Select 'Same Port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTB Group, the call back will be made using the OGTB Group, which you have defined.

By default, Same Port is selected.

- **OGTB Group:** If you selected OGTB Group for making the call back in the previous parameter, you must define the OGTB Group that must be used in this parameter.

By default, OGTB Group 01 is assigned.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTB Group that you define here for Call Back.

- FDL is used for communicating general maintenance information or for transmitting user defined information within the T1 link. General maintenance information is in the form of Performance Message Report which is generated by the SARVAM UCS Card T1E1PRI and depending upon the FDL Protocol, the Performance Message Report is sent every second or on request.

Select the **FDL** flag to enable. This parameter is applicable only if Framing = ESF. If the Network (Public or Private) to which the SARVAM UCS is connected does not support FDL then FDL will be disabled. By default, the T1 FDL is disabled.

If you have enabled FDL, configure the **FDL Protocol**. SARVAM UCS supports ANSI T1.403 and AT&T 54016 protocols of reporting the performance monitoring. By default, the T1 FDL Protocol is ANSI T1.403.

For more information, see ["E1/T1 Maintenance"](#)

- Enter appropriate **Debug Code (Level 1 to 4)**, to obtain debug information of various parts of T1E1 Card on the COM Port. By default, debug is off for all T1E1 ports for all levels.

Code is the value for the specified level to turn ON the debug for the parameters. Code range is from 000 to 255. Code value '000' for each level will turn off that level's debug.

Level and Code for T1E1 Port are as specified below:

Level 1:

Unused	Unused	Unused	Unused	Layer 4	CAS DSP	MFC R2	CAS
--------	--------	--------	--------	---------	---------	--------	-----

001	CAS
002	MFC R2
004	CAS DSP
008	Layer 4
000	Debug Off

Level 2:

Unused	Unused	Unused	HDLC (D-Channel)	FDL	ABCD Bits	Counters	Alarms
--------	--------	--------	------------------	-----	-----------	----------	--------

001	Alarms
002	Counters
004	ABCD Bits
008	FDL

016	HDLC (D Channel)
000	Debug Off

Level 3:

Unused	Flow Debug	NLS Debug	LAP Debug	SVC Primitives	Variables	State	Primitives
--------	------------	-----------	-----------	----------------	-----------	-------	------------

001	Primitives
002	State
004	Variables
008	SVC Primitives
016	LAP Debug
032	NLS Debug
064	Flow Debug
000	Debug Off

Level 4:

Unused	Unused	Unused	Unused	Unused	Unused	NI Debug	OS Task
--------	--------	--------	--------	--------	--------	----------	---------

001	OS Task
002	NI Debug
000	Debug Off

PRI/QSIG Parameters

If you have selected **PRI** as **Signal Type** on the Port Parameters page,

- Under **T1E1 Configuration**, click **PRI/QSIG Signaling** and configure the PRI/QSIG parameters.

T1E1:1 - PRI/QSIG Signaling	
ISDN Switch Variant	ETSI NET5
Offer continuous Bearer Channel Mapping(01-30)	<input type="checkbox"/>
D-Channel	16
Send Called Party Number Using	Called Party Number IE
Dialing Type for Called Party Number	Any
Caller-Type of Number (TON)	Unknown
Caller-Numbering Plan Identification (NPI)	ISDN Numbering
Called-Type of Number (TON)	Unknown
Called-Numbering Plan Identification (NPI)	ISDN Numbering
Modify Received CLI as per TON	<input checked="" type="checkbox"/>
Screening Indicator	User-provided, not screened
Receive Equalization Mode	Auto
Receive Equalization Parameters	8dB
Feed Inband Tone on T1E1-NT, before sending DISCONNECT	<input type="checkbox"/>
Send SETUP ACK with PI	<input type="checkbox"/>
Send PROCEED with PI	<input type="checkbox"/>
Send PROGRESS with PI	<input checked="" type="checkbox"/>
Send ALERT with PI	<input type="checkbox"/>
Transparently pass PI in case of ISDN / SIP call	<input checked="" type="checkbox"/>

- **ISDN Switch Variant:** ISDN supports a variety of service provider switches. Different countries use specific type of ISDN switch. This switch is designed using ISDN standard protocol. The type of switch determines various factors such as how many ISDN devices would be handled, which B-channel will support voice, video, data etc. Select the ISDN Switch Variant from the list. Default: ETSI NET5.
- **Offer continuous Bearer Channel Mapping(01-30):** Select this check box for continuous Bearer Channel Mapping for E1-QSIG/E1-PRI.
- **D-Channel:** Enter the Channel number that is used for Data Signaling. By default, D-Channel is 16. Valid Range is 1 to 31.
- **Send Called Party Number Using:** Select the appropriate option from the following for Send Called Party Number Using:
 - Called Party Number IE (Information Element)
 - Keypad Facility IE (Information Element)Default: Called Party Number IE is selected.
- **Dialing Type for Called Party Number:** Select the option from the following as supported by your exchange:
 - Enbloc
 - Digit-by-Digit
 - AnyDefault: Any.

- **Caller - Type of Numbering Plan (TON):** Select the appropriate option from the following for sending the type of numbering plan of the calling party:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved
 Default: Unknown.

- **Caller- Numbering Plan Identification (NPI):** Select the appropriate option from the following for sending the numbering plan identification of the calling party:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved
 Default: ISDN Numbering.

- **Called - Type of Numbering Plan (TON):** Select the appropriate option from the following for sending the type of numbering plan of the called party:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved
 Default: Unknown.

- **Called - Numbering Plan Identification (NPI):** Select the appropriate option from the following for sending the numbering plan identification of the called party:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved
 Default: ISDN Numbering.

- **Modify Received CLI as per TON:** This is applicable for PRI-TE mode only. If this check box is selected then the Calling Party Number received in SETUP message will be changed as per the Type of Number received in the SETUP message from Calling Party Number field by the system. Default: Disabled.

- **Screening Indicator:** Select the option as provided to you by your exchange. You can select from:
 - User provided, not screened
 - User Provided, verified and passed
 - User Provided, verified and failed
 - Network Provided

By default, User provided, not screened.

- **Receive Equalization Mode:** You can set the Receive Equalization Mode as Auto or Manual. By default, Auto is selected as the Receive Equalization Mode.
- **Receive Equalization Parameters:** This field increases the strength of incoming signals by a fixed amount to compensate for line losses. Select the required option from the list. By default, the receive equalization parameters of T1E1 is 8dB.
- **Feed Inband Tones on T1E1-NT, before sending DISCONNECT:** Select this flag, if you want to feed inband tones on T1E1-NT before sending DISCONNECT message. This flag is applicable only when T1E1 port is configured as 'Network'. When this flag is enabled, inband tones shall be feed for 15 seconds (fixed, non programmable) before sending DISCONNECT message.

When this flag is disabled, inband tones (Busy/Error as applicable for the state of the call) shall not be feed before sending the DISCONNECT message. However when DISCONNECT message is sent from T1E1-NT port, inband tones will always be sent with 'progress indicator 8'. By default, this flag is disabled.

- **Send SETUP ACK with PI:** Select this flag if you want the system to send PI (Progress indicator) element in Setup Ack message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Send PROCEED with PI:** Select this flag if you want the system to send PI (Progress indicator) in Proceed message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Send PROGRESS with PI:** Select this flag if you want the system to send PI (Progress indicator) in Progress message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. By default it is enabled.
- **Send ALERT with PI:** Select this flag if you want the system to send PI (Progress indicator) in Alert message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Transparently pass PI in case of ISDN to ISDN / SIP call:** Select this flag, if you want the system to just pass the PI as received to the other end. This option is relevant only when call landing on the T1E1 port are to be routed to ISDN or SIP ports. By default it is enabled.
- Click **Submit** to save changes.

E&M Signaling

Under **T1E1 Configuration**, click **E&M Signaling** and configure the E&M parameters.

The screenshot displays the configuration interface for E&M Signaling. On the left, a navigation menu lists various system settings, with 'E&M Signaling' highlighted under the 'T1E1 Configuration' section. The main configuration area, titled 'T1E1:1 - E&M Signaling', contains several fields: 'E&M Features Template' is set to '01'; 'B Bit Pattern' is set to 'Same as A bit'; 'B Bit Value' is set to '0'; 'CD bits Value' is set to '1'; and four checkboxes for 'Invert Bit A', 'Invert Bit B', 'Invert Bit C', and 'Invert Bit D' are all unchecked. At the bottom of the configuration area, there are 'Submit' and 'Default' buttons.

- **E&M Feature Template:** Assign an E&M Feature Template to the T1E1 Port. The E&M Feature Template is a set of features specific to E&M signaling, which define the behavior of the E&M ports, according to their 'Orientation Type', whether they are functioning as Stations, Trunks or Tie-Lines. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“E&M Feature Template”](#).

- **B Bit Pattern:** Select the Bit Pattern from Same as Bit A or Fixed Value. By default, the Code is 1 (Same as A bit).
- **B Bit Value:** Configure the B bit value, the value can be 0 or 1. By default, B bit value is 0.
- **CD Bit Value:** Configure the CD bit value, the valid range of the value is 1 to 3. By default, B bit value is 0.
- **Invert Bit A:** This parameter signifies whether A-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit A.

Default: Disabled (Do Not Invert Bit A).

- **Invert Bit B:** This parameter signifies whether B-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit B.

Default: Disabled (Do Not Invert Bit B1)

- **Invert Bit C:** This parameter signifies whether C-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit C.

Default: Disabled (Do Not Invert Bit C).

- **Invert Bit D:** This parameter signifies whether D-bit is to be inverted before transmitting and on receiving. Select the check box to enable, that is to Invert Bit D.

Default: Disabled (Do Not Invert Bit D).

RBS Parameters

Under **T1E1 Configuration**, click **T1 RBS Signaling** and configure the RBS parameters.

T1E1:1 - T1 RBS Signaling	
Line Signaling Variants	
Line Signaling Variant	E&M Wink Start FGD
Wink Timer (Milliseconds)	0160
Wink Wait Timer (Milliseconds)	0030
Wait Wink Timer (Milliseconds)	5000
Delay Duration (Milliseconds)	0100
Start Delay Timer (Seconds)	020
Register Signaling Variants	
Register Signaling Variant	DTMF
Inbound AN/DNIS Format	?ANI?DNIS?
Inbound Delimiter (?) character	*
Outbound AN/DNIS Format	?ANI?DNIS?
Outbound Delimiter (?) character	*

- **Line Signaling Variant:** Select the T1 Line Signaling Variant from following options:
 - SLT Loop Start
 - CO Loop Start
 - SLT Ground Start
 - CO Ground Start
 - E&M Immediate Dial/Start
 - E&M Wink Start
 - E&M Wink Start FGDDefault: E&M Wink Start FGD.
- **Wink Timer (milliseconds):** Wink timer refers to the momentary Off-Hook condition to acknowledge end of making an outgoing call. The Wink Timer ranges from 0001 ms to 9999 ms. Default: 160 msec.
- **Wink Wait Timer (milliseconds):** Wink Wait Timer signifies the maximum time the system should wait before sending a wink start signal after an incoming seizure is detected. Wink Wait Timer ranges from 0001 to 9999 msec. Default: 30msec.

Ensure that this timer is greater than the Wink Wait Timer of the other end.

- **Wait Wink Timer (milliseconds):** Wait Wink Timer signifies the time for which SARVAM UCS will wait for receiving the DNIS after sending the outgoing seizure signal. Wait Wink Timer ranges from 0001 to 9999 msec. Default: 5000 msec.

Make sure that this timer is greater than the Wait Wink Timer of the other end.

- **Delay Duration (milliseconds):** This duration signifies the time after which the DNIS information is to be sent while making an outgoing call. Range of the Delay Duration is from 0001 to 9999 msec. Default: 100 msec.
- **Start Delay Timer:** Start Delay Timer signifies the time for which SARVAM UCS waits for receiving DNIS from the network. This timer is loaded on receiving the Off-hook (I/C Seizure) on the receive channel (while receiving an incoming call). The Start Delay Timer ranges from 0001 to 9999 ms. Default: 20 msec.
- **Register Signaling Variant:** The Register Signaling Variant for T1/E1 Ports is set as DTMF.
- **Inbound ANI/DNIS Format:** Select the Inbound ANI/DNIS Format for T1/E1 Ports from the following options:
 - ANI
 - DNIS
 - ?ANI?
 - ?DNIS?
 - ?ANI?DNIS?
 - ?DNIS?ANI?
 Default: ?ANI?DNIS?.
- **Inbound Delimiter (?) Character:** Define the Inbound Delimiter Character in this field. Characters supported in this field are 0-9, #, *, A, B, C and D. Default: *
- **Outbound ANI/DNIS Format:** Select the Outbound ANI/DNIS Format for T1/E1 Port from the following options:
 - ANI
 - DNIS
 - ?ANI?
 - ?DNIS?
 - ?ANI?DNIS?
 - ?DNIS?ANI?
 Default: ?ANI?DNIS?.
- **Outbound Delimiter (?) Character:** Define the Outbound Delimiter Character in this field. Characters supported in this field are 0-9, #, *, A, B, C and D. Default: *

Configuring T1E1 Port Parameters using Jeeves

The commands explained below should be referred as:
• To program a single port: XXXX-1
• To program a range of ports: XXXX-2
• To program all the ports: XXXX-*

Port Parameters

T1E1-1

Hardware Slot-Port

Use following command to assign hardware ID to a T1E1 software port.

1107-T1E1-Slot-Port offset

Where,

T1E1 is from 01 to 08.

Slot is the number of the universal slot, where the T1E1 Card is installed, from 01 to 16.

Port is the number of the T1E1 port on the card, from 01 to 32.

Use following command to de-assign the hardware slot and the hardware port assigned to the T1E1 software port.

1106-T1E1-00-00

Port Status

Use the following command to enable/disable the port:

6101-1-T1E1-Port Status

6101-2-T1E1-T1E1-Port Status

6101-*-Port Status

Where,

T1E1 is from 01 to 08.

Port Status	Meaning
0	Disable
1	Enable

By default, the T1E1 Port is enabled.

Name

Use the following command to assign a name to the port:

5407-1-T1E1-Name

5407-2-T1E1-T1E1-Name

5407-*-Name

Where,

T1E1 is from 01 to 08.

Name can be of upto 18 characters.

Carrier

Use the following command to select the carrier:

6108-1-T1E1-Carrier Type

6108-2-T1E1-T1E1-Carrier Type

6108-*-Carrier Type

Where,

T1E1 is from 01 to 08.

Carrier Type	Meaning
1	E1
2	T1

Line type

Use following command to program signaling type/ Line type of a T1E1:

6105-1-T1E1-Line Type

6105-2-T1E1-T1E1-Line Type

6105-*-Line Type

Where,

T1E1 is from 01 to 08.

Line Type	Meaning
1	ISDN_E1_PRI
2	ISDN_T1_PRI
3	ISDN_E1_CAS
4	ISDN_T1_RBS
5	ISDN_E1_QSIG
6	ISDN_T1_QSIG
7	ISDN_E1_E&M
8	ISDN_T1_E&M

By default, signaling type/ of a T1E1 is 1.

*DDI Routing is not supported on T1/E1 trunk line if you have selected **E&M** as the **Signal Type**.*

Orientation Type

Use following command to program 'Orientation Type' for the T1E1 port:

6106-1-T1E1-Orientation Type

6106-2.T1E1-T1E1-Orientation Type

6106-*-Orientation Type

Where,

T1E1=01 to 08.

Orientation	Meaning
1	Terminal
2	Network
3	Tie Line

By default Type = 1.

When Orientation = Terminal, the port will be regarded as trunk. All the trunk related parameters will be applicable. When Orientation = Network, the port will be regarded as station. All the station related parameters will be applicable.

When Orientation = Tie-line, the port will be regarded as station for all IC calls to it and as trunk for all OG calls to be made through it.

Line Coding Mechanism

Use following command to program the Line Coding Mechanism for the T1E1 port:

6103-1-T1E1-Line Coding

6103-2-T1E1-T1E1-Line Coding

6103-*-Line Coding

Where,
T1E1 is from 01 to 08.

Line Coding	Meaning
1	AMI-Basic
2	B8ZS
3	CMI

By default, Line Coding is AMI-Basic.

Set Line Coding = AMI or B8ZS for T1 line. However, B8ZS is recommended.
Set Line Coding = AMI or HDB3 for E1 line. However, HDB3 is recommended.
CMI is used in Japan and since SARVAM UCS does not support Japan, this option will never be used.

Framing Mode

Use following command to program the Framing Mode for the T1E1 port:

6104-1-T1E1-Framing

6104-2-T1E1-T1E1-Framing

6104-*-Framing

Where,

Framing	Meaning
1	SF (D4) for T1
2	ESF for T1

By default, Framing is SF (D4).

Set Framing = SF or ESF for T1 line. However, ESF is recommended since it supports advanced features like CRC and FDL, which provide the performance reports.

Line Buildout Parameters

Use the following command to program the line build out parameters of a T1E1:

6162-1-T1E1-Code

6162-2-T1E1-T1E1-Code

6162-*-Code

Where,

T1E1 is from 01 to 08.

Code	Meaning
1	0-133ft
2	133-266ft
3	266-399ft
4	399-533ft
5	533-665ft

Code	Meaning
6	-7.5dB or equidistance
7	-16dB or equidistance
8	-22.5dB or equidistance

By default, the Line Build Out Parameters is 0-133ft.

DDI Routing

OG Reference ID

Use the following command to assign OG Reference ID to T1E1 port:

6131-1-T1E1-OG Reference ID

6131-2-T1E1-T1E1-OG Reference ID

6131-*-OG Reference ID

Where,

T1E1 is from 01 to 08.

OG Reference ID is from 00 to 99.

By default, OG Reference ID is 00.

IC Reference ID for Working Hour

Use the following command to assign IC Reference ID for Working Hour:

6132-1-T1E1-IC Reference ID

6132-2-T1E1-T1E1-IC Reference ID

6132-*-IC Reference ID

Where,

T1E1 is from 01 to 08.

IC Reference ID is from 00 to 99.

By default, IC Reference ID is 00.

IC Reference ID for Break Hour

Use the following command to assign IC Reference ID for Break Hour:

6133-1-T1E1-IC Reference ID

6133-2-T1E1-T1E1-IC Reference ID

6133-*-IC Reference ID

Where,

T1E1 is from 01 to 08.

IC Reference ID is from 00 to 99.

By default, IC Route Reference ID is 00.

IC Route Reference ID for Non-working Hour

Use the following command to assign IC Route Reference ID for Non-working Hour:

6134-1-T1E1-IC Reference ID

6134-2-T1E1-T1E1-IC Reference ID

6134-*-IC Reference ID

Where,

T1E1 is from 01 to 08.

IC Reference ID is from 00 to 99.

By default, IC Route ID is 00.

Templates

Trunk Feature Template

Use the following command to assign a Trunk Feature Template to the T1E1 Trunks, dial:

5806-1-T1E1- Trunk Feature Template Number to assign a template to a single T1E1 port.

5806-2-T1E1- Trunk Feature Template Number to assign the same template to a range of T1E1 ports.

5806-*- Trunk Feature Template Number to assign the same template to all T1E1 ports.

Where,

T1E1 is the Software Port number of the port from 01 to 08.

Template Number is the number of the customized Trunk Feature Template, from 01 to 50. Default: Trunk Feature Template 01.

Station Basic Feature Template

To assign a Station Basic Feature Template to a T1E1PRI port, dial:

5506-1-T1E1PRI-Template Number to assign a template to a single T1E1 port.

5506-2-T1E1PRI-T1E1PRI-Template Number to assign the same template to a range of T1E1 ports.

5506-*-Template Number to assign the same template to all T1E1 ports.

Where,

T1E1PRI is the number of the T1E1PRI Software port, from 01 to 08.

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all T1E1 ports.

Station Advance Features Template

To assign a Station Advanced Feature Template to a T1E1PRI port

5606-1-T1E1PRI-Template Number to assign a template to a single T1E1 port.

5606-2-T1E1PRI-T1E1PRI-Template Number to assign the same template to a range of T1E1 ports.

5606-*-Template Number to assign the same template to all T1E1 ports.

Where,

T1E1PRI is the number of the T1E1PRI Software port, from 01 to 08.

Template Number is the number of the Station Advanced Feature Template, from 01 to 50.

Default: Template 01 is assigned to all T1E1 ports.

Others

Priority

To assign priority to T1E1

3914-1-T1E1-Priority to assign a template to a single T1E1 port.

3914-2-T1E1PRI-T1E1PRI-Priority to assign the same priority to a range of T1E1 ports.

3914-*-Template Number to assign the same Priority to all T1E1 ports.

Where,

T1E1PRI is the number of the T1E1PRI Software port, from 01 to 08.

Priority is from 1 to 9. Default: 5-Normal.

Cost Factor

Use following command to assign a name to the T1E1 port:

6102-1-T1E1-SP

6102-2-T1E1-T1E1-SP

6102-*-SP

Where,

T1E1 is from 01 to 08.

SP is from 01 to 99.
By default, Service Provider is 01.

Glare Option

Use following command to program Glare Option for the T1E1 port:

6112-1-T1E1-Glare Option

6112-2-T1E1-T1E1-Glare Option

6112-*-Glare Option

Where,

T1E1 is from 01 to 08.

Glare Option	Meaning
1	Proceed
2	Held Back

By default, Glare Option is 2.

Set Glare=Proceed, if SARVAM UCS is to be given priority in event of Glare.

Set Glare=Held Back, if the other end of the link is to be given priority in event of Glare.

The Glare settings should be complimentary on either side of the link.

Category (Logical Partitioning)

Use following command to set the Category (Logical Partitioning) for the T1E1 port:

6121-1-T1E1-Category

6121-2-T1E1-T1E1-Category

6121-*-Category

Where,

T1E1 is from 01 to 08.

Category is from 1 to 4.

By default, Category is set as 1.

Idle Code

Use the following command to program the Idle Code of a T1E1:

6113-1-T1E1-Idle Code

6113-2-T1E1-T1E1-Idle Code

6113-*-Idle Code

Where,

T1E1 is from 01 to 08.

Idle Code is from 000 to 255 (corresponding to 8 bits).

By default, the idle code is 127 (7F).

The binary equivalent of the programmed value (000 to 255) is sent on the channel to signify that the channel is idle. (or Unused) This setting depends on the network. Most commonly applicable values are 7F and FF (Binary equivalent is 0111 1111 and 1111 1111, decimal equivalent is 127 and 255).

Use message mode of the Digital Switch IC to send the idle channel code.

RCOC

To enable RCOC on T1E1 Trunk

Dial **6145-1-T1E1-Code** to enable the feature on a single trunk.

Dial **6145-2-T1E1-T1E1-Code** to enable the feature on a range of trunks.

Dial **6145-*-Code** to enable the feature on all trunks.

Where,

T1E1 is the software port number of the trunk from 01 to 08.

Code is

0 for Disable

1 for Enable

Default: Disable

Channels

Return Call to Original Caller (RCOC)

Use the following command to enable RCOC on T1E1 Trunk:

6145-1-T1E1-Code to enable the feature on a single trunk.

6145-2-T1E1-T1E1-Code to enable the feature on a range of trunks.

6145-*-Code to enable the feature on all trunks.

Where,

T1E1 is the software port number of the trunk from 01 to 08.

Code is

0 for Disable

1 for Enable

Default: Disable

Channel Reserved for Data Call

Use the following command to reserve channels for data transmission on T1E1:

6135-1-T1E1-Channel Count (Data)

6135-2-T1E1-T1E1-Channel Count (Data)

6135-*-Channel Count (Data)

Where,

T1E1 is from 01 to 08.

Channel Count (Data) is from 00 to 30.

By default, Channel Count for data transmission is 00.

Channel Reserved for Outgoing Call

Use the following command to program number of channels reserved for OG channel count:

6136-1-T1E1-Channel Count (OG)

6136-2-T1E1-T1E1-Channel Count (OG)

6136-*-Channel Count (OG)

Where,

T1E1 is from 01 to 08.

Channel Count (OG) is from 00 to 30. "It specifies the number of channels to be reserved for making an OG calls.

For example, If OG channel count is programmed as 15, simultaneous 15 (maximum) OG calls can be made from the T1E1 port".

By default, OG Channel Count is 30.

Channel Reserved for Incoming Call

Use the following command to program number of channels reserved for IC channel count:

6137-1-T1E1-Channel Count (IC)

6137-2-T1E1-T1E1-Channel Count (IC)

6137-*-Channel Count (IC)

Where,

T1E1 is from 01 to 08.

Channel Count (IC) is from 00 to 30. "It specifies the number of channels to be reserved for making an IC calls. For example, If IC channel count is programmed as 10, simultaneous 10 (max.) IC calls can be received on the T1E1 port".

By default, Channel Count (IC) is 30.

Tone

Feed Dial Tone

Use following command to program the dial tone flag for T1E1 port:

6115-1-T1E1-Flag

6115-2-T1E1-T1E1-Flag

6115-*-Flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable
1	Enable

By default, Dial Tone Flag is '0' for all the T1E1 ports.

Feed Routing Tone

Use following command to program the routing tone flag for T1E1 port:

6116-1-T1E1-Flag

6116-2-T1E1-T1E1-Flag

6116-*-Flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable
1	Enable

By default, Routing Tone Flag is '0' for all the T1E1 ports.

Custom Pulse

T1/E1 Custom Pulse Width (CPW)

Use following command to enable/disable Custom Pulse Width (CPW) Flag for the T1E1 port for T1 signaling:

6171-1-T1E1-Flag

6171-2-T1E1-T1E1-Flag

6171-*-Flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable
1	Enable

By default, Custom Pulse Width Flag is '0'.

T1/E1Custom Pulse Width Word 1

This command is used for Pulse shaping in first phase.

Use following command to program Custom Pulse Width Word 1 for the T1E1 port for T1 signaling:

6172-1-T1E1-Custom Pulse Width Word 1

6172-2-T1E1-T1E1-Custom Pulse Width Word 1

6172-*-Custom Pulse Width Word 1

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 1 is from 000 to 127 volt.

By default, Custom Pulse Width Word 1 is 63 volt.

T1/E1Custom Pulse Width Word 2

This command is used for Pulse shaping in second phase.

Use following command to program Custom Pulse Width Word 2 for the T1E1 port for T1 signaling:

6173-1-T1E1-Custom Pulse Width Word 2

6173-2-T1E1-T1E1-Custom Pulse Width Word 2

6173-*-Custom Pulse Width Word 2

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 2 is from 000 to 127 volt.

By default, Custom Pulse Width Word 2 is 58 volt.

T1/E1Custom Pulse Width Word 3

This command is used for Pulse shaping in third phase.

Use following command to program Custom Pulse Width Word 3 for the T1E1 port for T1 signaling:

6174-1-T1E1-Custom Pulse Width Word 3

6174-2-T1E1-T1E1-Custom Pulse Width Word 3

6174-*-Custom Pulse Width Word 3

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 3 is from 000 to 127 volt.

By default, Custom Pulse Width Word 3 is 76 volt.

T1/E1Custom Pulse Width Word 4

This command is used for Pulse shaping in fourth phase.

Use following command to program Custom Pulse Width Word 4 for the T1E1 port for T1 signaling:

6175-1-T1E1-Custom Pulse Width Word 4

6175-2-T1E1-T1E1-Custom Pulse Width Word 4

6175-*-Custom Pulse Width Word 4

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 4 is from 000 to 127 volt.

