2000 ft. 22/24/26awg). By default, None is selected.
- **CO Gain Settings Template:** You can increase or decrease the level of Incoming Speech (Receive Gain) and Outgoing Speech (Transmit Gain) on the Trunk by changing the Rx Gain and Tx Gain to the desired level. Different levels can be set for each port type in the CO Gain Settings Template. By default, CO Gain Template 1 is assigned to all the CO Hardware Templates. If you want to assign a different Template, you must customize the CO Gain Settings Template first and then assign the number of the CO Gain Settings Template in this Template. To customize the CO Gain Settings, see [“Gain Settings”](#).
- **Answer Supervision:** It is a signal from the CO network to indicate to call maturity. Whenever you make an outgoing call from CO trunk, the CO network will give answer signaling when the called party answers the call.

This feature is particularly useful if you want to use [“Call Cost Calculation \(CCC\)”](#) to enable accurate billing. When the signal is received, the billing will start and in the absence of this signal, the call will not be billed, ensuring that unanswered and unsuccessful call attempts are not billed.

Answer Supervision Signal has three options:

- **Pseudo Answer:** It is used when no signaling is available from the PSTN. If this option is selected, the call will be considered as matured on the expiry of the 'Pseudo Answer Supervision Timer' (configurable; default 10 seconds), irrespective of whether or not the call actually gets matured. After this, the Call Duration Timer starts. Finally, the system starts detecting the “Disconnect Supervision” signal configured for the CO port.

Select this option only if there is no Answer Supervision Signal supported.

- **Polarity Reversal:** It is used as maturity signal when the answer signaling is given in the form of Battery Reversal. If the battery polarity of the line is -ve for TIP and +ve for RING, when the called party has answered the call, the CO network will reverse the battery polarity, TIP becomes +ve and Ring -ve. After this, the Call Duration Timer is started. Finally system starts detecting the Disconnect Supervision signal configured for the CO port.

By default, Answer Supervision is set as Pseudo Answer for each CO port.

Select the same Answer Supervision signal as provided by your CO Network. If the type of Answer Supervision signal selected in the system does not match with that of the CO network, the call will not be stored in the Station Message Detail Record (SMDR) buffer. For example, if the CO network does not support Answer Supervision, but you have set Polarity Reversal as Answer Supervision Type, the call will be considered as matured and will not be stored in the Station Message Detail Record (SMDR) buffer.

- **Pseudo Answer Supervision Timer:** Configure this timer if you have selected 'Pseudo Answer' as Answer Supervision Signal option.

This is the time period for which the system will wait before treating a call as matured (regardless of whether or not it was answered). The range of this Timer is from 001 to 255 seconds. By default the Pseudo Answer Supervision Timer is set to 10 seconds.

When Pseudo Answer is selected as Answer Supervision signal, the call duration measured by the system will not accurately reflect the actual call duration because the Pseudo Answer Supervision Timer is not related to the actual call maturity. For example, if the Pseudo Answer Supervision Timer is set to 015 seconds, the call will be considered as matured after 015 seconds, even if it is answered after 20 seconds. Similarly, if this Timer is set to 080 seconds, but the call was answered after 020 seconds and disconnected after 040 seconds, this call will never be considered as matured as it ends before 080 seconds.

- **Disconnect Supervision:** It is a signal from the CO network to indicate call disconnection. Whenever a call (incoming or outgoing) made from the CO trunk is disconnected by the remote party, the CO network will send Disconnect signal to the CO port. SARVAM UCS will detect this signal and release the CO port.

Disconnect Supervision signal is important when a PCO machine is connected to the (SLT Port) SARVAM UCS and or when SARVAM UCS is deployed in a Gateway application.

In such application scenarios, it is desirable that calls that are disconnected by either end - calling party or called party - is terminated by the system and the port is released. If the called (remote) party has disconnected the call but the calling party (extension that made the outgoing call from SARVAM UCS) has not disconnected the call, the call remains live within the system.

So, Disconnect Supervision signal is important, particularly when calls are routed from CO-to-CO ports, to indicate to the system that it needs to disconnect the call and release the port.

Disconnect Supervision signal has three options:

- **None:** When there this no signaling supported. Select this option only if there is no Disconnect Supervision signal supported.
- **Polarity Reversal:** Call disconnection is signaled as Polarity Reversal when the call is disconnected by the remote user. For example, if the battery polarity of the CO port is '+ve' for TIP and '-ve' for RING in speech condition then on disconnection by the remote user, TIP will become '-ve' and Ring '+ve'. The user gets an Error tone and the CO port is released.
- **Open Loop Disconnect:** Call Disconnection is signaled in the form of Open Loop, whereby the Battery voltage on the CO port is removed for a short duration. Voltage is restored after this short duration. However, the Polarity of Battery Voltage on the CO port is not changed.

This option is to be selected when call disconnection is signaled in the form of Open Loop Disconnect pulse by the CO network. System will check Open Loop Disconnect signal for the time configured for Open Loop Disconnect Timer for each CO port. If the time of the Open Loop signal detected is less than the Open Loop Disconnect Timer configured, it will not be considered as valid Open Loop signal for releasing the CO port. But if the Open loop is detected continuously for at least for the time set as the Open Loop Disconnect timer, it is considered as a valid Disconnect Supervision signal. The call will be released and caller will get error tone.

By default, Disconnect Supervision is set to None for each CO port.

Select the same Disconnect Supervision signal as provided by your CO Network.

- *Select the same Answer Supervision and Disconnect Supervision signal type supported by your CO network for the CO ports. Consider the following case:*
 - *The CO network supports Polarity Reversal signal as Answer and Disconnect Supervision.*
 - *But you have configured 'Pseudo Answer' as Answer Supervision signal and 'Polarity Reversal' as Disconnect Supervision signal for the CO ports in the system.*
 - *In this case, when a call is made through the CO port, the call will be considered as matured after the Pseudo Answer Supervision Timer.*
 - *Now, when the called party answers the call, the CO generates 'Polarity Reversal' as answer supervision signal on the CO port.*
 - *But as 'Polarity Reversal' is also configured as the Disconnect Supervision for the port, the system will interpret this (Answer Signaling) signal as Disconnect Supervision signal and disconnect the call.*

- **Open Loop Disconnect Timer (msec):** This parameter is applicable only if the option Open Loop Disconnect is selected as Disconnect Supervision on the CO port.

The range of this timer is from 017 to 986 milliseconds. By default, the Timer is set to 204 msec.

- **Disconnect Tone Detection:** This parameter is to be configured if Call Disconnection is signaled by the CO network in the form of Disconnect Tone.

When there is an incoming/outgoing call on/from the CO port is answered, the system will check whether the flag "Disconnect Tone detection is enabled. Only if the flag is enabled, the system will detect the Disconnect Tone.

If Disconnect Tone is detected, the system will consider the call as ended and will release the CO port.

- **Disconnect Tone Cadence:** To enable the system to detect the Disconnect Tone accurately, you must set the Cadence (ON-OFF time) and Frequency of the Disconnect Tone, as supported by the CO network.

Configure the following Disconnect Tone Cadence parameters:

- **Frequency 1 (Hz):** Frequency 1 is from 300 to 1400 Hz. Default: 400Hz
- **Operator:** This parameter has 3 options: No operator, Modulation (*), Addition (+). Default: No.

If 'No' operator is selected frequency 2 will not be applicable.

If Modulation is selected, frequency 1 and frequency 2 will be used as modulation, $F1 * F2$

If Addition is selected, frequency 1 and frequency 2 will be used as addition, $F1 + F2$.

- **Frequency 2 (Hz):** Frequency 2 is from 20 to 1400 Hz. Select Frequency 2 if the Disconnect Tone supported by the CO network is Dual Frequency. Default: 25Hz.
- **ON Time 1 (ms), OFF Time 1 (ms):** Select Cadence for the first cycle ON Time 1 and OFF Time 1. It may be 0 to 9999 milliseconds. Default: 750 ms ON Time 1, 750 ms OFF Time 1
- **ON Time 2(ms), OFF Time 2 (ms):** Select Cadence for the second cycle ON Time 2 and OFF Time 2. It may be 0 to 9999 milliseconds. Default: 750 ms ON Time 2, 750 ms OFF Time 2.

- **ON Time 3(ms), OFF Time 3 (ms):** Select Cadence for the third cycle ON Time 3 and OFF Time 3. It may be 0 to 9999 milliseconds. Default: 0 ms ON Time 3, 0 ms OFF Time 3.
- **ON Time 4(ms), OFF Time 4 (ms):** Select Cadence for the fourth cycle ON Time 4 and OFF Time 4. It may be 0 to 9999 milliseconds. Default: 0 ms ON Time 4, 0 ms OFF Time 4.

When disconnect tone detected on the port matches the Frequency and Cadences you have set, the call will be disconnected and the CO port will be released.

When Disconnect cadence is zero, SARVAM UCS will skip that cadence and match the next cadence.

SARVAM UCS will match the cadence for 3 cycles and then release the trunk.

- **Speech Delay Timer:** It is the time after which the system gives dial tone to the extension, when the extension user grabs the CO.

To understand the significance of this timer, let us consider a situation. Extension 2001 does not have calling permission for long distance numbers. The user of extension 2001 grabs a CO trunk, and dials a number 1022-6305555. The system dials out this number, as it starts with '1', but since the actual dial tone from the CO comes after some time, the CO interprets this number as 022-6305555 and establishes speech. This way an extension user who does not have permission for long distance calling, can dial out a long distance number. This situation can be prevented by setting the Speech Delay Timer to an appropriate value.

The range of this timer is from 000 to 255 seconds. By default it is set to '0' second.

- **Pause Timer:** This Timer is required for inserting delay while digits of a number string are out dialed from the CO trunk. The Pause Timer is applied when the features “[Closed User Group \(CUG\)](#)”, “[Multi-Stage Dialing](#)”, “[Emergency Dialing](#)”, “[Last Number Redial](#)”, “[Auto Redial](#)”, “[Abbreviated Dialing](#)”, “[Call Back on Trunk Ports](#)”, “[Quick Dial](#)”, “[RCOC \(Return Call to Original Caller\)](#)”, Least Cost Routing (“[Configuring LCR](#)”) are used to dial out the numbers from the CO port. The range of this timer is from 0500 to 2500 milliseconds. By default the timer is set to 1000 milliseconds.
- **Ring Cadence OFF Timer:** Configure this timer to set OFF time for Ring cadence. During the incoming call on CO port, if the CO gives ring in which the Ring OFF period is quite long, the system will consider that the ring has been stopped, and will stop ringing the SLT port, even though the incoming call is still present.

To get accurate indication, the system supports Ring Cadence OFF timer on CO port so that ring can continue even for incoming calls with long Ring OFF period.

The range of the Ring Cadence OFF timer is from 1 to 9 seconds. By default the timer is set to 6 seconds.

- **DTMF Out Dial:** While dialing out the DTMF digits from the CO port, the following attributes of DTMF signal are critical.
 - **DTMF Signal ON Time (ms):** It is the width of DTMF digit to be dialed out by the CO port and is configurable. By default the ON Time is set to 102 milliseconds.
 - **DTMF Inter-Digit Pause Timer (ms):** When the CO port dials out the DTMF digits on the CO, it waits for the Inter Digit Pause Timer, while dialing the DTMF digits on CO trunk. This timer is configurable. By default the timer is set to 102 milliseconds.

The 'level' of each DTMF digit is fixed, at -6.0 dB, but you may configure these parameters to match the CO network requirement.

These DTMF Out Dial attributes are applied when the features Redial, Auto Redial and Abbreviated Dialing are used to dial out the numbers from the CO port. These attributes are also applicable when you make a call from a DKP that has DTMF generation disabled.

- **DTMF Detection:** The default settings of DTMF Detection serve the requirements of most of the applications. However, you may fine tune the following parameters if you face any problems in DTMF detection.
 - **Minimum Level (dB):** This parameter signifies the minimum level (dB) of the DTMF digit to be considered as valid. By default, Minimum levels set to -4.5dB.
 - **Minimum ON Time (msec):** This parameter signifies the minimum time period for which the DTMF signal should be present in order to be detected. The valid range of this time is 17 to 204 milliseconds. By default, Minimum ON Time is set to 34 milliseconds.
 - **Minimum OFF Time (msec):** This parameter signifies the minimum time period between successive DTMF digits. The valid range of this time is 17 to 204 milliseconds. By default, Minimum OFF Time is set to 68.
- **Flash Timer (msec):** This parameter is relevant for dialing out Flash on the CO trunk to access some of the features of the PSTN. Configure the desired time of Flash to be generated on the CO trunk. The range of the timer is from 83 to 900 msec. By default the Flash Timer is set to 600 msec.
- **ON Hook Speed (msec):** This parameter allows you to set the amount of time for the line-side device to go on-hook. The ON-Hook speed specified is measured from the time the ON-Hook bit is cleared until loop current equals zero. Select the desired ON-Hook Speed from the following options:
 - <0.5ms
 - 3 ms
 - 26 msBy default, <0.5ms is selected as ON-Hook Speed.
- **OFF Hook Speed (ms):** This parameter defines the time to settle the line transients after which transmission or reception can occur. Select the desired OFF-Hook Speed from the following options:
 - 512 ms
 - 128 ms
 - 64 ms
 - 8 msBy default, OFF-Hook Speed is set to 8 milliseconds.
- **Current Limiting:** With this flag you can enable Loop Current Limiting mode. When this flag is enabled, the Loop Current will be limited to a maximum of 60mA. By default, the flag is disabled.
- **Minimum Loop Current (mA):** This parameter sets the minimum loop current at which DAA module of the CO port can operate. Select the minimum operational loop current from the following options as per your requirement:
 - 10
 - 12

- 14
- 16

The minimum Operational Loop Current set by default is set to '10 mA'.

- **Tip Ring Voltage (Volts):** This parameter allows you TIP/Ring Voltage Adjustment on the line side.

Countries where Low voltage is required should use lower TIP/RING voltage. Adjust the values of the Tip Ring Voltage to match your country requirements from the following options:

- 3.1
- 3.2
- 3.35
- 3.5

The default Tip/Ring voltage is 3.5.

- **Ringer Impedance:** Set the Ringer Impedance - High or Synthesized - for the CO port according your country-specific requirement.

'High' signifies 20Mohm Ringer Impedance. This is the default Ringer Impedance provided on the line side by the DAA module of the CO port. The DAA Module can provide higher impedance when 'Synthesized' impedance is selected.

Some countries like Poland, South Africa and Slovenia require higher ring impedance which is achieved by the DAA module, when Ringer Impedance is set to 'Synthesized' impedance. By default 'High' (20Mohm) is selected.

- **Ringer Threshold (Vrms):** This parameter defines the level below which the CO port would not validate the Ring signal and the level above which it validate the Ring signal. Set Ringer Threshold to the desired value from the following options:
 - 13.5 - 16.5
 - 19.35 - 23.65
 - 40.5 - 49.5

By default 13.5 - 16.5 Vrms is set as Ringer Threshold.

- **PPDC:** 'Pre-PSTN Digit Count' or PPDC is parameter is to be configured, only if the CO Trunk ports on which the template is applied are in a [“Behind the System Application”](#).

PPDC is the number of digits (dialed by an extension) to be ignored by the system before toll control check is begun. It is the same as the number.

In Behind the System Applications, another System may be connected to the SARVAM UCS, with some of its CO Trunks terminating into the Stations of the other System and other trunks directly connected to the PSTN.

PPDC for CO Trunk ports directly connected to the PSTN must be set to '0'.

For Trunk ports connected to stations of another System, PPDC must be configured as per the number of digits in the Trunk Access Code defined for that System.

If the TAC is a single digit, select '1'. If TAC is double or triple digit number, accordingly select '2' or '3' as the PPDC.

To know more about this feature, refer [“Behind the System Application”](#).

- **Gateway Application - Answer Signaling:** This parameter is to be configured if the CO Port is being used in a gateway application as a source port (from where calls originate).

The calls originating on the source port (CO port) are routed using another Trunk port, the terminating port, which may be any trunk port, for example: T1E1. When call made from the terminating port gets matured, this is signaled to the source port in the form of DTMF digits.

- **Use:** Enable this flag if you want the CO port to be used in a Gateway Application.
- **DTMF String (max. 4 digits):** Configure the DTMF digits to be sent to signal call maturity to the source port.
- **Category (Logical Partitioning):** This parameter assigns the CO Port to a trunk category for the purpose of Logical Partitioning. By default all CO Ports are assigned to Category 1¹⁷⁹.

If you have re-defined Category 1 or have assigned CO ports to a different category, say Category 3, enter the same number here.

You may configure the call permission between the Category assigned to CO Ports and other Categories (assigned to other Trunk ports). Refer the feature description [“Logical Partition”](#) to know more.

- **Rx Gain at SIP Trunk (Pass Through Fax):** This parameter allows you to improve the quality of Fax over IP¹⁸⁰. Configure this parameter if you have selected Pass Through Fax as the Type of Fax over IP on SIP Trunks, and if Pass Through Fax is to be received on a CO Trunk.
 - **Data Gain (dB):** select the dB Level for Data Gain. By default, Data Gain is set to -11 dB.
 - **Bypass Gain (dB):** select the dB Level for Bypass Gain. By default, Bypass gain is set to -9 dB.
- **Idle Wait Timer:** This is the time taken by the Central Office to detect and release the line after the CO trunk has been released by SARVAM UCS. This time may vary from Central Office to Central Office. Set the Idle Wait Timer as per the time taken by your Central Office.

Set this timer accurately. If the set time is more than the actual time taken by the CO to release the line, it will result in delay to the caller. If the set time is less than the actual time taken by the Central Office, no dial tone will be played to the caller.

Valid range 001 to 255. By default, it is set as 002 seconds.

Customizing the CO Hardware Templates

The CO ports provide the interface to connect SARVAM UCS to the POTS network. The standards and features supported by POTS networks across the world vary. For example, some networks support Caller ID Presentation using DTMF signaling, while some support Caller ID Presentation using FSK signaling; some networks offer 600 Ohms Impedance, while others offer complex impedance.

¹⁷⁹. Trunk ports interfaced with PSTN /PLMN (Public Land Mobile Network) are assigned this category.

¹⁸⁰. Normally, fax calls require less gain compared to voice calls. However, to improve fax reception, SARVAM UCS allows the configuring of gain settings for fax. Fax gain settings consist of Data Gain and Bypass Gain. SARVAM UCS supports Fax Receive Gain for SIP to CO Trunks, SIP to Digital Trunk calls as well as SIP to SLT Calls.

SARVAM UCS's versatile architecture allows it to be connected to such networks differing in their characteristics. You can configure the CO hardware features to match the standards supported by the POTS network of the country where the system is installed.

The 50 CO Hardware Templates offered by SARVAM UCS contain the default values of the above-listed parameters. The default parameter values of these are country specific and are loaded in each template according to the Country selected as the "Region".

For example, when India is selected as the Region, the default value of the AC Impedance is 600Ω, whereas it is 900 ohms when Philippines is selected as Region, and 320Ω + (1050Ω || 230 nF) for Region UK. Similarly, the default Rx CLI Type for Region India is 'Any ETSI DTMF format' while the same is 'Any FSK V.23 format' for Region UK.

By default, CO Hardware Template number 01 is assigned to all CO Trunk ports.

While the default CO Hardware Template number 01 has all with commonly used values to match your country-specific requirements, you can still customize each of the 50 Templates to match your preference or requirement.

If the CO Hardware Template number 01 fulfills your requirements, and if the same features are to be applied on all CO trunk ports, retain Template 01. Similarly, if you want only a few changes to be made to Template 01 and apply it on all CO Ports, make the changes and retain the template.

However, if different sets of features are to be allowed to different CO hardware ports, then prepare separate CO Hardware Templates and apply them on the ports as required.

You can use Jeeves or a Telephone to customize the CO Hardware Template.

Customizing CO Hardware Templates using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **CO Configuration**.
- Click **CO Hardware Template** to open the page.

Template No.	Trunk Type	Dial Type	Pulse Dial Ratio	Rx CLI Type	AC Impedance
1	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
2	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
3	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
4	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
5	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
6	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
7	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
8	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
9	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω
10	Normal	Tone	10PPS 1:2	Any ETSI DTMF format	600 Ω

- Select a CO Hardware Template Number you wish to customize. For example, Template 07.

- Customize the CO Hardware Template number 07 by setting the parameters to the desired values.

The screenshot shows the 'CO Hardware Templates' configuration page. The left sidebar contains a navigation menu with the following items: Call Cost Calculation, Call Duration Control, Change SA P/w, Change SE P/w, CLI Based Routing, Class of Service, Closed User Groups, Communication Port, Configuration Upload, CO Configuration (selected), CO Parameters, CO Hardware Templates (highlighted), CO Gain Settings, AC Impedance Test, Status, COSEC Integration, CTI, Date & Time, DDI Routing, Default the System, Dial Plan for SIP Extension, Department Groups, DISA - CLI Authentication, and DKP Configuration. The main content area shows a table of CO Hardware Templates with columns: Template No., Trunk Type, Dial Type, Pulse Dial Ratio, and Rx CLI Type. The table contains 10 rows, all with 'Normal' Trunk Type, 'Tone' Dial Type, and '10PPS 1:2' Pulse Dial Ratio. The Rx CLI Type is 'Any ETSI DTMF format' for all. At the bottom of the table are three buttons: 'Submit', 'Default', and 'Default One'.

Template No.	Trunk Type	Dial Type	Pulse Dial Ratio	Rx CLI Type
1	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
2	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
3	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
4	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
5	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
6	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
7	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
8	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
9	Normal	Tone	10PPS 1:2	Any ETSI DTMF format
10	Normal	Tone	10PPS 1:2	Any ETSI DTMF format

- Click **Submit** to save changes.
- Now, apply this CO Hardware Template 07 on the CO ports.
- To do this, click the link **CO Parameters** to open the page.
- Go to the CO software ports to which this Template you customized (07) is to be assigned, for example CO-007 and 008.

- Enter the number of the Template you customized, 07, in the field **CO Hardware Template** of each of these CO ports.