By default, Custom Pulse Width Word 4 is 00 volt.

Timer

Pause Timer

Use following command to program Pause Timer:

6109-1-T1E1- Pause Timer

6109-2-T1E1-T1E1-Pause Timer

6109-*-Pause Timer

Where,

T1E1 is from 01 to 08

Pause Timer is from 1 to 9 seconds

By default, Pause Timer is 3 seconds.

DTMF ON Time

Use following command to program DTMF ON Time:

6117-1-T1E1-DTMF ON Time

6117-2-T1E1-T1E1-DTMF ON Time

6117-*-DTMF ON Time

Where,

T1E1 is from 01 to 08.

DTMF ON Time is from 051 to 255 msec.

By default, DTMF ON Time is 102 msec.

DTMF Inter Digit Pause Timer

Use following command to program DTMF Inter digit Pause Timer:

6118-1-T1E1-DTMF Inter digit Pause Time

6118-2-T1E1-T1E1-DTMF Inter digit Pause Time

6118-*-DTMF Inter digit Pause Time

Where,

T1E1 is from 01 to 08

DTMF Inter digit Pause Time is from 051 to 255 msec.

By default, DTMF Inter digit Pause Time is 102 msec.

Gateway

Use Gateway Application - Answer Signaling?

Use following command to set flag for 'Gateway Application-Answer Signaling' on T1E1 trunk:

6119-1-T1E1-Gateway Application-Answer Signaling flag

6119-2-T1E1-T1E1-Gateway Application-Answer Signaling flag

6119-*- Gateway Application-Answer Signaling flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable

Flag	Meaning
1	Enable

By default, Gateway Application-Answer Signaling flag is 'disable'.

Gateway Application - Answer Signaling DTMF Digits

Use following command to program DTMF digits string to be dialed as Gateway Application-Answer Signaling:

6120-1-T1E1-Gateway Application-Answer Signaling DTMF String

6120-2-T1E1-T1E1-Gateway Application-Answer Signaling DTMF String

6120-1-T1E1-Gateway Application-Answer Signaling DTMF String

Where,

T1E1 is from 01 to 08.

DTMF Digits allowed for DTMF string are from (0 - 9), *, #, A, B, C, D.

Maximum 4 DTMF digits can be programmed. If you need less than 4 digits for DTMF string, terminate the command using #*.

To program #, *, A, B, C, D use following codes:

Digit	Code for programming through command
A	#4
B	#5
C	#6
D	#7
*	**
#	##

By default Gateway Application-Answer Signaling DTMF String is 'CCC'.

Call Budget

Call Budget Type

To program Call Budget Type on T1E1 Port, dial:

6122-1-T1E1-Budget Type to program call budget type for a single trunk port.

6122-2-T1E1-T1E1-Budget Type to program the same call budget type for a range of trunk ports.

6122-*-Budget Type to program the same call budget type for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Budget Type is

0 for None

1 for Amount

2 for Minutes

3 for Number of Calls

By default, Budget Type is None.

Call Budget Amount

To program Call Budget Amount on T1E1 Port, dial:

6123-1-T1E1-Budget Amount to program call budget amount for a single trunk port.

6123-2-T1E1-T1E1-Budget Amount to program the same amount for a range of trunk ports.

6123-*-Budget Amount to program the same amount for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Budget Amount is of 6 digits max. Use leading zeros if amount to be programmed has fewer than 6 digits.

By default Budget Amount is 999999.

Call Budget Minutes

To program Call Budget Minutes on T1E1 Port:

6124-1-T1E1-Minutes to program minutes for a single trunk port.

6124-2-T1E1-T1E1-Minutes to program the same minutes for a range of trunk ports.

6124-*-Minutes to program the same minutes for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Minutes is of 6 digits max. Use leading zeros if Minutes to be programmed has less than 6 digits.

By default, Minutes is 999999.

Call Budget Number of Calls

To program Call Budget Number of Calls on T1E1 Port, dial:

6125-1-T1E1-Number of calls to program number of calls for a single trunk port.

6125-2-T1E1-T1E1-Number of calls to program the same number of calls for a range of trunk ports.

6125-*-Number of calls to program the same number of calls for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Number of Calls is of 4 digits from 0001 to 9999. Use leading zeros if number of calls to be programmed has fewer than 4 digits.

By default, Number of calls is 9999.

Call Budget Reset Mode

To program Call Budget Reset Mode for T1E1, dial:

6138-1-T1E1-Call Budget Reset Mode to program reset mode for a single trunk port.

6138-2-T1E1-T1E1-Call Budget Reset Mode to program the same reset mode for a range of trunk ports.

6138-*-Call Budget Reset Mode to program the same reset mode for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

1 for Scheduled reset

2 for Manual reset

By default, Call Budget Reset Mode is Scheduled.

Call Budget Date for Scheduled Reset mode

To program the Date for Scheduled Reset mode for T1E1, dial:

6139-1-T1E1-Date to program date for a single trunk port.

6139-2-T1E1-T1E1-Date to program the date for a range of trunk ports.

6139-*-Date to program the date for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Date is

01 to 31 for Scheduled date to reset every month.

00 for Scheduled reset Daily.

By default, Reset date is 1st. of every month.

Call Back

Use the following commands to program Call Back on T1E1 Trunk ports. To know more about this feature, refer the topic Call Back on Trunk Ports.

To enable/disable Call Back on T1E1 port:

6176-1-T1E1- Call Back Flag

6176-2-T1E1-T1E1-Call Back Flag

6176- *-Call Back Flag

Where,

T1E1 is from 01 to 08

Call Back Flag	Meaning
0	Disable
1	Enable

By default, Call Back flag is disabled.

Call Back Timer

To program Call Back Timer for T1E1 port:

6177-1-T1E1-Call Back Timer

6177-2-T1E1-T1E1-Call Back Timer

6177- *-Call Back Timer

Where,

T1E1 is from 01 to 08

Pause Timer Range is from 01 to 99 Sec.

By default, Pause Timer is 10 Seconds

Call Back Mode

To program Call Back Mode on T1E1 port:

6178-1-T1E1-Call Back Mode

6178-2-T1E1-T1E1-Call Back Mode

6178- *-Call Back Mode

Where,

T1E1 is from 01 to 08

Call Back Mode is 1 to 5.

Call Back Mode	Meaning
1	Built-In Auto Attendant
2	PIN Auth. - Multiple Calls
3	CLI Auth. - Multiple Calls
4	CLI Auth. - Single Call - Ans. Sig.
5	Operator

By default, Call Back mode is Operator

Call Back On

To program Call Back On method for T1E1 port:

6179-1-T1E1-Call Back on selection
6179-2-T1E1-T1E1-Call Back on selection
6179-*-Call Back on selection

Where,

T1E1 is from 01 to 08

Call back on selection is

Call Back on	Meaning
1	CLI Number
2	Alternate Number

By default, Call Back on selection is CLI Number.

Incoming Number List

To assign Call Back - Incoming Number List to a T1E1 port:

6180-1-T1E1-Incoming Number List
6180-2-T1E1-T1E1-Incoming Number List
6180-*-Incoming Number List

Where,

T1E1 is from 01 to 08

Incoming Number List is from 01 to 16.

By default, Incoming Number List is 15.

Outgoing Number List

To assign a Call Back - Outgoing Number List to a T1E1 port:

6147-1-T1E1-Outgoing Number List
6147-2-T1E1-T1E1-Outgoing Number List
6147-*-Outgoing Number List

Where,

T1E1 is from 01 to 08

Outgoing Number List is from 01 to 16.

By default, Outgoing Number List is 16.

Call Back From

To define Call Back From for a T1E1 port:

6148-1-T1E1-Call Back From
6148-2-T1E1-T1E1-Call Back From
6148-*-Call Back From

Where,

T1E1 is from 01 to 08

Call Back From is

1 for Same Port

2 for OGTB Group

By default, Same Port is selected as Call Back From.

OGTB Group

To assign a Call Back - OGTB Group for a T1E1 port:

6149-1-T1E1-OGTB Group
6149-2-T1E1-T1E1-OGTB Group
6149-*-OGTB Group

Where,
 T1E1 is from 01 to 08
 OGTB Group is from 01 to 32
 By default, OGTBG is 01.

FDL

FDL Flag - copied from T1 Maintenance

Use following command to enable/disable T1 FDL on a T1E1PRI port:

6164-1-T1E1PRI-T1 FDL

6164-2-T1E1PRI-T1E1PRI-T1 FDL

6164-*-T1 FDL

Where,
 T1E1PRI is from 01 to 08.

T1 FDL	Meaning
0	Disable
1	Enable

By default, the T1 FDL is disabled.

FDL Protocol

Use following command to program the T1 FDL Protocol for a T1E1PRI port:

6165-1-T1E1PRI-T1 FDL Protocol

6165-2-T1E1PRI-T1E1PRI-T1 FDL Protocol

6165-*-T1 FDL Protocol

Where,
 T1E1PRI is from 01 to 08.

T1 FDL Protocol	Meaning
0	Disable
1	AT&T 54016
2	ANSI T1.403

By default, the T1 FDL Protocol is ANSI T1.403.

Refer ["E1/T1 Maintenance"](#)

Debug

SARVAM UCS supports debug of parameters (debug codes) depending on the Level of debug. On issuing this command the SARVAM UCS Card T1E1 will send the debug details to the COM port of the T1E1 port.

Debug Level	Command
Debug Level-1	6191-1-T1E1-1-XXX

Debug Level	Command
Debug Level-2	6191-1-T1E1-2-XXX
Debug Level-3	6192-1-T1E1-1-XXX
Debug Level-4	6192-1-T1E1-2-XXX

Option 1

Use following command to start/stop debug the parameters for the T1E1 port:

6191-1-T1E1-Level-Debug Code

6191-2-T1E1-T1E1-Level-Debug Code

6191-*-Level-Debug Code

Where,

T1E1 Port is from 01 to 08.

Level is from 1 to 4 (As shown below).

Code is the value for the specified level to turn ON the debug for the parameters. Code range is from 000 to 255.

Code value '000' for each level will turn off that level's debug.

Level 1:

Unused	Unused	Unused	Unused	Layer 4	CAS DSP	MFC R2	CAS
--------	--------	--------	--------	---------	---------	--------	-----

001	CAS
002	MFC R2
004	CAS DSP
008	Layer 4
000	Debug Off

Level 2:

Unused	Unused	Unused	HDLC (D-Channel)	FDL	ABCD Bits	Counters	Alarms
--------	--------	--------	------------------	-----	-----------	----------	--------

001	Alarms
002	Counters
004	ABCD Bits
008	FDL
016	HDLC (D Channel)
000	Debug Off

Level 3:

Unused	Flow Debug	NLS Debug	LAP Debug	SVC Primitives	Variables	State	Primitives
--------	------------	-----------	-----------	----------------	-----------	-------	------------

001	Primitives
002	State

004	Variables
008	SVC Primitives
016	LAP Debug
032	NLS Debug
064	Flow Debug
000	Debug Off

Level 4:

Unused	Unused	Unused	Unused	Unused	Unused	NI Debug	OS Task
--------	--------	--------	--------	--------	--------	----------	---------

001	OS Task
002	NI Debug
000	Debug Off

Default: Debug Code = 'Debug OFF' for all T1E1 ports for all levels.

T1E1:1 - PRI/QSIG Signaling

ISDN Switch Variant

Use following command to program the ISDN PRI Switch Variant:

6107-1-T1E1-ISDN Switch Variant

6107-2-T1E1-T1E1-ISDN Switch Variant

6107-*-ISDN Switch Variant

Where,

T1E1 is from 01 to 08.

ISDN PRI Variant	Meaning
1	ATT 4ESS
2	ATT 5ESS
3	Australia
4	DMS
5	ETSI NET5
6	NTT INS64
7	SWV Hongkong
8	US NI12
9	QSIG E1
10	QSIG T1

By default, ISDN PRI Switch Variant of a T1E1 is ETSI NET5.

Send Called Party Number Using

Use the following command to program overlap receiving timer:

6146-1-T1E1-Type
6146-2-T1E1-T1E1-Type
6146-*-Type

Where,

T1E1 is from 01 to 08.

Type is

1 for Keypad Facility IE

0 for Called Party IE

Default: Called Party Number IE

Overlap Receiving Timer

Use the following command to program overlap receiving timer:

6114-1-T1E1-Timer
6114-2-T1E1-T1E1-Timer
6114-*-Timer

Where,

T1E1 is from 01 to 08.

Timer is from 00 to 99.

By default, Overlap Receiving Timer is 15 seconds.

Caller-Type of Number (TON)

Use following command to program the Caller-Type of Number (TON) for a T1E1:

6126-1-T1E1-Source TON
6126-2-T1E1-T1E1-Source TON
6126-*-Source TON

Where,

T1E1 is from 01 to 08.

Source TON	Meaning
1	Unknown: This is used when the user or network has no a prior information about the numbering plan. In this case, the Address Value field is organized according to the network dialing plan. For example, prefix or escape digits might be present.
2	International Number.
3	National Number: Prefix or escape digits shall not be included.
4	Network Specific Number: This is used to indicate administration/Service number specific to the serving network. For example, used to access an operator.
5	Subscriber Number: This is used when a specific short number representation is stored in one or more SCs as part of a higher layer application.
6	Abbreviated Number.
7	Reserved Number.

By default, Caller-Type of Number (TON) of T1E1 is 1.

Caller-Numbering Plan Identification (NPI)

Use following command to program Caller-Numbering Plan Identification (NPI) for T1E1:

6127-1-T1E1-Source NPI
6127-2-T1E1-T1E1-Source NPI

6127-*-Source NPI

Where,

T1E1 is from 01 to 08.

Source NPI	Meaning
1	Unknown
2	ISDN Numbering Plan
3	Data Numbering Plan
4	Telex Numbering
5	National Numbering Plan
6	Private Numbering Plan
7	Reserved for Extension

By default, Caller-Numbering Plan Identification (NPI) for T1E1 is 2.

Called-Type of Number (TON)

Use following command to program Called-Type of Number (TON) for a T1E1:

6128-1-T1E1-Destination TON

6128-2-T1E1-T1E1-Destination TON

6128-*-Destination TON

Where,

T1E1 is from 01 to 08.

Destination TON	Meaning
1	Unknown: This is used when the user or network has no a prior information about the numbering plan. In this case, the Address Value field is organized according to the network dialing plan. For example, prefix or escape digits might be present.
2	International Number.
3	National Number: Prefix or escape digits shall not be included.
4	Network Specific Number: This is used to indicate administration/Service number specific to the serving network. For example, used to access an operator.
5	Subscriber Number: This is used when a specific short number representation is stored in one or more SCs as part of a higher layer application.
6	Abbreviated Number.
7	Reserved Number.

By default, Called-Type of Number (TON) of T1E1 is 1.

Called-Numbering Plan Identification (NPI)

Use following command to program Called-Numbering Plan Identification (NPI) for T1E1:

6129-1-T1E1-Destination NPI

6129-2-T1E1-T1E1-Destination NPI

6129-*-Destination NPI

Where,

T1E1 is from 01 to 08.

Destination NPI	Meaning
1	Unknown
2	ISDN Numbering Plan
3	Data Numbering Plan
4	Telex Numbering
5	National Numbering Plan
6	Private Numbering Plan
7	Reserved for Extension

By default, Called-Numbering Plan Identification (NPI) for T1E1 is 2.

Receive Equalization Mode

Use the following command to program auto receive equalization mode:

6110-1-T1E1-Mode

6110-2-T1E1-T1E1-Mode

6110-*-Mode

Where,

T1E1 is from 01 to 08.

Mode	Meaning
0	Manual
1	Auto

By default, Receive Equalization Mode is 1.

Receive Equalization Parameters

Use the following command to program the receive equalization parameters of a T1E1:

6111-1-T1E1-Receive Equalization Parameters

6111-2-T1E1-T1E1-Receive Equalization Parameters

6111-*-Receive Equalization Parameters

Where,

T1E1 is from 01 to 08.

Receive Equalization Parameters	Meaning
1	None
2	8 dB
3	16 dB
4	24 dB
5	32 dB
6	40 dB
7	48 dB

By default, the receive equalization parameters of T1E1 is 1.

Feed Inband Tones on T1E1-NT, before sending DISCONNECT

Use following command to program to select whether the inband tones should be feed on T1E1-NT before sending DISCONNECT message?

6130-1-T1E1-Flag

6130-2-T1E1-T1E1-Flag

6130-*-Flag

Where,

Flag	Meaning
0	No
1	Yes

Default = NO.

E&M Signaling

E&M Feature Template

Assign E&M Feature Template to T1E1 using following command:

Use Following command to assign E&M Feature Template to T1E1 Port

6004-1-T1E1-Template Number

6004-2-T1E1-T1E1- Template Number

6004-*- Template Number

Where,

T1E1 is from 01 to 08.

Template Number is 01 to 50.

By default, Template 01 is assigned to T1E1.

Now proceed to program other parameters for E&M on T1E1 using following commands:

B Bit Pattern

Use following command to select B Bit Pattern

7191-1-T1E1-Code

7191-2-T1E1-T1E1-Code

7191-*-Code

Where,

T1E1 is from 01 to 08.

Code	Meaning
1	Same as A bit
2	Fixed Value

By default, the Code is 1 (Same as A bit)

B Bit Value

Use following command to program B Bit Value

7192-1-T1E1-B Bit Value

7192-2-T1E1-T1E1- B Bit Value

7192-*- B Bit Value

Where,

T1E1 is from 01 to 08.

B bit value can be 0 or 1.

By default, B bit value is 0.

CD Bit Value

Use following command to program CD Bit Value

7193-1-T1E1-CD Bit Value

7193-2-T1E1-T1E1-CD Bit Value

7193-*- CD Bit Value

Where,

T1E1 is from 01 to 08.

CD bit value can be 1 or 3.

By default, CD bit value is 1.

Invert Bit A

Use following command to program to invert/don't invert Bit A for the T1E1 port:

7162-1-T1E1-Invert Bit A

7162-2-T1E1-T1E1-Invert Bit A

7162-*-Invert Bit A

Where,

T1E1 is from 01 to 08.

Invert Bit A	Meaning
0	Disable
1	Enable

By default, Invert Bit A is 0.

Invert Bit B

Use following command to program to invert/don't invert Bit B for the T1E1 port:

7163-1-T1E1-Invert Bit B

7163-2-T1E1-T1E1-Invert Bit B

7163-*-Invert Bit B

Where,

T1E1 is from 01 to 08.

Invert Bit B	Meaning
0	Disable
1	Enable

By default, Invert Bit B is 0.

Invert Bit C

Use following command to program to invert/don't invert Bit C for the T1E1 port:

7164-1-T1E1-Invert Bit C

7164-2-T1E1-T1E1-Invert Bit C

7164-*-Invert Bit C

Where,

T1E1 is from 01 to 08.

Invert Bit C	Meaning
0	Disable
1	Enable

By default, Invert Bit C is 0.

Invert Bit D

Use following command to program to invert/don't invert Bit D for the T1E1 port:

7165-1-T1E1-Invert Bit D

7165-2-T1E1-T1E1-Invert Bit D

7165-*-Invert Bit D

Where,

T1E1 is from 01 to 08.

Invert Bit D	Meaning
0	Disable
1	Enable

By default, Invert Bit D is 0.

RBS Signaling

To assign a Line Signaling Variants to the T1E1 port, dial:

6181-1-T1E1-T1 Line Signaling Variants

6181-2-T1E1-T1E1-T1 Line Signaling Variants

6181-*-T1 Line Signaling Variants

Where,

T1E1 is from 1 to 7.

T1 Line Signaling Variants	Meaning
1	SLT Loop Start
2	CO Loop Start
3	SLT Ground Start
4	CO Ground Start
5	E&M Immediate Start/Dial
6	E&M Wink Start
7	E&M Wink Start FGD

Default: E&M Wink Start.

To set the Wink Timer, dial:

6182-1-T1E1-Wink Timer

6182-2-T1E1-T1E1-Wink Timer

6182-*-Wink Timer

Where,

T1E1 is from 01 to 08.

Wink Timer is from 0001 to 9999 ms.

By default, T1 Wink Timer is 0200 ms.

Use the following command to program the T1 wink wait timer for T1E1:

6183-1-T1E1-Wink Wait Timer

6183-2-T1E1-T1E1-Wink Wait Timer

6183-*-Wink Wait Timer

Where,

T1E1 is from 01 to 08.

Wink Wait Timer is from 0001 to 9999 ms.

By default, T1 Wink Wait Timer is 0200 ms.

Use the following command to program the T1 wait wink timer for T1E1:

6184-1-T1E1-Timer

6184-2-T1E1-T1E1-Timer

6184-*-Timer

Where,

T1E1 is from 01 to 08.

Timer is from 0001 to 9999 ms.

By default, T1 Wait Wink Timer is 5000 ms.

Use the following command to program the T1 delay duration for T1E1:

6185-1-T1E1-Delay Duration

6185-2-T1E1-T1E1-Delay Duration

6185-*-Delay Duration

Where,

T1E1 is from 01 to 08.

Delay Duration is from 0001 to 9999 ms.

By default, T1 Delay Duration is 0140 ms.

Use the following command to program the T1 Start Delay Timer for T1E1:

6186-1-T1E1-Start Delay Timer

6186-2-T1E1-T1E1-Start Delay Timer

6186-*-Start Delay Timer

Where,

T1E1 is from 01 to 08.

Start Delay Duration is from 001 to 255 seconds.

By default, T1 Start Delay Timer is 020 seconds.

To assign a Register Signaling Variant to the T1E1 port, dial:

6161-1-T1E1-T1 Register Signaling Variant

6161-2-T1E1-T1E1-T1 Register Signaling Variant

6161-*-T1 Register Signaling Variant

Where,

T1E1 is from 01 to 08.

T1 Register Signaling Variant	Meaning
1	T1 RBS DTMF

T1 RBS DTMF: DNIS is transmitted in the corresponding speech channel using the DTMF signals as per the ITU-T Q.23.

To select the Inbound ANI/DNIS Format, dial:

6166-1-T1E1-Code

6166-2-T1E1-T1E1-Code

6166-*-Code

Where,

T1E1 is from 01 to 08.

Code is

T1 Register Signaling Variant	Code
ANI	1
DNIS	2
?ANI?	3
?DNIS?	4
?ANI?DNIS?	5
?DNIS?ANI?	6

By default, ?ANI?DNIS? is selected.

To assign the Inbound Delimiter (?) character, dial:

6167-1-T1E1-Character

6167-2-T1E1-T1E1-Character

6167-*-Character

Where,

T1E1 is from 01 to 08.

Character can be #, *, A,B,C,D and 0-9.

By default, * is set.

To assign the Outbound ANI/DNIS Format, dial:

6168-1-T1E1-Code

6168-2-T1E1-T1E1-Code

6168-*-Code

Where,

T1E1 is from 01 to 08.

Code is

T1 Register Signaling Variant	Code
ANI	1
DNIS	2
?ANI?	3

T1 Register Signaling Variant	Code
?DNIS?	4
?ANI?DNIS?	5
?DNIS?ANI?	6

By default, ?ANI?DNIS? is selected.

To assign the Outbound Delimiter (?) character

6169-1-T1E1-Character

6169-2-T1E1-T1E1-Character

6169-*-Character

Where,

T1E1 is from 01 to 08.

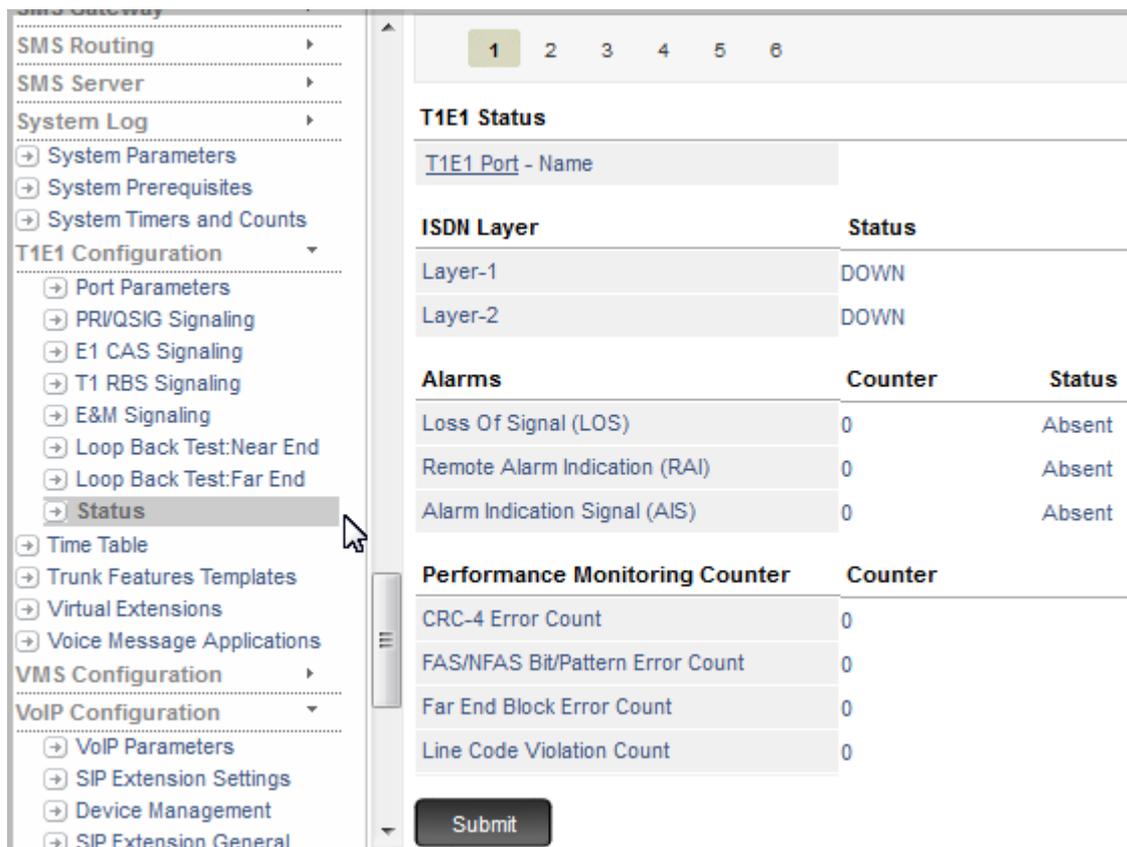

Character can be #, *, A,B,C,D and 0-9.

By default, * is set.

Viewing T1E1 Trunk Status

You can view the status of T1E1 Trunks on Jeeves only. To do this,

- Under **T1E1 Configuration**, click **Status**.

- For each T1E1 Trunk, the following settings will be displayed:
 - T1E1 Port No.
 - Name
 - Layer 1

- Layer 2
- Alarms
- Performance Monitoring Counter
- Call Budget Type
- Allotted Amount/Minutes/Calls
- Consumed Amount/Minutes/Calls
- Call Budget Reset Mode
- Call Budget Reset Scheduled (Date)
- Reset Consumed (this is not a status indicator. It is for resetting the Consumed Call Budget manually)

You can also view the T1E1 Trunk Status from the **Status** link. To view, click the T1E1 link under Status.

T1 RBS Parameters

What's this?

Some countries like North America support the standard of 1.544Mbps of PCM trunk. This is known as T1 Trunks. The T1 type of PCM Trunks use Robbed Bit Signaling. ROBBED-BIT signaling is a per-channel signaling technique for transmitting signaling bits on each channel in a T1E1 facility. The least-significant bit in every 6th transmitted information frame is removed and replaced by a signaling bit. This technique is also called in-band signaling. The maximum transmission rate for each bearer channel with ROBBED-BIT signaling is 56 Kbps.

ISDN-PRI signaling is carried on the 24th channel for a 1.544 Mbps connection and on the 16th channel for a 2.048 Mbps connection. There are two types of parameters:

- Line Signaling (ABCD Bits)
- Register Signaling

Line signaling is described by following types:

- E&M Wink Start FGD
- E&M Wink Start
- E&M Immediate Dial/Start
- SLT Ground start
- SLT Loop Start
- CO Loop Start
- CO Ground Start

T1 Line signaling type is applicable when the Line Type is programmed as T1 RBS for the T1E1 Port.

The Register signaling supported by SARVAM UCS is DTMF.

T1 Line signaling is applicable when the Line Type is programmed as ISDN_T1_RBS for the T1E1 Port. Refer chapter "Configuring T1 Trunks" to program Line Type as T1 RBS.

The various Line Signaling Variant are explained below:

E&M Wink Start

Bits A and B are set to 1 to indicate Off-hook. Bits A and B are set to 0 to indicate On-Hook. Bits C and D follow bits A and B. The application for making calls and receiving calls is explained below:

Making an OG Call

- To transmit Off-Hook, bits A, B, C and D on the transmit channel are set to 1.
- The far end (network) sends a wink (a momentary OFF-Hook for 200ms), that is, bits A, B, C and D on the receive channel receive a pulse (Active High) of 200ms.
- On receipt of the wink signal, DNIS (Dialed Number Identification Signal) is sent on the speech channels using the Register Signaling type (DTMF or Decadic (A-Bit) or R1 MFC or R2 MFC).

DNIS is Dialed Number In Service. It is the ISDN number that is being dialed. This is provided by the telco in the call setup messages. DNIS can be used to provide differentiated service to dialing users.

The call goes through when the called party answers the call.

Receiving an IC Call

- Bit A, B, C and D =1 are received on the receive channel.
- The System sends a wink.
- The far end sends the DNIS in the speech channels using Register Signaling.

Disconnect

- By the Network-Bits A and B on the receive channel are 0. Bits C and D are also 0 in ESF. Following this, the bits on the transmit channel are set to 0 by the System.
- By the System-Bit A and B on the transmit channel are set to 0. Bit C and D are also set to 0 in case of ESF. Following this, the bits A and B (C and D in ESF) are received as 0 on the receive channel.

E&M Wink Start FGD

- Bits A and B are set to 1 to indicate OFF-Hook. Bits A and B are set to 0 to indicate ON-Hook. Bits C and D follow bits A and B (Incase of ESF).

Making an OG Call

- To transmit OFF-Hook, bits A, B, C and D on the transmit channel are set to 1.
- The far end (network) sends a wink (a momentary OFF-Hook for 200ms.), that is, bits A, B, C and D on the receive channel receive a pulse (Active High) of 200ms.
- On receipt of the wink signal, DNIS (Dialed Number Identification Signal). It is the ISDN number that is being dialed. This is provided by the telco in the call setup messages. DNIS can be used to provide differentiated service to dialing users.) is sent on the speech channels using the Register Signaling type.
- The call goes through when the called party answers the call.

Receiving an IC Call

- Bit A, B, C and D =1 are received on the receive channel.
- The System sends a wink.
- The far end sends the DNIS in the speech channels using DTMF.
- On expiry of DTMF Inter-digit timer, the System sends a wink again.
- The System goes off hook when the call is answered by the called party.

Disconnect

- By the Network-Bits A and B on the receive channel are 0. Bits C and D are also 0 in ESF. Following this, the bits on the transmit channel are set to 0 by the System.
- By the System-Bit A and B on the transmit channel are set to 0. Bit C and D are also set to 0 in case of ESF. Following this, the bits A and (C and D in ESF) are received as 0 on the receive channel.

Please note that while using T1 RBS, only DID is being sent/received and not the CLI/ANI.

E&M Immediate Start/Dial

Same as E&M Wink Start. But here the O/G side sends the DNIS immediately after sending Off-hook on its transmit channel.

SLT Loop Start

The T1E1 port acts as a SLT port whereas the network acts as CO port. When configured for this type of signaling, the SLT side (the System) uses the A-bit whereas the CO side (the Network) uses the B-bit. Bits C and D follow A and B bits.

Direction	State	A	B	C	D
Transmit	ON-Hook	0	1	0	1
Transmit	OFF-Hook/Loop Closed	1	1	1	1
Receive	ON-Hook	0	1	0	1
Receive	OFF-Hook	0	1	0	1
Receive	Ringing	1	1	1	1

Making an OG Call

- To transmit OFF-Hook, bits A (and Bit C if ESF) on the transmit channel is set to 1.
- The far end provides dial tone. There is no signaling change.
- The SARVAM UCS sends the DNIS (Dialed Number Identification Signal) on the speech channels using the DTMF signals.
- The call goes through when the called party answers the call.

Receiving an IC Call

- Bit B (and bit D if ESF) toggles as per the ringing pattern.
- The Network sends the DNIS on the speech channel using DTMF signals.
- The System detects toggling of bit B. When the called station of the System answers, the System transmits Off-hook state by changing bit-A from 0 to 1.

Disconnect

By the Network:

- No indication from the Network. The System will detect error tone to detect a disconnect from the network. On detecting on-hook from the network, the System transmits on-hook by setting Bit A from 1 to 0.

By the System:

- The System transmits on-hook by setting Bit A from 1 to 0.

SLT Ground Start

The T1E1 port acts as a SLT port whereas the network acts as CO port. When configured for this type of signaling, the SLT side (the System) uses the A-bit (however, the System can use B-bit but generally it is ignored by the Network) whereas the CO side (the Network) uses the A and B-bits both. Bits C and D follow A and B bits.

Direction	State	A	B	C	D
Transmit	ON-Hook/Loop Open	0	1	0	1
Transmit	Ground on Ring	0	0	0	0
Transmit	OFF-Hook/Loop Closed	1	1	1	1
Receive	ON-Hook/No TIP Ground	1	1	1	1
Receive	OFF-Hook/TIP Ground	0	1	0	1
Receive	Ringing	0	0	0	0

Making an OG Call

- To transmit Off-hook, bits A (and Bit C if ESF) and B (and Bit C if ESF) on the transmit channel is set to 0.
- The network detects this change and goes off-hook. The A-bit on the receive channel goes from 1 to 0. The B-bit is set to 1.
- Bit A and Bit B are set to 1.
- Network sends dial tone.
- System detects dial tone and sends DNIS (DTMF digits) on the corresponding speech channel.
- The call goes through when the called party answers the call.

Receiving an IC Call

- Bit A (and bit C if ESF) goes from 1 to 0.
- Bit B (and bit D if ESF) toggles as per the ringing.
- The Network sends the DNIS on the speech channel using DTMF signals.
- The System detects toggling of bit B and the seizure on Bit A.
- When the called station of the System answers, the PBS transmits Off-hook state by changing bit-A from 0 to 1.
- The Network stops toggling of bit B. Bit B is set to 1.

Disconnect

- By the Network-A bit on the receive channel of the System goes from 0 to 1. On detecting on-hook from the network, the System transmits on-hook by setting Bit A from 1 to 0.
- By the System-The System transmits on-hook by setting Bit A from 1 to 0. On detecting on-hook from the system, the network transmits on-hook by setting Bit A from 0 to 1.

- CO Loop Start or CO Ground Start is used when the SARVAM UCS is connected to the Network, that is, when the T1E1 port is configured for Terminal mode (Connection mode).
- Whereas SLT Loop Start or SLT Ground Start is used when the SARVAM UCS is connected to another SARVAM UCS, that is, when the T1E1 port is configured for Network mode.

CO Loop Start-This is complementary to SLT Loop Start explained above.

CO Ground Start-This is complementary to SLT Ground Start explained above.

Configuring T1E1 Port Parameters using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **T1E1 Configuration**.
- Click **T1 RBS Parameters** to open the page and configure the following:
 - **Line Signaling Variant:** Select the T1 Line Signaling Variant from following options:
 - SLT Loop Start
 - CO Loop Start
 - SLT Ground Start
 - CO Ground Start
 - E&M Immediate Dial/Start
 - E&M Wink Start
 - E&M Wink Start FGD
 Default: E&M Wink Start FGD.
 - **Wink Timer (milliseconds):** Wink timer refers to the momentary Off-Hook condition to acknowledge end of making an outgoing call. The Wink Timer ranges from 0001 ms to 9999 ms. Default: 160 msec.
 - **Wink Wait Timer (milliseconds):** Wink Wait Timer signifies the maximum time the system should wait before sending a wink start signal after an incoming seizure is detected. Wink Wait Timer ranges from 0001 to 9999 msec. Default: 30msec.

Ensure that this timer is greater than the Wink Wait Timer of the other end.

- **Wait Wink Timer (milliseconds):** Wait Wink Timer signifies the time for which SARVAM UCS will wait for receiving the DNIS after sending the outgoing seizure signal. Wait Wink Timer ranges from 0001 to 9999 msec. Default: 5000 msec.

Make sure that this timer is greater than the Wait Wink Timer of the other end.

- **Delay Duration (milliseconds):** This duration signifies the time after which the DNIS information is to be sent while making an outgoing call. Range of the Delay Duration is from 0001 to 9999 msec. Default: 100 msec.
- **Start Delay Timer:** Start Delay Timer signifies the time for which SARVAM UCS waits for receiving DNIS from the network. This timer is loaded on receiving the Off-hook (I/C Seizure) on the receive channel (while receiving an incoming call). The Start Delay Timer ranges from 0001 to 9999 ms. Default: 20 msec.
- **Register Signaling Variant:** The Register Signaling Variant for T1/E1 Ports is set as DTMF.

- **Inbound ANI/DNIS Format:** Select the Inbound ANI/DNIS Format for T1/E1 Ports from the following options:
 - ANI
 - DNIS
 - ?ANI?
 - ?DNIS?
 - ?ANI?DNIS?
 - ?DNIS?ANI?
 Default: ?ANI?DNIS?.
- **Inbound Delimiter (?) Character:** Define the Inbound Delimiter Character in this field. Characters supported in this field are 0-9, #, *, A, B, C and D. Default: *
- **Outbound ANI/DNIS Format:** Select the Outbound ANI/DNIS Format for T1/E1 Port from the following options:
 - ANI
 - DNIS
 - ?ANI?
 - ?DNIS?
 - ?ANI?DNIS?
 - ?DNIS?ANI?
 Default: ?ANI?DNIS?.
- **Outbound Delimiter (?) Character:** Define the Outbound Delimiter Character in this field. Characters supported in this field are 0-9, #, *, A, B, C and D. Default: *

Configuring T1E1 Port Parameters using Telephone

- Enter SE mode from a DKP/SLT.
- To assign a Line Signaling Variants to the T1E1 port, dial:
 - 6181-1-T1E1-T1 Line Signaling Variants**
 - 6181-2-T1E1-T1E1-T1 Line Signaling Variants**
 - 6181-*-T1 Line Signaling Variants**
 Where,
 T1E1 is from 01 to 08.

T1 Line Signaling Variants	Meaning
1	SLT Loop Start
2	CO Loop Start
3	SLT Ground Start
4	CO Ground Start
5	E&M Immediate Start/Dial
6	E&M Wink Start
7	E&M Wink Start FGD

Default: E&M Wink Start.

- To set the Wink Timer, dial:
6182-1-T1E1-Wink Timer
6182-2-T1E1-T1E1-Wink Timer
6182-*-Wink Timer
Where,
T1E1 is from 01 to 08.
Wink Timer is from 0001 to 9999 ms.
By default, T1 Wink Timer is 0200 ms.
 - To configure the T1 wink wait timer for T1E1, dial:
6183-1-T1E1-Wink Wait Timer
6183-2-T1E1-T1E1-Wink Wait Timer
6183-*-Wink Wait Timer
Where,
T1E1 is from 01 to 08.
Wink Wait Timer is from 0001 to 9999 ms.
By default, T1 Wink Wait Timer is 0200 ms.
 - To program the T1 wait wink timer for T1E1, dial:
6184-1-T1E1-Timer
6184-2-T1E1-T1E1-Timer
6184-*-Timer
Where,
T1E1 is from 01 to 08.
Timer is from 0001 to 9999 ms.
By default, T1 Wait Wink Timer is 0200 ms.
- To program the T1 delay duration for T1E1, dial:
6185-1-T1E1-Delay Duration
6185-2-T1E1-T1E1-Delay Duration
6185-*-Delay Duration
Where,
T1E1 is from 01 to 08.
Delay Duration is from 0001 to 9999 ms.
By default, T1 Delay Duration is 0140 ms.
- To program the T1 Start Delay Timer for T1E1, dial:
6186-1-T1E1-Start Delay Timer
6186-2-T1E1-T1E1-Start Delay Timer
6186-*-Start Delay Timer
Where,
T1E1 is from 01 to 08.
Start Delay Duration is from 001 to 255 seconds.
By default, T1 Start Delay Timer is 020 seconds.
 - To assign a Register Signaling Variant to the T1E1 port, dial:
6161-1-T1E1-T1 Register Signaling Variant
6161-2-T1E1-T1E1-T1 Register Signaling Variant
6161-*-T1 Register Signaling Variant
Where,

T1E1 is from 01 to 08.

T1 Register Signaling Variant	Meaning
1	T1 RBS DTMF

T1 RBS DTMF: DNIS is transmitted in the corresponding speech channel using the DTMF signals as per the ITU-T Q.23.

- To select the Inbound ANI/DNIS Format, dial:

6166-1-T1E1-Code

6166-2-T1E1-T1E1-Code

6166-*-Code

Where,

T1E1 is from 01 to 08.

Code is

T1 Register Signaling Variant	Code
ANI	1
DNIS	2
?ANI?	3
?DNIS?	4
?ANI?DNIS?	5
?DNIS?ANI?	6

By default, ?ANI?DNIS? is selected.

- To assign the Inbound Delimiter (?) character, dial:

6167-1-T1E1-Character

6167-2-T1E1-T1E1-Character

6167-*-Character

Where,

T1E1 is from 01 to 08.

Character can be #, *, A,B,C,D and 0-9.

By default, * is set.

- To assign the Outbound ANI/DNIS Format, dial:

6168-1-T1E1-Code

6168-2-T1E1-T1E1-Code

6168-*-Code

Where,

T1E1 is from 01 to 08.

Code is

T1 Register Signaling Variant	Code
ANI	1
DNIS	2
?ANI?	3

T1 Register Signaling Variant	Code
?DNIS?	4
?ANI?DNIS?	5
?DNIS?ANI?	6

By default, ?ANI?DNIS? is selected.

- To assign the Outbound Delimiter (?) character, dial:

6169-1-T1E1-Character

6169-2-T1E1-T1E1-Character

6169-*-Character

Where,

T1E1 is from 01 to 08.

Character can be #, *, A,B,C,D and 0-9.

By default, * is set.

- Exit SE mode.

Configuring E1 Trunks

What's this?

Digital Signal Level 1 (T1E1) trunks use Bit-Oriented Signaling (BOS) and multiplexes 24 channels (T1 service) or 32 channels (E1 service) into a single data stream. T1E1 can be used for voice or voice-grade data and for data-transmission protocols. T1 trunk service multiplexes 24 channels into a single 1.544-Mbps data stream. E1 trunk service multiplexes 32 channels into a single 2.048-Mbps stream. Both T1 and E1 provide a digital interface for trunk groups.

Signaling Modes

Common Channel Signaling (CCS) is an industry-standard technique where any one of a group of channels carries the signals for the other channels. Matrix uses the 24th channel of a group for signaling. This signaling technique differs from 24-channel signaling. When the system is configured for Facility-Associated Signaling, 24-channel signaling uses the 24th channel in a T1E1 facility to carry signals. This technique also is called clear channel, out-of-band or alternate voice data (AVD) signaling.

Channel Associated Signaling (CAS) is similar to common-channel signaling and is used only when the Bit Rate is 2.048 Mbps (the trunk is used with an E1 interface). Signaling is carried on the 16th channel.

Common-channel signaling and channel associated signaling provide a maximum transmission rate of 64 Kbps for bearer channels.

ROBBED-BIT signaling is a per-channel in-band signaling technique for transmitting signaling bits on each channel in a T1E1 facility. The least-significant bit in every 6th transmitted information frame is removed and replaced by a signaling bit. This technique is also called in-band signaling. The maximum transmission rate for each bearer channel with ROBBED-BIT signaling is 56 Kbps.

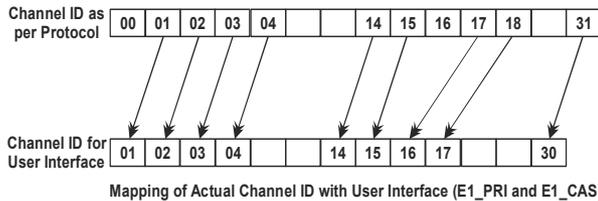

ISDN-PRI signaling is carried on the 24th channel for a 1.544 Mbps (T1) connection and on the 16th channel for a 2.048 Mbps (E1) connection.

QSIG is an ISDN based protocol for signaling between nodes of a Private Integrated Services network. Any of the common trunks, except for PCOL (Personal Central Office Line) trunks, can be analog or digital. (PCOL trunks can only be analog.) Administering a digital trunk group is very similar to administering its analog counterpart, but digital trunks must connect to a T1E1 port and this port must be administered separately.

User interface for E1_PRI and E1_CAS channels:

- In case of ISDN_E1_PRI and ISDN_E1_CAS the protocol supports 32 Channels ranging from 00 to 31, out of which 2 channels (channel no. 00 and 16) are used for framing/signaling. So effectively user has 30 channels for OG/IC calls.

- For better understanding of the user the channel IDs are mapped as shown below. Thus for the E1_PRI and E1_CAS the T1E1 port supports total 30 channels ranging from 01 to 30, which you can use for making and receiving calls.

- The system Debug is for trouble shooting and so the channel ID in debug will be as the actual channel ID as supported by the E1_PRI and E1_CAS protocols.
- Similarly, in case of T1 PRI, Protocol supports 24 channels (from 01 to 24), in which channel no. 24 is used for the signaling, so effectively there are 23 Voice channels are available.
- But in case of T1 RBS, Protocol supports 24 channels (from 01 to 24) and the protocol doesn't consume any channel for signaling so that there are total 24 channels available for the users.

Configuring T1E1 Port Parameters using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **T1E1 Configuration**.
- Click **Port Parameters** to open the page.

- Select the T1E1 Port number you want to configure by clicking the respective tab, and program the following port parameters:
 - SARVAM UCS will assign the **Hardware Slot-Port** automatically, when any card is inserted in the system.

Hardware slot is the number of the Universal slot of SARVAM UCS in which the T1E1 Card is inserted. Range of slot number is 01-16. Port is the number of T1E1 hardware port on the card to which the T1E1 line is connected. Range of Port is from 00-99.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields. By default, Hardware slot-Port is 00-00.

- Keep the **Enable T1E1 Port** flag enabled.

Clear the flag, only if you do not want to use this port. By default, it is enabled.

- You may assign a **Name** to the T1E1 Port for identification of the port. The Name may consist of a maximum of 12 characters. By default, it is blank.
- Select the **Carrier** type as **E1**. The Carrier type will automatically be assigned to the port when you select the region. You may it if required.
- Select **Signal Type**. Signal Type signifies the type of signaling to be used on E1 line. The E1 Signaling supported are:
 - PRI
 - CAS
 - QSIG
 - E&M

Default: PRI

If you select **PRI or QSIG** as the Signal Type, configure the **PRI/QSIG Parameters**.

If you select **CAS** as the Signal Type, configure the **CAS Parameters**.

If you select **E&M** as the Signal Type, configure the **E&M Parameters**.

- Set the **Orientation Type**. Select the orientation type from the following options:
 - Terminal
 - Network
 - Tie-LineDefault: Terminal
- If you have set **Terminal** as the **Orientation Type**, you must select the type of network with which the port is to be **Interfaced With**. Select the type of network from the following:
 - Public ISDN
 - Private ISDNDefault: Public ISDN

- You may configure the port to **Treat Incoming call as Trunk or Station**.

If you select **Trunk**, the system will treat all incoming calls as external calls landing on the trunk. The calls will be routed as per the **Trunk Feature Template** assigned to the T1E1 Port.

If you select **Station**, you must also assign a Station Basic Feature Template and Station Advanced Feature Template to the T1E1 Port.

When you select Station, the system will treat the calling party as an extension user. The user will have access to all the features and facilities of the system, as per the Station Basic Feature Template and Station Advanced Feature Template assigned to the T1E1 Port.

By default, Trunk is selected.

- If **Point-to-Point** is selected as the Interface Type, you can select the option **Trunk** or **Station** for the parameter **Treat Incoming call as**.
- If **Point-to-Multipoint** is selected as the Interface Type, only **Station** can be set as the option for the parameter **Treat Incoming call as**.
- If **Station** is selected as the option for **Treat Incoming call as**, the user will only be able to:
 - Dial Flexible Numbers
 - Dial Operator Code
 - Dial Trunk Access Code for making outgoing calls
 - Access the Global Directory
 - Make calls within the Closed User Group
- Line coding is a pattern that data assumes as it is propagated over a communication channel. Select the **Line Coding Mechanism** from the following:
 - AMI-Basic
 - HDB3
 - NRZ (Fiber Optic)Default: HDB3.
- Framing means to form a set of 24 or 32, 8 bits time slot that is to be treated as single transmission unit. The **Framing Modes** supported by SARVAM UCS are:
 - CEPT1 MF (No CRC)
 - CEPT1 MF (Forced CRC)
 - CEPT1 MF (Auto CRC)Default: CEPT1 MF (Auto CRC).
- Configure **Outgoing (OG) Reference ID**. By default, OG Reference ID is 00.
- Configure **Incoming (IC) Reference ID** for working hours, non-working hours and break hours. By default, IC Reference ID is 00.
- Assign **Trunk Feature Template** to the T1E1 Port. Trunk Feature Template is a set of general features that define the behavior of a Trunk Port. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“Trunk Feature Template”](#).

- **Station Basic Feature Template** assigned to the T1E1 Port is displayed in this field. Station Basic Feature Template is a set of general features that define the basic behavior of a station. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“Station Basic Feature Template”](#).

- **Station Advanced Feature Template** assigned to the T1E1 Port is displayed in this field. Station Advanced Feature Template is a set of advanced features, to be applied on extensions such as CLIP, Floor Service, Walk-in Class of Service. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“Station Advanced Feature Template”](#).

- Select **Priority** for the T1E1 Port. Priority is the precedence given to certain trunks and extensions over others in being answered by the destination extension. You can select from 1 to 9. By default, Priority 5-Normal is set for all T1E1Ports.

For know more about Priority feature, see [“Priority”](#).

- Assign a **Cost Factor** to the T1E1 Port. By default, all the T1E1 Ports are assigned Cost Factor 01.

For more details, see [“Cost Factor”](#).

- ISDN glare occurs if the system initiates an outgoing call on a B-Channel at the same time the network initiates an incoming call on that same B-channel. You may configure the **Glare Option** as **Proceed** or **Held Back**. While processing a glare condition, the configured Glare Option on T1E1 port will be considered.

- Select **Category (Logical Partition)** for the T1E1 Port. You may select from the following options:
 - 1
 - 2
 - 3
 - 4

By default, 1 is selected for all T1E1 Ports. Refer the feature description [“Logical Partition”](#) to know more.

- **Idle Code** is the 8-bit sequence that occupies the time slot on a E1/T1 trunk channel when it is not being used. By default, 127 is configured as the Idle Code.
- If you want SARVAM UCS to display the called party number as the CLI for incoming calls, select the **Display Called Party Number as CLI** check box. By default, Display Called Party Number as CLI option is disabled.

This option is useful when a single T1E1 line connection and Operator are shared by more than one organization. If you enable this option, make sure:

- you configure the names and corresponding numbers of the organizations sharing the line in the Global Directory of SARVAM UCS.
- the Operator has a DKP or an Extended IP Phone or a Mobile UC Client.

With this option enabled the Operator will be able to handle calls more efficiently. When there is an incoming call, SARVAM UCS matches the number with the numbers in the Global Directory. If a match is found SARVAM UCS displays the company name configured for that entry to the Operator, that is, the CLI will display the called party number and name.

After the Operator answers the call, the CLI will change and display the calling party number and name (if configured in the Global Directory).

If you keep this option disabled, the calling party number and name will be displayed as the CLI, both during an incoming call and after the call is answered by the Operator.

You can configure the Display Called Party Number as CLI option only from Jeeves.

- Select the **Allow Incoming CLI Modification** check box if you want to apply 'Allow Incoming CLI Modification' on the T1E1 Port. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see [“Incoming CLI Modification”](#).

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*For an incoming call on the E1 trunk, the Incoming CLI Modification will be applied only when both — the **Allow Incoming CLI Modification** check box and the **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- Select **Return Call to Original Caller (RCOC)** flag to enable this feature on the T1E1 Port. By default, RCOC flag is disabled.

For know more about RCOC feature, see [“RCOC \(Return Call to Original Caller\)”](#).

- In **Channel Reserved for Data Call**, configure the channels you want to reserve for Data Calls. By default, 00 channels are reserved.
- In **Channel Reserved for Outgoing Call**, configure the channels you want to reserve for making outgoing calls. By default, 30 channels are reserved.
- In **Channel Reserved for Incoming Call**, configure the channels you want to reserve for receiving incoming calls. By default, 30 channels are reserved.

When a caller dials the trunk access code or selective trunk access code for dialing the number directly on the trunk port, the caller waits for the dial tone before dialing the number. But some exchanges do not give Dial Tone for the T1E1 Port. For Example, when T1E1 port as E1CAS type is used in Delhi, it is observed that the exchange does not give dial tone when direct dialing on the trunk is used.

- Enable the **Feed Dial Tone** flag. SARVAM UCS will provides the dial tone to the caller when the T1E1 Port is accessed.

It is applicable only when Online dialing is used as, Store and Forward dialing, the dial tone is given to the caller. The dial tone is played as per the Dial Tone Timer.

By default, Feed Dial Tone flag is disabled.

- *When dial tone flag is disabled, user will hear the dial tone of the exchange if provided, otherwise, user will hear the silence.*
- *If the user is making the call from the SLT port and dial tone is not provided by the exchange, user will not know when to start dialing the number. In this case, it is possible that some digits are not out dialed on the port and wrong number is dialed out because system will out dial the number only if Outgoing call Acknowledge is received but the user is not aware of this condition. Hence, it is required to enable this flag, if exchange is not providing the dial tone.*
- When Online dialing or Store and Forward dialing are used, some exchanges do not provide any tone while routing/processing the call. Thus, the caller does not know whether the call is being processed or not as there is silence. In such case, You must enable the **Feed Routing Tone** flag, SARVAM UCS will play the routing tone to the caller. SARVAM UCS stops playing the routing tone when an alert message or connect message or disconnect message is received from the T1E1 Card.

By default, the **Feed Routing Tone** flag is disabled.