CO Parameters

Port No.	H/w Slot - Port	Enable Port	Name	CO Hardware Template	Trunk Features Template	Cost Factor
1	02 - 03	<input checked="" type="checkbox"/>		02	01	01
2	02 - 04	<input checked="" type="checkbox"/>		02	01	01
3	02 - 05	<input checked="" type="checkbox"/>		02	01	01
4	02 - 06	<input checked="" type="checkbox"/>		02	01	01
5	00 - 00	<input checked="" type="checkbox"/>		02	01	01
6	00 - 00	<input checked="" type="checkbox"/>		02	01	01
7	00 - 00	<input checked="" type="checkbox"/>		02	01	01

Buttons: Submit, Default, Default One, Advance, Call Traffic

- Click **Submit** to save your changes.
- Repeat the same steps to customize another template and apply it to the CO Port.

Customizing CO Hardware Templates using a Telephone

- Enter SE mode from a DKP/SLT.

To change the default value of a CO Hardware Parameter in a Template, dial:

- **5902-1-CO Hardware Template Number-Feature Number-Code** to change values of a parameter in a single template
- **5902-2- CO Hardware Template Number-CO Hardware Template Number-Feature Number-Code** to set the same value for the parameter in a range of templates.
- **5902-*-Feature Number-Code** to set the same value for the parameter in all templates. Template Number is the number of the CO Hardware Template from 01 to 50. Feature Number is the number of the CO Hardware Template Parameter from 01 to 50. Code is the value for each parameter from 0 to 58. Refer the following table.

Default Values of CO Hardware Templates (Region Code: India)

Parameter No.	01	03	04	05	02
Template No.	Trunk Type	Dial Type	Pulse Dial Ratio	Rx CLI Type	AC Termination Impedance
01	Normal	Tone	10PPS, 1:2	Any ETSI DTMF format	600 Ω
02 - 50	Same as Template 01				
Parameter Values					
0				None	
1	Normal	Pulse	10PPS, 1:2	Any ETSI DTMF format	600 Ω
2	Hotline	Tone	10PPS, 1:1	Any FSK V.23 format	900 Ω
3	-		20PPS, 1:2	Any FSK Bellcore format	270 Ω + (750 Ω 150 nF) and 275 Ω + (780 Ω 150 nF)
4			20PPS, 1:1	1st Ring, ETSI DTMF, 2nd Ring	220 Ω + (820 Ω 120 nF) and 220 Ω + (820 Ω 115 nF)
5				Polarity Reversal, ETSI DTMF, 1st Ring	370 Ω + (620 Ω 310 nF)
6				1st Ring, FSK, 2nd Ring	320 Ω + (1050 Ω 230 nF)
7				DT-AS, FSK, 1st Ring	370 Ω + (820 Ω 110 nF)
8				RP-AS, FSK, 1st Ring	275 Ω + (780 Ω 115 nF)
9				Polarity Reversal, DT-AS, FSK, 1st Ring	120 Ω + (820 Ω 110 nF)
10				Any DTMF Format (without Start/Stop Code)	350 Ω + (1000 Ω 210 nF)
11					200 Ω + (880 Ω 100 nF)
12					600 Ω + 2.16 μF
13					900 Ω + 1 μF
14					900 Ω + 2.16 μF
15					600 Ω + 1 μF
16					Global complex impedance

Parameter No.	48	49		08	09
Template No.	CO Termination	CO Line Type	CO Gain Settings Template	Answer Supervision	Pseudo Answer Supervision Timer (sec)
01	None	None	1	Pseudo Answer	20
02 - 50	Same as Template 01				
Parameter Values					
0	None	None		Pseudo Answer	001 - 255
1	900 Ω + 2.16 μ F	EIA-0	1	Polarity Reversal

For example, to change the Rx CLI Type in Template 07 from 'Any ETSI DTMF format' to 'Any FSK V.23 format', dial **5902-1-07-01-3**

Where,

07 is the template number

05 is the parameter number for Rx CLI Type

2 is the code for Any FSK V.23 format.

To default CO Hardware Template, dial:

- **5901-1- CO Hardware Template Number** to default a single template.
- **5901-2- CO Hardware Template Number - CO Hardware Template Number** to default a range of templates.
- **5901-*** to default all templates.

To assign a CO Hardware Template to a CO port, dial:

- **5903-1-CO-CO Hardware Template Number** to assign a hardware template to a single CO port.
- **5903-2-CO-CO-CO Hardware Template Number** to assign a hardware template to a range of CO ports.
- **5903-*-CO Hardware Template Number** to assign a hardware template to all CO ports.

Where,

CO is the Software Port number of the CO port from 001 to 128.

Template Number is the number of the customized CO Hardware Template, from 01 to 50. Default: Template 01.

- Exit SE mode.

E&M Feature Template

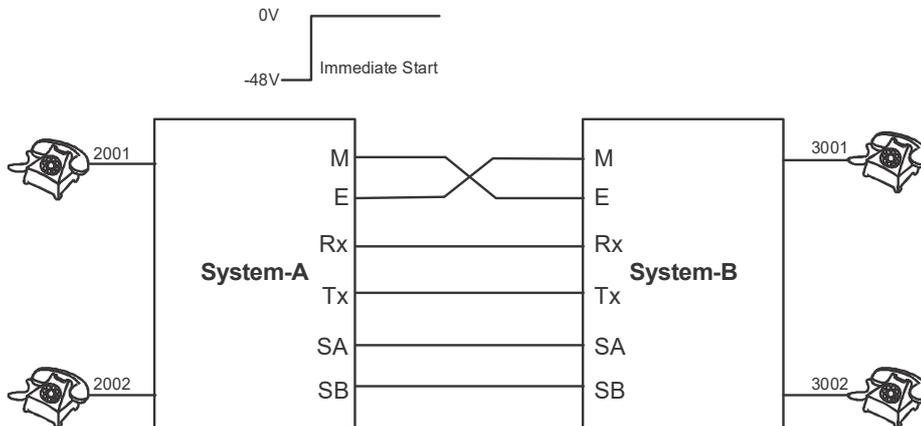

The E&M Feature Template is a set of features specific to E&M signaling, which define the behaviour of the E&M ports, according to their 'Orientation Type', whether they are functioning as Stations, Trunks or Tie-Lines.

The E&M Feature Template is applied also on T1E1PRI trunks which use E&M signaling. The SARVAM UCS offers 50 such Templates. The E&M templates are loaded with default values that serve the requirements of a broad user base, but can be customized as per user requirements.

E&M Feature Template Parameters

The E&M Feature Template has the following parameters:

- **Seizure Type:** E&M Trunk Seizure Type is the line protocol that defines how the equipment seizes the E&M Trunk. It is also referred to as Start Dial Supervision Signaling Protocol. SARVAM UCS supports the following Seizure Types:
 - **Immediate:** The method of seizing the E&M Line using Immediate Start for Outgoing and Incoming calls is illustrated below.

Outgoing Call:

While making an outgoing call, when the extension user of System A seizes the E&M Port of System A, the status of the "M" wire of its E&M port will go high, indicating that it has seized the E&M line. There will not be any signaling over the "E" wire of System A's E&M Port during seizure.

Incoming Call:

While receiving an incoming call over its E&M port, System-B will be ready to receive digits as soon as it detects high state on its "E" wire.

There will not be any signaling over the "M" wire of E&M Port of System B while receiving an incoming call.

- **Immediate with Ack:** The method of seizing the E&M Line using Immediate with Acknowledgment for Outgoing and Incoming calls is as follows:

Outgoing Call:

If this seizure type is selected, while an outgoing call is made by seizing the E&M Port, the 'M' wire will go high immediately.

The remote end will acknowledge this by making its 'M' wire high, which in turn will activate (high) 'E' wire of the E&M port of System-A.

On sensing high signal on 'E' wire, System-A will start dialing out the DTMF/Pulse digits.

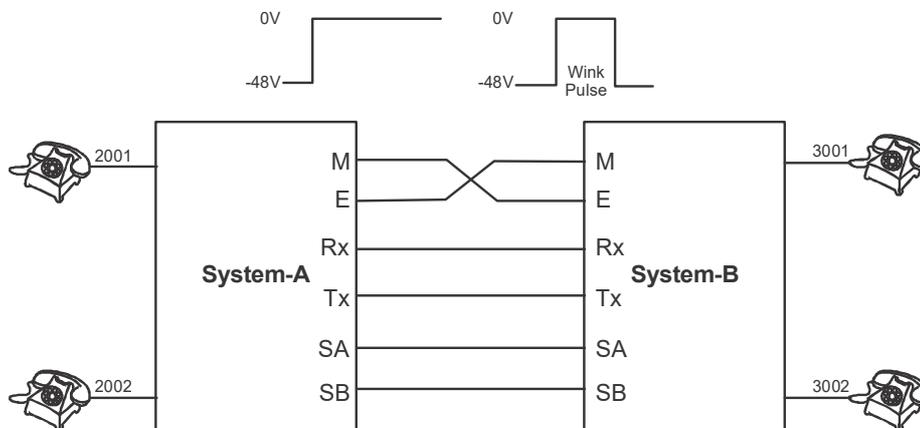

Incoming Call:

On detecting high signal on "E" wire of the E&M port, the system will consider it to be an incoming call seizure and hence it will immediately make its "M" wire high, which will allow the remote end to dial out the DTMF/Pulse digits.

Call Disconnection:

If the parameter 'Release Type' is configured as 'Status Change' and for this type of seizure, the "M" wire at the remote end goes Low for some call condition, the call will be disconnected. For example, "M" wire at the remote end will go 'Low' in the following conditions:

- Remote end user dials invalid number and does not hang up on getting Error Tone.
- Remote end user dials valid extension number and after conversation remote end hangs up first.
- Remote end user dials valid number and extension does not reply, but the remote party does not disconnect the call.
- Remote end has made 'Orientation Type' of E&M port as 'Trunk' and for Incoming calls, all the extensions in the trunk landing group are busy and also second call is not allowed to the extension user, the system will disconnect the call after the expiry of the Ring Back Tone Timer, by making the 'M' wire Low.
- **Immediate + Wink:** The method of seizing the E&M Line using Immediate + Wink Start for Outgoing and Incoming calls is described below.

Outgoing Call:

While making an outgoing call when the System A attempts a seizure (grab), the state of the "M" wire of the E&M port of System A will go high.

To acknowledge this, the E&M port of System B will send Wink signal over its "M" wire, when System B is ready to receive digits.

System A will wait for the duration of the 'Wait Wink Timer'. On receiving the acknowledgment in the form of Wink signal on the "E" wire of its E&M port, before the expiry of the Wait Wink Timer, System A will consider the trunk seizure as successful. Digits will be dialed out from E&M port.

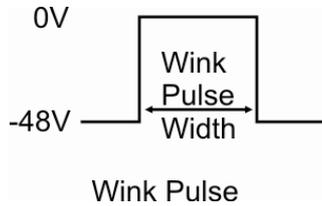

If Wink is not received from System B within the 'Wait Wink Timer', System-A will drop the call.

Incoming Call:

While receiving an incoming call over the 'M' wire of its E&M port, System B will send the Wink signal to the System A, which has initiated the seizure (grab).

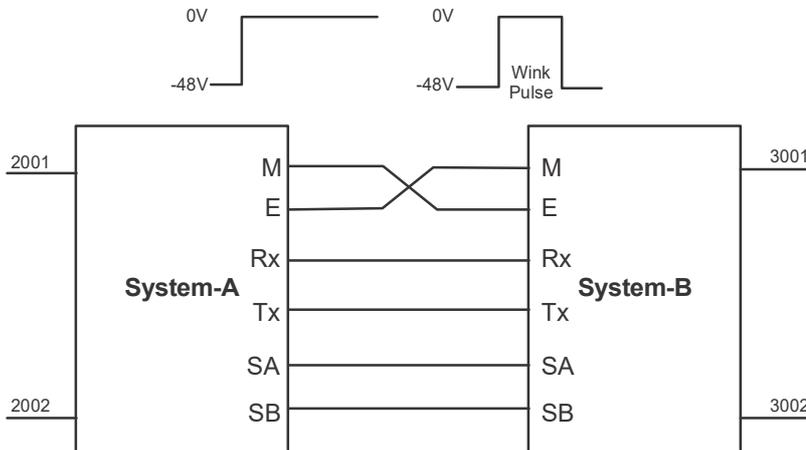

The 'Wink' signal will be sent by the System B when it is ready to receive the digits from the System A.

You can change the 'wink' pulse width by configuring the 'Wink Pulse Timer'.

The width of the Wink Pulse ranges from 0000 to 9999 milliseconds.

- **Immediate with Ack + Wink (MFC R2):** The method of seizing the E&M Line using Immediate with Ack + Wink (MFC R2) for outgoing and incoming calls is described below.

Outgoing Call:

When System-A attempts a seizure of (attempts to grab) the E&M Port, the 'M' Wire of the E&M Port of System-A will go high and wait for the E&M Port of System B to turn its 'M' wire high.

System-B detects this on its 'E' wire. To acknowledge this, the E&M port of System-B will turn its 'M' wire high and send a Wink signal over its 'M' Wire. Sending of the wink signal indicates the readiness of System-B to receive the digits of the called party number.

System-A will wait for the duration of the 'Wait Wink Timer' to receive the acknowledgment in form of the Wink Signal on the 'E' wire of its E&M port.

When System-A receives the acknowledgment from System-B, before the Wait Wink Timer expires, System-A considers the trunk seizure as successful and starts dialing out DTMF digits as per the MFCR2 Signaling protocol.

However, if System-A does not receive the Wink Signal within the 'Wait Wink Timer', or if invalid Wink Pulse is received (not according to Wink Pulse Timer), System-A will drop the call by turning its 'M' wire low.

Incoming Call:

On detecting high signal on 'E' wire of the E&M port, System-B will consider it to be an incoming call seizure and hence it will immediately make its 'M' wire high and send the Wink signal on the 'M' wire of System-A to indicate its readiness to receive the called party number digits. The width of the Wink Pulse (referred to as 'Proceed To Send' in MFCR2 Signaling) can be changed by setting the 'Wink Pulse Timer'.

System-A dials out the digits as per the MFCR2 Signaling protocol.

When the called extension of System-B answers the call, System-B sends the Wink signal on the 'M' wire of its E&M Port to indicate the call maturity.

Call Disconnection:

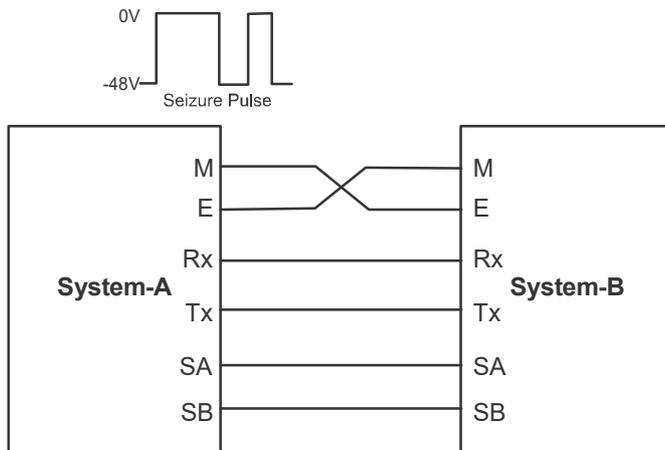

The call can be disconnected by the calling party, System-A, or the called party, System-B by changing the status of the 'M' wire to Low.

Call Disconnection takes place when 'M' wire is low. So, it is recommended that the Call 'Release Type' of the E&M Port for this Seizure Type (Immediate with Ack+Wink) be set to 'Status Change'.

If you select Immediate with Ack+Wink as the Seizure Type, you must configure the MFCR2 Signaling parameters.

- **Seizure Pulse:** The method of seizing the E&M Line using Seizure Pulse for Outgoing and Incoming Calls is described below.

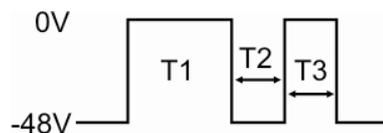

Outgoing Call:

While making an out going call from the E&M port of System-A, it will send Seizure Pulse over the "M" wire of its E&M port to seize the line.

Incoming Call:

While receiving an incoming call over the E&M Port System B will detect valid Seizure Pulse over the "E" wire of its E&M port.

Seizure Pulse can be set for various time periods T1, T2 and T3 as required.

The Seizure Pulse for T1, T2 and T3 ranges from 000 to 999 milliseconds.

- **Seizure Pulse + Wink:** The method of seizing the E&M Line using Seizure Pulse + Wink for Outgoing and Incoming Calls is as follows:

Outgoing Call:

While making an OG call, "Seizure Pulse" (as configured) will be sent on the "M" wire of E&M Port and will start 'Wait Wink Timer' and expect 'Wink' from the remote device.

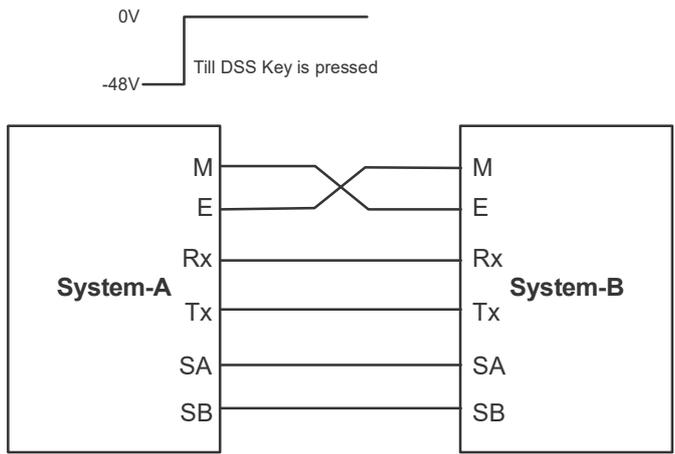

On receiving a valid Wink Pulse from the remote end within the Wait Wink Timer, digits will be dialed out on the E&M Port.

If a valid Wink Pulse is not received from the remote end, digits will be dialed out on the expiry of 'Wait Wink Timer'.

Incoming Call:

On detecting valid Seizure pulse (matching with configured value of seizure pulse) on "E" wire of the E&M Port, the E&M Port will send Wink pulse (of configured value) on "M" wire, and the call will be considered to be present.

- **Express:** Express Signaling works as illustrated below.

To make a call from System A to System B, the caller from System A presses the DSS Key of the desired E&M port.

For as long as the DSS key is pressed by caller from System A, the signal on the "M" wire of E&M port of System A will be high.

When the destination extension on System B answers, the caller from System A releases the DSS key, as the line seizure is successful.

When the caller from System A releases the DSS key, the signal on the 'M' wire of the E&M port of System A, and the "E" wire of the E&M port of System B will go low.

- **Radio A:** This seizure type to be used for supporting Combat Net Radio (CNR) signaling on the E&M port.

The E&M port of the SARVAM UCS will detect this pulse on the 'E' wire of its E&M port and recognize it as a seizure signal (incoming call indication).

The length of this input signal (pulse) can be defined by setting the 'Minimum Pulse Width for Radio Seizure' Timer. The SARVAM UCS will recognize the input signal on the 'E' wire of its E&M port as a seizure signal only if the signal is present for the duration of this timer.

Once the incoming call is detected by the E&M port, the call is routed to the Routing Group number as per the call routing logic configured for the E&M port.

When Routing Group member (extension) answers the call, speech is established with the CNR user.

Outgoing Call:

When any extension user of the System wants to contact the CNR user (Soldier), extension user must grab the E&M port by dialing TAC/Selective Trunk Access / DSS key of E&M Port.

When E&M Port is grabbed by the extension user, the 'M' wire of the E&M port is made high, to indicate the seizure signal to the radio equipment. The radio equipment then passes on the call to the CNR user's wireless phone.

Incoming Call:

When status of "E" wire of the E&M port goes high for greater than or equal to the 'Minimum Pulse Width for Radio Call' it is considered to be an incoming call, and the call is routed as per the current call routing logic.

The Minimum Pulse Width for Radio Call' timer will be applicable only if the seizure type is configured as 'Radio A' or 'Radio B'. The range of this timer is from 0000 to 9999 milliseconds. The default value of this pulse is 150 milliseconds.

When an extension user of the System answers an incoming call, the 'M' wire of the E&M Port will be made high.

The call between the extension user and the CNR user can be disconnected only if the extension user disconnects the call. So, it is recommended that the call 'Release Type' of the E&M port be set to 'None'.

- **Radio B:** Characteristics of M and E wire for seizure type 'Radio B' are as follows:

Outgoing Call:

When any extension user of the System wants to contact the CNR user (Soldier), extension user must grab the E&M port by dialing TAC/Selective Trunk Access / DSS key of E&M Port.

When E&M Port is grabbed by the extension user, the 'M' wire of the E&M port is made high, to indicate the seizure signal to the radio equipment. The radio equipment then passes on the call to the CNR user's wireless phone.

Incoming Call:

When the status of "E" wire of the E&M port goes high for greater than or equal to 'Minimum Pulse Width for Radio Call' SARVAM UCS considers it to be an incoming call, and routes the call as per the current call routing logic.

When an extension user answers the call, there is no signaling on the 'M' wire of the E&M port by SARVAM UCS.

The call between the extension user and the CNR user can be disconnected only if the extension user disconnects the call. So, it is recommended that the call 'Release Type' of the E&M port be set to 'None'.

The following table shows the status of the "M" wire of an E&M Port while making Outgoing calls and while receiving Incoming calls.

E&M Seizure Type	Status of 'M' Wire after seizure and in conversation in an OG Call	Status of 'M' Wire when an IC call is initiated	Status of 'M' Wire on answering and when in conversation in an IC Call
Immediate	High	Low	High
Immediate with Ack	High	Low	High
Immediate + Wink	High	Wink	High
Immediate with Ack +Wink (MFC R2)	High	Wink	High
Seizure Pulse	Low	Low	Low
Seizure Pulse + Wink	Low	Wink	Low
Express	Low	Low	Low
Radio A	High	Low	High
Radio B	High	Low	Low

- **Orientation Type:** Configure the Orientation Type of the E&M Port according to your installation scenario.