- To customize the pulse width option and set the pulse shapes configure the **Custom Pulse** parameters. SARVAM UCS generates pulse shapes which match the country standard, where it is installed. However, if the standard pulse shape does not match, SARVAM UCS enables you to customize the pulse width to match your exact requirements.

To use customize pulse width option and set the pulse shape in 1 to 4 phases, keep the **T1/E1 Custom Pulse Width (CPW) flag** enabled.

- **Word 1:** Set the pulse width for setting pulse shape in the 1st phase. The range of Custom Pulse Width-Word 1 is 001 to 127. Default: 109.
- **Word 2:** Set the pulse width for setting pulse shape in the 2nd phase. The range of Custom Pulse Width-Word 2 is 001 to 127. Default: 107.
- **Word 3:** Set the pulse width for setting pulse shape in the 3rd phase. The range of Custom Pulse Width-Word 3 is 001 to 127. Default: 64.
- **Word 4:** Set the pulse width for setting pulse shape in the 4th phase. The range of Custom Pulse Width-Word 4 is 001 to 127. Default: 64.
- Select the **Bearer Service** supported by your service provider. You can select from:
 - Speech
 - 3.1 KHz AudioBy default, Speech is selected.

- The **Overlap Receiving Timer** is relevant while receiving the called party number information in overlap receiving mode. It is not relevant for the port in overlap sending mode.

Range of Overlap Receiving Timer is from 01 to 99 seconds. Default: 15 seconds.

- Configure **Pause Timer** for the T1E1 Port. Range of Pause Timer is from 1 to 9 seconds. By default, it is set to 3 seconds for all T1E1 Ports.

This Timer is required to insert delay between the digits while dialing out DTMF digits on the T1E1 port. One of the applications for using this parameter is Multi-stage dialing. Refer chapter "[Multi-Stage Dialing](#)".

For example, if PPP2 is to be outdialed and Pause timer is programmed as 3 seconds, the SARVAM UCS will out dial the digit 2 after 9 seconds i.e delay of individual P i.e $3+3+3=9$.

- When the SETUP Message is sent by SARVAM UCS to the network (ISDN exchange), the exchange responds by sending SETUP ACK (Acknowledgment), and dial tone is played to the caller. The time taken by the exchange to respond to the SETUP message may vary from exchange to exchange. Set the **SETUP Response Timer (sec)** as per the time taken by the network to respond to the SETUP message and play dial tone to the caller.

Valid Range of the timer is 01 to 20 seconds. By default it is set to 4 seconds.

Change the default settings only if required. If the time you set is less than the time taken by the exchange to respond, no dial tone will be played to the caller.

You can configure the *SETUP Message Timer* only from Jeeves.

- Configure **DTMF On Time** for the T1E1 Port. Range of DTMF On Time is from 051 to 255 ms. By default, it is set to 102 ms for all T1E1 Ports.

The DTMF On Time is the time for which the DTMF digit which is to be outdialed by the SARVAM UCS remain On. One of the applications for using this parameter is Multi-stage dialing. Refer chapter "[Multi-Stage Dialing](#)".

- Configure **DTMF Inter Digit Pause Timer** for the T1E1 Port. Range of Inter Digit Pause Timer is from 051 to 255 ms. By default, it is set to 102 ms for all T1E1 Ports.

Inter Digit Pause Timer is the time for which the system will wait while receiving the dialing digits to consider it as end-of-dialing.

- Configure the **Minimum ON Time (msec)** for which the DTMF signal should be present in order to be detected. The valid range of this time is 10 to 200 milliseconds. By default, Minimum ON Time is set to 20 milliseconds.
- Configure the **Minimum OFF Time (msec)**. This parameter signifies the minimum time period between successive DTMF digits. The valid range of this time is 10 to 200 milliseconds. By default, Minimum OFF Time is set to 20 milliseconds.

Configure the **Minimum Level (dB)** for the DTMF digit to be considered as valid. The valid range of this time is 0 to -36.5 dB. By default, Minimum levels is set to -36.5dB.

- If SARVAM UCS is to be used as a Gateway, enable **Gateway Application-Answer Signaling** on the T1E1 Port and configure **DTMF String**. By default, Gateway Application-Answer Signaling is disabled and CCC is configured as DTMF String.

For more details, see "[Gateway Application-Answer Signaling](#)".

- Configure **Call Budget** parameters for the T1E1 Ports. Call Budget is an expense control feature of SARVAM UCS that allows you to keep track of the cost of phone calls made from the T1E1 Port. By default, Call Budget is enabled on the trunk. If you wish to change the default configuration or disable it for this T1E1 Port, configure the parameters as per your requirement:
 - **Type:** Select the type of Call Budget, that is, Amount or Minutes or Calls to be applied on the T1E1 Port. By default, Minutes is selected as the Call Budget type. To disable select Type as None.
 - **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 999999.
 - **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set as 000300.
 - **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of Calls in this field. By default the number of calls is set to 9999.
 - **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes/Number of Calls to be reset on a particular date of every month.

- **Scheduled (Date):** Select the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be reset every month. You may select 'Daily' if your plan suggests so.
- **Call Back:** This parameter is related to the 'Call Back on Trunk Port' feature. If you want to enable the 'Call Back on Trunk Port' feature on this T1E1 Port, configure the following parameters:
 - **Enable Call Back:** Enable this flag to activate the Call Back on Trunk Port feature. By default, this flag is disabled on all trunk port types. By default, the flag is disabled.
 - **Call Back Timer (sec):** This is the duration for which the system waits for the caller to disconnect before applying the Call Back. The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds.
- **Call Back Mode:** Select from the following options how a 'Call Back' call answered by the remote party should be routed:
 - Built-in Auto Attendant
 - PIN Authentication - Multiple Calls
 - CLI Authentication - Multiple Calls
 - CLI Authentication - Single Call - Answer Signaling
 - Operator
 By default, Operator is selected as the Call Back Mode.
- **Call Back on:** This parameter allows you to select if the call back should be made to the same number that was received or to a different number. If you want the call back to be made to the same number select the 'CLI number'. If you want the call back to be made to a different number, select 'Alternate Number'.

By default, CLI number is selected for Call Back.

- **Incoming Number List:** Program the number strings that are eligible for Call Back in this List. By default, Number List 15 is assigned to Call Back Incoming Number List.

Number List 15 is also assigned to all T1E1 Ports as well as all other Trunk port types. If you want the same numbers strings to be programmed commonly for all T1E1 Ports and Trunk Port types, retain this list.

If you want a different set of number strings to be programmed for this T1E1 Port, select a different Number List, and assign it to the T1E1 Port.

You may program the Incoming Number List either from the 'Number List' page or by clicking the 'Incoming Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Outgoing Number List:** Program the number strings that are to be called back in this List.

For each number string you programmed in the 'Incoming Number List', you must program in the corresponding index in the Outgoing Number List a number to which the call back is to be made. For example, for the number string programmed at Index 1 in the Incoming Number List, a corresponding number string at the same Index, Index 1, should be programmed in the 'Outgoing Number List'.

By default, Number List 16 is assigned to Outgoing Number List. The same Number List 16 is also assigned to all T1E1 Ports as well as all other Trunk port types.

You may program the default number list, or a different number list and assign it to this T1E1 Port.

You may program the Outgoing Number List either from the 'Number List' page or by clicking the 'Outgoing Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Call Back from:** This parameter determines the trunk port to be used to make the call back. The call back can be made using the Same Port or an "[OG Trunk Bundle Group](#)".

Select 'Same Port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTB Group, the call back will be made using the OGTB Group, which you have defined.

By default, Same Port is selected.

- **OGTB Group:** If you selected OGTB Group for making the call back in the previous parameter, you must define the OGTB Group that must be used in this parameter.

By default, OGTB Group 01 is assigned.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTB Group that you define here for Call Back.

- FDL is used for communicating general maintenance information or for transmitting user defined information within the T1 link. General maintenance information is in the form of Performance Message Report which is generated by the SARVAM UCS Card T1E1PRI and depending upon the FDL Protocol, the Performance Message Report is sent every second or on request.

Select the **FDL** flag to enable. This parameter is applicable only if Framing = ESF. If the Network (Public or Private) to which the SARVAM UCS is connected does not support FDL then FDL will be disabled. By default, the T1 FDL is disabled.

If you have enabled FDL, configure the **FDL Protocol**. SARVAM UCS supports ANSI T1.403 and AT&T 54016 protocols of reporting the performance monitoring. By default, the T1 FDL Protocol is ANSI T1.403.

For more information, see "[E1/T1 Maintenance](#)"

- Enter appropriate **Debug Code (Level 1 to 4)**, to obtain debug information of various parts of T1E1 Card on the COM Port. By default, debug is off for all T1E1 ports for all levels.

Code is the value for the specified level to turn ON the debug for the parameters. Code range is from 000 to 255. Code value '000' for each level will turn off that level's debug.

Level and Code for T1E1 Port are as specified below:

Level 1:

Unused	Unused	Unused	Unused	Layer 4	CAS DSP	MFC R2	CAS
--------	--------	--------	--------	---------	---------	--------	-----

001	CAS
002	MFC R2
004	CAS DSP
008	Layer 4
000	Debug Off

Level 2:

Unused	Unused	Unused	HDLC (D-Channel)	FDL	ABCD Bits	Counters	Alarms
--------	--------	--------	------------------	-----	-----------	----------	--------

001	Alarms
002	Counters
004	ABCD Bits
008	FDL
016	HDLC (D Channel)
000	Debug Off

Level 3:

Unused	Flow Debug	NLS Debug	LAP Debug	SVC Primitives	Variables	State	Primitives
--------	------------	-----------	-----------	----------------	-----------	-------	------------

001	Primitives
002	State
004	Variables
008	SVC Primitives
016	LAP Debug
032	NLS Debug
064	Flow Debug
000	Debug Off

Level 4:

Unused	Unused	Unused	Unused	Unused	Unused	NI Debug	OS Task
--------	--------	--------	--------	--------	--------	----------	---------

001	OS Task
002	NI Debug
000	Debug Off

PRI/QSIG Parameters

- Under **T1E1 Configuration**, click **PRI/QSIG Signaling** and configure the PRI/QSIG parameters.

- ISDN Switch Variant:** ISDN supports a variety of service provider switches. Different countries use specific type of ISDN switch. This switch is designed using ISDN standard protocol. The type of switch determines various factors such as how many ISDN devices would be handled, which B-channel will support voice, video, data etc. Select the ISDN Switch Variant from the list. By default, **ETSI NET5** is selected as the ISDN Switch Variant.
- Offer continuous Bearer Channel Mapping(01-30):** Select this check box for continuous Bearer Channel Mapping for E1-QSIG/E1-PRI.
- D-Channel:** Enter the Channel number that is used for Data signaling. By default, D-Channel is 16. Valid Range is 1 to 31.
- Send Called Party Number Using:** Select the appropriate option from the following for Send Called Party Number Using:
 - Called Party Number IE (Information Element)
 - Keypad Facility IE (Information Element)
 By default, Called Party Number IE is selected.
- Dialing Type for Called Party Number:** Select the type of dialing supported by your exchange. You can select:
 - Enbloc
 - Digit -by - Digit
 - Any
 By default, Any is selected as the Dialing Type for Called Party Number.

- **Caller - Type of Numbering Plan (TON):** Select the appropriate option from the following for sending the type of numbering plan of the calling party:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved
 Default: Unknown.

- **Caller- Numbering Plan Identification (NPI):** Select the appropriate option from the following for sending the numbering plan identification of the calling party:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved
 Default: ISDN Numbering.

- **Called - Type of Numbering Plan (TON):** Select the appropriate option from the following for sending the type of numbering plan of the called party:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved
 Default: Unknown.

- **Called - Numbering Plan Identification (NPI):** Select the appropriate option from the following for sending the numbering plan identification of the called party:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved
 Default: ISDN Numbering.

- **Modify Received CLI as per TON:** This is applicable for PRI-TE mode only. If this check box is selected then the Calling Party Number received in SETUP message will be changed as per the Type of Number received in the SETUP message from Calling Party Number field by the system. Default: Disabled.

- **Screening Indicator:** Select the option as provided to you by your exchange. You can select from:
 - User provided, not screened
 - User Provided, verified and passed
 - User Provided, verified and failed
 - Network Provided

By default, User provided, not screened.

- **Receive Equalization Mode:** You can set the Receive Equalization Mode as Auto or Manual. By default, Auto is selected as the Receive Equalization Mode.
- **Receive Equalization Parameters:** This field increases the strength of incoming signals by a fixed amount to compensate for line losses. Select the required option from the list. By default, the receive equalization parameters of T1E1 is 8dB.
- **Feed Inband Tones on T1E1-NT, before sending DISCONNECT:** Select this flag, if you want to feed inband tones on T1E1-NT before sending DISCONNECT message. This flag is applicable only when T1E1 port is configured as 'Network'. When this flag is enabled, inband tones shall be feed for 15 seconds (fixed, non programmable) before sending DISCONNECT message.

When this flag is disabled, inband tones (Busy/Error as applicable for the state of the call) shall not be feed before sending the DISCONNECT message. However when DISCONNECT message is sent from T1E1-NT port, inband tones will always be sent with 'progress indicator 8'. By default, this flag is disabled.

- **Send SETUP ACK with PI:** Select this flag if you want the system to send PI (Progress indicator) element in Setup Ack message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Send PROCEED with PI:** Select this flag if you want the system to send PI (Progress indicator) in Proceed message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Send PROGRESS with PI:** Select this flag if you want the system to send PI (Progress indicator) in Progress message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. By default it is enabled.
- **Send ALERT with PI:** Select this flag if you want the system to send PI (Progress indicator) in Alert message to other end. This option is relevant only when call landing on the T1E1 port are to be routed to SLT/CO/Mobile/DKP port. If T1E1 port is configured as 'Network', by default it is enabled and if T1E1 port is configured as 'Terminal', by default it is disabled.
- **Transparently pass PI in case of ISDN to ISDN / SIP call:** Select this flag, if you want the system to just pass the PI as received to the other end. This option is relevant only when call landing on the T1E1 port are to be routed to ISDN or SIP ports. By default it is enabled.
- Click **Submit** to save changes.

E1 CAS Parameters

Under **T1E1 Configuration**, click **E1 CAS Signaling** and configure the CAS parameters.

Register Signaling Parameters	
Forward Tone Maximum On Timer (T1) (Seconds)	15
Forward Tone Maximum Off Timer (T2) (Seconds)	24
Maximum Compelled Cycle Timer (T3) (Seconds)	15
Pulse Duration for Pulse Signal (Milliseconds)	150
Pulse Signal Maximum Wait Timer (Seconds)	15
First Forward Tone Wait Timer (Seconds)	15
Minimum MF Signal Persist Timer (Milliseconds)	020

- **E1 Line Signaling Variant:** The E1 Line Signaling Variant supported by SARVAM UCS is ITU T Q.400-Q.490.
- **E1 Register Signaling Variant:** Select the appropriate option from the following for the E1 Register Signaling Variant:
 - DTMF - DNIS/ANI is transmitted in the corresponding speech channel using the DTMF signals as per ITU-T Q.23.
 - MFC R2 - DNIS/ANI is transmitted in the corresponding speech channel using the MFC R2 signals as per ITU-T Q.400-Q490.

By default, E1 Register Signaling Variants is MFC R2.

Register Signaling Parameters

- **Forward Tone Maximum On Timer (T1) (Seconds):** This timer signifies the maximum time for which the forward signal remains ON, from the outbound end.

The range of Forward Time Maximum ON Timer is from 01 to 99 seconds. Default: 15 seconds.

The DSP (Digital Signaling Processor) device will send the forward tone for this timer and will expect backward signal within this timer. If no backward signal is received during this time, a timeout condition will occur in this case, an alert signal will be sent to the CPU Card, error tone be issued to the calling party and a clear forward signal will be sent on the line.

- **Forward Tone Maximum Off Timer (T2) (Seconds):** This timer signifies the maximum time between two out going forward signals. During this time the forward tone will remain OFF. If the outbound end does not send a forward signal for this time, the inbound end will interpret it as per its condition and shall take action accordingly.

The range of Forward Time Maximum OFF Timer is from 01 to 99 seconds. Default: 24 seconds.

- **Maximum Compelled Cycle Timer (T3) (Seconds):** This timer signifies the maximum time within which one compelled signaling cycle shall end.

The range of Maximum Compelled Cycle Timer is from 01 to 99 seconds. Default: 15 seconds.

- **Pulse Duration for Pulse Signal (Milliseconds):** Backward signals A-3, A-4, A-6 and A-15 are pulsed to the outbound end. Pulse duration of these signals vary from country to country.

The range of Pulse Duration for Pulsed Signals is from 001 to 999 ms. Default: 150 ms.

It is recommended that tolerance be fixed at +/- 25 ms.

- **Pulsed Signal Maximum Wait Timer (Seconds):** This timer signifies the time for which the outbound end waits for the pulsed signal. If the pulsed signal is not received during this time, the compelling signaling is said to be complete.

The range of Pulsed Signal Maximum Wait Timer is from 01 to 99 seconds. Default: 15 seconds.

- **First Forward Tone Wait Timer (Seconds):** This timer signifies the time between receipt of line seizure signal and the first forward signal.

The range of the First Forward Tone Wait Timer is from 08 to 24 seconds. Default: 15 seconds.

- **Minimum MF Signal Persist Timer (Milliseconds):** This timer signifies the minimum time for which the forward/backward signal shall be sustained on the line by the receiving end.

The range of Minimum MF Signal Persist Timer is from 001 to 255 ms. Default: 20 ms.

Outbound Parameters

- **Dialed Number Identification Signal (DNIS) End Type:** This parameter is applicable only when DNIS length is set to 99 (that is, variable). The outbound end indicates end of DNIS using a group I tone or using time out.

Range of DNIS End Type is from 00, 11 to 15; where 00 indicates End of DNIS as time out. 11 to 15 indicates group I tone to declare End of DNIS. Default: 15.

- **Address Number Information (ANI) Send Position:** This parameter signifies the number of DNIS digits after which address number information is to be sent. Address number information is usually sent on receiving the backward tone Send next digit or Send next ANI digit.

If send next address number information tone is received then this parameter is not applicable. But if same tone is used by the inbound end to request the next ANI digit and the next DNIS digit, ANI is sent after the number of digits as set in this field.

The range of ANI Send Position is from 00 to 99. Default: 00.

- **Is Address Number Information (ANI) Available:** This parameter indicates Group A tone (received from the inbound tone) that is to be interpreted as a question by the inbound end asking the outbound end whether the outbound end has ANI digits to be sent.

The range of Is ANI Available, Group A tone is from 01 to 15. Default: 05.

- **Positive Response to Is ANI Available:** This parameter signifies the Group 1 tone that the outbound end will send to the inbound end as a response to Is ANI Available tone from the inbound end. The tone defined in this parameter indicates the Group 1 tone with which the Outbound end will respond to the inbound end to indicate that it has ANI digits to be sent.

The range of Positive Response to Is ANI Available, Group 1 tone is from 01 to 15. Default: 01.

- **Negative Response to Is ANI Available:** This parameter signifies the Group 1 tone that the outbound end will send to the inbound end as a response to Is ANI Available tone from the inbound end. The tone defined in this parameter indicates the Group 1 tone with which the Outbound end will respond to the inbound end to indicate that it does not have ANI digits to be sent.

The range of Negative Response to Is ANI Available, Group 1 tone is from 01 to 15. Default: 10.

- **ANI End Tone Presentation Allowed:** This parameter signifies the Group 1 tone used to signify end of ANI digits with Presentation Allowed.

The range of End of ANI with Presentation Allowed, Group 1 tone is from 00, 11 to 15. Default:15.

- **ANI End Tone Presentation Restricted:** This parameter signifies the Group 1 tone used to signify end of ANI digits with Presentation Restricted.

The range of End of ANI with Presentation Restricted, Group 1 tone is from 00, 11 to 15. Default: 00.

Inbound Parameters

- **Dialed Number Identification Signal (DNIS) End Type:** This parameter is applicable only when the DNIS length is set to 99 (that is, variable). The outbound end indicates end of DNIS using a group I tone or using time out.

The range of DNIS End Type is from 00, 11 to 15; where 00 indicates End of DNIS as time out, 11 to 15 indicates group I tone to declare End of DNIS. Default:15.

- **Dialed Number Identification Signal (DNIS) Digit Length:** This parameter signifies the number of DNIS digits required by inbound end to indicate the Called party number during MFC R2 signaling. The range of DNIS Length is from 01 to 99. Default: 99.

DNIS Digit length (01 to 98) will be expected by the inbound end. (Practical value would be 01 to 10)

DNIS Digit length 99 indicates DNIS length is variable. Further action is taken after timeout or on receipt of I-15. Refer parameter 'DNIS End Type (Inbound)'.

- **Address Number Information (ANI) Request Position:** The inbound end may or may not request ANI digits. It may request ANI digits after receiving the first DNIS or after receiving second DNIS or even after receiving all the DNIS digits.

The range of ANI Request Position is as follows:

ANI Request	Meaning
00	Never request ANI digits

ANI Request	Meaning
01-98	Request ANI digits on receipt of these many DNIS digits
99	Request after receiving all the DNIS digits (complete DNIS)

Default: 99.

- **Address Number Information (ANI) Length:** This parameter signifies the number of ANI digits that would be expected by the inbound side as Calling Party Number during MFC R2 signaling. This parameter at the inbound side guides the inbound register to switch from requesting ANI digits back to requesting DID digits.

The range of ANI Length is from 00 to 99. Default: 99.

- ANI Length = 00, ANI is not sent by the Outbound end.
- ANI Length = 99, ANI Length is variable. If ANI length is variable, the logic waits for End of ANI from the outbound side. The inbound end will sense for I-12 and I-15. I-12 is used to signify that no ANI digits are available whereas I-15 is used to signify end of ANI digits. Some countries like China use I-15 to signify both the events viz. End of ANI and no ANI digits available.
- **Ask Address Number Information (ANI):** This parameter specifies the backward group A tone used to ask the outbound end whether it has ANI digits to be sent. This parameter is also known as **Request ANI Category**.

The range of Ask ANI is from 00, 01 to 15. If no tone is sent by the inbound end, set this parameter to 00. For India, this parameter is set to 04. Default: 05.

- **Positive Response to Ask ANI:** This parameter specifies that the Group 1 forward tone is to be received by the inbound end from the outbound which in turn indicates that outbound end has ANI digits to be sent. This parameter is also known as ANI category.

The range of Positive Response to Ask ANI is from 01 to 15. Default: 01.

For example, In India I-1 or I-10 is sent by the outbound end. In Kuwait, I-6 is sent. This parameter cannot be zero because; Is ANI Available request will be made by the inbound end only if the country supports this protocol.

- **Negative Response to Ask ANI:** This parameter specifies the Group 1 forward tone to be received by the inbound end from the outbound which would indicate that outbound end has ANI digits to be sent. This parameter is also known as ANI category.

The range of Negative Response to Ask ANI is from 01 to 15. Default: 10.

For example, in India I-1 or I-10 is sent by the outbound end. In Kuwait, I-6 is sent. This parameter cannot be zero because; Is ANI Available request will be made by the inbound end only if the country supports this protocol.

- **ANI End Tone Presentation Allowed:** This parameter specifies the Group I tone that the inbound end should expect from the outbound end to consider End of ANI digits with information that the Presentation of ANI by the outbound end is allowed.

The range of ANI End Tone Presentation Allowed is 00 or from 11 to 15. Default: 15.

If no tone is sent, set this parameter to 00. For India use A-4, for China use A-1.

- **ANI End Tone Presentation Restricted:** This parameter specifies the group I tone that the inbound end shall expect from the outbound end to consider End of ANI digits with an information that the Presentation of ANI by the outbound end is Restricted.

The range of ANI End Tone Presentation Restricted is 00 or from 11 to 15. Default: 00.

If no tone is sent, set this parameter to 00. For India use A-4, for China use A-1.

- **Ask Calling Party Sub Category:** This parameter specifies the group 1 tone that the inbound end shall expect from the outbound end to consider End of ANI digits with an information that the Presentation of ANI by the outbound end is Restricted. Select this flag to enable. Default: Disabled.

Forward Group II

- **Ordinary Subscriber:** This parameter specifies the forward group II tone used to inform the inbound end that the calling party is an Ordinary Subscriber. This signal is sent in response to Calling Party Category signal Request from the inbound end.

Ordinary Subscriber is 00, 01 to 15. Default: 01. If this parameter is not applicable, assign 00.

- **Priority Subscriber:** This parameter specifies the forward group II tone used to inform the inbound end that the calling party is a Priority Subscriber. This signal is sent in response to Calling Party Category signal Request from the inbound end.

Priority Subscriber is 00, 01 to 15. Default: 02. If this parameter is not applicable, assign 00.

- **Maintenance Equipment:** This parameter specifies the forward group II tone used to inform the inbound end that the calling party is Maintenance equipment.

Maintenance Equipment is 00, 01 to 15. Default: 03. If this parameter is not applicable, assign 00.

- **Operator:** This parameter specifies the forward group II tone used to inform the inbound end that the calling party is Operator.

Operator is from 00, 01 to 15. Default: 05. If this parameter is not applicable, assign 00.

- **Pay Phone:** This parameter specifies the forward group II tone used to inform the inbound end that the calling party is Pay Phone (Coin box).

Pay Phone is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Data Transmission:** This parameter specifies the forward group II tone used to inform the inbound end that the call is a Data Call.

Data Transmission is from 00, 01 to 15. Default: 06. If this parameter is not applicable, assign 00.

- **Interception Operator:** This parameter specifies the forward group II tone used to inform the inbound end that the call is from Interception Operator.

Interception Operator is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

Backward Group A

- **Send Next Digit (N+1) (DNIS):** This parameter specifies the backward group A tone used to request next digit. Be it ANI digit or DNIS digit.

Send next Digit range is 00, 01 to 15. Default: 01. If you do not want to use any tone, assign 00.

For India, use A-1 to signify Send DNIS Digit event.

- **Send Last But One Digit (N-1) (DNIS):** This parameter specifies the backward group A tone used to request last but one digit that is, N-1 digit. Be it ANI digit or DNIS digit.

Send last but one digit range is 00, 01 to 15. Default: 02. If you do not want to use any tone, assign 00.

For India, use A-9 to signify Send last but one digit event.

- **Send Last But Two Digits (N-2) (DNIS):** This parameter specifies the backward group A tone used to request last but two digits that is, N-2 digit. Be it ANI digit or DNIS digit.

Send last but two digits range is 00, 01 to 15. Default: 07. If you do not want to use any tone, assign 00.

For India, use A-7 to signify Send last but two digits event.

- **Send Last But Three Digits (N-3) (DNIS):** This parameter specifies the backward group A tone used to request last but three digits that is, N-3 digit. Be it ANI digit or DNIS digit.

Send last but three digits range is 00, 01 to 15. Default: 08. If you do not want to use any tone, assign 00.

For India use A-8 to signify Send last but three digits event.

- **Send Caller Party Category and ANI Digit:** It is to send calling party's category requests transmission of a group II signal. Range is 00 to 15. By Default, it is 05.

- **Address Completed, Change over of Group B:** This parameter specifies the backward group A tone used to inform the inbound end that the incoming register at the inbound end needs no additional address digit and is about to go over to transmission of a group B signal conveying the status of equipment at the subscriber at the inbound end.

Address-Complete, Changeover to reception of Group B signal range is 00, 01 to 15. Default: 03. If you do not want to use any tone, assign 00.

- **Send Calling Party Category and Change to Group C:** This parameter specifies the backward group A tone used by the inbound end to request Calling Party Category from the outbound end. This tone also informs the outbound end to change to reception of Group C signal.

Send Calling Party Category and Change to Group C range is from 00, 01 to 15. Default: 00. If you do not want to use any tone, assign 00.

- **Congestion in the National Network:** This parameter specifies the backward group A tone used to inform the congestion at the inbound end.

Congestion in National Network range is 00, 01 to 15. Default: 04. If you do not want to use any tone, assign 00.

- **Send Calling Party Category:** This parameter specifies the backward group A tone used to request calling party category.

Send calling party's category range is 00, 01 to 15. Default: 05. If you do not want to use any tone, assign 00.

For India, use A-7 to signify 'Send calling party's category' event.

- **Address Completed, Charge, Set Speech Condition:** This parameter specifies the backward group A tone used to inform the inbound end that the incoming register at the inbound end needs no additional address digit, but will not send Group B signals. Also charge the call on answer.

The range of Address-Complete, Charge, Set-up Speech conditions is 00, 01 to 15. Default: 06. If you do not want to use any tone, assign 00.

- **Repeat DNIS Digits from Beginning:** This parameter specifies the backward group A tone used to inform the outbound end to send all the DNIS digits from the beginning.

The range of Repeat DNIS digits from beginning is 00, 01 to 15. Default: 00. If you do not want to use any tone, assign 00.

- **Send Next ANI Digits:** This parameter specifies the backward group A tone used to request next (first) ANI digit.

The range of Send Next ANI Digit is 00 or 01 to 15. Default: 00. If no such tone is sent, set this parameter to 00.

A few countries use different tone to request next ANI digit and next DNIS digits. For example, India uses A-4, China uses A-1.

Backward Group B

- **Send Special Information Tone:** This parameter specifies the backward group B tone used to inform the outbound end that the call cannot be made through because of reasons beyond those which are considered by the Protocol. Hence Special Information tone will be sent to the calling party. SARVAM UCS will send only the Group B signal and then disconnect the call.

The range of Send Special Information Tone is from 00, 01 to 15. Default: 02. If you do not want to use any tone, assign 00.

- **Send Special Information Tone and Setup Speech Conditions:** This parameter specifies the backward group B tone used to inform the outbound end that the call cannot be made through because of reasons beyond those which are considered by the Protocol. Hence, Special information tone will be sent to the calling party and request the outbound end to setup speech conditions.

In this case, SARVAM UCS shall connect the calling party to the voice message of the system informing the caller that the call cannot be connected.

The range of Send Special Information Tone and setup speech conditions is from 00, 01 to 15. Default: 02. If you do not want to use any tone, assign 00.

- **Subscriber Line Busy:** This parameter specifies the backward group B tone used to inform the outbound end that the called subscriber is busy.

Subscriber Line busy range is from 00, 01 to 15. Default: 03. If you do not want to use any tone, assign 00.

- **Subscriber Line Free, Charge:** This parameter specifies the backward group B tone used to inform the outbound end that the called subscriber is free and the call is to be charged on answer.

The range of Subscriber Line free, Charge is from 00, 01 to 15. Default: 06. If you do not want to use any tone, assign 00.

- **Subscriber Line Free, No charge:** This parameter specifies the backward group B tone used to inform the outbound end that the called subscriber is free, but the call is not to be charged on answer. This signal permits non-chargeable calls without the need for transferring **no charge** information by line signals.

The range of Subscriber Line free, NO Charge is 00, 01 to 15. Default: 07. If you do not want to use any tone, assign 00.

- **Congestion:** This parameter specifies the backward group A tone used to inform that congestion is encountered after changeover from Group-A to Group-B signals.

Congestion range is from 00, 01 to 15. Default: 04. If you do not want to use any tone, assign 00.

- **Unallocated Number:** This parameter specifies the backward group B tone used to inform the outbound end that the number received is not in use.

The range of Unallocated Number is from 00, 01 to 15. Default: 05. If you do not want to use any tone, assign 00.

- **Subscriber Line Out of Order:** This parameter specifies the backward group B tone used to inform the outbound end that the called subscriber's line is out of order.

Range of Subscriber's Line out of order is from 00, 01 to 15. Default: 08. If you do not want to use any tone, assign 00.

- **Call Rejected, No Indication:** This parameter specifies the Group B backward tone used to inform the outbound end that the call is rejected but there is no indication of cause.

Call rejected, No indication range is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Alternative Answer Tone:** This parameter specifies the Group B backward tone used to inform the outbound end that the call is accepted and the speech path is made through.

Alternative Answer Tone range is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Changed Number:** This parameter specifies the Group B backward tone used to inform the outbound end that the number dialed by the calling party is changed. However, this parameter is rarely used.

The range of Changed Number (announcement on line) is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

Backward Group C

- **Send Next ANI Digit:** This parameter specifies the backward group C tone to request next (even first) ANI digit from the outbound end.

The range of Send next ANI digit (Group C) is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Request Transition Back to Group A and Restart from First DNIS (Group C):** This parameter specifies the backward group C tone to restart from the first DNIS and request transition to Group A.

The range of Request transition to Group A and restart from first DNIS is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Address Completed, Change to Reception of Group B:** This parameter specifies the backward group C tone used to signify Address completed, change to reception of Group B signal.

The range of Address completed, change to reception of Group B signal is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Congestion:** This parameter specifies the backward group C tone used to signify Congestion.

The range of Congestion is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Request Transition Back to Group A and Sent Next DNIS:** This parameter specifies the backward group C tone used to signify request transition back to group A, and send next DNIS.

The range of Request transition back to group A, and send next DNIS is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

- **Request Transition Back to Group A and Repeat the Last DNIS:** This parameter specifies the backward group C tone used to signify request transition back to group A, and repeat the last DNIS. The range of Request transition back to group A, and repeat the last DNIS is from 00, 01 to 15. Default: 00. If this parameter is not applicable, assign 00.

Line Signal Parameters

- **Line Signaling:** By default this flag is enabled. If you are unable to make outgoing calls, check with your Service Provider and disable this option. This option will be relevant only when you Tie-up SARVAM UCS with another PBX.
- **C & D Bits:** This parameter indicates the default values of C and D bits when the T1/E1 Port transmits line signals.

CD Bits	Meaning (Binary Value)
0	00 (C=0, D=0)
1	01
2	10
3	11

Default: 01 that is, C and D Bit is 1

The C and D bits received during an IC call should be ignored by the system.

- **Invert Bit A:** This parameter signifies whether A-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit A.

Default: Disabled (Do Not Invert Bit A).

- **Invert Bit B:** This parameter signifies whether B-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit B.

Default: Disabled (Do Not Invert Bit B1)

- **Invert Bit C:** This parameter signifies whether C-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit C.

Default: Disabled (Do Not Invert Bit C).

- **Invert Bit D:** This parameter signifies whether D-bit is to be inverted before transmitting and on receiving. Select the check box to enable, that is to Invert Bit D.

Default: Disabled (Do Not Invert Bit D).

- **E1 Metering Bit:** This parameter signifies the bit used by the network to signal metering pulses. You can select from the following options:

- None
- Bit-A
- Bit-B
- Bit-C
- Bit-D

Default: Bit-A.

- **E1 Metering Pulse Minimum Timer (Milliseconds):** This timer signifies the minimum time for which the metering bit is changed, to be recognized as a genuine metering pulse subject to E1 Metering Pulse Minimum timer.

All Changes occurred for time less than this timer is ignored. The range of E1 Metering Pulse Minimum timer is from 20ms to 1000ms. Default: 150ms.

- **Clear Back Signal:** This parameter signifies the signal used to signify that the called party has disconnected the line first. This is indicated in two ways: Release Guard (Ab =1) or Forced Release (Bb = 0). This parameter is country specific.

Default: Release Guard.

- **Release Timer (Milliseconds):** This timer signifies the time for which the clear back signal should persist on the line to be recognized as a genuine clear back signal. This is also known as Clear Back timer.

The range of Release Timer is from 20ms to 1000ms. Default: 400 ms.

- **Line Seizure Acknowledge Wait Timer (Milliseconds):** This timer signifies the time for which the outbound end waits for seizure acknowledgement from the inbound end after sending the line seizure

signal. On expiry of this timer, clear forward signal is sent by the outbound end. Alarm is to be generated. This timer is applicable only when acting as outbound end.

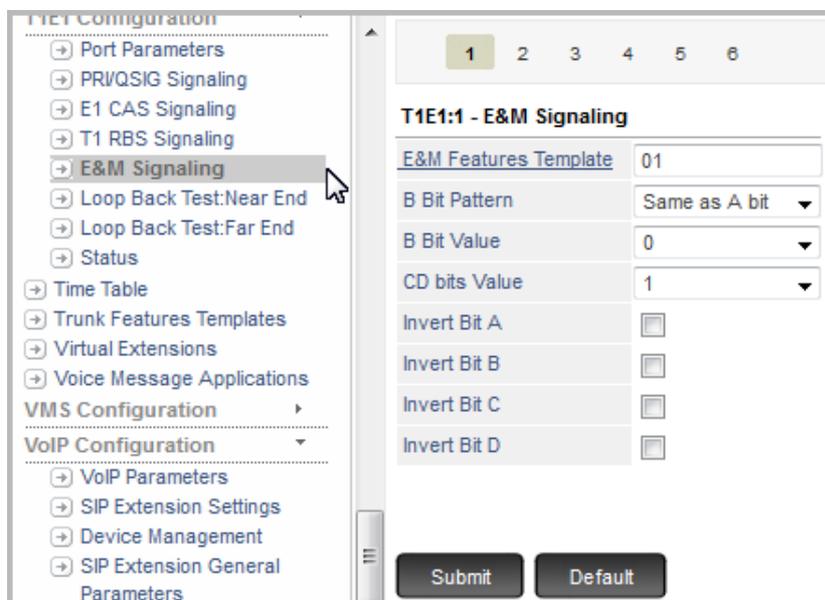

The range of Line Seizure acknowledge Wait Timer is from 0001ms to 9999 ms. Default: 200ms.

- **Release Guard Timer (Milliseconds):** This timer signifies the time for which inbound register waits before declaring the channel idle (sending idle signal) when clear forward line signal is received from the outbound end. This timer is applicable for Forced Release signal. This timer is applicable only when acting as inbound end. This timer depends on the speed of switching and processing.

The range of Release Guard Timer is from 0000 ms to 9999 ms. Default: 200ms.

E&M Signaling

Under **T1E1 Configuration**, click **E&M Signaling** and configure the E&M parameters.

- **E&M Feature Template:** Assign an E&M Feature Template to the T1E1 Port. The E&M Feature Template is a set of features specific to E&M signaling, which define the behavior of the E&M ports, according to their 'Orientation Type', whether they are functioning as Stations, Trunks or Tie-Lines. By default, Template 01 is assigned to all T1E1 Ports.

For more details, see [“E&M Feature Template”](#).

- **B Bit Pattern:** Select the Bit Pattern from Same as Bit A or Fixed Value. By default, the Code is 1 (Same as A bit).
- **B Bit Value:** Configure the B bit value, the value can be 0 or 1. By default, B bit value is 0.
- **CD Bit Value:** Configure the CD bit value, the valid range of the value is 1 to 3. By default, B bit value is 0.
- **Invert Bit:** This parameter signifies whether A-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit A.

Default: Disabled (Do Not Invert Bit A).

- **Invert Bit B:** This parameter signifies whether B-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit B.

Default: Disabled (Do Not Invert Bit B1)

- **Invert Bit C:** This parameter signifies whether C-bit is to be inverted before transmitting and on receiving. Select the check box to Invert Bit C.

Default: Disabled (Do Not Invert Bit C).

- **Invert Bit D:** This parameter signifies whether D-bit is to be inverted before transmitting and on receiving. Select the check box to enable, that is to Invert Bit D.

Default: Disabled (Do Not Invert Bit D).

Configuring T1E1 Port Parameters using Jeeves

The commands explained below should be referred as:
• To program a single port: XXXX-1
• To program a range of ports: XXXX-2
• To program all the ports: XXXX-*

Port Parameters

T1E1-1

Hardware Slot-Port

Use following command to assign hardware ID to a T1E1 software port.

1107-T1E1-Slot-Port offset

Where,

T1E1 is from 01 to 08.

Slot is the number of the universal slot, where the T1E1 Card is installed, from 01 to 16.

Port is the number of the T1E1 port on the card, from 01 to 32.

Use following command to de-assign the hardware slot and the hardware port assigned to the T1E1 software port.

1106-T1E1-00-00

Port Status

Used to enable/disable the port. When the Port is disabled, it will not be allotted to the user on grabbing the port. Instead the user will get error tone.

Use the following command to enable/disable the port:

6101-1-T1E1-Port Status

6101-2-T1E1-T1E1-Port Status

6101-*-Port Status

Where,

T1E1 is from 01 to 08.

Port Status	Meaning
0	Disable
1	Enable

By default, the T1E1 Port is enabled.

Name

Use the following command to assign a name to the port:

5407-1-T1E1-Name

5407-2-T1E1-T1E1-Name

5407-*-Name

Where,

T1E1 is from 01 to 08.

Name can be of upto 18 characters.

Carrier

Use the following command to select the carrier:

6108-1-T1E1-Carrier Type

6108-2-T1E1-T1E1-Carrier Type

6108-*-Carrier Type

Where,

T1E1 is from 01 to 08.

Carrier Type	Meaning
1	E1
2	T1

Line type

Use following command to program signaling type/ Line type of a T1E1:

6105-1-T1E1-Line Type

6105-2-T1E1-T1E1-Line Type

6105-*-Line Type

Where,

T1E1 is from 01 to 08.

Line Type	Meaning
1	PRI
2	QSIG
3	CAS
4	E&M

By default, signaling type of a T1E1 is 1.

DDI Routing is not supported on T1/E1 trunk line if you have selected **E&M** as the **Signal Type**.

Orientation Type

Use following command to program 'Orientation Type' for the T1E1 port:

6106-1-T1E1-Orientation Type

6106-2-T1E1-T1E1-Orientation Type

6106-*-Orientation Type

Where,

T1E1=01 to 08.

Orientation	Meaning
1	Terminal
2	Network
3	Tie Line

By default Type = 1.

When Orientation = Terminal, the port will be regarded as trunk. All the trunk related parameters will be applicable.

When Orientation = Network, the port will be regarded as station. All the station related parameters will be applicable.

When Orientation = Tie-line, the port will be regarded as station for all IC calls to it and as trunk for all OG calls to be made through it.

Line Coding Mechanism

Use following command to program the Line Coding Mechanism for the T1E1 port:

6103-1-T1E1-Line Coding

6103-2-T1E1-T1E1-Line Coding

6103-*-Line Coding

Where,

T1E1 is from 01 to 08.

Line Coding	Meaning
1	AMI-Basic
2	HDB3
3	NZR (Fiber Optic)

By default, Line Coding is HDB3.

Framing Mode

Use following command to program the Framing Mode for the T1E1 port:

6104-1-T1E1-Framing

6104-2-T1E1-T1E1-Framing

6104-*-Framing

Where,

Framing	Meaning
1	CEPT1 MF (No CRC)
2	CEPT1 MF (Forced CRC)
3	CEPT1 MF (Auto CRC)

By default, Framing is CEPT1 MF (Auto CRC).

DDI Routing

OG Reference ID

Use the following command to assign OG Reference ID to T1E1 port:

6131-1-T1E1-OG Reference ID

6131-2-T1E1-T1E1-OG Reference ID

6131-*-OG Reference ID

Where,

T1E1 is from 01 to 08.

OG Reference ID is from 00 to 99.

By default, OG Reference ID is 00.

IC Reference ID for Working Hour

Use the following command to assign IC Reference ID for Working Hour:

6132-1-T1E1-IC Reference ID

6132-2-T1E1-T1E1-IC Reference ID

6132-*-IC Reference ID

Where,

T1E1 is from 01 to 08.

IC Reference ID is from 00 to 99.

By default, IC Reference ID is 00.

IC Reference ID for Break Hour

Use the following command to assign IC Reference ID for Break Hour:

6133-1-T1E1-IC Reference ID

6133-2-T1E1-T1E1-IC Reference ID

6133-*-IC Reference ID

Where,

T1E1 is from 01 to 08.

IC Reference ID is from 00 to 99.

By default, IC Route Reference ID is 00.

IC Route Reference ID for Non-working Hour

Use the following command to assign IC Route Reference ID for Non-working Hour:

6134-1-T1E1-IC Reference ID

6134-2-T1E1-T1E1-IC Reference ID

6134-*-IC Reference ID

Where,

T1E1 is from 01 to 08.

IC Reference ID is from 00 to 99.

By default, IC Route ID is 00.

Templates

Trunk Feature Template

Use the following command to assign a Trunk Feature Template to the T1E1 Trunks, dial:

5806-1-T1E1- Trunk Feature Template Number to assign a template to a single T1E1 port.

5806-2-T1E1- Trunk Feature Template Number to assign the same template to a range of T1E1 ports.

5806-*- Trunk Feature Template Number to assign the same template to all T1E1 ports.

Where,

T1E1 is the Software Port number of the port from 01 to 08.

Template Number is the number of the customized Trunk Feature Template, from 01 to 50. Default: Trunk Feature Template 01.

Station Basic Feature Template

To assign a Station Basic Feature Template to a T1E1PRI port, dial:

5506-1-T1E1PRI-Template Number to assign a template to a single T1E1 port.

5506-2-T1E1PRI-T1E1PRI-Template Number to assign the same template to a range of T1E1 ports.

5506-*-Template Number to assign the same template to all T1E1 ports.

Where,

T1E1PRI is the number of the T1E1PRI Software port, from 01 to 08.

Template Number is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all T1E1 ports.

Station Advance Features Template

To assign a Station Advanced Feature Template to a T1E1PRI port

5606-1-T1E1PRI-Template Number to assign a template to a single T1E1 port.

5606-2-T1E1PRI-T1E1PRI-Template Number to assign the same template to a range of T1E1 ports.

5606-*-Template Number to assign the same template to all T1E1 ports.

Where,

T1E1PRI is the number of the T1E1PRI Software port, from 01 to 08.

Template Number is the number of the Station Advanced Feature Template, from 01 to 50.

Default: Template 01 is assigned to all T1E1 ports.

Others

Priority

To assign priority to T1E1

3914-1-T1E1-Priority to assign a template to a single T1E1 port.

3914-2-T1E1PRI-T1E1PRI-Priority to assign the same priority to a range of T1E1 ports.

3914-*-Template Number to assign the same Priority to all T1E1 ports.

Where,

T1E1PRI is the number of the T1E1PRI Software port, from 01 to 08.

Priority is from 1 to 9. Default: 5-Normal.

Cost Factor

Assign a Cost Factor to the T1E1 port. This is useful in LCR.

Use following command to assign a name to the T1E1 port:

6102-1-T1E1-SP

6102-2-T1E1-T1E1-SP

6102-*-SP

Where,

T1E1 is from 01 to 08.

SP is from 01 to 99.

By default, Service Provider is 01.

Glare Option

Use following command to program Glare Option for the T1E1 port:

6112-1-T1E1-Glare Option

6112-2-T1E1-T1E1-Glare Option

6112-*-Glare Option

Where,

T1E1 is from 01 to 08.

Glare Option	Meaning
1	Proceed
2	Held Back

By default, Glare Option is 2.

Set Glare=Proceed, if SARVAM UCS is to be given priority in event of Glare.

Set Glare=Held Back, if the other end of the link is to be given priority in event of Glare.

The Glare settings should be complimentary on either side of the link.

Category (Logical Partitioning)

Use following command to set the Category (Logical Partitioning) for the T1E1 port:

6121-1-T1E1-Category

6121-2-T1E1-T1E1-Category

6121-*-Category

Where,

T1E1 is from 01 to 08.

Category is from 1 to 4.

By default, Category is set as 1.

Idle Code

Use the following command to program the Idle Code of a T1E1:

6113-1-T1E1-Idle Code

6113-2-T1E1-T1E1-Idle Code

6113-*-Idle Code

Where,

T1E1 is from 01 to 08.

Idle Code is from 000 to 255 (corresponding to 8 bits).

By default, the idle code is 127 (7F).

Use message mode of the Digital Switch IC to send the idle channel code.

RCOC

To enable RCOC on T1E1 Trunk, dial:

6145-1-T1E1-Code to enable the feature on a single trunk.

6145-2-T1E1-T1E1-Code to enable the feature on a range of trunks.

6145-*-Code to enable the feature on all trunks.

Where,

T1E1 is the software port number of the trunk from 01 to 08.

Code is

0 for Disable

1 for Enable

Default: Disable

Channels

Return Call to Original Caller (RCOC)

Use the following command to enable RCOC on T1E1 Trunk:

6145-1-T1E1-Code to enable the feature on a single trunk.

6145-2-T1E1-T1E1-Code to enable the feature on a range of trunks.

6145-*-Code to enable the feature on all trunks.

Where,

T1E1 is the software port number of the trunk from 01 to 08.

Code is

0 for Disable

1 for Enable

Default: Disable

Channel Reserved for Data Call

Use the following command to reserve channels for data transmission on T1E1:

6135-1-T1E1-Channel Count (Data)

6135-2-T1E1-T1E1-Channel Count (Data)

6135-*-Channel Count (Data)

Where,

T1E1 is from 01 to 08.

Channel Count (Data) is from 00 to 30.

By default, Channel Count for data transmission is 00.

Channel Reserved for Outgoing Call

Use the following command to program number of channels reserved for OG channel count:

6136-1-T1E1-Channel Count (OG)

6136-2-T1E1-T1E1-Channel Count (OG)

6136-*-Channel Count (OG)

Where,

T1E1 is from 01 to 08.

Channel Count (OG) is from 00 to 30. "It specifies the number of channels to be reserved for making an OG calls.

For example, If OG channel count is programmed as 15, simultaneous 15 (maximum) OG calls can be made from the T1E1 port".

By default, OG Channel Count is 30.

Channel Reserved for Incoming Call

Use the following command to program number of channels reserved for IC channel count:

6137-1-T1E1-Channel Count (IC)

6137-2-T1E1-T1E1-Channel Count (IC)

6137-*-Channel Count (IC)

Where,

T1E1 is from 01 to 08.

Channel Count (IC) is from 00 to 30. "It specifies the number of channels to be reserved for making an IC calls. For example, If IC channel count is programmed as 10, simultaneous 10 (max.) IC calls can be received on the T1E1 port".

By default, Channel Count (IC) is 30.

Tone

Feed Dial Tone

Use following command to program the dial tone flag for T1E1 port:

6115-1-T1E1-Flag

6115-2-T1E1-T1E1-Flag

6115-*-Flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable
1	Enable

By default, Dial Tone Flag is '0' for all the T1E1 ports.

Feed Routing Tone

Use following command to program the routing tone flag for T1E1 port:

6116-1-T1E1-Flag

6116-2-T1E1-T1E1-Flag

6116-*-Flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable
1	Enable

By default, Routing Tone Flag is '0' for all the T1E1 ports.

Custom Pulse

T1/E1 Custom Pulse Width (CPW)

Use following command to enable/disable Custom Pulse Width (CPW) Flag for the T1E1 port for T1 signaling:

6171-1-T1E1-Flag

6171-2-T1E1-T1E1-Flag

6171-*-Flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable
1	Enable

By default, Custom Pulse Width Flag is '0'.

T1/E1Custom Pulse Width Word 1

This command is used for Pulse shaping in first phase.

Use following command to program Custom Pulse Width Word 1 for the T1E1 port for T1 signaling:

6172-1-T1E1-Custom Pulse Width Word 1

6172-2-T1E1-T1E1-Custom Pulse Width Word 1

6172-*-Custom Pulse Width Word 1

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 1 is from 000 to 127 volt.

By default, Custom Pulse Width Word 1 is 63 volt.

T1/E1Custom Pulse Width Word 2

This command is used for Pulse shaping in second phase.

Use following command to program Custom Pulse Width Word 2 for the T1E1 port for T1 signaling:

6173-1-T1E1-Custom Pulse Width Word 2

6173-2-T1E1-T1E1-Custom Pulse Width Word 2

6173-*-Custom Pulse Width Word 2

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 2 is from 000 to 127 volt.

By default, Custom Pulse Width Word 2 is 58 volt.

T1/E1Custom Pulse Width Word 3

This command is used for Pulse shaping in third phase.

Use following command to program Custom Pulse Width Word 3 for the T1E1 port for T1 signaling:

6174-1-T1E1-Custom Pulse Width Word 3

6174-2-T1E1-T1E1-Custom Pulse Width Word 3

6174-*-Custom Pulse Width Word 3

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 3 is from 000 to 127 volt.

By default, Custom Pulse Width Word 3 is 76 volt.

T1/E1Custom Pulse Width Word 4

This command is used for Pulse shaping in fourth phase.

Use following command to program Custom Pulse Width Word 4 for the T1E1 port for T1 signaling:

6175-1-T1E1-Custom Pulse Width Word 4

6175-2-T1E1-T1E1-Custom Pulse Width Word 4

6175-*-Custom Pulse Width Word 4

Where,

T1E1 is from 01 to 08.

Custom Pulse Width Word 4 is from 000 to 127 volt.

By default, Custom Pulse Width Word 4 is 00 volt.

Timer

Pause Timer

Use following command to program Pause Timer:

6109-1-T1E1- Pause Timer

6109-2-T1E1-T1E1-Pause Timer

6109-*-Pause Timer

Where,

T1E1 is from 01 to 08

Pause Timer is from 1 to 9 seconds

By default, Pause Timer is 3 seconds.

DTMF ON Time

Use following command to program DTMF ON Time:

6117-1-T1E1-DTMF ON Time

6117-2-T1E1-T1E1-DTMF ON Time

6117-*-DTMF ON Time

Where,

T1E1 is from 01 to 08.

DTMF ON Time is from 051 to 255 msec.

By default, DTMF ON Time is 102 msec.

DTMF Inter Digit Pause Timer

Use following command to program DTMF Inter digit Pause Timer:

6118-1-T1E1-DTMF Inter digit Pause Time

6118-2-T1E1-T1E1-DTMF Inter digit Pause Time

6118-*-DTMF Inter digit Pause Time

Where,

T1E1 is from 01 to 08

DTMF Inter digit Pause Time is from 051 to 255 msec.

By default, DTMF Inter digit Pause Time is 102 msec.

Gateway

Use Gateway Application - Answer Signaling?

Use following command to set flag for 'Gateway Application-Answer Signaling' on T1E1 trunk:

6119-1-T1E1-Gateway Application-Answer Signaling flag

6119-2-T1E1-T1E1-Gateway Application-Answer Signaling flag

6119-*- Gateway Application-Answer Signaling flag

Where,

T1E1 is from 01 to 08.

Flag	Meaning
0	Disable

Flag	Meaning
1	Enable

By default, Gateway Application-Answer Signaling flag is 'disable'.

Gateway Application - Answer Signaling DTMF Digits

Use following command to program DTMF digits string to be dialed as Gateway Application-Answer Signaling:

6120-1-T1E1-Gateway Application-Answer Signaling DTMF String

6120-2-T1E1-T1E1-Gateway Application-Answer Signaling DTMF String

6120-1-T1E1-Gateway Application-Answer Signaling DTMF String

Where,

T1E1 is from 01 to 08.