Select 'Station' if the E&M port is to function as Extension. All Extension-related parameters, the ["Station Basic Feature Template"](#) and the ["Station Advanced Feature Template"](#), will be applicable to this port.

Select 'Trunk' as orientation type if the port is to be assigned the feature of a trunk line. All trunk-related parameters, ["E&M Feature Template"](#), will be applicable to this port.

Select 'Tie Line'¹⁸¹ if the E&M port is to function as both a Station and a Trunk. The system will regard the port as a Station for incoming calls and as a Trunk for outgoing calls. The Station Basic and Advanced Feature Templates as well as the Trunk Feature Template will be applied on this port.

By default, the Orientation Type of all E&M ports is 'Station'.

- **Dial Type:** Digits can be dialed over E&M Tie Line by two methods:
 - **Tone:** In this Dial Type, the DTMF signals will be sent on the "Tx" of the E&M port of the originating side and it will be received over the "Rx" of the E&M port of the terminating side.
 - **Pulse:** In this Dial Type, the dialed digits will be sent on the "M" wire of the E&M port of the originating side and will be received over the "E" wire of the E&M port of the terminating side.

181. Such as in Systems used as Transit Exchanges as in a PLCC Network.

The way digits are sent varies according to the Trunk Seizure Type, as described for each Seizure Type below.

- **Express:** the caller can make call by pressing the DSS key.
- **Immediate:** the System seizes the Tie Line and the system will start the Pause Timer. On the expiry of the Pause Timer the System sends the digits to the remote System.
- **Seizure Pulse + Wink:** on receiving Wink signal from the terminating end, the originating side (which initiates seizure) will start the Pause Timer and on expiry of Pause Timer it will start sending digits.
- **Seizure Pulse:** the originating System system will start the Pause Timer after sending the Seizure Pulse. On expiry of the Seizure Pulse Timer it will send digits to the terminating end.

- **Pulse Dial Ratio:** This parameter is to be configured if 'Pulse' is selected as Dial Type in the previous parameter. Select the Pulse Dial Ratio from any of the following values:

- 10PPS, 1:2
- 10PPS, 2:3
- 10PPS, 1:1
- 20PPS, 1:2
- 20PPS, 2:3
- 20PPS, 1:1

The default Pulse Dial Ratio is 10PPS, 1:2

- **Wink Wait Timer (sec):** This parameter is to be configured, if 'Immediate + Wink' or 'Seizure Pulse + Wink' have been selected as Seizure Type for the E&M port.

The Wink Wait Timer is the Time period for which the system waits for the acknowledgment in the form of Wink Signal on "E" wire of the E&M port of the SARVAM UCS to consider it as a successful seizure.

The range of this timer is from 000 to 255 seconds. By default the timer is set to '000' seconds.

- **Wink Pulse Timer (msec):** This parameter is to be configured, if 'Immediate + Wink' or 'Seizure Pulse + Wink' have been selected as Seizure Type for the E&M port.

The Wink Pulse Timer defines the width of the Wink Pulse. The range of this timer is from 0000-9999 milliseconds. By default the timer is set to '0000' milliseconds.

- **Seizure Pulse Timers (msec):** This parameter is to be configured, if 'Seizure Pulse' is selected as Seizure Type for the E&M port.

- **T1:** This is the time period of the first ON period of the 'Seizure Pulse'.
- **T2:** this is the time period of the second ON period of the 'Seizure Pulse'
- **T3:** this is the time period of the third ON period of the 'Seizure Pulse'.

The range of T1, T2 and T3 is from 000-999 milliseconds. By default the timer is set to '000' milliseconds.

- **Minimum Pulse Width for Radio Seizure (msec):** This Timer is to be configured if 'Radio A' or 'Radio B' have been selected as the Seizure Type for the E&M ports.

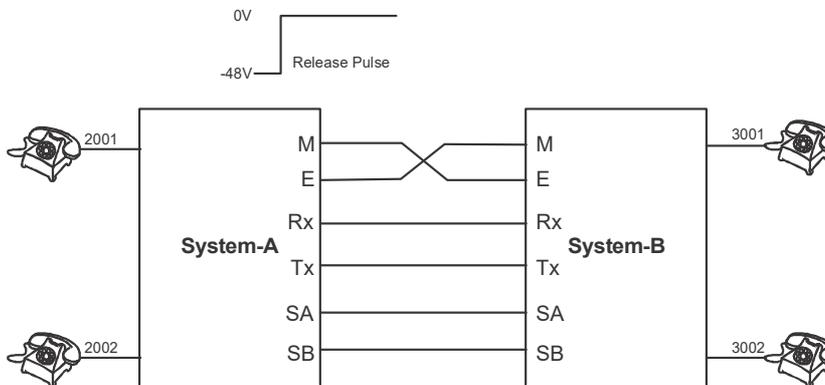

The Minimum Pulse Width for Radio Seizure defines the time for which the SARVAM UCS will wait to detect the width of the pulse sent by the Radio Interface Device¹⁸² on the 'E' wire of the E&M port and recognize it as a seizure signal (incoming call indication).

The range of this timer is from 000 to 999 milliseconds. By default the timer is set to '150' milliseconds.

- **Release Type:** SARVAM UCS supports four methods to 'release' E&M calls based on, which end will release the call and 'release pulse width'. These are:
 - **None:** Select this option if you have selected "Express" as Trunk Seizure Type for the E&M port. It is advisable to keep the Release Type as "None" in case the protocol does not support any signaling for disconnecting the E&M port, for the reason that 'Trunk-to-Trunk Inactivity Timer' will be started if the E&M port with Release type "None" is involved in a Trunk-to-Trunk call.
 - **Release Pulse:** Select this option if the specific Pulse width of the Release Pulse is to be used to disconnect the call. This Pulse width is configurable, as shown below:

The call can be disconnected by either party by sending Release Pulse. Consider the following example:

SLT 2001 is connected to System-A and SLT 3001 is connected to System-B.

SLT 2001 user goes ON-Hook.

- System-A will send Release Pulse over the "M" wire of its E&M port.
- System-A will release its E&M port.
- The Release Pulse sent by System-A will be received and detected on the "E" wire of the E&M port of the System-B.
- System-B will release its E&M port.

SLT 3001 user goes ON-Hook.

- System-B will send Release Pulse over the "M" wire of its E&M port.
- System-B will release its E&M port.
- The Release pulse sent by System-B will be received and detected on the "E" wire of the E&M port of the System-A.
- System-A will release its E&M port.

- **Status Change:** Select this option, if Status change of 'M' wire ('M' wire is low) is to be considered for release of the E&M call.

By default, 'Status Change' is selected as the Release Type for all E&M ports.

182. Connected on the 'M' wire of the E&M port. The Radio Interface Device sends pulse of approximately 100msec or higher.

If you selected 'Immediate with Ack + Wink' as Seizure Type for the E&M Port, select 'Status Change' as Release Type for the port.

- **Release Pulse Timer (msec):** This timer is to be configured if you selected the option 'Release Pulse' as the Release Type for E&M calls in the previous parameter.

This timer defines the specific Pulse width of the Release Pulse is to be used to disconnect the call. The range of this timer is from 0000-9999 milliseconds. By default the timer is set to '0000' milliseconds.

- **CCS - When End Point:** CCS (Comander Control Signal) is a type of signal used by PLCC Networks to improve the quality of speech transmission. The PLCC network awaits this signal from the System when speech is established. SARVAM UCS supports CCS. The system sends CCS signal to the PLCC panel.

This parameter is relevant if the E&M line is being used in a Power Line Communication Network (PLCC).

This flag should be enabled if the E&M port is used as an Endpoint in a PLCC network. When the E&M Port is used as an Endpoint, the system sends CCS to the PLCC panel while making an outgoing call through the E&M port and when receiving an incoming call on the E&M port.

By default, the flag is enabled.

- **CCS - When Transit Exchange:** This flag is to be enabled if the E&M port is used as a Transit exchange in a PLCC network.

When the E&M Port is used as a Transit Exchange: The system sends CCS to the PLCC panel when there is an Incoming/Outgoing Transit call through the E&M port.

By default, the flag is enabled.

- **DTMF Detection:** This flag is relevant when the 'Dial Type' for the E&M Port is selected as 'Tone'. This flag is of significance while receiving incoming calls.
- **Max. OG Pulse Digit Count:** This count defines the maximum number of digits that can be dialed out to make a call. When dialing out the number, if the number of digits exceeds this count, the port which is used for dialing these numbers is released automatically.
- **Idle Wait Timer (sec):** This timer signifies the time after which the codes could be simply (Station Numbers or Station Numbers with Exchange ID) dialed over the E&M trunk.

The Idle Wait Timer is useful in two conditions:

- **When Forced Disconnection is used.** For example, two exchanges A and B are connected through E&M trunk. Extension 2002 of System A is talking to extension 3001 of System B over the E&M line.

Extension 2001 of System A calls extension 3001 of System B and finds it to be busy.

Extension 2001 is allowed to use forced disconnection feature. Extension 2001 issues the forced disconnection command. The System A disconnects the Extension 2002. It then waits for the Idle Wait Timer to expire and then dials 3001 over the E&M trunk.

- **To stop any station from grabbing the E&M trunk until call is released.** For example, when Extension 2001 of System A goes On-Hook, System A sends a release signal over the E&M trunk to System B. In turn, System B sends a release signal to System A as an acknowledgment.

The E&M Idle Wait Timer set in System A does not allow any other extension of System A to grab the E&M trunk. Similarly, E&M Idle Wait Timer set in System B does not allow any extension of System to grab the E&M trunk.

- **Flash Timer (msec):** This Timer is significant when the System acts as a Transit exchange for a call. The flash received on one E&M Port is generated on another E&M Port involved in a Transit call.
- **Pause Timer (msec):** This Timer defines the time for which the system waits before dialing the outside number after grabbing the E&M trunk.

Sometimes an extension user may not get a dial tone immediately on grabbing a trunk, in this case, the extension user may wait for the dial tone before dialing out the number. However, when the system dials out the number, if there is no pause time, it is possible that the system may dial out the number before getting the dial tone. This may result in a wrong number being dialed out. The Pause Timer helps avoid this.

The range of this timer is from 0000 to 9999 msec. By default the Timer is set to 800 msec.

- **Pseudo Answer Supervision Timer (sec):** This is the time period after which, the system will consider the call as matured, irrespective of whether the call was answered or not. At the end of the Timer, the system will start detecting Disconnect Supervision.

The range of this timer is from 000 to 255 seconds. By default the Timer is set to 030 seconds.

- **Ring Timer (sec):** This is the time for which the extensions connected to SARVAM UCS ring for incoming calls.

The Ring Timer is useful in situations where the users may not be able to immediately answer on the first few rings. The range of this timer is from 000 to 255 seconds. By default the Timer is set to 255 seconds.

- **Inter-Digit Pause Timer (msec):** This Timer defines the time gap to be inserted between digits of a number string being dialed by the system.

The range of this timer is from 000 to 999 milliseconds. By default the Timer is set to 750 milliseconds.

- **DTMF Out Dial:** This parameter is of significance when the system dials out DTMF digits to enable the device at the remote end (in this case a System) to detect and decode the Tones. You must configure both the DTMF ON Time and the Level (dB) according to the DTMF digit detection capacity of the remote System.

For example, System A and System B are connected over E&M Line. System B detects DTMF digits only if the tone remains present (ON) for 100 milliseconds frequency and at a transmit level of 4 dB. The DTMF Out Dial parameter for System A should be configured accordingly. The DTMF Out Dial ON Time should be set to 100ms and Level to 4dB.

- **DTMF ON Time (msec):** This is the Time for which the DTMF digit tone will remain ON, while being dialed out by the SARVAM UCS. The range of this timer is 50 to 500 milliseconds. By default the ON Time is set to 100 milliseconds.

This Timer must be configured according to the DTMF digit detection capacity of the remote device.

- **DTMF Tx Level (dB):** This is the Transmit Level of the DTMF digit dialed out by the system. The range of DTMF Out Dial 'Level' is from 0 to 7. By default DTMF Out Dial Level is set to 3.
- **MFC R2 Signaling:** This parameter is relevant only if you selected 'Immediate with Ack + Wink' as the Seizure Type. Configure the following timers related to MFCR2 Signaling.
 - **Forward Tone Maximum ON Time (T1) (sec):** the range of this timer is from 1 to 99 seconds. By default it is set to 15 seconds.
 - **Forward Tone Maximum OFF Timer (T2) (sec):** The range of this timer is from 1 to 99. By default it is set to 24 seconds.
 - **Maximum Compelled Cycle Timer (T3) (sec):** the range of this timer is from 1 to 99. By default it is set to 15 seconds.
 - **Pulse Duration for Pulse Signal (msec):** The range of this timer is from 001 to 999. By default, it is set to 150 seconds.
 - **Pulse Signal Maximum Wait Timer (sec):** The range of this timer is from 1 to 99. By default, it is set to 15 seconds.
 - **First Forward Tone Wait Timer (sec):** The range of this timer is from 8 to 24. By default, it is set to 15 seconds.
 - **Minimum MF Signal Persist Timer (msec):** The range of this timer is from 1 to 255 seconds. By default, it is set to 20 seconds.
 - **Inter Digit Wait Timer (sec):** By default it is set to 10 seconds.
 - **Ask CLI:** By default, it is enabled.
- **Prefix String:** This parameter is useful when the System's connected using E&M lines do not send 0 when the user dials a number of another exchange. You must configure this parameter as zero along with the exchanges's ID and appropriately configure the strip digit count parameter in the CUG Table.
- **Category (Logical Partitioning):** This parameter assigns the E&M Port to a trunk category for the purpose of Logical Partitioning. By default all E&M Ports are assigned to Category 3¹⁸³.

If you have re-defined Category 3 or have assigned E&M ports to a different category, say Category 2, enter the same number here.

You may configure the call permission between the Category assigned to E&M Ports and other Categories. Refer the feature description "[Logical Partition](#)" to know more.

183. Trunk ports used to interconnect two Systems are assigned this category.

Customizing E&M Feature Template

By default E&M Feature Template 01 is applied on all E&M Ports. This template has 'Station' as the default Orientation Type.

If all the E&M Ports are to be configured as 'Stations', then retain this template.

If all the E&M Ports are to be configured as 'Trunks', use the default E&M Feature Templates 09 and 10 which have 'Trunks' as Orientation Type.

If some of the E&M Ports are to be configured as Stations, some as Trunks and yet others as Tie Lines, prepare different E&M Feature Template for each Orientation Type and apply them to the related ports.

The E&M Feature Template can be customized using Jeeves and a Telephone.

Customizing E&M Feature Template using Jeeves

- Log in to Jeeves as System Engineer.
- Under **Configuration**, click **E&M Configuration**.
- Click **E&M Feature Template**.

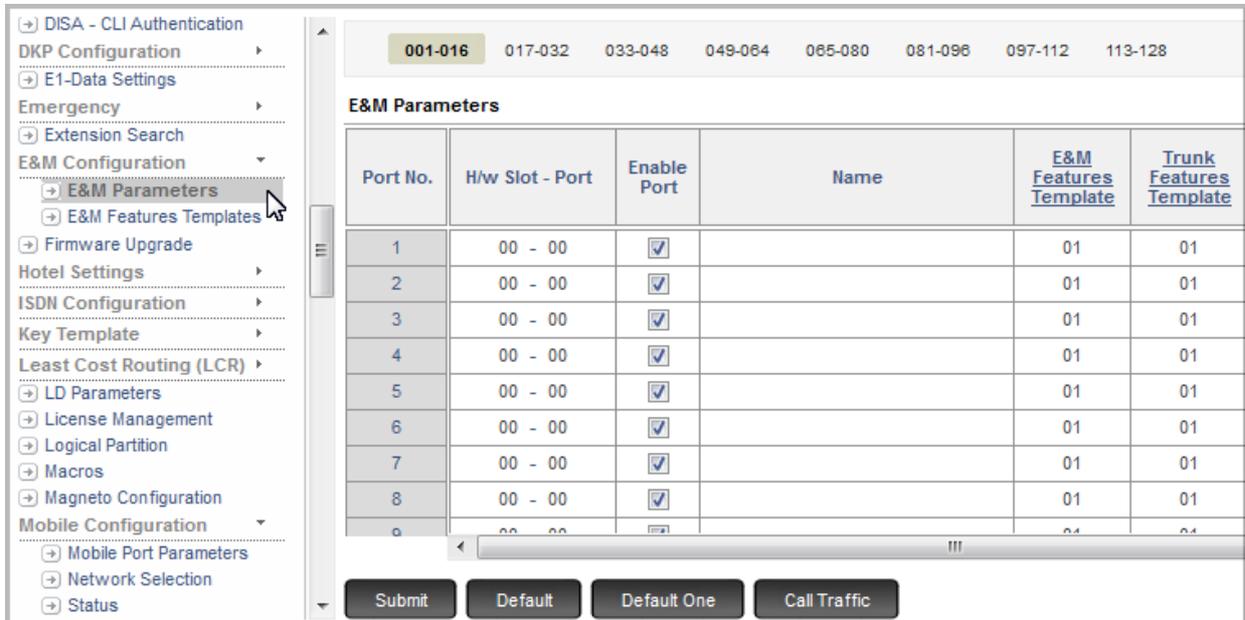

The screenshot displays the 'E&M Features Templates' configuration interface. On the left is a navigation menu with 'E&M Features Templates' selected. The main area shows a table with 8 templates. The '01-10' tab is active. Below the table are 'Submit', 'Default', and 'Default One' buttons.

Template No.	Seizure Type	Orientation Type	Dial Type	Pulse Dial Ratio
1	Immediate	Station	Pulse	10PPS1:2
2	Immediate	Station	Tone	10PPS1:2
3	Immediate+Wink	Station	Pulse	10PPS1:2
4	Immediate+Wink	Station	Tone	10PPS2:3
5	Immediate+Wink+Ack(MfcR2)	Station	Tone	10PPS1:1
6	Seizure Pulse	Station	Tone	10PPS1:2
7	Seizure Pulse+Wink	Station	Pulse	10PPS1:2
8	Seizure Pulse+Wink	Station	Tone	10PPS1:2

- Select an E&M Feature Template Number.
- Customize the E&M Feature Template.
- Click **Submit** to save changes.
- Now, apply the E&M Feature Template you customized to the E&M Ports and T1E1PRI ports.

To apply E&M Feature Template on E&M ports:

- Click the **E&M Parameters** to open the page.
- Apply the E&M Feature Template you customized to the E&M Port by entering the template number in the **E&M Feature Template** field of this port.

- Click **Submit** to save changes.

To apply E&M Feature Template on T1E1PRI ports:

- Click **T1E1 Configuration**.
- Click the **E&M Signaling**.

- Click the tab of the desired T1E1 trunk port number (1 to 8), you wish to apply the E&M feature Template.

- Enter the number of the Template you customized in the field **E&M Feature Template** of the selected T1E1 trunk port.
- Click **Submit** to save changes.

Customizing E&M Feature Template using a Telephone

- Enter SE mode from a DKP/SLT.

To change the default values of a Parameter in an E&M Feature Template:

- **6002-1-Template Number-Parameter Number-Code** to change the value of a parameter in a single template.
- **6002-2-Template Number-Template Number-Parameter Number-Code** to set the same value for the parameter in a range of templates.
- **6002-*-Parameter Number-Code** to set the same value for the parameter in all templates.

Where,

Template Number is the number of the E&M Feature Template from 01 to 50.

Parameter Number is the number of the E&M Feature Template Parameter from 01 to 35.

Code is the parameter value.

Refer the following table for the Parameter Number and default parameter values of all E&M Feature Templates.

Default E&M Feature Templates

Radio A																											
Radio B																											
Immediate with Ack+Wink (MFCR2)																											

For example, you want to Immediate with Ack +Wink in the E&M Template number 2.

- Dial **6002-1-2-01-9**

Where

2 is for E&M Template number 2

01 is parameter number for Seizure Type

9 is the value of Immediate with Ack+Wink

To restore default values to the Parameters of an E&M Feature Template:

- Dial **6001-1-Template Number** to restore default values of the parameters of a single template.
- Dial **6001-2-Template Number-Template Number** to restore the default values of a range of templates.
- Dial **6001-*** to restore the default values of all templates.

To assign an E&M Feature Template to an E&M port

- Dial **6003-1-E&M-Template Number** to assign a template to a single E&M port.
- Dial **6003-2-E&M-E&M-Template Number** to assign the same template to a range of ports.
- Dial **6003-*-Template Number** to assign the same template to all ports.

Where,

E&M is the number of the E&M Software port from 001 to 128.

Template Number is the number of the E&M Feature Template from 01 to 50.

Default: Template 01 is assigned to all E&M ports.

To assign E&M Feature Template to a T1E1 Port:

- Dial **6004-1-T1E1-Template Number** to assign a template to a single T1E1 port.
- Dial **6004-2-T1E1-T1E1-Template Number** to assign the same template to a range of T1E1 ports.
- Dial **6004-*-Template Number** to assign the same template to all T1E1 ports.

Where,

T1E1 is the number of the T1E1PRI Software port, 01 to 08.

Template Number is the number of the E&M Feature Template from 01 to 50.

Default: Template 01 is assigned to all T1E1 ports.

- Exit SE mode.

Trunk Feature Template

The Trunk Feature Template is a set of general features that define the behavior of a Trunk port. SARVAM UCS offers 50 such Templates.

A Trunk Feature Template is assigned to all the Trunk types: SIP, T1E1 PRI, BRI, Mobile, CO and E&M.

Trunk Feature Template Parameters

The Trunk Feature Template contains the following features:

- **Time Table:** Select a Time Table for the Trunk ports.

A Time Table is a schedule of the three Time Zones, namely: Working Hours, Break Hours, Non-Working hours for a week.

Certain features of the SARVAM UCS like Operator, Auto Attendant, DISA, Trunk Landing Group, require the trunk to behave differently in each Time Zone. For example, it can be made to land on the Operator extension during working hours, and on the extension of the dining area during Break (lunch) hours, and on the extension of the Security Personnel during non-working hours.