DTMF Digits allowed for DTMF string are from (0 - 9), *, #, A, B, C, D.

Maximum 4 DTMF digits can be programmed. If you need less than 4 digits for DTMF string, terminate the command using #*.

To program #, *, A, B, C, D use following codes:

Digit	Code for programming through command
A	#4
B	#5
C	#6
D	#7
*	**
#	##

By default Gateway Application-Answer Signaling DTMF String is 'CCC'.

Call Budget

Call Budget Type

To program Call Budget Type on T1E1 Port, dial:

6122-1-T1E1-Budget Type to program call budget type for a single trunk port.

6122-2-T1E1-T1E1-Budget Type to program the same call budget type for a range of trunk ports.

6122-*-Budget Type to program the same call budget type for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Budget Type is

0 for None

1 for Amount

2 for Minutes

3 for Number of Calls

By default, Budget Type is None.

Call Budget Amount

To program Call Budget Amount on T1E1 Port, dial:

6123-1-T1E1-Budget Amount to program call budget amount for a single trunk port.

6123-2-T1E1-T1E1-Budget Amount to program the same amount for a range of trunk ports.

6123-*-Budget Amount to program the same amount for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Budget Amount is of 6 digits max. Use leading zeros if amount to be programmed has fewer than 6 digits.

By default Budget Amount is 999999.

Call Budget Minutes

To program Call Budget Minutes on T1E1 Port:

6124-1-T1E1-Minutes to program minutes for a single trunk port.

6124-2-T1E1-T1E1-Minutes to program the same minutes for a range of trunk ports.

6124-*-Minutes to program the same minutes for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Minutes is of 6 digits max. Use leading zeros if Minutes to be programmed has less than 6 digits.

By default, Minutes is 999999.

Call Budget Number of Calls

To program Call Budget Number of Calls on T1E1 Port, dial:

6125-1-T1E1-Number of calls to program number of calls for a single trunk port.

6125-2-T1E1-T1E1-Number of calls to program the same number of calls for a range of trunk ports.

6125-*-Number of calls to program the same number of calls for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Number of Calls is of 4 digits from 0001 to 9999. Use leading zeros if number of calls to be programmed has fewer than 4 digits.

By default, Number of calls is 9999.

Call Budget Reset Mode

To program Call Budget Reset Mode for T1E1, dial:

6138-1-T1E1-Call Budget Reset Mode to program reset mode for a single trunk port.

6138-2-T1E1-T1E1-Call Budget Reset Mode to program the same reset mode for a range of trunk ports.

6138-*-Call Budget Reset Mode to program the same reset mode for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

1 for Scheduled reset

2 for Manual reset

By default, Call Budget Reset Mode is Scheduled.

Call Budget Date for Scheduled Reset mode

To program the Date for Scheduled Reset mode for T1E1, dial:

6139-1-T1E1-Date to program date for a single trunk port.

6139-2-T1E1-T1E1-Date to program the date for a range of trunk ports.

6139-*-Date to program the date for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Date is

01 to 31 for Scheduled date to reset every month.

00 for Scheduled reset Daily.

By default, Reset date is 1st. of every month.

Call Back

Use the following commands to program Call Back on T1E1 Trunk ports. To know more about this feature, refer the topic Call Back on Trunk Ports.

To enable/disable Call Back on T1E1 port:

6176-1-T1E1- Call Back Flag

6176-2-T1E1-T1E1-Call Back Flag

6176- *-Call Back Flag

Where,

T1E1 is from 01 to 08

Call Back Flag	Meaning
0	Disable
1	Enable

By default, Call Back flag is disabled.

Call Back Timer

To program Call Back Timer for T1E1 port:

6177-1-T1E1-Call Back Timer

6177-2-T1E1-T1E1-Call Back Timer

6177- *-Call Back Timer

Where,

T1E1 is from 01 to 08

Pause Timer Range is from 01 to 99 Sec.

By default, Pause Timer is 10 Seconds

Call Back Mode

To program Call Back Mode on T1E1 port:

6178-1-T1E1-Call Back Mode

6178-2-T1E1-T1E1-Call Back Mode

6178- *-Call Back Mode

Where,

T1E1 is from 01 to 08

Call Back Mode is 1 to 5.

Call Back Mode	Meaning
1	Built-in Auto Attendant
2	PIN Auth. - Multiple Calls
3	CLI Auth. - Multiple Calls
4	CLI Auth. - Single Call - Ans. Sig.
5	Operator

By default, Call Back mode is Operator

Call Back On

To program Call Back On method for T1E1 port:

6179-1-T1E1-Call Back on selection
6179-2-T1E1-T1E1-Call Back on selection
6179-*-Call Back on selection

Where,
T1E1 is from 01 to 08
Call back on selection is

Call Back on	Meaning
1	CLI Number
2	Alternate Number

By default, Call Back on selection is CLI Number.

Incoming Number List

To assign Call Back - Incoming Number List to a T1E1 port:

6180-1-T1E1-Incoming Number List
6180-2-T1E1-T1E1-Incoming Number List
6180-*-Incoming Number List

Where,
T1E1 is from 01 to 08
Incoming Number List is from 01 to 16.
By default, Incoming Number List is 15

Outgoing Number List

To assign a Call Back - Outgoing Number List to a T1E1 port:

6147-1-T1E1-Outgoing Number List
6147-2-T1E1-T1E1-Outgoing Number List
6147-*-Outgoing Number List

Where,
T1E1 is from 01 to 08
Outgoing Number List is from 01 to 16.
By default, Outgoing Number List is 16.

Call Back From

To define Call Back From for a T1E1 port:

6148-1-T1E1-Call Back From
6148-2-T1E1-T1E1-Call Back From
6148-*-Call Back From

Where,
T1E1 is from 01 to 08
Call Back From is
1 for Same Port
2 for OGTB Group
By default, Same Port is selected as Call Back From.

OGTB Group

To assign a Call Back - OGTB Group for a T1E1 port:

6149-1-T1E1-OGTB Group
6149-2-T1E1-T1E1-OGTB Group

6149-*-OGTB Group

Where,

T1E1 is from 01 to 08

OGTB Group is from 01 to 32

By default, OGTBG is 01.

FDL

FDL Flag - copied from T1 Maintenance

T1 FDL can be enabled/disabled. This parameter is applicable only if Framing = ESF. If the Network (Public or Private) to which the SARVAM UCS is connected does not support FDL then T1 FDL will be disabled.

Use following command to enable/disable T1 FDL on a T1E1PRI port:

6164-1-T1E1PRI-T1 FDL

6164-2-T1E1PRI-T1E1PRI-T1 FDL

6164-*-T1 FDL

Where,

T1E1PRI is from 01 to 08.

T1 FDL	Meaning
0	Disable
1	Enable

By default, the T1 FDL is disabled.

FDL Protocol

SARVAM UCS will support both the protocols of reporting the performance monitoring. This parameter is applicable only if T1 FDL is enabled and Framing = ESF. This parameter will match the protocol expected by the other end of the link.

Use following command to program the T1 FDL Protocol for a T1E1PRI port:

6165-1-T1E1PRI-T1 FDL Protocol

6165-2-T1E1PRI-T1E1PRI-T1 FDL Protocol

6165-*-T1 FDL Protocol

Where,

T1E1PRI is from 01 to 08.

T1 FDL Protocol	Meaning
0	Disable
1	AT&T 54016
2	ANSI T1.403

By default, the T1 FDL Protocol is ANSI T1.403.

Refer ["E1/T1 Maintenance"](#).

Debug

SARVAM UCS supports debug of parameters (debug codes) depending on the Level of debug. On issuing this command the T1E1 Card will send the debug details to the COM port of the T1E1 port.

Debug Level	Command
Debug Level-1	6191-1-T1E1-1-XXX
Debug Level-2	6191-1-T1E1-2-XXX
Debug Level-3	6192-1-T1E1-1-XXX
Debug Level-4	6192-1-T1E1-2-XXX

Use following command to start/stop debug the parameters for the T1E1 port:

6191-1-T1E1-Level-Debug Code

6191-2-T1E1-T1E1-Level-Debug Code

6191-*-Level-Debug Code

Where,

T1E1 Port is from 01 to 08.

Level is from 1 to 4 (As shown below).

Code is the value for the specified level to turn ON the debug for the parameters. Code range is from 000 to 255.

Code value '000' for each level will turn off that level's debug.

Level 1:

Unused	Unused	Unused	Unused	Layer 4	CAS DSP	MFC R2	CAS
--------	--------	--------	--------	---------	---------	--------	-----

001	CAS
002	MFC R2
004	CAS DSP
008	Layer 4
000	Debug Off

Level 2:

Unused	Unused	Unused	HDLC (D-Channel)	FDL	ABCD Bits	Counters	Alarms
--------	--------	--------	------------------	-----	-----------	----------	--------

001	Alarms
002	Counters
004	ABCD Bits
008	FDL
016	HDLC (D Channel)
000	Debug Off

Level 3:

Unused	Flow Debug	NLS Debug	LAP Debug	SVC Primitives	Variables	State	Primitives
--------	------------	-----------	-----------	----------------	-----------	-------	------------

001	Primitives
002	State
004	Variables
008	SVC Primitives
016	LAP Debug
032	NLS Debug
064	Flow Debug
000	Debug Off

Level 4:

Unused	Unused	Unused	Unused	Unused	Unused	NI Debug	OS Task
--------	--------	--------	--------	--------	--------	----------	---------

001	OS Task
002	NI Debug
000	Debug Off

Default: Debug Code = 'Debug OFF' for all T1E1 ports for all levels.

Refer "[T1 RBS Parameters](#)"

T1E1:1 - PRI/QSIG Signaling**ISDN Switch Variant**

This field selects the variant for ISDN PRI when ISDN PRI is selected as signaling mode. This must match with the other end of the link.

Use following command to program the ISDN PRI Switch Variant:

6107-1-T1E1-ISDN Switch Variant

6107-2-T1E1-T1E1-ISDN Switch Variant

6107-*-ISDN Switch Variant

Where,

T1E1 is from 01 to 08.

ISDN PRI Variant	Meaning
1	ATT 4ESS
2	ATT 5ESS
3	Australia
4	DMS

ISDN PRI Variant	Meaning
5	ETSI NET5
6	NTT INS64
7	SWV Hongkong
8	US NI12
9	QSIG E1
10	QSIG T1

By default, ISDN PRI Switch Variant of a T1E1 is ETSI NET5.

Send Called Party Number Using

Use the following command to program overlap receiving timer:

6146-1-T1E1-Type

6146-2-T1E1-T1E1-Type

6146-*-Type

Where,

T1E1 is from 01 to 08.

Type is

1 for Keypad Facility IE

0 for Called Party IE

Default: Called Party Number IE

Overlap Receiving Timer

Use the following command to program overlap receiving timer:

6114-1-T1E1-Timer

6114-2-T1E1-T1E1-Timer

6114-*-Timer

Where,

T1E1 is from 01 to 08.

Timer is from 00 to 99.

By default, Overlap Receiving Timer is 15 seconds.

Caller-Type of Number (TON)

Use following command to program the Caller-Type of Number (TON) for a T1E1:

6126-1-T1E1-Source TON

6126-2-T1E1-T1E1-Source TON

6126-*-Source TON

Where,

T1E1 is from 01 to 08.

Source TON	Meaning
1	Unknown: This is used when the user or network has no a prior information about the numbering plan. In this case, the Address Value field is organized according to the network dialing plan. For example, prefix or escape digits might be present.
2	International Number.
3	National Number: Prefix or escape digits shall not be included.

Source TON	Meaning
4	Network Specific Number: This is used to indicate administration/Service number specific to the serving network. For example, used to access an operator.
5	Subscriber Number: This is used when a specific short number representation is stored in one or more SCs as part of a higher layer application.
6	Abbreviated Number.
7	Reserved Number.

By default, Caller-Type of Number (TON) of T1E1 is 1.

Caller-Numbering Plan Identification (NPI)

Use following command to program Caller-Numbering Plan Identification (NPI) for T1E1:

6127-1-T1E1-Source NPI

6127-2-T1E1-T1E1-Source NPI

6127-*-Source NPI

Where,

T1E1 is from 01 to 08.

Source NPI	Meaning
1	Unknown
2	ISDN Numbering Plan
3	Data Numbering Plan
4	Telex Numbering
5	National Numbering Plan
6	Private Numbering Plan
7	Reserved for Extension

By default, Caller-Numbering Plan Identification (NPI) for T1E1 is 2.

Called-Type of Number (TON)

Use following command to program Called-Type of Number (TON) for a T1E1:

6128-1-T1E1-Destination TON

6128-2-T1E1-T1E1-Destination TON

6128-*-Destination TON

Where,

T1E1 is from 01 to 08.

Destination TON	Meaning
1	Unknown: This is used when the user or network has no a prior information about the numbering plan. In this case, the Address Value field is organized according to the network dialing plan. For example, prefix or escape digits might be present.
2	International Number.
3	National Number: Prefix or escape digits shall not be included.

Destination TON	Meaning
4	Network Specific Number: This is used to indicate administration/Service number specific to the serving network. For example, used to access an operator.
5	Subscriber Number: This is used when a specific short number representation is stored in one or more SCs as part of a higher layer application.
6	Abbreviated Number.
7	Reserved Number.

By default, Called-Type of Number (TON) of T1E1 is 1.

Called-Numbering Plan Identification (NPI)

Use following command to program Called-Numbering Plan Identification (NPI) for T1E1:

6129-1-T1E1-Destination NPI

6129-2-T1E1-T1E1-Destination NPI

6129-*-Destination NPI

Where,

T1E1 is from 01 to 08.

Destination NPI	Meaning
1	Unknown
2	ISDN Numbering Plan
3	Data Numbering Plan
4	Telex Numbering
5	National Numbering Plan
6	Private Numbering Plan
7	Reserved for Extension

By default, Called-Numbering Plan Identification (NPI) for T1E1 is 2.

Receive Equalization Mode

Use the following command to program auto receive equalization mode:

6110-1-T1E1-Mode

6110-2-T1E1-T1E1-Mode

6110-*-Mode

Where,

T1E1 is from 01 to 08.

Mode	Meaning
0	Manual
1	Auto

By default, Receive Equalization Mode is 1.

Receive Equalization Parameters

This field increases the strength of incoming signals by a fixed amount to compensate for line losses.

Use the following command to program the receive equalization parameters of a T1E1:

6111-1-T1E1-Receive Equalization Parameters

6111-2-T1E1-T1E1-Receive Equalization Parameters

6111-*-Receive Equalization Parameters

Where,

T1E1 is from 01 to 08.

Receive Equalization Parameters	Meaning
1	None
2	8 dB
3	16 dB
4	24 dB
5	32 dB
6	40 dB
7	48 dB

By default, the receive equalization parameters of T1E1 is 1.

Feed Inband Tones on T1E1-NT, before sending DISCONNECT

Use following command to program to select whether the inband tones should be feed on T1E1-NT before sending DISCONNECT message?

6130-1-T1E1-Flag

6130-2-T1E1-T1E1-Flag

6130-*-Flag

Where,

Flag	Meaning
0	No
1	Yes

Default = NO.

E1 CAS Signaling

T1E1-1

E1 Line Signaling Variant

The following command is applicable when the Bit Rate=E1.

Use following command to program E1 Line Signaling Variant for the T1E1 port:

6152-1-T1E1-E1 Line Signaling Variant

6152-2-T1E1-T1E1-E1 Line Signaling Variant

6152-*-E1 Line Signaling Variant

Where,
T1E1 is from 01 to 08.

E1 Line Signaling Variant	Meaning
01	ITU T Q.400-Q.490

By default, E1 Line Signaling Variant is 01.

E1 Register Signaling Variant

Use following command to program E1 Register Signaling Variant for the T1E1 port:

6153-1-T1E1-E1 Register Signaling Variant

6153-2-T1E1-T1E1-E1 Register Signaling Variant

6153-*-E1 Register Signaling Variant

Where,

T1E1 is from 01 to 08.

E1 Register Signaling Variant	Meaning
1	DTMF
2	MFC R2

By default, E1 Register Signaling Variants is 2.

- **DTMF:** DNIS/ANI is transmitted in the corresponding speech channel using the DTMF signals as per ITU-T Q.23.
- **MFC R2:** DNIS/ANI is transmitted in the corresponding speech channel using the MFC R2 signals as per ITU-T Q.400-Q490.

Register Signaling Parameters

Forward tone Maximum ON timer (T1)

This timer signifies the maximum time for which the forward signal can be ON, from the outbound end.

Use the following command to program Forward Tone Maximum ON Timer:

7101-1-T1E1-Forward Tone Maximum ON Timer

7101-2-T1E1-T1E1-Forward Tone Maximum ON Timer

7101-*-Forward Tone Maximum ON Timer

Where,

T1E1 is from 01 to 08.

Forward Tone Maximum ON Timer is from 01 to 99 seconds.

By default, Forward Tone Maximum ON Timer is 15 secs.

Forward Tone Maximum OFF Timer (T2)

Use the following command to program Forward Tone Maximum Off Timer:

7102-1-T1E1-Forward Tone Maximum OFF Timer

7102-2-T1E1-T1E1-Forward Tone Maximum OFF Timer

7102-*-Forward Tone Maximum OFF Timer

Where,

T1E1 is from 01 to 08.

Forward Tone Maximum OFF Timer is from 01 to 99 seconds.

By default, Forward Tone Maximum Off Timer is 24 seconds. This timer will be less than the Incoming R2 register timeout timer programmed by the inbound end.

Maximum Compelled Cycle Time (T3)

Use the following command to program the Maximum compelled cycle time:

7103-1-T1E1-Maximum Compelled Cycle Time

7103-2-T1E1-T1E1-Maximum Compelled Cycle Time

7103-*-Maximum Compelled Cycle Time

Where,

T1E1 is from 01 to 08.

Total Call Set Up Timer is from 01 to 99 seconds.

By default, Maximum Compelled Cycle Time is 15 secs.

Pulse Duration for Pulse Signal

Use the following command to program Pulse duration for pulsed signals:

7104-1-T1E1-Pulse Duration for Pulse Signal

7104-2-T1E1-T1E1-Pulse Duration for Pulse Signal

7104-*-Pulse Duration for Pulse Signal

Where,

T1E1 is from 01 to 08.

Tolerance is fixed at +/-25ms.

By default, the Pulse Duration for Pulsed Signals is 150ms.

Pulse Signal Maximum Wait Timer

Use the following command to program the Pulsed Signal Maximum Wait Timer:

7105-1-T1E1-Pulse Signal Maximum Wait Timer

7105-2-T1E1-T1E1-Pulse Signal Maximum Wait Timer

7105-*-Pulse Signal Maximum Wait Timer

Where,

T1E1 is from 01 to 08.

Pulsed Signal Maximum Wait Timer is from 01 to 99 seconds.

By default, Pulsed Signal Maximum Wait Timer is 15 secs.

First Forward Tone Wait Timer

Use the following command to program first forward tone wait timer:

7106-1-T1E1-First Forward Tone Wait Timer

7106-2-T1E1-T1E1-First Forward Tone Wait Timer

7106-*-First Forward Tone Wait Timer

Where,

T1E1 is from 01 to 08.

First forward tone wait timer is from 08 to 24 seconds.

By default, the First Forward Tone Wait Timer is 15 seconds.

Minimum MF Signal Persist Timer

Use following command to program Minimum MF Signal Persist timer:

7107-1-T1E1-Minimum MF Signal Persist Timer

7107-2-T1E1-T1E1-Minimum MF Signal Persist Timer

7107-*-Minimum MF Signal Persist Timer

Where,

T1E1 is from 01 to 08.

Minimum MF Signal Persist timer is from 001 to 255 ms.

By default, Minimum MF Signal Persist timer is 20 ms.

Outbound Parameters

Dialed Number Identification Signal (DNIS) END Type

Use following command to program to set DNIS END Type (outbound) for T1E1 port:

7108-1-T1E1-End of DNIS

7108-2-T1E1-T1E1-End of DNIS

7108-*-End of DNIS

Where,

T1E1 is from 01 to 08.

End of DNIS is from 00, 11 to 15.

00 indicates End of DNIS as time out.

01 to 15 indicates group 1 tone to declare End of DNIS.

By default, DNIS End Type (Outbound) is 15.

Address Number Information (ANI) Send Position

Use following command to program the ANI Send Position:

7110-1-T1E1-ANI Send Position

7110-2-T1E1-T1E1-ANI Send Position

7110-*-ANI Send Position

Where,

T1E1 is from 01 to 08.

ANI Send Position is from 00 to 99.

By default, ANI Send Position is 00.

Is Address Number Information (ANI) Available

Use following command to program Is ANI Available (Outbound):

7111-1-T1E1-Is ANI Available (Outbound)

7111-2-T1E1-T1E1-Is ANI Available (Outbound)

7111-*-Is ANI Available (Outbound)

Where,

T1E1 is from 01 to 08.

Is ANI Available (Outbound) is Group A tone from 00 to 15. If no question by the inbound end, set this parameter to 00.

By default, Is ANI Available is '05'.

Positive Response to Is ANI Available

Use the following command to program the Positive Response to Is ANI Available (Outbound):

7112-1-T1E1-Positive Response to Is ANI Available

7112-2-T1E1-T1E1-Positive Response to Is ANI Available

7112-*-Positive Response to Is ANI Available

Where,

T1E1 is from 01 to 08.

Positive Response to Is ANI Available is a Group 1 tone from 01 to 15.

By default, Positive Response to Is ANI Available is 01.

Negative Response to Is ANI Available

Use following command to program the Negative Response to Is ANI Available (Outbound):

7113-1-T1E1-Negative Response to Is ANI Available

7113-2-T1E1-T1E1-Negative Response to Is ANI Available

7113-Negative Response to Is ANI Available***

Where,

T1E1 is from 01 to 08.

Negative Response to Is ANI Available is a Group 1 tone from 01 to 15.

By default, Negative Response to Is ANI Available is 10.

ANI End Tone Presentation Allowed

Use the following command to program the End of ANI with Presentation Allowed (Outbound):

7114-1-T1E1-ANI End Tone with Presentation Allowed (Outbound)

7114-2-T1E1-T1E1-ANI End Tone with Presentation Allowed (Outbound)

7114--ANI End Tone with Presentation Allowed (Outbound)***

Where,

T1E1 is from 01 to 08.

ANI End Tone with Presentation Allowed (Outbound) is a Group 1 tone from 00, 11 to 15. If no such tone is sent, set this parameter to 00.

By default, ANI End Tone with Presentation Allowed (Outbound) is 15.

ANI End Tone Presentation Restrict

Use the following command to program the End of ANI with Presentation Restricted (Outbound):

7115-1-T1E1-ANI End Tone with Presentation Restrict (Outbound)

7115-2-T1E1-T1E1-ANI End Tone with Presentation Restrict (Outbound)

7115--ANI End Tone with Presentation Restrict (Outbound)***

Where,

T1E1 is from 01 to 08.

ANI End Tone with Presentation Restrict (Outbound) is a Group 1 tone from 00, 11 to 15. If no such tone is sent, set this parameter to 00.

By default, ANI End Tone with Presentation Restrict (Outbound) is 00.

Inbound Parameters

Dialed Number Identification Signal (DNIS) End Type

Use following command to program DNIS End Type:

7109-1-T1E1-DNIS End Type

7109-2-T1E1-T1E1-DNIS End Type

7109--DNIS End Type***

Where,

T1E1 is from 01 to 08.

DNIS End Type is from 00, 11 to 15.

00 indicates End of DNIS as time out.

01 to 15 indicates group 1 tone to declare End of DNIS.

By Default, DNIS End Type (Inbound) is 15.

Dialed Number Identification Signal (DNIS) Digit Length

Use following command to program the DNIS Digit Length:

7116-1-T1E1-DNIS Digit Length

7116-2-T1E1-T1E1-DNIS Digit Length

7116--DNIS Digit Length***

Where,

T1E1 is from 01 to 08.

DNIS Digit Length is from 01 to 99.

By default, DNIS Digit Length is 99.

- DNIS Digit length (01 to 98) will be expected by the inbound end. (Practical value would be 01 to 10)
- DNIS Digit length 99 indicates DNIS length is variable. Further action is taken after timeout or on receipt of I-15. Refer parameter 'DNIS End Type (Inbound)'.

Address Number Information (ANI) Request Position

Use following command to program the number of DNIS digits after which ANI digits should be requested by the inbound end:

7117-1-T1E1-ANI Request Position

7117-2-T1E1-T1E1-ANI Request Position

7117-*-ANI Request Position

Where,

T1E1 is from 01 to 08.

ANI Request Position is from 00, 01 to 99.

ANI Request Position=00 indicates Never request ANI digits.

ANI Request Position=01 to 98 indicates Request ANI digits on receipt of these many DNIS digits.

ANI Request Position = 99 indicates Request after receiving all the DNIS digits (complete DNIS).

By default, ANI Request Position is 99.

Address Number Information (ANI) Length

Use following command to program ANI Length (Inbound):

7118-1-T1E1-ANI Length

7118-2-T1E1-T1E1-ANI Length

7118-*-ANI Length

Where,

T1E1 is from 01 to 08.

ANI Length = 00 to 99.

By default, ANI Length is 99.

- ANI Length=00 indicates ANI is not sent by the Outbound end.
- ANI Length = 99 indicates ANI Length is variable. If ANI length is variable, the logic waits for End of ANI from the outbound side. The inbound end will sense for I-12 and I-15. I-12 is used to signify that no ANI digits are available whereas I-15 is used to signify end of ANI digits. Some countries like China use I-15 to signify both the events viz. End of ANI and no ANI digits available.

Ask Address Number Information (ANI)

Use following command to program the ASK ANI available:

7119-1-T1E1-ASK ANI

7119-2-T1E1-T1E1-ASK ANI

7119-*-ASK ANI

Where,

T1E1 is from 01 to 08.

ASK ANI Available is from 00 or 01 to 15.

If no such tone is sent by the inbound end, set this parameter to 00. For India, this should be set to 04

By default, Ask ANI (Inbound) is '05'.

Positive Response to Ask ANI

Use following command to program Positive Response to Ask ANI:

7120-1-T1E1-Positive Response to Ask ANI

7120-2-T1E1-T1E1-Positive Response to Ask ANI

7120-*-Positive Response to Ask ANI

Where,

T1E1 is from 01 to 08.

Positive Response to Ask ANI is from 01 to 15.
By default, Positive Response to Ask ANI is 01.

- This cannot be zero. This is because; Is ANI Available request would be made by the inbound end only if the country supports this protocol. In such event, Is ANI Available request will be responded to.

For example, In India I-1 or I-10 is sent by the Outbound end. In Kuwait, I-6 is sent.

Negative Response to Ask ANI

Use following command to program Negative Response to Ask ANI:

7121-1-T1E1-Negative Response to Ask ANI
7121-2-T1E1-T1E1-Negative Response to Ask ANI
7121-*-Negative Response to Ask ANI

Where,

T1E1 is from 01 to 08.

Negative Response to Ask ANI is from 01 to 15.

By default, Negative Response to Ask ANI is 10.

- This cannot be zero. This is because; Is ANI Available request would be made by the inbound end only if the country supports this protocol. In such event, Is ANI Available request will be responded to.

For example, In India I-1 or I-10 is sent by the Outbound end. In Kuwait, I-6 is sent.

ANI End Tone Presentation Allowed

Use following command to program the ANI End Tone Presentation Allowed:

7122-1-T1E1-ANI End Tone Presentation Allowed
7122-2-T1E1-T1E1-ANI End Tone Presentation Allowed
7122-*-ANI End Tone Presentation Allowed

Where,

T1E1 is from 01 to 08.

By default, ANI End Tone Presentation Allowed is 15.

- ANI End Tone Presentation Allowed is 00 or 11 to 15. If no such tone is sent, set this parameter to 00. For example, India uses A-4, China uses A-1, etc.

ANI End Tone Presentation Restricted

Use following command to program the ANI End Tone Presentation Restricted:

7123-1-T1E1-ANI End Tone Presentation Restricted
7123-2-T1E1-T1E1-ANI End Tone Presentation Restricted
7123-*-ANI End Tone Presentation Restricted

Where,

T1E1 is from 01 to 08.

By default, ANI End Tone Presentation Restricted (Inbound) is 00.

ANI End Tone Presentation Restricted is 00 or 11 to 15. If no such tone is sent, set this parameter to 00. For example: India uses A-4, China uses A-1, etc.

Ask Calling Party Sub Category

Use following command to program the Ask Calling Party Sub Category:

7160-1-T1E1-Code
7160-2-T1E1-T1E1-Code
7160-*-Code

Where,
T1E1 is from 01 to 08.
Code is
1 to enable
0 to disable

Forward Group B

Ordinary Subscriber

Use following command to program the Ordinary Subscriber:

7124-1-T1E1-Ordinary Subscriber

7124-2-T1E1-T1E1-Ordinary Subscriber

7124-*-Ordinary Subscriber

Where,

T1E1 is from 01 to 08.

Ordinary Subscriber is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Ordinary Subscriber is 01.

Priority Subscriber

Use following command to program the Priority Subscriber:

7125-1-T1E1-Priority Subscriber

7125-2-T1E1-T1E1-Priority Subscriber

7125-*-Priority Subscriber

Where,

T1E1 is from 01 to 08.

Priority Subscriber is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Priority Subscriber is 02.

Maintenance Equipment

Use following command to program the Maintenance Equipment:

7126-1-T1E1-Maintenance Equipment

7126-2-T1E1-T1E1-Maintenance Equipment

7126-*-Maintenance Equipment

Where,

T1E1 is from 01 to 08.

Maintenance Equipment is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Maintenance Equipment is 03.

Operator

Use following command to program the Operator:

7127-1-T1E1-Operator

7127-2-T1E1-T1E1-Operator

7127-*-Operator

Where,

T1E1 is from 01 to 08.

Operator is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Operator is 05.

Pay Phone

Use following command to program the Pay Phone:

7128-1-T1E1-Pay Phone

7128-2-T1E1-T1E1-Pay Phone

7128-*-Pay Phone

Where,

T1E1 is from 01 to 08.

Operator is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Pay Phone is 00.

Data Transmission

Use following command to program the Data Transmission:

7129-1-T1E1-Data Transmission

7129-2-T1E1-T1E1-Data Transmission

7129-*-Data Transmission

Where,

T1E1 is from 01 to 08.

Data Transmission is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Data Transmission is 06.

Interception Operator

Use following command to program the Interception Operator:

7130-1-T1E1-Interception Operator

7130-2-T1E1-T1E1-Interception Operator

7130-*-Interception Operator

Where,

T1E1 is from 01 to 08.

Interception Operator is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Interception Operator is 00.

Backward Group A

Send next Digit (N+1) (DNIS)

Use following command to program the Send next Digit:

7131-1-T1E1-Send Next Digit

7131-2-T1E1-T1E1-Send Next Digit

7131-*-Send Next Digit

Where,

T1E1 is from 01 to 08.

Send next Digit is 00, 01 to 15. 00 is used for No tone.

By default, Send Next Digit is 01.

Send last but one Digit (N-1) (DNIS)

Use following command to program the Send last but one Digit:

7132-1-T1E1-Send Last But One Digit

7132-2-T1E1-T1E1-Send Last But One Digit

7132-*-Send Last But One Digit

Where,

T1E1 is from 01 to 08.

Send Last But One Digit is 00, 01 to 15. 00 is used for No tone.

By default, Send Last But One Digit (N-1) is 02.

Send last but two digit (N-2) (DNIS)

Use following command to program the Send last but two digit:

7134-1-T1E1-Send Last But Two Digit

7134-2-T1E1-T1E1-Send Last But Two Digit

7134-*-Send Last But Two Digit

Where,

T1E1 is from 01 to 08.

Send Last But Two Digit is 00, 01 to 15. 00 is used for No tone.

By default, Send Last But Two Digit (N-2) is 07.

Send last but three Digit (N-3) (DNIS)

This parameter specifies the backward group A tone used to request last but three digit, that is, N-3 digit. Be it ANI digit or DNIS digit.

Use following command to program the Send Last But Three Digit:

7135-1-T1E1-Send Last But Three Digit

7135-2-T1E1-T1E1-Send Last But Three Digit

7135-*-Send Last But Three Digit

Where,

T1E1 is from 01 to 08.

Send last but three digit is 00, 01 to 15. 00 is used for No tone.

By default, Send Last But Three Digit is 08.

Send Caller Party Category and ANI Digit

Use following command to program the Send Caller Party Category and ANI Digit:

7135-1-T1E1-Send Caller Party Category and ANI Digit

7135-2-T1E1-T1E1-Send Caller Party Category and ANI Digit

7135-*-Send Caller Party Category and ANI Digit

Where,

T1E1 is from 01 to 08.

Send Caller Party Category and ANI Digit is 00 to 15.

By default, Send Last But Three Digit is 08.

Address-Complete, Change over to Group B

Use following command to program the Address-Complete, Change over to reception of Group B signals:

7136-1-T1E1-Address-Complete, Change Over to Reception of Group B Signals

7136-2-T1E1-T1E1-Address-Complete, Change Over to Reception of Group B Signals

7136-*-Address-Complete, Change Over to Reception of Group B Signals

Where,

T1E1 is from 01 to 08.

Address-Complete, Change Over to Reception of Group B Signals is 00, 01 to 15. 00 is used for No tone.

By default, Address-Complete, Change Over to Reception of Group B Signals is 03.

Send Calling Party Category and Change to Group C

Use following command to program the Send Calling Party Category and Change to Group C:

7137-1-T1E1-Send Calling Party Category and Change to Group C

7137-2-T1E1-T1E1-Send Calling Party Category and Change to Group C

7137-*-Send Calling Party Category and Change to Group C

Where,

T1E1 is from 01 to 08.

Send Calling Party Category and change to Group C is from 00, 01 to 15. 00 is used for No tone.
By default, Send Calling Party Category and Change to Group C is 00.

Congestion in National Network

Use following command to program congestion in the National Network

7138-1-T1E1-Congestion in National Network

7138-2-T1E1-T1E1-Congestion in National Network

7138-*-Congestion in National Network

Where,

T1E1 is from 01 to 08.

Congestion in National Network is 00, 01 to 15. 00 is used for No tone.

By default, Congestion in National Network is 04.

Send Calling Party Category

Use following command to program the Send caller party's category:

7139-1-T1E1-Send Calling Party Category

7139-2-T1E1-T1E1-Send Calling Party Category

7139-*-Send Calling Party Category

Where,

T1E1 is from 01 to 08.

Send Caller Party Category is 00, 01 to 15. 00 is used for No tone.

By default, Send Calling Party's Category is 05.

Address-Completed, Charge, Set Speech Conditions

Use following command to program the Address-Complete, Charge, Set-up Speech Conditions of Group B signals:

7140-1-T1E1-Address-Complete, Charge, Set-up Speech Conditions

7140-2-T1E1-T1E1-Address-Complete, Charge, Set-up Speech Conditions

7140-*-Address-Complete, Charge, Set-up Speech Conditions

Where,

T1E1 is from 01 to 08.

Address-Complete, Charge, Set-up Speech Conditions is 00, 01 to 15. 00 is used for No tone.

By default, Address-Complete, Charge Set-up Speech Conditions is 06.

Repeat DNIS digits from Beginning

Use following command to program the repeat DNIS digits from beginning of Group B signals:

7141-1-T1E1-Repeat DNIS Digits from Beginning

7141-2-T1E1-T1E1-Repeat DNIS Digits from Beginning

7141-*-Repeat DNIS Digits from Beginning

Where,

T1E1 is from 01 to 08.

Repeat DNIS Digits from Beginning is from 00, 01 to 15. 00 is used for No tone.

By default, Repeat DNIS Digits from Beginning is 00.

Send Next ANI Digit

Use following command to program the Send Next ANI Digit

7142-1-T1E1-Send Next ANI Digit

7142-2-T1E1-T1E1-Send Next ANI Digit

7142-*-Send Next ANI Digit

Where,

T1E1 is from 01 to 08.

Send Next ANI Digit is 00 or 01 to 15. If no such tone is sent, set this parameter to 00.

By default, Send Next ANI Digit is 05.

- Few countries use different tone to request next ANI digit and next DNIS digits.
- For example: India uses A-4, China uses A-1, etc.

Backward Group B

Send Special Information Tone

Use following command to program the Send Special Information Tone:

7143-1-T1E1-Send Special Information Tone

7143-2-T1E1-T1E1-Send Special Information Tone

7143-*-Send Special Information Tone

Where,

T1E1 is from 01 to 08.

Send Special Information Tone is from 00, 01 to 15. 00 is used for No tone.

By default, Send Special Information Tone is 02.

Send Special Information Tone and Setup Speech Conditions

Use following command to program the Send Special Information Tone and Setup Speech Condition:

7144-1-T1E1-Send Special Information Tone and Setup Speech Conditions

7144-2-T1E1-T1E1-Send Special Information Tone and Setup Speech Conditions

7144-*-Send Special Information Tone and Setup Speech Conditions

Where,

T1E1 is from 01 to 08.

Send Special Information Tone, and Setup Speech Conditions is from 00, 01 to 15. 00 is used for No tone.

By default, Send Special Information Tone and Setup Speech Conditions is 02.

Subscriber Line Busy

Use following command to program the subscriber line busy:

7145-1-T1E1-Subscriber Line Busy

7145-2-T1E1-T1E1-Subscriber Line Busy

7145-*-Subscriber Line Busy

Where,

T1E1 is from 01 to 08.

Subscriber Line Busy is from 00, 01 to 15. 00 is used for No tone.

By default, Subscriber Line Busy is 03.

Subscriber Line Free, Charge

Use following command to program the subscriber line free, charge:

7146-1-T1E1-Subscriber Line Free, Charge

7146-2-T1E1-T1E1-Subscriber Line Free, Charge

7146-*-Subscriber Line Free, Charge

Where,

T1E1 is from 01 to 08.

Subscriber Line Free, Charge is from 00, 01 to 15. 00 is used for No tone.

By default, Subscriber Line Free, Charge is 06.

Subscriber Line Free, No charge

Use following command to program the subscriber line free, no charge:

7147-1-T1E1-Subscriber Line Free, NO Charge

7147-2-T1E1-T1E1-Subscriber Line Free, NO Charge

7147-*-Subscriber Line Free, NO Charge

Where,

T1E1 is from 01 to 08.

Subscriber Line Free, NO Charge is from 00, 01 to 15. 00 is used for No tone.

By default, Subscriber Line Free, NO Charge is 07.

Congestion

Use following command to program Congestion:

7148-1-T1E1-Congestion

7148-2-T1E1-T1E1-Congestion

7148-*-Congestion

Where,

T1E1 is from 01 to 08.

Congestion is from 00, 01 to 15. 00 is used for No tone.

By default, Congestion is 04.

Unallocated Number

Use following command to program the Unallocated Number:

7149-1-T1E1-Unallocated Number

7149-2-T1E1-T1E1-Unallocated Number

7149-*-Unallocated Number

Where,

T1E1 is from 01 to 08.

Unallocated Number is from 00, 01 to 15. 00 is used for No tone.

By default, Unallocated Number is 05.

Subscriber's Line Out of Order

Use following command to program the subscriber's line out of order:

7150-1-T1E1-Subscriber's Line out of Order

7150-2-T1E1-T1E1-Subscriber's Line out of Order

7150-*-Subscriber's Line out of Order

Where,

T1E1 is from 01 to 08.

Subscriber's Line out of order is from 00, 01 to 15. 00 is used for No tone.

By default, Subscribers Line Out of Order is 08.

Call Rejected, No Indication

Use following command to program the Call rejected, No indication of cause:

7151-1-T1E1-Call rejected, No indication

7151-2-T1E1-T1E1-Call rejected, No indication

7151-*-Call rejected, No indication

Where,

T1E1 is from 01 to 08.

Call rejected, No indication is from 00 to 15.

By default, Call rejected, No indication is 00.

Alternative Answer Tone

Use following command to program the Alternative Answer Tone:

7152-1-T1E1-Alternative Answer Tone

7152-2-T1E1-T1E1-Alternative Answer Tone

7152-*-Alternative Answer Tone

Where,
T1E1 is from 01 to 08.
Alternative Answer Tone is from 00, 01 to 15. Use '00' when this parameter is not applicable.
By default, Alternative Answer Tone is 00.

Changed Number

Use following command to program the Changed Number (announcement on line):

7153-1-T1E1-Changed Number
7153-2-T1E1-T1E1-Changed Number
7153-*-Changed Number

Where,
T1E1 is from 01 to 08.
Changed Number (announcement on line) is from 00, 01-15. Use '00' when this parameter is not applicable.
By default, Changed Number (announcement on line) is 00.

Backward Group C

Send Next ANI digit

Use following command to program the Send next ANI digit:

7154-1-T1E1-Send Next ANI Digit
7154-2-T1E1-T1E1-Send Next ANI Digit
7154-*-Send Next ANI Digit

Where,
T1E1 is from 01 to 08.
Send next ANI digit (Group C) is from 00, 01 to 15. Use '00' when this parameter is not applicable.
This parameter is applicable in Mexico only.
By default, Send Next ANI Digit (Group C) is 00.

Request Transition to Group A and Restart From First DNIS

Use following command to program the Request transition to Group A and restart from first DNIS.

7155-1-T1E1-Request Transition to Group A and Restart from First DNIS
7155-2-T1E1-T1E1-Request Transition to Group A and Restart from First DNIS
7155-*-Request Transition to Group A and Restart from First DNIS

Where,
T1E1 is from 01 to 08.
Request Transition to Group A and Restart from First DNIS is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Request Transition to Group A and Restart from First DNIS is 00.

Address Completed, Change to Reception of Group B

Use following command to program the Address completed, change to reception of Group B signal:

7156-1-T1E1-Address Completed, Change to Reception of Group B Signal
7156-2-T1E1-T1E1-Address Completed, Change to Reception of Group B Signal
7156-*-Address Completed, Change to Reception of Group B Signal

Where,
T1E1 is from 01 to 08.
Address Completed, Change to Reception of Group B Signal is from 00, 01 to 15. Use '00' when this parameter is not applicable.
By default, Address Completed, Change to Reception of Group B Signal is 00.

Congestion

This parameter specifies the backward group C tone used to signify Congestion

Use following command to program the tone for Congestion:

7157-1-T1E1-Congestion

7157-2-T1E1-T1E1-Congestion

7157-*-Congestion

Where,

T1E1 is from 01 to 08.

Congestion is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Congestion is 00.

Request Transition Back to Group A, and Sent Next DNIS

Use following command to program the tone for request transition back to group A, and send next DNIS signal:

7158-1-T1E1-Request Transition Back to Group A, and Send Next DNIS

7158-2-T1E1-T1E1-Request Transition Back to Group A, and Send Next DNIS

7158-*-Request Transition Back to Group A, and Send Next DNIS

Where,

T1E1 is from 01 to 08.

Request transition back to group A, and send next DNIS is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Request Transition Back to Group A, and Send Next DNIS is 00.

Request Transition Back to Group A, and Restart the Last DNIS

Use following command to program the tone for request transition back to group A, and repeat the last DNIS:

7159-1-T1E1-Request Transition Back to Group A, and Restart the Last DNIS

7159-2-T1E1-T1E1-Request Transition Back to Group A, and Restart the Last DNIS

7159-*-Request Transition Back to Group A, and Restart the Last DNIS

Where,

T1E1 is from 01 to 08.

Request Transition Back to Group A, and Restart the Last DNIS is from 00, 01 to 15. Use '00' when this parameter is not applicable.

By default, Request Transition Back to Group A and Restart the Last DNIS is 00.

Line Signal Parameters

C and D Bits

This parameter indicates the default values of C and D bits when the SARVAM UCS transmits line signals.

Use following command to program the C and D Bits for T1E1 port:

7161-1-T1E1-C and D Bits

7161-2-T1E1-T1E1-C and D Bits

7161-*-C and D Bits

Where,

T1E1 is from 01 to 08.

CD Bits	Meaning (Binary Value)
0	00 (C=0, D=0)
1	01

CD Bits	Meaning (Binary Value)
2	10
3	11

By default, CD Bits is 1.

The C and D bits received during an IC call are ignored by the SARVAM UCS.

Invert Bit A

Use following command to program to invert/don't invert Bit A for the T1E1 port:

7162-1-T1E1-Invert Bit A

7162-2-T1E1-T1E1-Invert Bit A

7162-*-Invert Bit A

Where,

T1E1 is from 01 to 08.

Invert Bit A	Meaning
0	Disable
1	Enable

By default, Invert Bit A is 0.

Invert Bit B

Use following command to program to invert/don't invert Bit B for the T1E1 port:

7163-1-T1E1-Invert Bit B

7163-2-T1E1-T1E1-Invert Bit B

7163-*-Invert Bit B

Where,

T1E1 is from 01 to 08.

Invert Bit B	Meaning
0	Disable
1	Enable

By default, Invert Bit B is 0.

Invert Bit C

Use following command to program to invert/don't invert Bit C for the T1E1 port:

7164-1-T1E1-Invert Bit C

7164-2-T1E1-T1E1-Invert Bit C

7164-*-Invert Bit C

Where,

T1E1 is from 01 to 08.

Invert Bit B	Meaning
0	Disable
1	Enable

By default, Invert Bit C is 0.

Invert Bit D

Use following command to program to invert/don't invert Bit D for the T1E1 port:

7165-1-T1E1-Invert Bit D

7165-2-T1E1-T1E1-Invert Bit D

7165-*-Invert Bit D

Where,

T1E1 is from 01 to 08.

Invert Bit D	Meaning
0	Disable
1	Enable

By default, Invert Bit D is 0.

E1 Metering Bit

Use following command to program the E1 Metering Bit for the T1E1 port:

7166-1-T1E1-E1 Metering Bit

7166-2-T1E1-T1E1-E1 Metering Bit

7166-*-E1 Metering Bit

Where,

T1E1 is from 01 to 08.

E1 Metering Bit	Meaning
0	None
1	Bit-A
2	Bit-B
3	Bit-C
4	Bit-D

By default, E1 Metering Bit is 1.

E1 Metering Pulse Minimum Timer

Use following command to program the Metering Pulse Minimum timer for the T1E1 port:

7167-1-T1E1-E1 Metering Pulse Minimum Timer

7167-2-T1E1-T1E1-E1 Metering Pulse Minimum Timer

7167-*-E1 Metering Pulse Minimum Timer

Where,
T1E1 is from 01 to 08.
E1 Metering Pulse Minimum timer is from 20ms to 1000ms.
By default, E1 Metering Pulse Minimum Timer is 150ms.

Clear Back Signal

Use following command to program the Clear Back Signal for the T1E1 port:

7168-1-T1E1-Clear Back Signal
7168-2-T1E1-T1E1-Clear Back Signal
7168-*-Clear Back Signal

Where,
T1E1 is from 01 to 08.

Clear Back Signal	Meaning
1	Release Guard (Ab=1)
2	Forced Release (Bb=0)

By default, Clear Back Signal is 1.

Release Timer

Use following command to program the Release Timer for the T1E1 port:

7169-1-T1E1-Release Timer
7169-2-T1E1-T1E1-Release Timer
7169-*-Release Timer

Where,
T1E1 is from 01 to 08.
Release Timer is from 20ms to 1000ms.
By default, Release Timer is 400 ms.

Line Seizure Acknowledge Wait Timer

Use following command to program Line seizure acknowledge wait timer:

7170-1-T1E1-Line Seizure Acknowledge Wait Timer
7170-2-T1E1-T1E1-Line Seizure Acknowledge Wait Timer
7170-*-Line Seizure Acknowledge Wait Timer

Where,
T1E1 is from 01 to 08.
Line Seizure Acknowledge Wait Timer is from 0001 to 9999 milli seconds.
By default, Line Seizure Acknowledge Wait Timer is 200ms.

Release Guard Timer

Use following command to program Release Guard Timer:

7171-1-T1E1-Release Guard Timer
7171-2-T1E1-T1E1-Release Guard Timer
7171-*-Release Guard Timer

Where,
T1E1 is from 01 to 08.
T1E1 Release Guard Timer is from 0000 to 9999 milliseconds.
By default, Release Guard Timer is 200ms. This timer depends on the speed of switching and processing.

E&M Signaling

E&M Feature Template

Assign E&M Feature Template to T1E1 using following command:

Use Following command to assign E&M Feature Template to T1E1 Port

6004-1-T1E1-Template Number

6004-2-T1E1-T1E1- Template Number

6004-*- Template Number

Where,

T1E1 is from 01 to 08.

Template Number is 01 to 50.

By default, Template 01 is assigned to T1E1.

B Bit Pattern

Use following command to select B Bit Pattern

7191-1-T1E1-Code

7191-2-T1E1-T1E1-Code

7191-*-Code

Where,

T1E1 is from 01 to 08.

Code	Meaning
1	Same as A bit
2	Fixed Value

By default, the Code is 1 (Same as A bit)

B Bit Value

Use following command to program B Bit Value

7192-1-T1E1-B Bit Value

7192-2-T1E1-T1E1- B Bit Value

7192-*- B Bit Value

Where,

T1E1 is from 01 to 08.

B bit value can be 0 or 1.

By default, B bit value is 0.

CD Bit Value

Use following command to program CD Bit Value

7193-1-T1E1-CD Bit Value

7193-2-T1E1-T1E1-CD Bit Value

7193-*- CD Bit Value

Where,

T1E1 is from 01 to 08.

CD bit value can be 1 or 3.

By default, CD bit value is 1.

Invert Bit A

Use following command to program to invert/don't invert Bit A for the T1E1 port:

7162-1-T1E1-Invert Bit A

7162-2-T1E1-T1E1-Invert Bit A

7162-*-Invert Bit A

Where,

T1E1 is from 01 to 08.

Invert Bit A	Meaning
0	Do not invert
1	Invert

By default, Invert Bit A is 0.

Invert Bit B

Use following command to program to invert/don't invert Bit B for the T1E1 port:

7163-1-T1E1-Invert Bit B

7163-2-T1E1-T1E1-Invert Bit B

7163-*-Invert Bit B

Where,

T1E1 is from 01 to 08.

Invert Bit B	Meaning
0	Do not invert
1	Invert

By default, Invert Bit B is 0.

Invert Bit C

Use following command to program to invert/don't invert Bit C for the T1E1 port:

7164-1-T1E1-Invert Bit C

7164-2-T1E1-T1E1-Invert Bit C

7164-*-Invert Bit C

Where,

T1E1 is from 01 to 08.

Invert Bit C	Meaning
0	Do not invert
1	Invert

By default, Invert Bit C is 0.

Invert Bit D

Use following command to program to invert/don't invert Bit D for the T1E1 port:

7165-1-T1E1-Invert Bit D

7165-2-T1E1-T1E1-Invert Bit D

7165-*-Invert Bit D

Where,

T1E1 is from 01 to 08.

Invert Bit D	Meaning
0	Do not invert
1	Invert

By default, Invert Bit D is 0.

Viewing T1E1 Trunk Status

You can view the status of T1E1 Trunks on Jeeves only. To do this,

- Under **T1E1 Configuration**, click **Status**.

- For each T1E1 Trunk, the following settings will be displayed:
 - T1E1 Port No.
 - Name
 - Layer 1
 - Layer 2
 - Alarms
 - Performance Monitoring Counter
 - Call Budget Type
 - Allotted Amount/Minutes/Calls
 - Consumed Amount/Minutes/Calls
 - Call Budget Reset Mode
 - Call Budget Reset Scheduled (Date)
 - Reset Consumed (this is not a status indicator. It is for resetting the Consumed Call Budget manually)

You can also view the T1E1 Trunk Status from the **Status** link. To view, click the T1E1 link under Status.

Configuring Data Parameters

The SARVAM UCS supports 4 Data ports. For more information about this card, see the topic [“The Data Card”](#).

You can configure the Data Port Parameters only when you have set **E1** as the **Carrier** type in the **Port Parameters** under **T1E1 Configuration**. See [“Configuring E1 Trunks”](#) for more details. To configure the Data Port Parameters, see [“E1 Data Settings”](#).

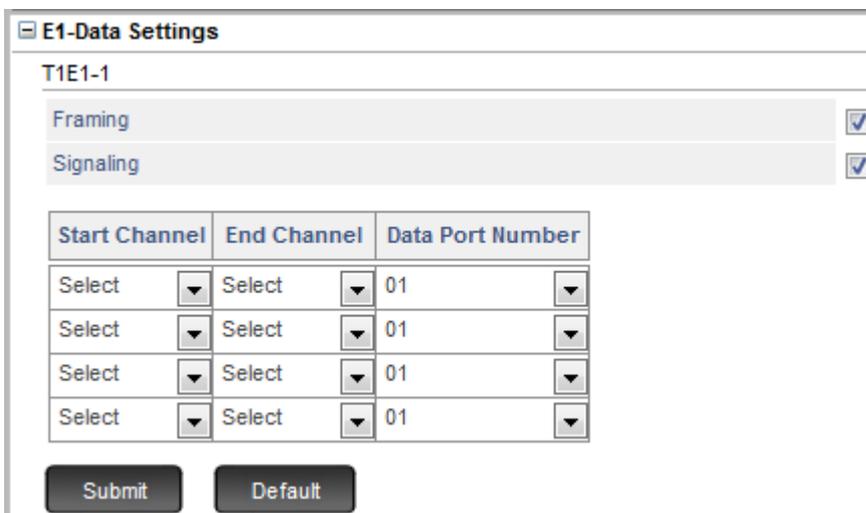

Configuring Data Parameters using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **E1-Data Settings** to open the page.

E1 Data Settings

- Click **E1-Data Settings** to expand.

The image shows a screenshot of the 'E1-Data Settings' configuration page. At the top, there is a tab labeled 'T1E1-1'. Below the tab, there are two settings: 'Framing' and 'Signaling', each with a checked checkbox. Below these are four rows of a table for configuring data channels. Each row has three columns: 'Start Channel', 'End Channel', and 'Data Port Number'. Each column contains a 'Select' dropdown menu. The 'Data Port Number' column has a default value of '01'. At the bottom of the form, there are two buttons: 'Submit' and 'Default'.

- Select the **T1E1 Port** tab, for which you want to configure the data parameters.
- By default, both **Framing** and **Signaling** are enabled. You can divide the E1 channels to route Voice calls as well as for Data communication.
- Select the number of E1 Channels to be used for routing data from E1 to the desired Data port in **Start Channel** and **End Channel**. Default: Start and End Channel are blank.
- In **Data Port Number**, select the desired Data Port to which the E1 Port is to be mapped. Default: 1.