So, a Time Table is assigned to extensions defining the Time Zones for the entire week, so that the system can execute the Time Zone-dependent features and facilities according to the Time Table.

There are 8 different Time Table templates to select from. By default, the Time Table 1 is assigned to all Trunk Feature Templates. All seven days of the week are 'working hours 9:00-18:00' with break hours '13:00 -14:00 hrs'.

You may also customize the default Time Table 1 OR customize and assign a different Time Table to the Trunk Feature Template. Please refer the topic "[Time Tables](#)" for more details.

- **Operator:** Define the Operator for the Trunks on which the template is applied. Operator is used to route the call when the caller dials '9' during an Auto Attendant call. This parameter is of significance only if Built-In Auto Attendant/DISA is enabled on the trunk.

The system supports multiple Operators. In each Time Zone any one of the 20 Operators can be selected.

Trunks may be assigned to a single Operator, or different groups of Trunks may be assigned to different Operators, so that call management is more efficient. For instance certain Trunks may be assigned to Operator 1, while some may be assigned to Operator 2 and the rest to Operator 3.

Operator 1 is the default in the Trunk Feature Template. If you want to assign different trunks to different Operators, you must create a separate Trunk Feature Template with a different Operator for each trunk group.

Refer the topic [“Operator”](#) to know more.

- **CLI Based Routing:** Select the check box to enable CLI Based Routing on the Trunk for each Time Zone: Working Hours (WH), Break Hours (BH) and Non-working Hours (NH). Default: disabled.

If you enable CLI Based Routing on the trunk for a Time Zone, make sure you also configure the CLI Based Routing Table. To know more, refer the feature description [“CLI Based Routing”](#).

- **Trunk Landing Group (Routing Group):** This parameter allows you to configure the group of extensions on which incoming calls on the trunks (to which this template is assigned) are to be landed. This group of extensions is referred to as 'Trunk Landing Group' (TLG).

To configure the TLG, you must first configure Routing Groups. Refer [“Trunk Landing Group \(TLG\)”](#) for instructions on configuring trunk landing groups. Also refer the topic [“Routing Group”](#).

There are as many as 96 Routing Groups which can be assigned as TLG. By default, Routing Group 01 is assigned as TLG for all Time Zones. If you have prepared a different TLG for each Time Zone, for example, Routing Group 02 for Working Hours and Break Hours, Routing Group 3 for Non-Working Hours, then enter the number of these Routing Groups in the TLG field.

- **Auto Attendant:** This parameter is to be configured if you want to enable [“Auto Attendant”](#) on the trunk ports on which you will apply the template.

Auto Attendant can be enabled or disabled for each Time Zone, namely Working Hours (WH), Break Hours (BH) and Non-Working Hours (NH).

- For each Time Zone, you may select the desired **Auto Attendant Type** from the following:
 - **OFF:** Select this option if you want to disable Auto Attendant for the Time Zone.
 - **Built-In Auto Attendant:** Select this option if you want the calls to be answered by the built-in Auto Attendant of the SARVAM UCS. In Built-In Auto Attendant, SARVAM UCS answers the call using Voice Modules, if assigned, or it answers the call and plays the appropriate call progress tone - Dial tone, Ring Back tone, Busy tone - for each call state.

If you select this option, make sure you also configure the Built-In Auto Attendant related Timers and Flags, record and assign the Built-In Auto Attendant related Voice Message and set the Start Time for the Greeting Messages. Refer the topics [“Auto Attendant”](#) , [“Voice Message Applications”](#) and [“Greeting Message Time”](#) in *System Parameters* for instructions.

- **Voice Mail Auto Attendant:** Select this option if you want the calls to be answered by the Auto Attendant of the Voice Mail System. The Voice Mail System of SARVAM UCS answers calls and processes them according to the Voice Mail Auto Attendant Menu assigned to the trunk.

By default, Auto Attendant is disabled (OFF) for all the Time Zones.

- **Auto Attendant Delayed Timer:** Set this Timer, if you want to enable [“Delayed Auto Attendant”](#) on the trunk.

When you enable Delayed Auto Attendant, SARVAM UCS routes the incoming call on the trunk to the Trunk Landing Group assigned to this trunk. It waits for the duration of the Auto Attendant Delayed Timer for any of the extensions in the Trunk Landing Group to answer the call.

If none of the extensions in the Trunk Landing Group answers the call before the expiry of the Auto Attendant Delayed Timer, SARVAM UCS processes the call according to the type of Auto Attendant - Built-In Auto Attendant or Voice Mail Auto Attendant, set for the trunk.

To enable Delayed Auto Attendant, set the timer to the desired value from the list. By default, it is set as Never that is it is disabled.

- **Voice Mail Auto Attendant (VMAA) Menu:** if you have selected the *Voice Mail Auto Attendant* as the Auto Attendant Type, select the VMAA Menu to assign to the respective Trunk Feature Template.

You may click the *Voice Mail Auto Attendant (VMAA) Menu* link to edit the parameters of desired VMAA Menu. For details, see [“Voice Mail Auto-Attendant Menu”](#).

- **DISA:** This parameter is to be configured if you want to enable [“Direct Inward System Access \(DISA\)”](#) on the trunk ports on which you will apply the template.

DISA can be enabled or disabled for each Time Zone, namely Working Hours (WH), Break Hours (BH) and Non-Working Hours (NH).

For each Time Zone, you may select the desired DISA option from the following:

- **Disabled:** Select this option if you want to disable DISA.
- **PIN Auth.-Multiple calls:** Select this option if you want to enable DISA with PIN Authentication and allow multiple calls during the DISA login session.
- **CLI Auth.-Multiple calls:** Select this option if you want to enable DISA login with CLI Authentication and allow multiple calls to be made during the DISA login session.

Caller numbers that do not match with the CLI Table will be routed as per the logic of the Trunk Feature Template.

- **CLI Auth.-One call:** Select this option if you want to enable DISA session with CLI Authentication, and allow only a single call to be made during the DISA login session. This form of DISA is used when SARVAM UCS is installed in a Gateway application. This form of DISA is applicable on CO Trunks only.

By default, DISA is disabled for all Time Zones.

- **Trunk Auto Answer:** This parameter is relevant only if you want to enable the [“Trunk Auto Answer”](#) feature on the Trunk ports on which this template is applied.

Trunk Auto Answer enables calls landing on a trunk to be answered automatically by greeting the caller with a voice message before the call is actually handled.

You can set the following types of Trunk Auto Answer:

- **OFF:** Select this option if you do not want Trunk Auto Answer on the trunk.
- **For all Calls:** Select this option if you want all incoming calls landing on the trunk line to be answered.
- **When Busy:** Select this option if you want the system to answer incoming calls on the trunk to be answered if the landing destination is busy.
- **Delayed:** Select this option if you want SARVAM UCS to answer the incoming calls on the trunk if not answered by the landing destination within a certain time period, set as the *Delayed Trunk Auto Answer Timer*.

The system first routes the incoming calls to the Trunk Landing Group. It waits for the duration of the Delayed Trunk Auto Answer timer for any of the extensions in the Trunk Landing Group to answer the call.

If the call is not answered by any of the extensions, before the expiry of this timer, the system answers the call and routes it as per the Trunk Auto Answer logic.

- If you select **Delayed** as the Trunk Auto Answer option, you must also configure the **Delayed Trunk Auto Answer** timer. Valid Range of the timer is 01 to 99 seconds. By default, it is set as 10 seconds.

Trunk Auto Answer can be enabled or disabled for each Time Zone, namely Working Hours (WH), Break Hours (BH) and Non-Working Hours (NH).

By default, Trunk Auto Answer is Off.

If you have enabled Trunk Auto Answer for All Calls, When Busy or Delayed, you must also set the Trunk Auto Answer Greeting Message.

- **Trunk Auto Answer Greeting Message:** This parameter is to be configured only if you have enabled Trunk Auto Answer **For All Calls** or **When Busy** for a Time Zone in the previous parameter.

Assign the number of the Trunk Auto Answer Greeting with which callers will be greeted. For this you must first record a Voice Module with the desired Greeting Message and assign it to this parameter.

You can assign up to 4 Greetings Messages for Trunk Auto Answer and assign a different Greeting message for each Time Zone. Refer the topic "[Voice Message Applications](#)" for instructions on configuring the greetings.

Enter the number of the Greeting Message you want to be played for each Time Zone. By default, Trunk Auto Answer Greeting number 1 is assigned to all Time Zones.

- **Trunk Auto Answer RBT Message Type:** This parameter is to be configured only if you have enabled Trunk Auto Answer 'For All Calls' or 'When Busy' for a Time Zone in the previous parameter.

When Trunk Auto Answer is enabled on a trunk, the system will answer the caller with a Greeting message once, and play the Ring Back Tone (RBT) Message Type you have selected. You can select an RBT Message Type from the following options:

- **None:** The system will play Ring Back Tone to the caller after the Trunk Auto Answer Greeting Message.

- **Internal MOH:** The system will play internal music-on-hold to the caller after playing the Trunk Auto Answer Greeting Message.
- **RBT Message:** The system will play a voice message continuously to the caller.

If you select this option, you must first record a Voice Module with the desired RBT Greeting Message.

You can set up to 4 RBT Messages. You can also assign a different RBT message for each Time Zone. Refer the topic "[Voice Message Applications](#)" for instructions on configuring the RBT Message. Assign the number of the RBT Message you want to be played to callers in each Time Zone.

By default, 'None' is selected as RBT Message Type for all Time Zones.

- **Trunk Auto Answer Busy Bye Message:** This parameter is to be configured only if you have enabled Trunk Auto Answer ('For All Calls' or 'When Busy') for a Time Zone.

When Trunk Auto Answer is enabled on a trunk, the system will answer the caller with a Greeting message once, and play the Ring Back Tone (RBT) Message Type you have selected (see previous parameter) continuously for the duration of the Built-In Auto Attendant Inactivity Timer. If the landing destination (called extension) is busy on the expiry of this Timer, the system will inform the caller about the busy state in two ways, which you can select from the following options:

- **None:** The system will play a Busy Tone to the caller.
- **Bye Message:** The system will play a voice message to the caller.

If you select this option, you must first record a Voice Module with the desired Bye Message.

You can set up to 4 Busy Bye Message. You can also assign a different Busy Bye message for each Time Zone. Refer the topic "[Voice Message Applications](#)" for instructions on configuring the Busy Bye Message.

Assign the number of the Bye Message you want to be played to callers in each Time Zone.

By default 'None' is selected as Busy Bye Message for all Time Zones.

- **Priority:** Select a Priority Level for the trunks on which the template will be applied.

Each trunk of the SARVAM UCS can be assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority.

Whenever there are incoming calls on multiple trunks, the call on the trunk with higher priority will be answered by the Operator extension first. To know more, read the feature description "[Priority](#)".

By default, the Priority of all trunks is set to '9-Highest'. Decide what Priority Level you will assign to the trunks and set the desired level for the trunk.

- **SMDR-OG Storage:** This flag is used to enable or disable the storage of details of outgoing calls from the trunk. Please refer the topic "[Station Message Detail Recording-Storage](#)" for more details. By default, storage of outgoing calls is enabled.

- **SMDR-IC Storage:** This flag is used to enable or disable storage of details of incoming calls on the trunk. Please refer the topic "[Station Message Detail Recording-Storage](#)" to know more. By default, storage of incoming calls is enabled.
- **Hold on DSS Key Press:** This flag defines the 'Hold' state of the external called party, when an extension user presses a DSS key to dial another port.

For example, the DKP extension user (on DKP-001 port) is in the middle of speech with an external party on a Trunk port CO-002.

If extension user of DKP-001 presses a DSS key to call another extension port DKP-003, two situations are possible, depending on whether the Hold on DSS Key Press flag is enabled or disabled:

- **When the Hold Flag is enabled:** CO-002 will be played music-on-hold. DKP-001 will hear Ring Back Tone and the call will be placed on DKP-003.
- **When Hold Flag is disabled:** CO-002 will be disconnected. DKP-001 will hear Ring Back Tone, and call will be placed on DKP-003.

By default the Hold On DSS Key Press flag is enabled.

- **Forced Account Code:** This parameter is related to the "[Account Codes](#)" feature of the SARVAM UCS. This flag must be enabled, if the feature Forced Account Code is to be applied on the trunks.

When this flag is enabled, the system will prompt extension users to dial the Account Code whenever they grab a trunk to dial out a number. The system will allow extension users to dial out numbers only when after they have dialed the Account Code or Name.

By default, the flag is disabled. Refer the feature description for "[Account Codes](#)" to know more.

Account Codes feature must also be enabled in the Class of Service of extension users who are to be allowed this feature.

- **Call Cost Calculation Pulse Rate Option:** This parameter is to be configured only if you want to apply the "[Call Cost Calculation \(CCC\)](#)" feature on the trunks on which the template is applied.

You have four options for Pulse Rate Types. Select from Pulse Rate Type for Pulse Rate Option 1 to 4 which you want to apply on the trunks.

- **Call Cost Calculation Time Schedule:** This parameter is to be configured only if you want to apply the "[Call Cost Calculation \(CCC\)](#)" feature on the trunks on which the template is applied.

The Pulse Rates offered by service providers may vary according to the time of the day. In such cases, you must first define the Time Zone (time of the day) for which a particular Pulse Rate should be applied and the Time Schedule for each Time Zone.

You can configure up to four different Time Zones - T1, T2, T3 and T4 with different Pulse rates in the CCC-"[Configuring Pulse Rate Types](#)".

Now, configure the Call Cost Calculation Time Schedule, by specifying the Start Time and the End time (in 24hours: minutes format) for each Time Zone.

The default Time Schedule (starts and end time) for each Time Zone Index are as follows:

Time Zone Index	Start Time	End Time
T1	00:00	23:59
T2	00:00	23:59
T3	00:00	23:59
T4	00:00	23:59

If your service provider offers the same Pulse Rate for the entire day,

- configure only one Time Zone Index with the Pulse Rate, for instance, T1, in the CCC-Normal Pulse Rate Table.
- Now, set the Time Schedule for Time Zone, T1, with the start and end time in Hours: Minutes format;
- set the start and end time of the other Time Zone Index, T2 to T4, to 00:00 (hours: minutes).

Similarly, if your service provider supports two different Pulse Rates in a day, set the Start and the End time for two Time Zones and set the other two to 00:00.

- **Call Duration Control:** This parameter is to be configured only if you want to apply the “[Call Duration Control \(CDC\)](#)” feature on the trunks on which the template is applied.

By default the Call Duration Control - **For IC Calls** check box is selected (enabled). Clear the check box to disable.

By default the Call Duration Control - **For OG Calls** check box is selected (enabled). Clear the check box to disable.

- **Call Taping:** This parameter is to be configured only if you want to apply the “[Call Taping](#)” feature on the trunks on which the template is applied.

Select the Call Taping check box to enable.

- Click **Submit**.

Customizing Trunk Feature Templates

By default, Trunk Feature Template 01 is assigned to all Trunk Types: SIP, T1E1 PRI, BRI, Mobile, CO and E&M. The default values of the parameters of this template are sufficient to meet the common requirements of most users.

If the default values of the Template fulfill the requirements of all Trunk types, retain this template. If you want to change some of the feature settings and apply the template to all trunk types, you may simply customize this template.

However, if you want to assign different feature settings for different trunk types, you are recommended to prepare and apply separate Trunk Feature Templates for each Trunk type.

This can be done using Jeeves and from a telephone.

Customizing Trunk Feature Template using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Trunk Feature Template**.

Template No.	Time Table	Operator	CLI Based Routing			Trunk Landing Group (Routing Group)			Type	Delay Auto Attendance	Voice Mail Auto Attendant (VMAA) Menu
			WH	BH	NH	WH	BH	NH			
1	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
2	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
3	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
4	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
5	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
6	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
7	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
8	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
9	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour
10	1	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	01	01	01	OFF	Never	Working Hour

- Select a Trunk Feature Template Number, for instance 02.
- Customize the Template by changing the values of the desired parameters.
- Click **Submit** to save changes.
- Apply the Trunk Feature Template you customized to the CO Port type.
- To apply the template on CO Trunks,
 - Open **CO Parameters** page.
 - Go to the CO software ports to which this Template you customized is to be assigned, for instance CO-001 to 003.

- Enter the number of the Trunk Feature Template you customized, 02, in the **Trunk Feature Template** field of this port.

The screenshot displays the 'CO Parameters' configuration page. The left sidebar shows a navigation menu with 'CO Parameters' selected. The main content area features a table with the following data:

Port No.	H/w Slot - Port	Enable Port	Name	CO Hardware Template	Trunk Features Template	Cost Factor
1	02 - 03	<input checked="" type="checkbox"/>		02	01	01
2	02 - 04	<input checked="" type="checkbox"/>		02	01	01
3	02 - 05	<input checked="" type="checkbox"/>		02	01	01
4	02 - 06	<input checked="" type="checkbox"/>		02	01	01
5	00 - 00	<input checked="" type="checkbox"/>		02	01	01
6	00 - 00	<input checked="" type="checkbox"/>		02	01	01
7	00 - 00	<input checked="" type="checkbox"/>		02	01	01
8	00 - 00	<input checked="" type="checkbox"/>		02	01	01
9	00 - 00	<input checked="" type="checkbox"/>		02	01	01
10	00 - 00	<input checked="" type="checkbox"/>		02	01	01
11	00 - 00	<input checked="" type="checkbox"/>		02	01	01
12	00 - 00	<input checked="" type="checkbox"/>		02	01	01
13	00 - 00	<input checked="" type="checkbox"/>		02	01	01
14	00 - 00	<input checked="" type="checkbox"/>		02	01	01
15	00 - 00	<input checked="" type="checkbox"/>		02	01	01
16	00 - 00	<input checked="" type="checkbox"/>		02	01	01

At the bottom of the page, there are five buttons: Submit, Default, Default One, Advance, and Call Traffic.

- Click **Submit** to save changes.
- To apply the template on Mobile Ports,
 - Click **Mobile Configuration**.
 - Click **Mobile Port Parameters** to open the page.

- Enter the number of the template you customized in the field **Trunk Feature Template** of the Mobile Software ports to which you want to assign this template.

Port No.	H/w Slot-Port	Enable Port	Name	Band Selection (Freq in MHz) (GSM)
1	05 - 01	<input checked="" type="checkbox"/>		All Band
2	05 - 02	<input checked="" type="checkbox"/>		All Band
3	05 - 03	<input checked="" type="checkbox"/>		All Band
4	05 - 04	<input checked="" type="checkbox"/>		All Band
5	00 - 00	<input checked="" type="checkbox"/>		All Band
6	00 - 00	<input checked="" type="checkbox"/>		All Band
7	00 - 00	<input checked="" type="checkbox"/>		All Band

- Click **Submit** to save changes.
- Repeat the same steps to create another template and apply it on the desired Trunk Port type.
To apply the template on E&M ports, open **E&M Parameters** page under E&M Configuration.
To apply the template on SIP Trunks, open **SIP Parameters** page under VoIP Configuration.
To apply the template to BRI Trunks, open **BRI Parameters** page under BRI Configuration.
To apply the template on T1 lines, open **T1 Port Parameters** page under T1E1 Configuration.
To apply the template on E1 lines, open **E1 Port Parameters** page under T1E1 Configuration.
- Remember to click **Submit** to save your settings on each page.

Customizing Trunk Feature Template using a Telephone

- Enter SE mode from a DKP/SLT.

To change the default value of a Trunk Feature Parameter in a Template, dial:

- **5802-1-Trunk Feature Template Number-Feature Number-Code** to change the value of a parameter in a single template
- **5802-2-Trunk Feature Template Number-Trunk Feature Template Number-Feature Number-Code** to set the same value for the parameter in a range of templates.
- **5802-*-Feature Number-Code** to set the same value for the parameter in all templates.
Template Number is the number of the Trunk Feature Template from 01 to 50.
Parameter Number is the number of the Trunk Feature Template Parameter from 01 to 40.
Code is the value for each parameter from 0 to 9.
Refer the following table for the parameter numbers and the values for the codes.

Trunk Feature Templates - Parameter Numbers and Default Values

Para. No	01	02	03	04	05	06	07	08	09	10	11	12

For example: Assign Trunk Landing Group 03 to Working Hours and Break Hours and Trunk Landing Group 04 to Non-Working Hours in Template 02.

To assign TLG 03 to Working Hours, dial:

- **5802-1-02-03-03**

Where,

02 is the template number

03 is the parameter number for TLG-Working Hours

03 is the code for the TLG to be assigned to Working Hours.

To assign TLG 03 to Break Hours, dial:

- **5802-1-02-04-03**

Where,

02 is the template number

04 is the parameter number for TLG-Break Hours

03 is the code for the TLG to be assigned to Break Hours.

To assign TLG 04 to Non-Working Hours, dial:

- **5802-1-02-05-03**

Where,

02 is the template number

05 is the parameter number for TLG-Non-Working Hours

03 is the code for the TLG to be assigned to Non-Working Hours.

To default Trunk Feature Templates, dial:

- **5801-1-Trunk Feature Template Number** to default a single template.
- **5801-2-Trunk Feature Template Number-Trunk Feature Template Number** to default a range of templates.
- **5801-*** to default all templates.

Where,

Trunk Feature Template is the template number from 01 to 50.

- To assign a Trunk Feature Template to a Trunk Port type:

For CO trunks, dial:

- **5803-1-CO- Trunk Feature Template Number** to assign a feature template to a single CO port.
- **5803-2-CO-CO- Trunk Feature Template Number** to assign a feature template to a range of CO ports.
- **5803-*- Trunk Feature Template Number** to assign a feature template to all CO ports.

Where,

CO is the Software Port number of the CO port from 001 to 128.

Template Number is the number of the customized Trunk Feature Template, from 01 to 50. Default: Template 01.

For BRI trunks, dial:

- **5804-1-BRI- Trunk Feature Template Number** to assign a feature template to a single BRI port.
- **5804-2-BRI-BRI- Trunk Feature Template Number** to assign a feature template to a range of BRI ports.
- **5804-*- Trunk Feature Template Number** to assign a feature template to all BRI ports.

Where,

BRI is the Software Port number of the CO port from 01 to 32.

Template Number is the number of the customized Trunk Feature Template, from 01 to 50. Default: Template 01.

For E&M Trunks, dial:

- **5805-1-E&M- Trunk Feature Template Number** to assign a template to a single E&M port.
- **5805-2-E&M-E&M- Trunk Feature Template Number** to assign the same template to a range of E&M ports.
- **5805-*- Trunk Feature Template Number** to assign the same template to all E&M ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Template Number is the number of the customized Trunk Feature Template, from 01 to 50. Default: Trunk Feature Template 01.

For T1E1 Trunks, dial:

- **5806-1-T1E1- Trunk Feature Template Number** to assign a template to a single T1E1 port.
- **5806-2-T1E1- Trunk Feature Template Number** to assign the same template to a range of T1E1 ports.
- **5806-*- Trunk Feature Template Number** to assign the same template to all T1E1 ports.

Where,

T1E1 is the Software Port number of the port from 01 to 08.

Template Number is the number of the customized Trunk Feature Template, from 01 to 50. Default: Trunk Feature Template 01.

For Mobile ports, dial:

- **5807-1-Mobile- Trunk Feature Template Number** to assign a template to a single Mobile port.
- **5807-2-Mobile-Mobile- Trunk Feature Template Number** to assign the same template to a range of Mobile Ports.
- **5807-*- Trunk Feature Template Number** to assign the same template to all Mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Template Number is the number of the Trunk Feature Template, from 01 to 50.

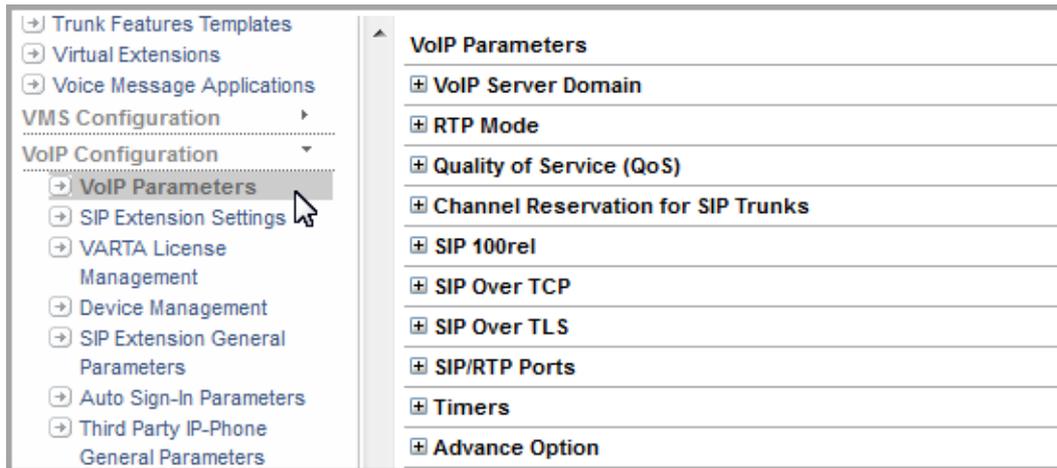

Default: Trunk Feature Template 01.

- Exit SE mode.

Configuring VoIP Parameters

Configuring VoIP Parameters using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **VoIP Parameters** to open the page.

VoIP Server Domain

Click **VoIP Server Domain** to expand.

- **VoIP Server Domain:** This parameter is of relevance only if you are configuring SIP Extensions.

The system is capable of maintaining a domain for registering SIP clients (any SIP-enabled device) as SIP Extensions.

Configure the Server Domain if you want SIP clients to register with the Registrar Server of the system using the domain handled by the system¹⁸⁴. The Domain Name can be a maximum of 40 characters. Default: Blank.

If you configure Server Domain for registration of SIP clients, you must also map the Domain Name and the IP Address of the WAN Port to the DNS Server in the network.

184. SIP clients can be registered with the system either using the domain handled by the CPU or using the WAN or LAN Port IP Address.

If domain is programmed, the system will listen for the SIP message which is redirected to the programmed domain only. It will also listen for SIP messages on the WAN IP address and LAN IP address.

But if domain is not programmed, the system will listen for SIP messages only on the WAN IP Address and LAN IP address.

RTP Mode

Click **RTP Mode** to expand.

RTP Mode	
RTP Mode	Transcoding ▼
MoH Vocoder Preference 1	G.729 AB ▼
MoH Vocoder Preference 2	G.711 A-Law ▼
MoH Vocoder Preference 3	G.711 μ -Law ▼

- **RTP Mode:** Select the desired RTP mode using which you want SARVAM UCS to route speech in SIP to SIP calls.

You can select from the following:

- **Transcoding:** When this option is selected, RTP packets will be routed using Vocoder channels¹⁸⁵ for SIP to SIP calls. SIP users (Extended SIP Clients and Standard SIP Clients) will be able to access all the features of SARVAM UCS. This option uses two Vocoder channels for SIP to SIP calls. Thus the maximum number of SIP to SIP calls per system is equal to the number of Vocoder channels divide by 2.
- **RTP Relay:** When this option is selected, RTP packets will be routed without using Vocoder channels for SIP to SIP calls. The system will use Vocoder channels to route SIP to TDM calls and vice versa. System will use Vocoder channels for some features and Standard SIP Clients will be able to use limited features of SARVAM UCS. Refer to [“SARVAM UCS Features supported with RTP/Direct RTP”](#) for more details.
- **Direct RTP:** When this option is selected, no Vocoder channel will be used for SIP to SIP calls and RTP packets will be sent to and fro directly between SIP end points. If transfer of RTP packets is not possible between SIP end points, system will use RTP Relay as the fallback option. The system will use Vocoder channels to route SIP to TDM calls and vice versa. System will use Vocoder channels for some features and Standard SIP Clients will be able to use limited features of SARVAM UCS. Refer to [“SARVAM UCS Features supported with RTP/Direct RTP”](#) for more details.

- *Direct RTP is not supported on SIP Trunks and MATRIX VARTA ADR100/AMP100/WIN200, therefore the system will use RTP Relay.*
- *If RTP Relay or Direct RTP is selected,*
 - *Maximum 550 Audio calls¹⁸⁶ or 55 Video calls are supported in SARVAM UCS.*
 - *Certain voice messages will not be played. See [“Voice Message Applications”](#) for more details.*
- *If you change the RTP Mode, the system will release all ongoing calls.*
- **MoH Vocoder Preference:** If RTP Mode is set as RTP Relay or Direct RTP, the system will play the MoH stored in the Vocoder module when the system holds any SIP end point. The MoH is played as per the configured MoH Vocoder Preference.

185. The number of Vocoder channels that will be supported would be as per the license you purchase.

186. ETERNITY PENX supports 64 Direct RTP Audio Calls and 16 Video Calls.

Select the Vocoders in the order of their preference, for **MoH Vocoder Preference 1**, **MoH Vocoder Preference 2** and **MoH Vocoder Preference 3**.

If required, you can customize the MoH to be played as per your requirement. For detailed instructions, see ["Uploading Custom MoH"](#).

Quality of Service (QoS)

Click **Quality of Service (QoS)** to expand.

Quality of Service (QoS)	
SIP DiffServe/ToS	26
Voice DiffServe/ToS	46
Video DiffServe/ToS	46
FAX DiffServe/ToS	46

- **Quality of Service (QoS):** QoS refers to priority of IP packets on network layer. It can be programmed for both signaling (SIP) and media (Voice, Video and Fax). Configure the following types QoS:
 - **SIP DiffServe/ToS:** The system sends all the SIP signaling messages with this QoS setting. This field defines the priority bits for SIP messages. The Valid *DiffServe* range is from 00-63, default: 26
 - **Voice DiffServe/ToS:** The system sends all the Voice packets with this QoS setting. This field defines the priority bits for Voice packet. The Valid *DiffServe* range is from 00-63, default: 46
 - **Video DiffServe/ToS:** The system sends all the Video packets with this QoS setting. This field defines the priority bits for Video packet. The Valid *DiffServe* range is from 00-63, default: 46
 - **Fax DiffServe/ToS:** The system sends all the Fax packets with this QoS setting. This field defines the priority bits for Fax packet. The Valid *DiffServe* range is from 00-63, default: 46

QoS parameters are applicable for all packets (SIP/ Media) leaving both LAN and WAN port as well as TCP connection.

Channel Reservation for SIP Trunks

Click **Channel Reservation for SIP Trunks** to expand.

Channel Reservation for SIP Trunks	
Reserve Channels for SIP Trunks	00 ▼

- **Channels Reserved for SIP Trunks:** The Vocoder module supports up to 128 voice channels, which can be used by SIP Extensions and SIP Trunks.

It may happen that SIP Extension users use most of the channels of the Vocoder module, leaving too few or none for making/receiving SIP Trunk calls.

This can be avoided by reserving some voice channels exclusively for SIP Trunk calls.

Specify the minimum number of voice channels you want to reserve for SIP Trunk calls. By default, no channel is reserved.

SIP 100rel

Click **SIP 100rel** to expand.

- **SIP 100rel:** This parameter is to be configured if you want to support reliable transmission of (SIP) provisional responses. Enable 100rel by selecting the check box, if you want the Vocoder module to use 100rel for reliable transmission of SIP provisional responses and to use PRACK (Provisional Acknowledgment). Default: Disabled.

SIP Over TCP

Click **SIP Over TCP** to expand.

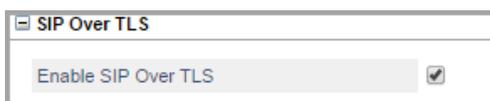

- **SIP Over TCP:** SARVAM UCS supports transporting of SIP messages over User Datagram Protocol (UDP), Transfer Control Protocol (TCP) as well as Transport Layer Security connection (TLS). Despite the advantages that SIP over TCP and SIP over TLS offer, it is more common to use UDP to transport SIP messages.

By default, SIP Over TCP is enabled. To be able to send SIP messages over TCP, you must configure 'TCP' as the 'Default Transport for Outgoing Messages' on the 'SIP Trunk Parameters' page.

If you do not want to transport SIP messages using TCP, clear the SIP Over TCP check box.

SIP Over TLS

Click **SIP Over TLS** to expand.

- **SIP Over TLS:** SARVAM UCS supports transporting of SIP messages over Transport Layer Security. TLS offers secure SIP signaling.

By default, SIP Over TLS is enabled. To be able to send SIP messages over TLS, you must configure 'TLS' as the 'Default Transport for Outgoing Messages' on the 'SIP Trunk Parameters' page.

If you do not want SIP messages to be transported using TLS, clear the SIP Over TLS check box.

SIP/RTP Ports

Click **SIP/RTP Ports** to expand.

SIP/RTP Ports	
SIP UDP Port	05060
SIP TCP Port	05060
SIP TLS Port	05061
RTP Listening Port	08000

- **SIP UDP Port:** This port defines the port on which SARVAM UCS listens for SIP messages transported over UDP. This port is also used as the source port for sending SIP messages to the remote peer. The valid range for this port is 1025-65535. Default: 05060.
- **SIP TCP Port:** This port defines the port on which SARVAM UCS listens for SIP messages transported over TCP. This port is also used as the source port for sending SIP messages to the remote peer. The valid range for this port is 1025-65535. The default SIP TCP Port is 05060.
- **SIP TLS Port:** This port defines the port on which SARVAM UCS listens for SIP messages transported over TLS. This port is also used as the source port for sending SIP messages to the remote peer. The valid range for this port is 1025-65535. The default SIP TLS Port is 05061.
- **RTP Listening Port:** This port defines the port on which SARVAM UCS listens for RTP Packets. This port is also used as the source port for sending RTP packets to the remote peer. The valid range for this port is 1025-65278. The default RTP Listening Port is 08000.

Timers

Click **Timers** to expand.

Timers	
SIP INVITE Timer (sec)	030
SIP Provisional Timer (sec)	060
General Request Timer (sec)	20

- **SIP Invite Timer (sec):** This is the time in seconds for which the system waits for a response from the called party after ending INVITE message. This timer starts after sending INVITE message to the called party and stops on receipt of the provisional response or the final response or when the user disconnects the call. On expiry of the timer, the call process is terminated by the SARVAM UCS and an error tone is played to the user. The range of the SIP Invite Timer is 010-180 seconds. Default: 30 seconds.
- **SIP Provisional Timer (sec):** This is the time in seconds for which the system waits for the final response after receiving the provisional response from the called party. This timer starts on the receipt of the provisional response from the called party and stops on receipt of the final response from the called party or when the user disconnects the call. On expiry of the timer, the SARVAM UCS terminates the call process and plays error tone to the user. The range of SIP provisional Timer is 010-180. Default: 60 seconds.
- **General Request Timer (sec):** The time in seconds for which the system waits for response for a transaction request. This timer starts on the initiation of a transaction. This timer stops on receipt of a

response for the request. On expiry of the timer, the system clears the transaction. This timer is used for Registration request, etc. The range of the General Request Timer is 10-60 seconds. Default: 20 seconds.

The Timers will be applicable only after System Restart.

Advance Option

Click **Advance Option** to expand.

Check User-Agent for routing call

Index	User Agents
1	MATRIX SARVAM UCS SME V1R7.2.0 Mat_Trunk
2	
3	
4	
5	
6	
7	
8	
9	
10	

- **Check User-Agent for routing call:** Default: Disabled. Select the check box to enable. If enabled SARVAM UCS will check if the call is originated from a trunk or an extension.

In the User Agent table, under **User Agents**, configure the User Agent Strings of the other PBXs from which you want incoming call to land on the extensions. In this table the first index is reserved for Matrix Systems and is not editable. You can configure the User Agent Strings of the other PBXs from index 2 to 10.

Now, let us consider a scenario:

- We have two PBX's, either Matrix at both the ends or at one end Matrix and at the other any Third party PBX. Let us consider PBX A (Matrix PBX) and PBX B (Third Party PBX).
- Both the PBX's have the same extension numbers configured, for example 2001.
- You have configured a P2P trunk between the two PBX's.

Now, when 2001 of PBX A receives an incoming call from 2001 of PBX B through the P2P trunk, then the system checks if **Check User-Agent for routing call** is enabled.

If enabled, then the system will check the User Agent in the INVITE request and compares the same with the entries in User Agent Table. Only if an exact match is found the system will place the call, else it will reject it.

Configuring SIP Trunks

SIP trunks may be Proxy or Non-Proxy. All SIP trunks are considered as Proxy trunks by default.

Regardless of whether a SIP Trunk is Proxy or Non-Proxy, it must be assigned to the LAN/WAN Port, which is to be used for that SIP trunk and the SIP trunk must be enabled. VoIP Calls can be initiated after suitable configuration of the SIP trunk number in the Outgoing Trunk Bundle Group.

For Proxy SIP Trunks, you must program the following parameters required for registration with the Proxy Server.

- Enable the SIP trunk.
- Program the SIP ID, registrar Server Address, Registrar Server Port, Authentication ID, Authentication Password as provided by your ITSP.
- If your ITSP uses Outbound Proxy, Enable the Outbound Proxy for the SIP trunk and also program the Outbound Proxy Server Address and Port as provided by your ITSP.

The maximum number of SIP trunks supported by SARVAM UCS is 99.

If you have installed a single VoIP module, you can configure all SIP trunks on the same module.

Configuring SIP Trunks using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Trunk Parameters** to open the page.

The screenshot shows the 'VoIP Configuration' page. The left sidebar contains a navigation menu with 'SIP Trunk Parameters' selected. The main content area displays a table titled 'SIP Trunk Parameters' with columns for 'SIP Trunk No.', 'Enable SIP Trunk', 'Name', 'SIP ID', and 'SIP Trunk Mode'. The table lists 8 trunks, all with 'Proxy' mode. Below the table are buttons for 'Submit', 'Default', 'Default One', and 'Advance'.

SIP Trunk No.	Enable SIP Trunk	Name	SIP ID	SIP Trunk Mode
1	<input type="checkbox"/>			Proxy
2	<input type="checkbox"/>			Proxy
3	<input type="checkbox"/>			Proxy
4	<input type="checkbox"/>			Proxy
5	<input type="checkbox"/>			Proxy
6	<input type="checkbox"/>			Proxy
7	<input type="checkbox"/>			Proxy
8	<input type="checkbox"/>			Proxy

Configure the following SIP Trunk parameters for the SIP trunks:

- **SIP Trunk No.:** This non-editable field is the number of the SIP trunk. The SIP trunks are numbered from 01 to 99.
- **Enable SIP Trunk:** This flag is for enabling or disabling the SIP trunk. To be able to make incoming and outgoing calls from the SIP trunk, click to enable the SIP trunk. By default, the SIP trunk is disabled, disallowing incoming and outgoing calls. You may disable SIP trunks that are not functioning.

- **Name:** You may assign a 'Name' to each SIP trunk to facilitate identification. Whenever there is an incoming call without CLI on this port, the Name you have programmed will be displayed on the landing extension, provided it is a DKP.

The Name assigned to the SIP trunk may consist of a maximum of 18 characters. The Name of the port may be the name of the ITSP the SIP trunk is subscribed with (recommended).

- **SIP ID:** Enter the SIP User ID provided by the ITSP. SIP User ID is the ID that callers will use to call this SIP trunk.

The SIP User ID may be a number or text for remote parties to call on the SIP trunk. For example, if SIP URI provided by the ITSP is 12345@abc.com, enter 12345 in this field. SIP User ID may consist of a maximum of 40 characters. All ASCII characters are allowed.

- **SIP Trunk Mode:** You may select SIP Trunk Mode as **Proxy** or **Peer-to-Peer**, according to your requirement.

If you are using the services of an Internet Telephony Service Provider (ITSP), select **Proxy** to register this SIP trunk with the ITSP.

If you are not using this service, select **Peer-to-Peer**.

- During Incoming Call Routing to select a SIP trunk, SARVAM UCS compares the SIP ID received in the Request URI of the INVITE message with the SIP ID configured on the SIP Trunk.

If you do not want SARVAM UCS to check the SIP ID received in the Request URI of the INVITE message, clear the **Check SIP ID During Incoming Call** check box. Default: Enabled.

- **Treat Incoming calls as:** If you select Peer-to-Peer as the SIP Trunk mode, you may configure the trunk to **Treat Incoming call as: Trunk or Station**.

If you select **Trunk**, the incoming calls will be routed as per the **Trunk Feature Template** assigned to the SIP Trunk.

If you select **Station**, the system will route the incoming call as follows:

- When only a number is received in the "To:" field of the INVITE message, SARVAM UCS will check the number in the Closed User Group Table. If a match is found in the CUG table the call will be routed as per the corresponding Outgoing Trunk Bundle Group.
- If the CUG Table is not configured or if no match is found for the number received in the "To:" field of the INVITE message, the system will check if there is an extension number that matches with the number received in the "To:" field of the INVITE message. If a match is found the call is routed to the desired extension number.
- When a Trunk Access Code and a number is received in the "To:" field of the INVITE message, the system will route the call as per the Outgoing Trunk Bundle Group assigned in the Station Basic Feature Template of the SIP Trunk.

By default, Trunk is selected.

- *If Station is selected as the option for Treat Incoming call as, the user will only be able to:*
 - *Dial Flexible Numbers*

- *Dial Operator Code*
 - *Dial Trunk Access Code for making outgoing calls*
 - *Access the Global Directory*
 - *Make calls within the Closed User Group*
- **Registrar Server Address:** Enter the Proxy/Registrar Server Address. Both IPv4 and IPv6 addresses are supported. The Server Address may be an IP Address or a Domain name, of maximum 40 characters
 - **Registrar Server Port:** Enter the Registrar Server Listening Port. The valid range is from 1025 to 65535. By default, 5060 is set as the Listening Port of the Registrar Server.
 - **Re-registration Time (sec):** The Registrar Server deletes an entry of its client from its database on expiry of a fixed timer, which is set by the Registrar Server. SARVAM UCS sends a registration request before this Timer expires to remain registered on the server.

Enter the value of the Timer after which the system should send registration request to maintain registration binding with the server. The valid range of this timer is from 00001- 65535. By default the Timer is set to 3600 seconds.

- **Registration Retry Time (sec):** This Timer stands for the period between retries for registration. If the registration attempt fails, SARVAM UCS sends the registration request on the expiry of this Timer again. The system continues to send the registration request till it gets registered. The valid range of this timer is from 00001- 65535. By default the Timer is set to 00010 seconds.
- **Authentication User ID:** Enter the Authentication ID provided by the ITSP for this SIP trunk. The Authentication User ID may be a string of 40 characters (maximum), including ASCII characters.
- **Authentication Password:** Enter the Authentication Password provided by the ITSP for this SIP trunk. The Authentication Password may be a string of 24 characters (maximum), including ASCII characters.
- **Outbound Proxy:** This parameter is relevant only if the ITSP has a SIP outbound server to handle voice calls. If yes, program the following parameters:
 - **Enable:** Select this check box to enable Outbound Proxy. By default the flag is disabled.
 - **Server Address:** Enter the Outbound Proxy Server's address. Both IPv4 and IPv6 addresses are supported. It may be an IP Address or Domain name. A maximum of 48 characters, including ASCII characters are allowed.
 - **Server Port:** Enter the Outbound Proxy Server's Listening Port. The valid range for this is 1025-65535. By default the Server Port is 5060.
- **Trusted IP Address/es:** You must configure IP Address table to allow incoming calls from specific IP addresses on this SIP Trunk. Both IPv4 and IPv6 addresses are supported. If you select *Peer to Peer* as the SIP Trunk Mode and you do not configure this table, incoming calls on this SIP Trunk will be rejected.

If you select *Proxy* as the SIP Trunk Mode and you do not configure this table, incoming calls will be allowed only from the Registrar Server Address or Outbound Proxy Address. All other calls on this SIP Trunk will be rejected.

To configure the IP Address table,

- Click **IP Address Table**.

7	
8	
9	
10	

Note: While Programming IPV6 address as Trusted IP address use "[]" square bracket.

Buttons: Submit, Default

If you have selected SIP Trunk mode as Peer to Peer, configure the following.

- **Allow from all IP Addresses:** Enable this check box, if you want to allow incoming calls on this SIP Trunk from all IP Addresses. Default: Disabled.
- **Apply Digest Authentication:** Enable this check box, if you want to allow incoming calls from callers only after the callers have authenticated themselves (with their User ID and Password). If the caller does not enter valid credentials in two attempts, the system will reject the call.

If you have enabled *Allow from all IP Addresses* check box, Apply Digest Authentication check box will be enabled automatically. You must configure the Digest Authentication table.

To configure the table, click the **Apply Digest Authentication** link. For detailed instructions, see [“Digest Authentication”](#).

- **Consider Peer to Peer Table for Trusted IP Address:** Enable this check box, if you also want to allow incoming calls from the domain names or IP Addresses configured in the Peer to Peer table. Default: Enabled. To know more about Peer to Peer table, see [“Peer-to-Peer Calling”](#).

If you have selected SIP Trunk mode as Proxy or Peer to Peer, configure the Trusted IP Address table.

The first entry in the table will display the *Proxy/Registrar Server Address:Port* or *Outbound Proxy Address: Port* as configured for this SIP Trunk (applicable only for Proxy Mode). For the Index numbers 1 to 10,

- Enter the **IP Address** and the corresponding **Port** from which you want to allow incoming calls.

Do not configure the port, if you want to allow incoming calls from all the ports for a particular IP Address.

- Click **Submit** to save your entries and close the window.
- **SIP Hardware Template:** Assign a [“SIP Hardware Template”](#) to the SIP Trunk. The SIP Hardware Template contains voice quality related features such as Voice Codec selection, Tx and Rx Gains, Echo Cancellation, Jitter Buffer and, Fax-over-IP options and related parameters.

There are 32 different templates to choose from. Each template can also be altered to suit your requirement and preferences. By default, Template number 01 assigned to all SIP Trunks. Template number 01 is also assigned to all SIP Extensions.

First, check if the values in Template 01 fulfill the feature requirements of the SIP Trunks. Retain this template, if it fulfills the feature requirements of all SIP Trunks and if the same features are to be allowed to all SIP Trunks.

If different sets of SIP hardware features are to be allowed to different SIP Trunks, then prepare separate SIP Hardware Templates and apply them on the SIP Trunks. To do this,

- Under 'VoIP Configuration', click the 'SIP Hardware Template' link.
- Select a Template number, for example 03.
- Customize Template number 03 and click 'Submit'.
- Now go back to the 'SIP Trunks' page.
- Enter the number of the Template you customized, Template 03 in the 'SIP Hardware Template' field of the SIP Trunk on which you want to apply this template.
- Click 'Submit' at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different SIP Hardware Template to another SIP Trunk.
- Also, refer the topic [“SIP Hardware Template”](#) to know more about customizing the templates and applying on the SIP Trunks.

- **Trunk Feature Template:** A Trunk Feature Template is a set of features like Time Table, Operator, Auto Attendant, DISA, Trunk Auto Answer, Trunk Landing Group, SMDR Storage, etc., that defines the behavior of a Trunk. Apply a Trunk Feature Template to the SIP trunk. By default, Trunk Feature Template 01 is applied on all SIP trunks as well as all other trunk types. Refer the topic “[Trunk Feature Template](#)” to know more.

Click the 'Trunk Feature Template' link to open the page. Check if the default Template 01 fulfills your requirement for the SIP trunk.

If the default Template 01 does not fulfill your requirement, prepare another Trunk Feature Template¹⁸⁷, and enter the newly prepared Template number for the SIP trunk.

- **Cost Factor:** This parameter is of relevance only if 'Least Cost Routing' feature is applied on the SIP trunk.

Cost Factor is a number assigned to each trunk for identification. This number also serves as a preference number for the trunk. The Cost Factor can be from 1 to 99. Trunks having the same preference must be assigned the same Cost Factor. Different trunk types can also be assigned the same Cost Factor. These trunks are used for routing calls.

Assign a Cost Factor to the SIP trunk, for instance, 02 and program Least Cost Routing Table accordingly.

For example, if you want to route all outgoing calls starting with number '9' through the SIP trunk 01 only,

- You must first assign a Cost Factor (01-99) to SIP trunk 01, for example, 02.
- Click the 'Least Cost Routing - Number Based' link to open the page.
- Enter '9' in the 'Number' column, Cost Factor '02' as Preference 1, 2, 3 and 4.
- Click 'Submit' to save your settings.

All outgoing calls assigned Cost Factor trunk 02 will be made from SIP trunk 01.

- **Simultaneous Calls**¹⁸⁸: This parameter is for defining the number of simultaneous calls to be allowed on the SIP trunk. Default:32.

The number of simultaneous SIP calls depends on the number of simultaneous calls allowed by the ITSP with whom you have subscribed this SIP Trunk.

If the ITSP supports less than 32 simultaneous calls on SIP Trunks, you must program this parameter accordingly.

- Click **Submit** to save your configuration settings.

¹⁸⁷. The default template is applied on the ports of all trunk types supported by SARVAM UCS. Changes to the default template will be applied on all trunk types also. So, you are advised to prepare a new template and apply it to the desired trunk types.

¹⁸⁸. This parameter is only applicable if you have set the RTP Mode as Transcoding in “[Configuring VoIP Parameters](#)”. The number of simultaneous calls supported will depend on the number of Vocoder channels available. The channels supported depends on the license purchased. For details, refer to Vocoder Channels in “[License Management](#)”.

Advanced Configuration Parameters

The above listed parameters fulfill the basic SIP trunk configuration requirements of most users. However, it is anticipated that some users may desire other less commonly used parameters such as RCOC, Accept Anonymous Calls on SIP trunks, Call Budget on SIP trunks, etc.

For such users, you may click the **Advance** button and configure the following parameters:

SIP Trunk Parameters				
SIP Trunk No.	Enable SIP Trunk	Name	SIP ID	SIP Trunk Mode
1	<input type="checkbox"/>			Proxy <input type="text"/>
2	<input type="checkbox"/>			Proxy <input type="text"/>
3	<input type="checkbox"/>			Proxy <input type="text"/>
4	<input type="checkbox"/>			Proxy <input type="text"/>
5	<input type="checkbox"/>			Proxy <input type="text"/>
6	<input type="checkbox"/>			Proxy <input type="text"/>
7	<input type="checkbox"/>			Proxy <input type="text"/>
8	<input type="checkbox"/>			Proxy <input type="text"/>

- Return Call to Original Caller (RCOC):** Enable this flag if you want to apply the 'Return Call to Original Caller' on this SIP trunk.

If this feature is enabled on the SIP trunk, the system will route calls returned by remote parties back to the extensions that originally made the call from this Trunk (the original callers' extensions). To know more, refer the feature description for ["RCOC \(Return Call to Original Caller\)"](#).
- Station Basic Feature Template:** Assign a ["Station Basic Feature Template"](#) to the SIP trunk. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences. Default: Template number 01 assigned to all SIP trunks.
- Station Advanced Feature Template:** Assign a ["Station Advanced Feature Template"](#) to the SIP trunk. There are 50 different templates to choose from. Each template can also be altered to suit your requirement and preferences. Default: Template number 01 assigned to all SIP trunks.
- Add 'rinstance' in Register:** 'rinstance' is any random value which can be used by the WAN Port to fetch its own contact binding, that is, to know the Registration Expiry Timer assigned by the server. By default, this flag is enabled.
- Send REGISTER Message:** With this parameter you can select whether or not the system should send REGISTER message from the SIP trunk. By default, this flag is enabled allowing REGISTER message to be sent from the SIP trunk.
- Allow OG Calls without Registration:** This parameter is to be enabled to allow outgoing calls to be made from the SIP trunk, even when the SIP trunk is not registered. If this flag is disabled the system will not

allow outgoing calls to be made if the status of the SIP trunk is 'not registered'. By default, this flag is disabled.

- **Send OPTIONS as Heartbeat:** With this parameter you can select whether or not the system should send the OPTIONS message periodically to the Proxy Server to monitor its availability. Calls can be made and received only if the Proxy Server is alive.

If the Proxy Server is unavailable, like no response is received, the status of the SIP Trunk will display "Heartbeat Failed" along with the Reason for Failure.

To view status of the Proxy Server, go to **SIP Trunk Status**.

If you enable **Send OPTIONS as Heartbeat**, you must configure the Heartbeat Interval.

- **Heartbeat Interval:** Define the **Heartbeat Interval (Seconds)**, the time period, from 10 to 999 seconds, after which SARVAM UCS should send the OPTIONS message to the Proxy Server. Default: 30 seconds.
- **DNS Record Type:** Set this parameter as provided to you by your Service Provider. You may select any of the following options:

- **A/AAAA Record:** Select this option, if you want SARVAM UCS to send the query to the DNS Server to fetch the IP Address of the Target Server on which further SIP messages are to be sent.

A Record maps to an IPv4 Address of the Target Server, while AAAA (quad-A) Record maps to an IPv6 Address.

- **SRV Record:** Select this option, if you want SARVAM UCS to send the SRV query to the DNS Server to fetch the Destination Port. The system will also make a DNS A query to fetch the IP Address of the Target Server on which further SIP messages are to be sent.
- **NAPTR/SRV Record:** Select this option, if you want SARVAM UCS to send queries to the DNS Server to fetch the Transport, Port and IP Address of the Target Server on which further SIP messages are to be sent.

By default, A Record is set as the DNS Record Type.

This parameter will be checked when:

- *SIP Trunk Mode is configured as Proxy.*
- *Registrar Server Address is configured as Domain and Outbound Proxy Address is blank OR Registrar Server Address is configured as Domain/IP Address and Outbound Proxy Address is configured as Domain.*
- **Send CLI in FROM field:** This parameter allows you to configure the CLI of the SIP Trunk to be sent to the remote party on outgoing calls made using the SIP trunk. You may select any of the following options as desired:
 - **CLIR:** Select this option if you do not want the CLI to be sent.
 - **SIP ID:** You may select this option if you want the SIP ID programmed on the SIP Trunk to be sent as CLI.

- **Calling Party Wise:** Select this option if you want to send the Calling Extension Number (the number of the extension making the outgoing call through the SIP trunk) as CLI.

When reverse DDI is programmed on the SIP Trunk, the DDI number of the calling extension will be sent, instead of its extension number.

If the calling extension has disabled the parameter 'Send DDI as CLI' in its Station Advanced Feature Template, then its Pilot number configured in the Outgoing Reference Table will be sent as CLI. If calling extension has enabled CLIR, no CLI will be sent on the SIP Trunk.

- **Fixed Number:** Select this option if you want a specific number to be sent as CLI. When you select this option, you must also define the number to be sent as CLI.

You may select this option if you wish to send any of your trunk line numbers as CLI on the SIP Trunk so as to enable the called party to call back the calling party using this CLI.

Since it is not possible to call back a SIP ID, Fixed Number offers you a solution, using which you can send a trunk line number as CLI on the SIP Trunk. Using this CLI, the called party can call back the calling party.

If you select this option, you must configure the **Fixed Number**. The Fixed Number may consist of a maximum of 40 characters. Valid characters are from 0-9 and plus (+).

By default, SIP ID is set as the Send CLI in FROM field for all SIP Trunks.

When extension number of the calling extension is blank, and the 'Send CLI in FROM field' programmed for the SIP Trunk is other than "SIP ID", then also SIP ID will be sent as CLI.

When Emergency numbers are dialed using the SIP Trunk and even if CLIR is set as the 'Send CLI in FROM field' option, the system will send the number of the caller as CLI.

- **Send Called Party Number In:** SARVAM UCS provides you the option to Send Called Party Number in "To" or "Request URI" field. You may select — "To, Request URI", "To", "Request URI". Default: To, Request URI.
 - If you select *To*, then the called party number will be sent in "To" field, whereas SIP ID configured on the trunk will be sent in the "Request URI" field.
 - If you select *Request URI*, then the called party number will be sent in the "Request URI" field, while SIP ID configured on the trunk will be sent in the "To" field.
 - If you select *To, Request URI*, then the called party number will be sent in both the fields.

If the SIP ID is not configured and you select the option — *To* or *Request URI*, then the called party number will be sent in both the fields.

If the called party number is not available in any of the above cases then the remote server address will be sent in the selected field.

- **Allow Incoming CLI Modification:** To apply Incoming CLI Modification on the SIP trunk, select the **Allow Incoming CLI Modification** check box. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see [“Incoming CLI Modification”](#).

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*For an incoming call on the SIP trunk, the Incoming CLI Modification will be applied only when both — the **Allow Incoming CLI Modification** check box and the **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- **Use “tel” URI type in:** If your ITSP requires “tel” in the URI so that it can handle/ route calls to/from global numbers, select the desired option from any of the following:
 - TO, Request URI
 - FROM
 - TO, Request URI and FROM

The system will send 'tel' URI in the selection headers and Request URI according to the selection you make. This will be used while making an Outgoing call.

By default **None** is selected.

- **Send "user=phone":** Select this check box, if you want SARVAM UCS to add user=phone in the Request URI/FROM/TO header of the INVITE message. Default: Disabled.

SARVAM UCS will send user=phone, only if the SIP ID is numeric.

- **P-Asserted-Identity/P-Preferred-Identity for Outgoing calls:** Configure the following **P-Asserted-Identity/P-Preferred-Identity for Outgoing calls** parameters as provided to you by your Service Provider.

- Select **Add P-Asserted-Identity/P-Preferred-Identity** check box, if supported by your Service Provider.
- Select **P-Preferred-Identity** or **P-Asserted-Identity** as **Identity**.

- Select the desired **Caller ID** option:
 - **SIP ID:** If you want the SIP ID configured on the SIP Trunk to be displayed as the Caller ID.
 - **Calling Party Wise:** If you want the Calling Extension Number (the number of the extension making the outgoing call through the SIP trunk) to be displayed as the Caller ID.
 - **Fixed Number:** If you want a specific number to be sent as the Caller ID. When you select this option, you must also define the number to be sent as the Caller ID.

The Fixed Number may consist of a maximum of 40 characters. Valid characters are from 0-9 and plus (+) .

By default P-Asserted-Identity/P-Preferred-Identity for Outgoing calls is disabled.

- **P-Asserted-Identity/P-Preferred-Identity for Incoming calls:** Configure the following **P-Asserted-Identity/P-Preferred-Identity for Incoming calls** parameters as provided to you by your Service Provider.

- Select **Get CLI from P-Asserted-Identity/P-Preferred-Identity** check box, if supported by your Service Provider.
- Select **P-Preferred-Identity** or **P-Asserted-Identity** as the **Preference**.
- By default **Handle Privacy Header** is enabled. If the system receives Privacy Header as:
 - **Privacy: ID**, anonymous will be displayed as the CLI to the called extension.
 - **Privacy: None**, the CLI received from the Service Provider will be displayed to the called extension.

If No Privacy header is received the CLI received from the Service Provider will be displayed to the called extension.

 - If you do not want the system to handle the Privacy Header, clear the check box.

By default P-Asserted-Identity/P-Preferred-Identity for Incoming calls is disabled.

- **Redirection:** When an incoming call is diverted/forwarded to an external number using the same SIP Trunk, configure the following parameters as required by your ITSP:
 - Select the desired **Call Redirection Type**. You may select **Generate new Call** or **Send 302**. Default: Generate new Call.
 - If you want the system to send 181 response to the source upon redirection, enable the **Sending of 181 responses upon Redirection** check box. Default: Disabled.
 - If you have selected **Generate new Call** as the **Call Redirection Type**, you may select the **Include "Diversion" while diverting the call** check box. The system includes incoming call request information in Diversion header, along with the reason of redirection. Default: Disabled.
 - If you have selected **Generate new Call** as the **Call Redirection Type**, you may select the **Include "History-Info" while diverting the call** check box. The system includes the incoming call request information as well as the new call information in the INVITE/REINVITE requests generated on the target. Default: Disabled.
 - If you have selected **Generate new Call** as the **Call Redirection Type**, select the desired option in **CLI while Diversion/Redirection**. You may select **Self** or **Received**. Default: Self.

If you select **Self**, the system will send SIP Trunks' Identity and if you select **Received** the system will send the received CLI to the target.
- **Call Transfer Type:** Select the **Call Transfer Type as** supported by your ITSP. System will send the Call Transfer request to the transferee only if calls are routed through the same SIP Trunk. You may select:
 - **System:** In this option, the SARVAM UCS will handle the Call Transfer locally.
 - **Network:** In this option, the Call Transfer is handled by the Network.

Default: System.

- **Accept Anonymous Calls?:** The option is for accepting calls without CLI that land on the SIP trunk. By default this option is disabled, that is, calls without CLI will not be allowed on this SIP trunk port. Select the check box to enable.
- **Source Port IP Address:** Select the Source Port IP Address for the SIP trunk. You may select from any of the following options, as applicable to your installation scenario.
 - **Use WAN Port IP Address:** Select this option, if the WAN Port is connected directly to the public Internet.
 - **Use LAN Port IP Address:** Select this option, if the LAN Port is connected within the LAN network.
 - **Use IP Address fetched using STUN:** Select this option, if the WAN Port is located behind a NAT router other than Symmetric.
 - **Use Router's Public IP Address:** Select this option if the WAN Port is located behind a NAT router (any type).
- **Handle rport:** Select the desired option from:
 - **Force NAT:** By default, this option is selected. The system will not check Contact/Via header etc. while sending SIP messages and will follow Symmetric Signaling.
 - **RFC 3581:** Select this option, if you want the system to follow Standard RFC's while sending SIP messages.

Default: Force NAT

- **Use Symmetric RTP?:** The use of Symmetric RTP makes it possible for a SIP device to send the RTP on the same connection on which it is listening for RTP. This is done only on peer to peer SIP trunks.

Enable this flag, if the WAN Port is located on a public IP and you want outgoing calls to the SIP Client located behind the NAT Router. OR if you need to receive incoming calls from the SIP Client located behind the NAT router. By default, Use of Symmetric RTP is disabled.

- **Accept RTP Packets from Random Port:** By default, this is disabled, that is, the System will accept RTP packets from the negotiated RTP port only.

Enable this flag, if you want the system to accept RTP packets from any random port.

- *Accept RTP Packets from Random Port parameter is applicable only if:*
 - *Use Symmetric RTP? is disabled.*
 - *RTP Packets flag in PCAP is disabled. For details, see ["PCAP Trace"](#).*
 - *RTP Mode is set as Transcoding or RTP Relay. For details, see ["Configuring VoIP Parameters"](#).*
- *The System security might be at risk, if you enable this option as packets from all RTP ports are accepted by the System.*
- **Default Transport for Outgoing Message:** Configure this parameter for Proxy SIP Trunks only. The SARVAM UCS supports three options for transporting outgoing SIP messages:
 - **UDP:** Outgoing messages are transported using UDP. By default this option is selected.

- **TCP:** Outgoing messages are transported using TCP. If you select this option, you must enable 'SIP Over TCP' on the 'VoIP Parameters' page.
- **TLS:** Outgoing messages are transported using TLS. If you select this option, you must enable 'SIP Over TLS' on the 'VoIP Parameters' page.

By default, UDP is selected as the Default Transport for Outgoing Message.

The Default Transport for Outgoing Message options are checked only if you have enabled SIP over TCP or SIP over TLS.

If the SIP over TCP and SIP over TLS are disabled, all outgoing SIP messages will be transported over UDP only.

- **SRTP Mode:** SARVAM UCS supports SRTP (Secure Real Time Protocol) for secure conversations over SIP. The SARVAM UCS supports the following options:
 - **Disable:** SARVAM UCS uses normal RTP for transporting the speech packets.
 - **Optional:** SARVAM UCS uses SRTP for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will use normal RTP for transporting the speech packets.
 - If you select this option, you must configure the **SRTP Media Type**. You may select **AVP** or **SAVP**. By default, AVP is selected as the SRTP Media Type.
 - **Forced:** SARVAM UCS uses only SRTP (SAVP) for transporting the speech packets. If the remote user does not support SRTP, SARVAM UCS will reject incoming calls from and drop outgoing calls made to such users.

By default, SRTP Mode is Disabled.

- **Call Budget:** By default, Call Budget is enabled on the trunk. If you wish to change the default configuration or disable it for this SIP trunk, configure the parameters as per your requirement:
 - **Type:** Select the type of Call Budget on Trunk—Amount or Minutes or Calls—to be applied on this SIP trunk. By default, Minutes is selected as the Call Budget type. To disable select Type as None.
 - **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 99999.
 - **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set as 000300.
 - **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of Calls in this field. By default the number of calls is set to 9999.
 - **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes/Number of Calls to be reset on a particular date of every month.
 - **Scheduled (Date):** Select the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be reset every month. You may select 'Daily' if your plan suggests so.

The consumed Call Budget Amount/Minutes/Number of Calls can be reset also using SA and SE commands, referred to as Manual Reset. Refer the feature description [“Call Budget on Trunk”](#).

- **Call Back:** This parameter is related to the “Call Back on Trunk Port” feature. If you want to enable the ‘Call Back on Trunk Port’ feature on this SIP trunk, configure the following parameters:
 - **Enable Call Back:** Enable this flag to activate the Call Back on Trunk Port feature. By default, this flag is disabled on all trunk port types. By default, the flag is disabled.
 - **Call Back Timer:** This is the duration for which the system waits for the caller to disconnect before applying the Call Back. The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds for all SIP Trunks.
 - **Call Back Mode:** Select from the following options how a ‘Call Back’ call answered by the remote party should be routed:
 - Built-In Auto Attendant
 - PIN Authentication - Multiple Calls
 - CLI Authentication - Multiple Calls
 - CLI Authentication - Single Call - Answer Signaling
 - Operator

By default, Operator is selected as the Call Back Mode.

- **Call Back on:** This parameter allows you to select if the call back should be made to the same number that was received or to a different number. If you want the call back to be made to the same number select the ‘CLI number’. If you want the call back to be made to a different number, select ‘Alternate Number’.
By default, CLI number is selected for Call Back.
- **Incoming Number List:** Program the number strings that are eligible for Call Back in this List. By default, Number List 15 is assigned to Call Back Incoming Number List.

Number List 15 is also assigned to all SIP trunks as well as all other Trunk port types. If you want the same numbers strings to be programmed commonly for all SIP trunks and Trunk Port types, retain this list.

If you want a different set of number strings to be programmed for this SIP Trunk, select a different Number List, and assign it to the SIP trunk port.

You may program the Incoming Number List either from the ‘Number List’ page or by clicking the ‘Incoming Number List’ link to reach the Number List page.

Refer the topic [“Number Lists”](#) to know more, and for configuration instructions.

- **Outgoing Number List:** Program the number strings that are to be called back in this List. For each number string you programmed in the ‘Incoming Number List’, you must program in the corresponding index in the Outgoing Number List a number to which the call back is to be made. For example, for the number string programmed at Index 1 in the Incoming Number List, a corresponding number string at the same Index, Index 1, should be programmed in the ‘Outgoing Number List’.

By default, Number List 16 is assigned to Outgoing Number List. The same Number List 16 is also assigned to all SIP trunks as well as all other Trunk port types.

You may program the default number list, or a different number list and assign it to this SIP Trunk port.

You may program the Outgoing Number List either from the 'Number List' page or by clicking the 'Outgoing Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Call Back from:** This parameter determines the trunk port to be used to make the call back. The call back can be made using the same port or an "[OG Trunk Bundle Group](#)".

Select 'Same port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTBG, the call back will be made using the OGTBG, which you have defined.

By default, Same port is selected.

- **OGTB Group:** If you selected OGTBG for making the call back in the previous parameter, you must define the OGTBG that must be used in this parameter.

By default, OGTBG 01 is assigned to all SIP trunks.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTBG that you define here for Call Back.

- **Incoming (IC) Reference ID:** Assign an Incoming Reference ID for the SIP trunk for Working Hours, Break Hours, Non-Working Hours. By default, 00 is assigned as Incoming Reference ID for all three time zones.
- **Outgoing (OG) Reference ID:** Assign an Outgoing Reference ID for the SIP Trunk, from 00 to 99. By default, 00 is assigned as Outgoing Reference ID.
- **Pause Timer (sec):** This Timer is required for inserting delay while digits of a number string are out dialed from the SIP trunk. The Pause Timer will be applicable when the letter 'P' is configured in the DTMF number string which is to be out dialed as DTMF digits on the SIP trunk. The range of this timer is from 1 to 9 seconds. By default the Timer is set to 3 seconds.

For example, if 'PPP3' is to be out dialed and Pause timer is programmed as 3 seconds, the SARVAM UCS will out dial the digit 3 after 9 seconds, after a delay of individual P ($3+3+3=9$). The range of this Timer is from 1 to 9.

This parameter is used for the "[Multi-Stage Dialing](#)" feature.

- **DTMF ON Timer:** This is the time for which the DTMF digit will remain ON, while being out dialed by the SARVAM UCS. This parameter finds its application in the feature "[Multi-Stage Dialing](#)". The range of this timer is from 051 to 255 milliseconds. By default, ON Time is defined as 102 msec.
- **DTMF Inter Digit Pause (msec):** This is the time for which the SARVAM UCS will wait before dialing the successive digits.
- **Category (Logical Partition):** This parameter assigns the SIP Trunks to a trunk category for the purpose of Logical Partitioning. By default all SIP Trunks are assigned to Category 4. Do not change the default setting.

If you want to change the call permission between the SIP Trunks and other trunks, click the 'Category' link to open the Logical Partitioning page. You may program the call permission between Category 4 (assigned to SIP Trunks) and other Categories. Refer the feature description "[Logical Partition](#)" to know more.

- **Gateway Application - Answer Signaling:** This parameter is to be programmed if the SIP trunk is being used in a gateway application as a source port (from where calls originate). The calls originated on the source port (SIP trunk) are routed using another Trunk port, the terminating port, which may be any trunk port, like T1E1. When call made from the terminating port gets matured, this is signaled to the source port in the form of DTMF digits.
 - **Use?:** Enable this flag if you want the SIP trunk to be used in a Gateway Application.
 - **DTMF String:** Program the DTMF digits to be sent to signal call maturity to the source port.
- **Send Re-INVITE over SIP Trunk on Hold:** With this parameter you can select whether or not the system should send Re-INVITE message from the SIP Trunk to the Remote Peer, when an external call over the SIP Trunk is put on hold by the extension user. Set this parameter as per the requirement of the Remote Peer. The Remote Peer can be a Proxy Server or a SIP Device.

By default, Send Re-Invite over SIP Trunk on Hold is disabled. For more information see "[Call Hold](#)".

- **Delayed Offer:** Enable this flag, if you want the SIP Trunk to generate INVITE without SDP. Default: Disabled.
- **Fetch Called Party Number From:** SARVAM UCS extensions may be assigned DDI numbers provided by the ITSP. When INVITE is received from ITSP, the ITSP may send the DDI number either in the "Request URI" of the INVITE message or in the "To:" field of the INVITE message.

By default, Request URI is selected. Ask your ITSP if you need to change this parameter.

- **Called Party Number as CLI:** If you want SARVAM UCS to display the called party number received in the INVITE message as the CLI, select the Display Called Party Number as CLI check box. By default, Display Called Party Number as CLI option is disabled.

This parameter is useful when a single SIP Trunk having DDI Numbers and Operator are shared by more than one organization. If you enable this option, make sure:

- you configure the names and corresponding numbers of the organizations sharing the SIP Trunk in the Global Directory of SARVAM UCS.
- the Operator has a DKP or an Extended IP Phone or a Mobile UC Client.

With this option enabled the Operator will be able to handle calls more efficiently. When there is an incoming call, SARVAM UCS matches the number with the numbers in the Global Directory. If a match is found SARVAM UCS displays the company name configured for that entry to the Operator, that is, the CLI will display the called party number and name.

After the Operator answers the call, the CLI will change and display the calling party number and name (if configured in the Global Directory).

If you keep this option disabled, the calling party number and name will be displayed as the CLI, both during an incoming call and after the call is answered by the Operator.

You can configure the Display Called Party Number as CLI option only from Jeeves.

- **On Connecting Media Send:** If Built-In Auto Attendant or DISA is enabled on the SIP Trunk, select the response you want the system to send on Connecting Media, that is **200 OK** or **183 Session Progress**.
- **Answer Source Trunk on Receiving:** When a call received on any trunk of SARVAM UCS is routed through the SIP Trunk, select the response after which the call on the source trunk must be answered. You can select **Early Media** or **200 OK**.
- If you have configured the above parameters, click **Submit** at the bottom of the page to save your configuration settings.

Viewing SIP Trunk Status

You can also view the settings of the SIP Trunk Parameters on Jeeves.

To do this,

- Under **VoIP Configuration**, click the **SIP Trunk Status** link.

SIP Trunk No.	Name	Status	Registration Time	Registration Retry Count
1		Disable		
2		Disable		
3		Disable		
4		Disable		
5		Disable		
6		Disable		
7		Disable		
8		Disable		
9		Disable		
10		Disable		
11		Disable		
12		Disable		
13		Disable		
14		Disable		
15		Disable		
16		Disable		
17		Disable		
18		Disable		
19		Disable		

- For each SIP trunk (number), the following settings will be displayed:
 - SIP Trunk Number
 - Name
 - Status
 - Registration Time
 - Registration Retry Count
 - Reason for Failure
 - Call Budget Type
 - Allotted Amount/Minutes/Calls
 - Consumed Amount/Minutes/Calls
 - Scheduled Reset

- Budget Reset Scheduled (Date)
- Reset Consumed Budget (this is not a status indicator. It is for resetting the Consumed Call Budget manually)

You can also view the SIP Trunk Status from the **Status** link. To view, click the SIP Trunk link under Status.

Configuring PRI Trunks

What's this?

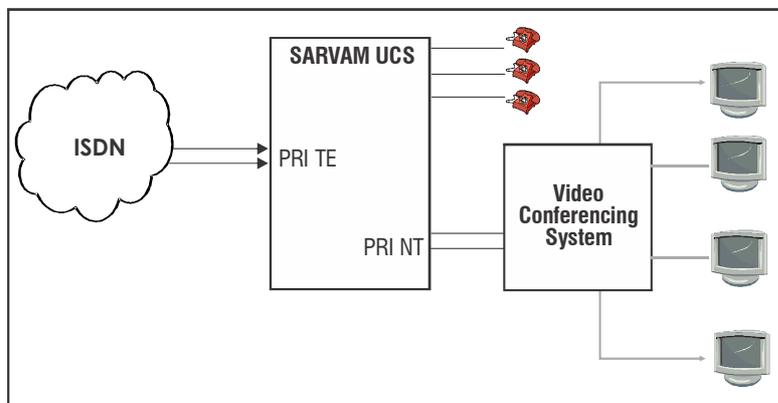

- This topic explains the connection of PRI line, and application of PRI.
- For MSN Numbering System, please refer "[Configuring BRI Trunks](#)".
- PRI port of the SARVAM UCS configured for NT mode can be connected to the PRI Port of another System configured for TE mode. In such case, the SARVAM UCS will behave as Transit Exchange.
- Dialing method on the PRI port is not programmable. The PRI port (configured for TE mode) will send the called party number in Enbloc mode.
- All the switch variants are applicable to the PRI port whether programmed in TE or NT mode.

Applications:

Applications for PRI-NT Port are as described below:

- Video conferencing system connected to the PRI-NT port with IC/OG calls.
- Data Calls support.
- Networking of Systems.

Video conferencing system connected to the PRI-NT port:

- Connect the Video Conference system (H.320) to the PRI-NT port of the SARVAM UCS.
- This feature works only if it is supported by the Service Provider. Video Conference is established mainly by the Video Conferencing (VC) equipment.
- Video Conferencing requires 6 B-channels. But Video Conferencing can also be done at lower bit rates also using the "aggregation" of 6 B channels which must be supported by the VC equipment.
- The VC equipment uses two methods:H.221 and H.242 BONDING, for aggregation.
- More than one Video conferencing system can be connected to the SARVAM UCS to each PRI-NT port.
- It also supports internal calling like, one Video Conferencing system to another.

OG calls from VC

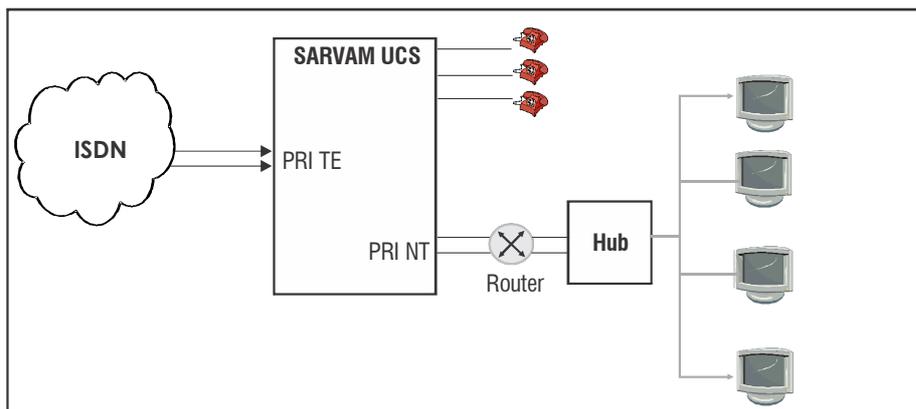

- After suitable connections to the VC equipment, user follows following sequence:
- Program the OGTBG (OG Trunk Bundle Group) such that the user gets at least 6 B-channels of the same PRI port.
- Go OFF-Hook.
- Dial the trunk access code to grab the PRI trunk.
- Dial the destination number.
- If VC at the called party responds, the call is established which occupies 6-B Channels.
- If 6 B-channels on the same PRI port are not available, user at VC will get busy tone.
- The user at calling party's VC gets dial tone of the ISDN exchange.
- The user at VC starts dialing the destination number. The destination number is sent in keypad IE by the VC user to the PRI-NT port whereas it is dialed on the PRI-TE port in the method programmed for the port that is, Enbloc.
- Rest of the signaling is done between the VC equipment and the called party's VC equipment.
- If VC equipment supports Phone Book feature, user can make call using the feature.
- At the end of VC, all the 6 B-channels are freed and available for other users.
- It is preferable that the SE will assign an OGTBG to the Video Conferencing equipment in such a manner that the same group is not assigned to any other station. This is to allow Video Conferencing call at any time.

IC Video Call:

- Following steps are followed for IC call:
 - Program the system to place IC video calls to the PRI-NT port using DDI Routing Table.
 - For this, program the DDI Routing Table. Refer related chapter.
 - You can also prepare the Trunk Landing Group (Routing Group) to land the call to PRI-NT port. For this purpose, Routing Group is to be modified.

Data Calls from PRI-NT:

- SARVAM UCS PRI-NT port supports data communication also.
- For data-communication, connect the Router supporting ISDN-PRI or a Computer with SARVAM UCS Card T1E1PRI to the PRI-NT port as shown below:

Using this feature following applications are supported:

- The computers connected in the LAN can browse the net through the PRI.
- Remote LAN Access the Computers in the LAN can access the computer/computers in LAN at the remote end (Branch office/Home office).
- Files can be transferred from one LAN to another.

OG Data calls from the Router

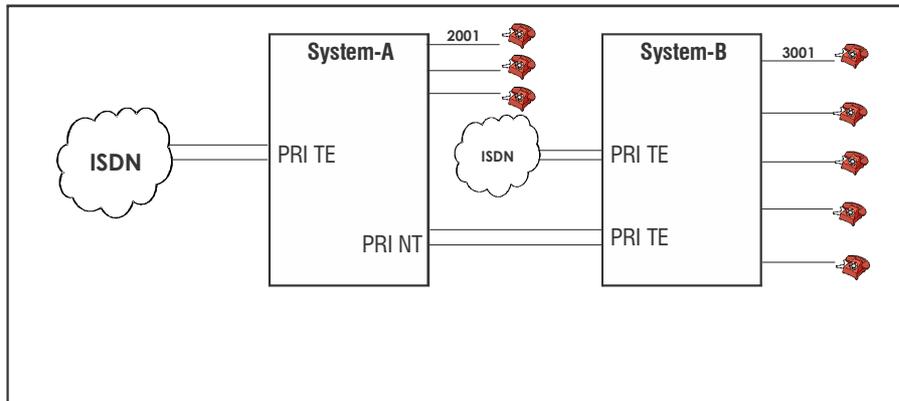

- The data call can be made by the router requesting desired number of channels. This establishes a live connection between the Router and the ISP through the System. The users on the LAN can browse the net as normal using Internet Explorer or Netscape Navigator.
- For this, the SARVAM UCS will allocate data channels only on the PRI-TE port so as to leave other channels for speech calls when the system detects the call to be a data call.
- Similarly, a Remote Computer can be accessed (Remote LAN Access) by dialing the Remote users' number (The remote end System should be so programmed that the call made to a number lands directly on the Router.) This establishes a permanent connection between the two Routers (and hence two LAN networks).
- Now the user at System-A can access the computer in LAN at the remote end in the same way as accessing another computer on the same network.

IC Data calls to the Router:

- Program the Trunk Landing Group such that all data calls will land on the PRI-NT port to which the Router is connected using CLI based Routing logic or DDI based routing logic.
- However, while routing call on the PRI-NT port, the System will check that the data channels reserved for data communication on the PRI-NT port are enough to establish the call. Otherwise the call will be rejected.
- The call will be rejected if the number of channels, reserved for data calls are already busy with one data-call.

Networking of Systems:

One of the applications is also for connecting multiple Systems using PRI-NT and PRI-TE ports. A simple connection of only two Systems is explained below. Refer following figure for connecting another System to the PRI-NT port.

Various cases of Calls from System-A to System-B can be:

Case-1: (2001 calls 3001)

- A station 2001 of System-A can call a station 3001 of System-B by dialing 3001.
- Such a call can be routed using CUG table of System-A. Refer chapter "[Closed User Group \(CUG\)](#)".

Case-2: (2001 calls a subscriber of ISDN network connected to System-B)

Method 1

- Program (for System-A) an OGTBG containing the PRI-NT port and assign Trunk access code to it.
- Grab the PRI-NT by dialing access code. User of 2001 will get dummy dial tone of the System-A.
- Dial a station number 3001 of System-B.

Method 2

- User of 2001 can dial trunk access code of System-A, and dial a trunk access code of System-B. He will be connected to ISDN network through System-B.
- Then he can make OG call on PRI-NT port as per method programmed for the PRI-NT port. (For example, PRI-NT port can be programmed as a Trunk port and when station user of System-B grabs the PRI-NT port, his call will be placed on the destination programmed for PRI-NT port in the Trunk Landing Group).

Case-3: (3001 to 2001)

Station 3001 of System-B will go Off-Hook.

- Using CUG feature of System-B, 3001 can call 2001 through PRI-NT port. Refer chapter "[Closed User Group \(CUG\)](#)" for more details.
- 3001 can also dial Trunk Access Code to grab its PRI-TE port. He will get dial tone of PRI-NT Port of System-A. Now 3001 can dial 2001 or trunk access code to make a call to the ISDN network connected to System-A.

How to configure

For programming of the PRI, please refer topic [“Configuring E1 Trunks”](#) and [“Configuring T1 Trunks”](#) for more details.

- *Trunk software ports are automatically assigned to the PRI port by the system depending on the slot in which they are inserted.*
- *Please take care to **terminate the PRI line on the HDSL interface only** of the ISDN modem.*
- *The DDI Routing and Routing Tables shall be programmed as explained in chapters on DDI.*

Configuring T1 Trunks

What's this?

Digital Signal Level 1 (T1E1) trunks use Bit-Oriented Signaling (BOS) and multiplexes 24 channels (T1 service) or 32 channels (E1 service) into a single data stream. T1E1 can be used for voice or voice-grade data and for data-transmission protocols. T1 trunk service multiplexes 24 channels into a single 1.544-Mbps data stream. E1 trunk service multiplexes 32 channels into a single 2.048-Mbps stream. Both T1 and E1 provide a digital interface for trunk groups.

Signaling Modes

Common Channel Signaling (CCS) is an industry-standard technique where any one of a group of channels carries the signals for the other channels. Matrix uses the 24th channel of a group for signaling. This signaling technique differs from 24-channel signaling. When the system is configured for Facility-Associated Signaling, 24-channel signaling uses the 24th channel in a T1E1 facility to carry signals. This technique also is called clear channel, out-of-band or alternate voice data (AVD) signaling.

ROBBED-BIT signaling is a per-channel in-band signaling technique for transmitting signaling bits on each channel in a T1E1 facility. The least-significant bit in every 6th transmitted information frame is removed and replaced by a signaling bit. This technique is also called in-band signaling. The maximum transmission rate for each bearer channel with ROBBED-BIT signaling is 56 Kbps. T1 RBS Protocol supports 24 channels (from 01 to 24) and the protocol doesn't consume any channel for signaling so that there are total 24 channels available for the users.

ISDN-PRI signaling is carried on the 24th channel for a 1.544 Mbps (T1) connection and on the 16th channel for a 2.048 Mbps (E1) connection. In case of T1 PRI Protocol supports 24 channels (from 01 to 24), in which channel no. 24 is used for the signaling, so effectively there are 23 Voice channels are available.

QSIG is an ISDN based protocol for signaling between nodes of a Private Integrated Services network. Any of the common trunks, except for PCOL (Personal Central Office Line) trunks, can be analog or digital. (PCOL trunks can only be analog.) Administering a digital trunk group is very similar to administering its analog counterpart, but digital trunks must connect to a T1E1 port and this port must be administered separately.

Configuring T1E1 Port Parameters using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **T1E1 Configuration**.
- Click **Port Parameters** to open the page.

- Select the T1E1 Port number you want to configure by clicking the respective tab, and program the following port parameters:

- SARVAM UCS will assign the **Hardware Slot-Port** automatically, when any card is inserted in the system.

Hardware slot is the number of the Universal slot of SARVAM UCS in which the T1E1 Card is inserted. Range of slot number is 01-16. Port is the number of T1E1 hardware port on the card to which the T1E1 line is connected. Range of Port is from 00-99.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields. By default, Hardware slot-Port is 00–00.

- Keep the **Enable T1E1 Port** flag enabled.

Clear the flag, only if you do not want to use this port. By default, it is enabled.

- You may assign a **Name** to the T1E1 Port for identification of the port. The Name may consist of a maximum of 12 characters. By default, it is blank.
- Select the **Carrier** type as **T1**. The Carrier type will automatically be assigned to the port when you select the region. You may it if required.
- Select **Signal Type**. Signal Type signifies the type of signaling to be used on E1 line. The E1 Signaling supported are:
 - PRI
 - RBS
 - QSIG
 - E&M
 Default: PRI

If you select **PRI or QSIG** as the Signal Type, configure the **PRI/QSIG Parameters**.

If you select **RBS** as the Signal Type, configure the **RBS Parameters**.

If you select **E&M** as the Signal Type, configure the **E&M Parameters**.

- Set the **Orientation Type**. Select the orientation type from the following options:
 - Terminal
 - Network
 - Tie-LineDefault: Terminal
- If you have set **Terminal** as the **Orientation Type**, you must select the type of network with which it is to be **Interfaced With**. The network may be:
 - Public ISDN
 - Private ISDNDefault: Public ISDN
- You may configure the port to **Treat Incoming call as Trunk or Station**.

If you select **Trunk**, the system will treat all incoming calls as external calls landing on the trunk. The calls will be routed as per the **Trunk Feature Template** assigned to the T1E1 Port.

If you select **Station**, you must also assign a Station Basic Feature Template and Station Advanced Feature Template to the T1E1 Port.

When you select Station, the system will treat the calling party as an extension user. The user will have access to all the features and facilities of the system, as per the Station Basic Feature Template and Station Advanced Feature Template assigned to the T1E1 Port.

By default, Trunk is selected.

- *If Point-to-Point is selected as the Interface Type, you can select the option **Trunk** or **Station** for the parameter **Treat Incoming call as**.*
- *If Point-to-Multipoint is selected as the Interface Type, only **Station** can be set as the option for the parameter **Treat Incoming call as**.*
- *If **Station** is selected as the option for **Treat Incoming call as**, the user will only be able to:*
 - *Dial Flexible Numbers*
 - *Dial Operator Code*
 - *Dial Trunk Access Code for making outgoing calls*
 - *Access the Global Directory*
 - *Make calls within the Closed User Group*
- Line coding is a pattern that data assumes as it is propagated over a communication channel. Select the **Line Coding Mechanism** from the following:
 - AMI-Basic
 - B8ZS
 - NRZ (Fiber Optic)Default: AMI-Basic.

- Framing means to form a set of 24 or 32, 8 bits time slot that is to be treated as single transmission unit. The **Framing Modes** supported by SARVAM UCS are:
 - SF (D4)
 - ESF
 Default: SF (D4)
- **Line Buildout Parameter** field reduces the outgoing signal strength by a fixed amount. The appropriate level of loss depends on the distance between your switch (measured by cable length from the smart jack) and the nearest repeater. Where another switch is at the end of the circuit, as in campus environments, use the cable length between the 2 switches to select the appropriate setting from the list. This field is relevant if the Near-end CSU type field is integrated. By default, 0-133ft is selected as the Line Buildout Parameter.
- Configure **Outgoing (OG) Reference ID**. By default, OG Reference ID is 00.
- Configure **Incoming (IC) Reference ID** for working hours, non-working hours and break hours. By default, IC Reference ID is 00.
- Assign **Trunk Feature Template** to the T1E1 Port. Trunk Feature Template is a set of general features that define the behavior of a Trunk Port. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“Trunk Feature Template”](#).

- **Station Basic Feature Template** assigned to the T1E1 Port is displayed in this field. Station Basic Feature Template is a set of general features that define the basic behavior of a station. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“Station Basic Feature Template”](#).

- **Station Advanced Feature Template** assigned to the T1E1 Port is displayed in this field. Station Advanced Feature Template is a set of advanced features, to be applied on extensions such as CLIP, Floor Service, Walk-in Class of Service. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“Station Advanced Feature Template”](#).

- Select **Priority** for the T1E1 Port. Priority is the precedence given to certain trunks and extensions over others in being answered by the destination extension. You can select from 1 to 9. By default, Priority 5-Normal is set for all T1E1Ports.

For know more about Priority feature, see [“Priority”](#).

- Assign a **Cost Factor** to the T1E1 Port. By default, all the T1E1 Ports are assigned Cost Factor 01.

For more details, see [“Cost Factor”](#).

- ISDN glare occurs if the system initiates an outgoing call on a B-Channel at the same time the network initiates an incoming call on that same B-channel. You may configure the **Glare Option** as **Proceed** or **Held Back**. While processing a glare condition, the configured Glare Option on T1E1 port will be considered.
- Select **Category (Logical Partition)** for the T1E1 Port. You may select from the following options:
 - 1
 - 2

- 3
- 4

By default, 1 is selected for all T1E1 Ports. Refer the feature description “[Logical Partition](#)” to know more.

- **Idle Code** is the 8-bit sequence that occupies the time slot on a E1/T1 trunk channel when it is not being used. By default, 127 is configured as the Idle Code.
- If you want SARVAM UCS to display the called party number as the CLI for incoming calls, select the **Display Called Party Number as CLI** check box. By default, Display Called Party Number as CLI option is disabled.

This option is useful when a single T1E1 line connection and Operator are shared by more than one organization. If you enable this option, make sure:

- you configure the names and corresponding numbers of the organizations sharing the line in the Global Directory of SARVAM UCS.
- the Operator has a DKP or an Extended IP Phone or a Mobile UC Client.

With this option enabled the Operator will be able to handle calls more efficiently. When there is an incoming call, SARVAM UCS matches the number with the numbers in the Global Directory. If a match is found SARVAM UCS displays the company name configured for that entry to the Operator, that is, the CLI will display the called party number and name.

After the Operator answers the call, the CLI will change and display the calling party number and name (if configured in the Global Directory).

If you keep this option disabled, the calling party number and name will be displayed as the CLI, both during an incoming call and after the call is answered by the Operator.

You can configure the Display Called Party Number as CLI option only from Jeeves.

- Select the **Allow Incoming CLI Modification** check box if you want to apply 'Allow Incoming CLI Modification' on the T1E1 Port. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see “[Incoming CLI Modification](#)”.

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*For an incoming call on the T1 trunk, the Incoming CLI Modification will be applied only when both — the **Allow Incoming CLI Modification** check box and the **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- Select **Return Call to Original Caller (RCOC)** flag to enable this feature on the T1E1 Port. By default, RCOC flag is disabled.

For know more about RCOC feature, see “[RCOC \(Return Call to Original Caller\)](#)”.

- In **Channel Reserved for Data Call**, configure the channels you want to reserve for Data Calls. By default, 00 channels are reserved.

- In **Channel Reserved for Outgoing Call**, configure the channels you want to reserve for making outgoing calls. By default, 30 channels are reserved.
- In **Channel Reserved for Incoming Call**, configure the channels you want to reserve for receiving incoming calls. By default, 30 channels are reserved.
- When a caller dials the trunk access code or selective trunk access code for dialing the number directly on the trunk port, the caller waits for the dial tone before dialing the number. But some exchanges do not give Dial Tone for the T1E1 Port. For Example, when T1E1 port as E1CAS type is used in Delhi, it is observed that the exchange does not give dial tone when direct dialing on the trunk is used.

Enable the **Feed Dial Tone** flag. SARVAM UCS will provides the dial tone to the caller when the T1E1 Port is accessed.

It is applicable only when Online dialing is used as, Store and Forward dialing, the dial tone is given to the caller. The dial tone is played as per the Dial Tone Timer.
By default, Feed Dial Tone flag is disabled.

- *When dial tone flag is disabled, user will hear the dial tone of the exchange if provided, otherwise, user will hear the silence.*
- *If the user is making the call from the SLT port and dial tone is not provided by the exchange, user will not know when to start dialing the number. In this case, it is possible that some digits are not out dialed on the port and wrong number is dialed out because system will out dial the number only if Outgoing call Acknowledge is received but the user is not aware of this condition. Hence, it is required to enable this flag, if exchange is not providing the dial tone.*
- When Online dialing or Store and Forward dialing are used, some exchanges do not provide any tone while routing/processing the call. Thus, the caller does not know whether the call is being processed or not as there is silence. In such case, You must enable the **Feed Routing Tone** flag, SARVAM UCS will play the routing tone to the caller. SARVAM UCS stops playing the routing tone will be stopped when an alert message or connect message or disconnect message is received from the T1E1 Card.

By default, the Feed Routing Tone flag is disabled.

- To customize the pulse width option and set the pulse shapes configure the **Custom Pulse** parameters. SARVAM UCS generates pulse shapes which match the country standard, where it is installed. However, if the standard pulse shape does not match, SARVAM UCS enables you to customize the pulse width to match your exact requirements.

To use customize pulse width option and set the pulse shape in 1 to 4 phases, keep the **T1/E1 Custom Pulse Width (CPW) flag** enabled.

- **Word 1:** Set the pulse width for setting pulse shape in the 1st phase. The range of Custom Pulse Width-Word 1 is 001 to 127. Default: 109.
- **Word 2:** Set the pulse width for setting pulse shape in the 2nd phase. The range of Custom Pulse Width-Word 2 is 001 to 127. Default: 107.
- **Word 3:** Set the pulse width for setting pulse shape in the 3rd phase. The range of Custom Pulse Width-Word 3 is 001 to 127. Default: 64.

- **Word 4:** Set the pulse width for setting pulse shape in the 4th phase. The range of Custom Pulse Width-Word 4 is 001 to 127. Default: 64.
- Select the **Bearer Service** supported by your service provider. You can select from:
 - Speech
 - 3.1 KHz Audio
 By default, Speech is selected.

- The **Overlap Receiving Timer** is relevant while receiving the called party number information in overlap receiving mode. It is not relevant for the port in overlap sending mode.

Range of Overlap Receiving Timer is from 01 to 99 seconds. Default: 15 seconds.

- Configure **Pause Timer** for the T1E1 Port. Range of Pause Timer is from 1 to 9 seconds. By default, it is set to 3 seconds for all T1E1 Ports.

This Timer is required to insert delay between the digits while dialing out DTMF digits on the T1E1 port. One of the applications for using this parameter is Multi-stage dialing. Refer chapter "[Multi-Stage Dialing](#)".

For example, if PPP2 is to be outdialed and Pause timer is programmed as 3 seconds, the SARVAM UCS will out dial the digit 2 after 9 seconds i.e delay of individual P i.e $3+3+3=9$.

- When the SETUP Message is sent by SARVAM UCS to the network (ISDN exchange), the exchange responds by sending SETUP ACK (Acknowledgment), and dial tone is played to the caller. The time taken by the exchange to respond to the SETUP message may vary from exchange to exchange. Set the **SETUP Response Timer (sec)** as per the time taken by the network to respond to the SETUP message and play dial tone to the caller.

Valid Range of the timer is 01 to 20 seconds. By default it is set to 4 seconds.

Change the default settings only if required. If the time you set is less than the time taken by the exchange to respond, no dial tone will be played to the caller.

You can configure the SETUP Message Timer only from Jeeves.

- Configure **DTMF On Time** for the T1E1 Port. Range of DTMF On Time is from 051 to 255 ms. By default, it is set to 102 ms for all T1E1 Ports.

The DTMF On Time is the time for which the DTMF digit which is to be outdialed by the SARVAM UCS remain On. One of the applications for using this parameter is Multi-stage dialing. Refer chapter "[Multi-Stage Dialing](#)".

- Configure **DTMF Inter Digit Pause Timer** for the T1E1 Port. Range of Inter Digit Pause Timer is from 051 to 255 ms. By default, it is set to 102 ms for all T1E1 Ports.

Inter Digit Pause Timer is the time for which the system will wait while receiving the dialing digits to consider it as end-of-dialing.

- Configure the **Minimum ON Time (msec)** for which the DTMF signal should be present in order to be detected. The valid range of this time is 10 to 200 milliseconds. By default, Minimum ON Time is set to 20 milliseconds.

- Configure the **Minimum OFF Time (msec)**. This parameter signifies the minimum time period between successive DTMF digits. The valid range of this time is 10 to 200 milliseconds. By default, Minimum OFF Time is set to 20 milliseconds.

Configure the **Minimum Level (dB)** for the DTMF digit to be considered as valid. The valid range of this time is 0 to -36.5 dB. By default, Minimum levels is set to -36.5dB.

- If SARVAM UCS is to be used as a Gateway, enable **Gateway Application-Answer Signaling** on the T1E1 Port and configure **DTMF String**. By default, Gateway Application-Answer Signaling is disabled and CCC is configured as DTMF String.

For more details, see [“Gateway Application-Answer Signaling”](#).

- Configure **Call Budget** parameters for the T1E1 Ports. Call Budget is an expense control feature of SARVAM UCS that allows you to keep track of the cost of phone calls made from the T1E1 Port. By default, Call Budget is enabled on the trunk. If you wish to change the default configuration or disable it for this T1E1 Port, configure the parameters as per your requirement:

- **Type:** Select the type of Call Budget, that is, Amount or Minutes or Calls to be applied on the T1E1 Port. By default, Minutes is selected as the Call Budget type. To disable select Type as None.

- **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 999999.

- **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set as 000300.

- **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of Calls in this field. By default the number of calls is set to 9999.

- **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes/Number of Calls to be reset on a particular date of every month.

- **Scheduled (Date):** Select the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be reset every month. You may select 'Daily' if your plan suggests so.

- **Call Back:** This parameter is related to the 'Call Back on Trunk Port' feature. If you want to enable the 'Call Back on Trunk Port' feature on this T1E1 Port, configure the following parameters:

- **Enable Call Back:** Enable this flag to activate the Call Back on Trunk Port feature. By default, this flag is disabled on all trunk port types. By default, the flag is disabled.

- **Call Back Timer (sec):** This is the duration for which the system waits for the caller to disconnect before applying the Call Back. The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds.

- **Call Back Mode:** Select from the following options how a 'Call Back' call answered by the remote party should be routed:

- Built-In Auto Attendant
- PIN Authentication - Multiple Calls
- CLI Authentication - Multiple Calls

- CLI Authentication - Single Call - Answer Signaling
- Operator

By default, Operator is selected as the Call Back Mode.

- **Call Back on:** This parameter allows you to select if the call back should be made to the same number that was received or to a different number. If you want the call back to be made to the same number select the 'CLI number'. If you want the call back to be made to a different number, select 'Alternate Number'.
By default, CLI number is selected for Call Back.
- **Incoming Number List:** Program the number strings that are eligible for Call Back in this List. By default, Number List 15 is assigned to Call Back Incoming Number List.

Number List 15 is also assigned to all T1E1 Ports as well as all other Trunk port types. If you want the same numbers strings to be programmed commonly for all T1E1 Ports and Trunk Port types, retain this list.

If you want a different set of number strings to be programmed for this T1E1 Port, select a different Number List, and assign it to the T1E1 Port.

You may program the Incoming Number List either from the 'Number List' page or by clicking the 'Incoming Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Outgoing Number List:** Program the number strings that are to be called back in this List.

For each number string you programmed in the 'Incoming Number List', you must program in the corresponding index in the Outgoing Number List a number to which the call back is to be made. For example, for the number string programmed at Index 1 in the Incoming Number List, a corresponding number string at the same Index, Index 1, should be programmed in the 'Outgoing Number List'.

By default, Number List 16 is assigned to Outgoing Number List. The same Number List 16 is also assigned to all T1E1 Ports as well as all other Trunk port types.

You may program the default number list, or a different number list and assign it to this T1E1 Port.

You may program the Outgoing Number List either from the 'Number List' page or by clicking the 'Outgoing Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Call Back from:** This parameter determines the trunk port to be used to make the call back. The call back can be made using the Same Port or an "[OG Trunk Bundle Group](#)".

Select 'Same Port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTB Group, the call back will be made using the OGTB Group, which you have defined.

By default, Same Port is selected.

- **OGTB Group:** If you selected OGTB Group for making the call back in the previous parameter, you must define the OGTB Group that must be used in this parameter.

By default, OGTB Group 01 is assigned.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTB Group that you define here for Call Back.

- FDL is used for communicating general maintenance information or for transmitting user defined information within the T1 link. General maintenance information is in the form of Performance Message Report which is generated by the SARVAM UCS Card T1E1PRI and depending upon the FDL Protocol, the Performance Message Report is sent every second or on request.

Select the **FDL** flag to enable. This parameter is applicable only if Framing = ESF. If the Network (Public or Private) to which the SARVAM UCS is connected does not support FDL then FDL will be disabled. By default, the T1 FDL is disabled.

If you have enabled FDL, configure the **FDL Protocol**. SARVAM UCS supports ANSI T1.403 and AT&T 54016 protocols of reporting the performance monitoring. By default, the T1 FDL Protocol is ANSI T1.403.

For more information, see ["E1/T1 Maintenance"](#)

- Enter appropriate **Debug Code (Level 1 to 4)**, to obtain debug information of various parts of T1E1 Card on the COM Port. By default, debug is off for all T1E1 ports for all levels.

Code is the value for the specified level to turn ON the debug for the parameters. Code range is from 000 to 255. Code value '000' for each level will turn off that level's debug.

Level and Code for T1E1 Port are as specified below:

Level 1:

Unused	Unused	Unused	Unused	Layer 4	CAS DSP	MFC R2	CAS
--------	--------	--------	--------	---------	---------	--------	-----

001	CAS
002	MFC R2
004	CAS DSP
008	Layer 4
000	Debug Off

Level 2:

Unused	Unused	Unused	HDLC (D-Channel)	FDL	ABCD Bits	Counters	Alarms
--------	--------	--------	------------------	-----	-----------	----------	--------

001	Alarms
002	Counters
004	ABCD Bits
008	FDL

016	HDLC (D Channel)
000	Debug Off

Level 3:

Unused	Flow Debug	NLS Debug	LAP Debug	SVC Primitives	Variables	State	Primitives
--------	------------	-----------	-----------	----------------	-----------	-------	------------

001	Primitives
002	State
004	Variables
008	SVC Primitives
016	LAP Debug
032	NLS Debug
064	Flow Debug
000	Debug Off

Level 4:

Unused	Unused	Unused	Unused	Unused	Unused	NI Debug	OS Task
--------	--------	--------	--------	--------	--------	----------	---------

001	OS Task
002	NI Debug
000	Debug Off

PRI/QSIG Parameters

If you have selected **PRI** as **Signal Type** on the Port Parameters page,

- Under **T1E1 Configuration**, click **PRI/QSIG Signaling** and configure the PRI/QSIG parameters.

The screenshot shows the configuration page for T1E1:1 - PRI/QSIG Signaling. The left sidebar contains a navigation menu with categories like SLT Configuration, Station Advance Features, Station Basic Features, Station Message Detail, Recording, SMS Gateway, SMS Routing, SMS Server, SMTP Settings, System Log, System Parameters, System Prerequisites, System Timers and Counts, T1E1 Configuration, Port Parameters, PRI/QSIG Signaling, E1 CAS Signaling, T1 RBS Signaling, E&M Signaling, Loop Back Test: Near End, Loop Back Test: Far End, Status, Time Table, Trunk Features Templates, Virtual Extensions, Voice Message Applications, VMS Configuration, and VoIP Configuration. The main content area is titled 'T1E1:1 - PRI/QSIG Signaling' and contains the following settings:

ISDN Switch Variant	ETSI NET5
Offer continuous Bearer Channel Mapping(01-30)	<input type="checkbox"/>
D-Channel	16
Send Called Party Number Using	Called Party Number IE
Dialing Type for Called Party Number	Any
Caller-Type of Number (TON)	Unknown
Caller-Numbering Plan Identification (NPI)	ISDN Numbering
Called-Type of Number (TON)	Unknown
Called-Numbering Plan Identification (NPI)	ISDN Numbering
Modify Received CLI as per TON	<input checked="" type="checkbox"/>
Screening Indicator	User-provided, not screened
Receive Equalization Mode	Auto
Receive Equalization Parameters	8dB
Feed Inband Tone on T1E1-NT, before sending DISCONNECT	<input type="checkbox"/>
Send SETUP ACK with PI	<input type="checkbox"/>
Send PROCEED with PI	<input type="checkbox"/>
Send PROGRESS with PI	<input checked="" type="checkbox"/>
Send ALERT with PI	<input type="checkbox"/>
Transparently pass PI in case of ISDN / SIP call	<input checked="" type="checkbox"/>

At the bottom of the form, there are two buttons: 'Submit' and 'Default'.

- ISDN Switch Variant:** ISDN supports a variety of service provider switches. Different countries use specific type of ISDN switch. This switch is designed using ISDN standard protocol. The type of switch determines various factors such as how many ISDN devices would be handled, which B-channel will support voice, video, data etc. Select the ISDN Switch Variant from the list. Default: ETSI NET5.
- Offer continuous Bearer Channel Mapping(01-30):** Select this check box for continuous Bearer Channel Mapping for E1-QSIG/E1-PRI.
- D-Channel:** Enter the Channel number that is used for Data Signaling. By default, D-Channel is 16. Valid Range is 1 to 31.
- Send Called Party Number Using:** Select the appropriate option from the following for Send Called Party Number Using:
 - Called Party Number IE (Information Element)
 - Keypad Facility IE (Information Element)
 Default: Called Party Number IE is selected.
- Dialing Type for Called Party Number:** Select the option from the following as supported by your exchange:
 - Enbloc
 - Digit-by-Digit
 - Any
 Default: Any.

- **Caller - Type of Numbering Plan (TON):** Select the appropriate option from the following for sending the type of numbering plan of the calling party:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved
 Default: Unknown.

- **Caller- Numbering Plan Identification (NPI):** Select the appropriate option from the following for sending the numbering plan identification of the calling party:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved
 Default: ISDN Numbering.

- **Called - Type of Numbering Plan (TON):** Select the appropriate option from the following for sending the type of numbering plan of the called party:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved
 Default: Unknown.

- **Called - Numbering Plan Identification (NPI):** Select the appropriate option from the following for sending the numbering plan identification of the called party:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved
 Default: ISDN Numbering.

- **Modify Received CLI as per TON:** This is applicable for PRI-TE mode only. If this check box is selected then the Calling Party Number received in SETUP message will be changed as per the Type of Number received in the SETUP message from Calling Party Number field by the system. Default: Disabled.

- **Screening Indicator:** Select the option as provided to you by your exchange. You can select from:
 - User provided, not screened
 - User Provided, verified and passed
 - User Provided, verified and failed
 - Network Provided

By default, User provided, not screened.

- **Receive Equalization Mode:** You can set the Receive Equalization Mode as Auto or Manual. By default, Auto is selected as the Receive Equalization Mode.
- **Receive Equalization Parameters:** This field increases the strength of incoming signals by a fixed amount to compensate for line losses. Select the required option from the list. By default, the receive equalization parameters of T1E1 is 8dB.
- **Feed Inband Tones on T1E1-NT, before sending DISCONNECT:** Select this flag, if you want to feed inband tones on T1E1-NT before sending DISCONNECT message. This flag is applicable only when T1E1 port is configured as 'Network'. When this flag is enabled, inband tones shall be feed for 15 seconds (fixed, non programmable) before sending DISCONNECT message.

When this flag is disabled, inband tones (Busy/Error as applicable for the state of the call) shall not be feed before sending the DISCONNECT message. However when DISCONNECT message is sent from T1E1-NT port, inband tones will always be sent with 'progress indicator 8'. By default, this flag is disabled.

- **Send SETUP ACK with PI:** Select this flag if you want the system to send PI (Progress indicator) element in Setup Ack message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Send PROCEED with PI:** Select this flag if you want the system to send PI (Progress indicator) in Proceed message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Send PROGRESS with PI:** Select this flag if you want the system to send PI (Progress indicator) in Progress message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. By default it is enabled.