- The E1 Channels not configured above to route Data, shall be used to route Voice Calls.
- Click **Submit** to save.
- By default, **Framing** is enabled. You can use this E1 Port for both Voice Calling and Data Communication.

Clear this check box, if you want to use this E1 Port for Data Communication only. When you clear this check box, Framing is disabled and you can allot all the E1 channels to a single data port only.

The screenshot displays the 'E1-Data Settings' configuration page. At the top, there are tabs numbered 1 through 8, with tab 1 selected. Below the tabs, the 'E1-Data Settings' section is expanded to show 'T1E1-1' settings. There are three rows: 'Framing' with a checked checkbox, 'Signaling' with an unchecked checkbox, and 'Assign all channels of this E1 Port to Data Port Number' with a dropdown menu. The dropdown menu is open, showing options '01', '02', '03', and '04', with '01' selected. Below the settings are 'Submit' and 'Default' buttons. At the bottom, there is a link for 'DATA Card Firmware Update'.

In **Assign all channels of this E1 Port to Data Port Number**, select the desired Data Port to which you want to assign all the E1 channels.

- By default, **Signaling** is enabled. You can use this E1 Port for both Voice Calling and Data Communication.

Clear this check box, if you want to use this E1 Port for Data Communication only. When you clear this check box, Signaling is disabled and you can allot different E1 channels to different data ports.

- Select the number of E1 Channels to be used for routing data from E1 to the desired Data port in **Start Channel** and **End Channel**. Default: Start and End Channel are blank.
- In **Data Port Number**, select the desired Data Port to which the E1 Port is to be mapped. Default: 1.
- Click **Submit** to save.
- Repeat the same steps to map another E1 port to a Data port and select the channels to be used for routing data between the two ports.

DATA Card Firmware Upgrade

- Click **DATA Card Firmware Update** to expand.

- Select the **Use ETHERNET-4 port for FTP access of DATA Card** check box to access the FTP.

- Click **OK**.

DATA Card Firmware Update

Use ETHERNET-4 port for FTP access of DATA card

IP Address	000	.	000	.	000	.	000
Subnet Mask	000	.	000	.	000	.	000
Default Gateway	000	.	000	.	000	.	000

Submit **Default**

- Enter the **IP Address** through which the FTP of the Data Card can be accessed. Default: Blank
- Enter the **Subnet Mask**. Default: Blank
- Enter the **Default Gateway**. Default: Blank
- Click **Submit**.

Configuring BRI Trunks

BRI port of the SARVAM UCS configured for NT mode can be connected to the BRI Port of another System configured for TE mode. In such case, the SARVAM UCS will behave as Transit Exchange.

Dialing method (en bloc/overlap) on the BRI port is programmable. This is because many PSTN exchanges support only Overlap receiving. Hence, in such cases the BRI port (configured for TE mode) will send the called party number in overlap mode.

SARVAM UCS supports a software port entity called "ISDN Terminal" which can be connected to the BRI-NT port and will be treated as stations of the System.

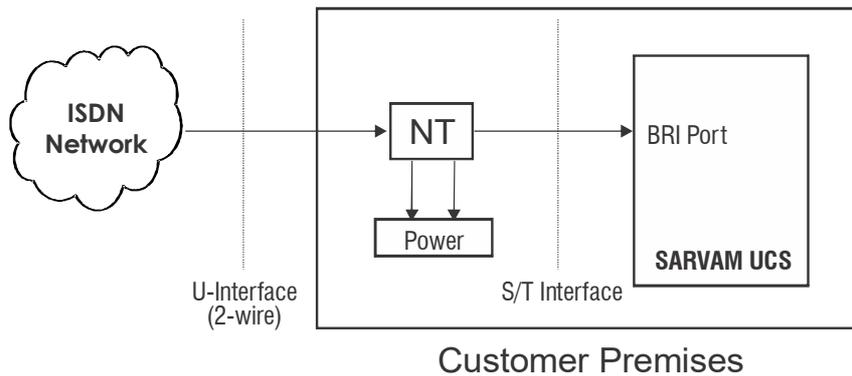

How it works

- The ISDN numbering plan with SARVAM UCS revolves around Multiple Subscriber Number (MSN) and Direct Dialing In (DDI).
- With MSN feature, practically all the station users or other specific terminals can be given a unique telephone number. One station can be assigned a number 2765400, other station can be assigned 2765401, etc. Hence, for one subscriber the Service Provider can assign multiple numbers. Hence this feature is called Multiple Subscriber Number.
- The SARVAM UCS can be programmed to land all the calls coming through various channels of the BRI line on the Operator just like in case of normal trunk.
- Alternatively, using DDI feature of ISDN the calls can be made to land directly on the desired stations. To accomplish this requirement, each station should be given a unique directory number. On assigning directory number, a table is formed internally called DDI table as shown below:

Station (S/w Port No.)	Directory Number
000	03
005	04
006	05
008	06
009	07

- When a caller calls a MSN number, the call lands on the System. The System compares the incoming number with the DDI table. If the incoming number matches with any number in the DDI table, it routes the call to the specific station. If the incoming number does not match with any number in the DDI table then it is matched with CLI number. If it matches with any number in the CLI table, the call is routed according to the CLI table. If the number does not match with either of these tables then the call is routed to the landing destination.

How to connect the BRI line?

- Most of the Service Providers provide the NT1 along with the BRI line.
- At the Customer's Premises, the BRI line is terminated on the NT1. The S/T interface of the NT1 is connected to BRI port of the SARVAM UCS.

The configuration details of U interface (RJ-45) at NT1 are given below:

Pin Number	Pin Detail
4	Tx
5	Rx

The configuration details of S/T interface (RJ-45) on NT1 are given below:

Pin Number	Pin Detail
3	Rx1
4	Tx1
5	Tx2
6	Rx2

Association of BRI port and ISDN Terminal:

- The 'ISDN terminal' is defined as a real port type in the system.
- Since 32 BRI ports are supported at present and as per protocol a maximum of 8 terminals can be connected to the BRI port; at present 64 software ports are supported for ISDN terminals, namely 01 to 64 (Maximum 64 Terminals).
- ISDN terminals (software ports) do not have any hardware slot and port Id of their own.
- ISDN terminals (software ports) are associated to the BRI software port and the BRI software port has a hardware slot and port ID of its own.
- Each ISDN terminal is assigned an access code (flexible number), station basic template, station advanced template and a CPU group.

The ISDN terminals do not have a direct software port number as other port types have. Rather the ISDN terminals have a derived software port number. Such derived software port numbers are used while programming extension name or assigning Station Basic Feature or Station Advanced Feature templates or programming Routing Group.

For Call routing from the BRI NT:

- When call is made from the ISDN terminal the BRI port will check the calling party number sent by the ISDN Terminal. If the calling party number = Programmed access code of the ISDN Terminal which are assigned to the BRI port, the BRI Terminal will process the call further as per the Station Basic Feature Template and Station Advanced Feature Template assigned to the ISDN Terminal.
- If the ISDN terminal doesn't send the calling party number while making the OG call, the Station Basic/Advanced Feature template assigned to the BRI port will be used, for call processing.
- When the ISDN terminal doesn't send the calling party number = Access code programmed for the BRI port on which it is connected, while making the OG call, the Station Basic/Advanced Feature Template assigned to the BRI port will be applied.
- When ISDN terminal sends calling party number which is not programmed for any ISDN terminals assigned to that particular BRI Port, neither its access code of that particular BRI port, the call will be dropped, by the BRI port.

BRI port Orientation Type

- BRI port can be connected to a public ISDN exchange, private ISDN exchange or to an ISDN terminal (BRI Access).
- When the BRI port is connected to a Public ISDN exchange, it behaves as a terminal. SARVAM UCS supports this function of BRI Access by assigning it a parameter viz. Orientation = Terminal. The signaling used for this Orientation is Q.931-protocol.
- When the BRI port is connected to an ISDN Phone or ISDN Video phone, it behaves as a 'network'. SARVAM UCS supports this function of BRI Access by assigning it a parameter viz. Orientation = Network. In this case, the BRI port behaves as network. The signaling used for this Orientation is Q.931- protocol.
- When the BRI port is connected to a private ISDN (the main application of this configuration is CUG, feature transparency, etc.), the BRI port is used as a pipe of 128Kbps. It is of no significance which end acts as network and which acts as terminal (User) since the role of the BRI port in such case will be to route the call depending on the signaling protocol applied on the BRI port (128Kbps link). SARVAM UCS supports this function of BRI Access by assigning it a parameter viz. Orientation = Tie-line. In this case, the BRI port behaves as 128Kbps link. The signaling used for this Orientation can be any of the Inter-exchange signaling protocol for BRI Access. The most commonly used is QSIG.

TEI negotiation on BRI port

- BRI port supports both automatic and fixed TEI negotiation, so that it can be integrated with a system of another vendor. If 'Fixed' mode is selected, its value is required to be configured using SE commands or Jeeves. TEI is 'Terminal Endpoint Identifier' protocol for negotiation used while connecting to the BRI port with remote BRI port.

Applications of BRI-NT Port:

Two applications are described below:

- Video Phone
- Making Data Call

Video Phone

- An important application of BRI-NT is establishing a Video Call using Video phone. It is used just like other ISDN Phones.
- Video Phone can be used with SARVAM UCS supporting a BRI connection. SARVAM UCS does not support call transfer from one Video Terminal to another Terminal. But the call routing is implemented by preparing suitable OG Trunk Bundle Group (OGTBG).
- The OGTBG for the Video Phone should be so formed by the SE that a BRI channel will be allotted by the Call Processing logic (preferably).
- If the OGTBG formed by the SE contains a non-ISDN trunk and if by the OGTBG logic this non-ISDN trunk is to be allotted to the ISDN phone which has requested 2 B-channels then the call will be dropped. The non-ISDN trunk is allowed only if the ISDN user makes an audio call. The system will allot first channel even if other channels are available.

OG Call using Video Phone:

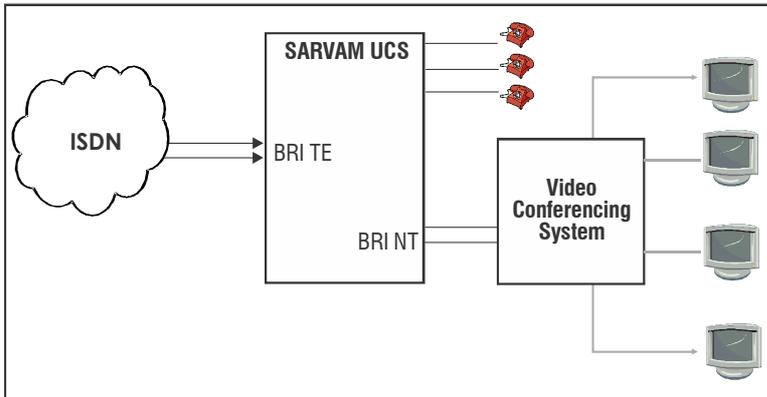

- The SARVAM UCS will support supplementary feature viz. Hold only. If the terminal equipment uses Hold feature to hold a video call, it will be applicable.
- The SARVAM UCS does not support logic for converting audio call to video call.
- Instead, the Video Phone user will have to use one Trunk Access Code (and hence OGTBG) to make and receive Video call and another TAC to make an audio call.

IC call to a Video Phone:

- User can program normal DDI routing logic to route the IC call to the Video Phone using the first or additional channels.
- Depending upon terminal equipment call, the call will be answered by the Operator and transferred to the Video Phone.

Video Conference

As shown in the figure SARVAM UCS supports Video conference from BRI-NT port.

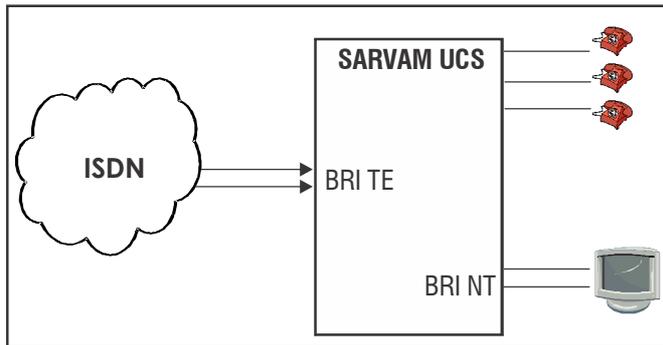

- This feature works only if it is supported by the Service Provider. Video Conference is established mainly by the Video Conferencing (VC) equipment.
 - A Video Conference system (H.320) can be connected to any of the BRI-NT port.
 - For Video conferencing, three BRI-NT ports of SARVAM UCS are connected to the three ports of the VC equipment (The remaining one port of the Video Conference system remains free).
 - Thus user will assign at least 6 B-channels to the OGTBG that is to be assigned to the VC equipment. (User can assign BRI-NT software port nos. 01 to 03 to the Video Conferencing equipment).
 - The user will program the routing of IC calls to the Video Conferencing equipment using DDI routing table for placing IC video conferencing calls.
 - More than one VC-equipment can be connected to a BRI-NT Port.
-  • *Video Conferencing generally requires 6 B-channels. But Video Conferencing can also be done at lower bit rates also using the “aggregation” of 6 B channels which must be supported by the VC equipment.*
- *Please note that a Video Conference call cannot be transferred or kept on Hold.*

Making Data Calls

- SARVAM UCS BRI-NT port supports data communication also.

- For data-communication, connect the Router supporting ISDN-BRI or a Computer with the BRI Card (BRI-NT port) as shown below:

Using this feature following applications are supported:

- The computers connected in the LAN can browse the net through the BRI.
- Remote LAN Access, the Computers in the LAN can access the computer/computers in LAN at the remote end (Branch office/Home office).
- Files can be transferred from one LAN to another.

OG Data calls from the Router:

- The data call can be made by the router requesting desired number of channels. This establishes a live connection between the Router and the ISP through the system. The users on the LAN can browse the net as normal using Internet Explorer or Netscape Navigator.
- For this, the SARVAM UCS will allocate data channels only on the BRI-TE port so as to leave other channels for speech calls when the system detects the call to be a data call.
- Similarly, a Remote Computer can be accessed (Remote LAN Access) by dialing the Remote users' number (The remote end system should be so programmed that the call made to a number lands directly on the Router.) This establishes a permanent connection between the two Routers (and hence two LAN networks).
- Now the user of the system can access the computer in LAN at the remote end in the same way as accessing another computer on the same network.

IC Data calls to the Router:

- Program the Trunk Landing Group such that all data calls will land on the BRI-NT port to which the Router is connected using CLI based Routing logic or DDI based routing logic.
- However, while routing call on the BRI-NT port, the system will check that the data channels reserved for data communication on the BRI-NT port are enough to establish the call. Otherwise the call will be rejected.
- The call will be rejected if the number of channels reserved for data calls, are already busy with one data-call.

Configuring BRI Parameters using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **BRI Configuration**.
- Click **BRI Parameters**.

Port No.	H/w Slot - Port	Enable Port	Name	Orientation Type
1	00 - 00	<input checked="" type="checkbox"/>		Terminal
2	00 - 00	<input checked="" type="checkbox"/>		Terminal
3	00 - 00	<input checked="" type="checkbox"/>		Terminal
4	00 - 00	<input checked="" type="checkbox"/>		Terminal
5	00 - 00	<input checked="" type="checkbox"/>		Terminal
6	00 - 00	<input checked="" type="checkbox"/>		Terminal
7	00 - 00	<input checked="" type="checkbox"/>		Terminal
8	00 - 00	<input checked="" type="checkbox"/>		Terminal

- SARVAM UCS will assign the **Hardware Slot-Port** automatically, when any card is inserted in the system.

Hardware slot is the number of the Universal slot of SARVAM UCS in which the BRI Card is inserted. Range of slot number is 01-16. Port is the number of BRI hardware port on the card to which the BRI line is connected. Range of Port is from 00-99.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields. By default, Hardware slot-Port is 00-00.

- Keep the **BRI Port** enabled.

Clear the **Enable Port** check box, only if you do not want to use this port. By default, it is enabled.

- You may assign a **Name** to the BRI Port for identification of the port. The Name may consist of a maximum of 12 characters. By default, it is blank.
- Set **Orientation Type** for BRI Port. You may select from the following options:
 - Terminal
 - Network
 - Tie Line

By default, Orientation Type is Terminal.

Orientation Type - Terminal

If you select **Terminal** as **Orientation Type**, configure the following:

- Enable **Power Feed** flag, if you want SARVAM UCS to feed power to the terminal equipment. By default, it is disabled.
- Select **Interface Type** as Point-to-Point or Point-to-Multipoint according to your installation. By default, it is Point-to-Multipoint.
- The **TEI Negotiation** mode will be set automatically as per the Interface Type selected for the BRI Port.
 - If the Point-to-Point is selected as the Interface Type, the **TEI Negotiation** will be set as **Fixed**.
 - You must also configure **TEI Negotiation Value (for Fixed Mode)**. TEI Value range is from 00 to 63. By default, it is 00. TEI Value of BRI (TE) port of SARVAM UCS should match with the TEI Value expected by the NT equipment at other end.
 - If Point-to-Multipoint is selected as the Interface Type, the **TEI Negotiation** will be set as **Auto**.

When you change the TEI mode on any port, the BRI Card will restart.

- You may configure the port to **Treat Incoming call as Trunk** or **Station**.

If you select **Trunk**, the system will treat all incoming calls as external calls landing on the trunk. The calls will be routed as per the **Trunk Feature Template** assigned to the BRI Port.

If you select **Station**, you must also assign a Station Basic Feature Template and Station Advanced Feature Template to the BRI Port.

When you select Station, the system will treat the calling party as an extension user. The user will have access to all the features and facilities of the system, as per the Station Basic Feature Template and Station Advanced Feature Template assigned to the BRI Port.

By default, Trunk is selected.

- *If Point-to-Point is selected as the Interface Type, you can select the option **Trunk** or **Station** for the parameter **Treat Incoming call as**.*
- *If Point-to-Multipoint is selected as the Interface Type, only **Station** can be set as the option for the parameter **Treat Incoming call as**.*
- *If **Station** is selected as the option for **Treat Incoming call as**, the user will only be able to:*
 - *Dial Flexible Numbers*
 - *Dial Operator Code*
 - *Dial Trunk Access Code for making outgoing calls*
 - *Access the Global Directory*
 - *Make calls within the Closed User Group*
- Different countries use specific type of ISDN switch. The type of switch determines various factors such as how many ISDN devices would be handled, which B-channel will support voice, video, data etc. Select **ISDN Switch Variant** supported by your country. You may select from the following options:
 - ATT_4ESS
 - ATT_5ESS

- AUSTRALIA
- AUTO CONFIG
- DMS_100
- ETSI_NET3
- NTT_INS64
- SWV_HONG_KONG
- US_NI1
- US_NI2
- VN_X

By default, it is ETSI_NET3.

- Configure **Outgoing (OG) Reference ID** for working hours, non-working hours and break hours. By default, OG Reference ID is 00.
- Configure **Incoming (IC) Reference ID** for working hours, non-working hours and break hours. By default, IC Reference ID is 00.
- Assign **Trunk Feature Template** to the BRI Port. Trunk Feature Template is a set of general features that define the behavior of a Trunk Port. By default, Template 01 is assigned to all BRI Ports.

For more details, see [“Trunk Feature Template”](#).

- Assign a **Cost Factor** to the BRI Port. By default, all the BRI Ports are assigned Cost Factor 01.

For more details, see [“Cost Factor”](#).

- **Station Basic Feature Template** assigned to the BRI Port is displayed in this field. Station Basic Feature Template is a set of general features that define the basic behavior of a station. By default, Template 01 is assigned to all BRI Ports.

For more details, see [“Station Basic Feature Template”](#).

- **Station Advanced Feature Template** assigned to the BRI Port is displayed in this field. Station Advanced Feature Template is a set of advanced features, to be applied on extensions such as CLIP, Floor Service, Walk-in Class of Service. By default, Template 01 is assigned to all BRI Ports.

For more details, see [“Station Advanced Feature Template”](#).

- If you have set **Terminal** as the **Orientation Type**, you must select the type of network with which the port is to be **Interfaced With**. Select the type of network from the following:

- Public ISDN
- Private ISDN

Default: Public ISDN

- If you want SARVAM UCS to display the called party number as the CLI for incoming calls, select the **Display Called Party Number as CLI** check box. By default, Display Called Party Number as CLI option is disabled.

This option is useful when a single BRI line connection and Operator are shared by more than one organization. If you enable this option, make sure:

- you configure the names and corresponding numbers of the organizations sharing the line in the Global Directory of SARVAM UCS.

- the Operator has a DKP or an Extended IP Phone or a Mobile UC Client.

With this option enabled the Operator will be able to handle calls more efficiently. When there is an incoming call, SARVAM UCS matches the number with the numbers in the Global Directory. If a match is found SARVAM UCS displays the company name configured for that entry to the Operator, that is, the CLI will display the called party number and name.

After the Operator answers the call, the CLI will change and display the calling party number and name (if configured in the Global Directory).

If you keep this option disabled, the calling party number and name will be displayed as the CLI, both during an incoming call and after the call is answered by the Operator.

You can configure the Display Called Party Number as CLI option only from Jeeves.

- Select the **Allow Incoming CLI Modification** check box if you want to apply 'Allow Incoming CLI Modification' on the BRI Port. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see [“Incoming CLI Modification”](#).

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*For an incoming call on the BRI trunk, the Incoming CLI Modification will be applied only when both — the **Allow Incoming CLI Modification** check box and the **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- Select **Layer 1 Mode** depending upon the type of line terminated on BRI port of SARVAM UCS.

The Public ISDN provides different types of lines in different countries as mentioned below:

- On Demand
- Always ON

In 'On Demand' type of line, layer 1 (physical layer) remains 'down' when the line is idle. When the network places incoming call, it activates the layer 1 and places the call. When the terminal makes outgoing call, the layer 1 gets activated automatically.

In 'Always ON' type of line, layer 1 is always 'up', in normal condition. By default, Layer 1 Mode is 'Always ON'.

When the system detects 'layer 1 down', it removes the unhealthy line from the OGTBG. If you have assigned a DSS Key to the BRI Port/channel, the faulty condition is indicated by LED indication.

DSS key LED behavior

When Layer 1 of BRI line is down or not connected, DSS key LED will glow 1 sec On and 3 sec Off in violet color.

If Layer 1 of BRI line is up, the DSS key LED will be turned off.

- SARVAM UCS uses the BRI Port to place call only if the layer 1 is 'up'. When layer 1 goes 'down', SARVAM UCS considers the line as un-healthy and will not use this BRI as destination port. SARVAM UCS will place the call using the alternate port programmed in the same routing group.
- The default Layer 1 Mode is 'Always ON'. Hence, if the interfaced line is of the type 'On Demand', the calls will not get routed through BRI port, unless the 'Layer 1 Mode' is changed to 'On Demand'.
- When the port is un-healthy, the SARVAM UCS routes the call using other healthy port. However, this depends upon the member selection method and other ports programmed in the OG Trunk Bundle Group (OGTBG). Refer chapter "[OG Trunk Bundle Group](#)" for more details.

- Select **Priority** for the BRI Port. Priority is the precedence given to certain trunks and extensions over others in being answered by the destination extension. You can select from 1 to 9. By default, Priority 5-Normal is set for all BRI Ports.
For know more about Priority feature, see "[Priority](#)".
- Select **Return Call to Original Caller (RCOC)** check box to enable this feature on the BRI Port. By default, RCOC flag is disabled.

For know more about RCOC feature, see "[RCOC \(Return Call to Original Caller\)](#)".

- Set **Overlap Receiving Timer** for BRI Port. This timer is relevant while receiving the called party number information in overlap receiving mode. By default, it is set to 15 seconds.
- When the SETUP Message is sent by SARVAM UCS to the network (ISDN exchange), the exchange responds by sending SETUP ACK (Acknowledgment), and dial tone is played to the caller. The time taken by the exchange to respond to the SETUP message may vary from exchange to exchange. Set the **SETUP Response Timer (sec)** as per the time taken by the network to respond to the SETUP message and play dial tone to the caller.

Valid Range of the timer is 01 to 20 seconds. By default it is set to 4 seconds.

Change the default settings only if required. If the time you set is less than the time taken by the exchange to respond, no dial tone will be played to the caller.

You can configure the SETUP Message Timer only from Jeeves.

- Configure **Idle Code** for the BRI Port. Range of Idle Code is from 000 to 255. By default, it is 127 (7F).

The binary equivalent of the configured value (000 to 255) is sent on the channel to signify that the channel is idle (or Used). This setting depends on the network. Most commonly applicable values are 7F and FF (Binary equivalent is 0111 1111 and 1111 1111, decimal equivalent is 127 and 255).

- Select the number of **Channels** to be **reserved** for **Data Communication**. Channel count is from 0 to 2. By default, number of channels reserved for Data Communication is 02.
- Select the number of **Channels** to be **reserved** for **Outgoing Calls**. Channel count is from 0 to 2. By default, number of channels reserved for Outgoing Calls is 02.
- Select the number of **Channels** to be **reserved** for **Incoming Calls**. Channel count is from 0 to 2. By default, number of channels reserved for Incoming Calls is 02.

- Select the required option for sending the **Caller- Type of Numbering Plan (TON)** from the following:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved

By default, Unknown is selected.

- Select the required option for sending the **Caller- Numbering Plan Identification (NPI)** from the following:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved

By default, ISDN Numbering is selected.

- Select the required option for sending the **Called-Type of Numbering Plan (TON)** from the following:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved

By default, Unknown is selected.

- Select the required option for sending the **Called-Numbering Plan Identification (NPI)** from the following:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved

By default, ISDN Numbering is selected.

- Select the **Screening Indicator** as provided to you by your exchange. You can select from:
 - User provided, not screened
 - User Provided, verified and passed
 - User Provided, verified and failed
 - Network Provided

By default, User provided, not screened.

- Select the **Bearer Service** supported by your service provider. You can select from:
 - Speech

- 3.1 KHz Audio

By default, Speech is selected.

- Configure **Call Budget** parameters for the BRI Ports. Call Budget is an expense control feature of SARVAM UCS that allows you to keep track of the cost of phone calls made from the BRI Port. By default, Call Budget is enabled. If you wish to change the default configuration or disable it for this BRI port, configure the parameters as per your requirement:
 - **Type:** Select the type of Call Budget, that is, Amount or Minutes or Calls to be applied on the BRI Port. By default, Minutes is selected as the Call Budget type. To disable select Type as None.
 - **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 999999.
 - **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set as 000300.
 - **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of Calls in this field. By default the number of calls is set to 9999.
 - **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes/Number of Calls to be reset on a particular date of every month.
 - **Scheduled (Date):** Select the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be reset every month. You may select 'Daily' if your plan suggests so.
- **Call Back:** This parameter is related to the 'Call Back on Trunk Port' feature. If you want to enable the 'Call Back on Trunk Port' feature on this BRI Port, configure the following parameters:
 - **Enable Call Back:** Enable this flag to activate the Call Back on Trunk Port feature. By default, this flag is disabled on all trunk port types. By default, the flag is disabled.
 - **Call Back Timer (sec):** This is the duration for which the system waits for the caller to disconnect before applying the Call Back. The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds.
 - **Call Back Mode:** Select from the following options how a 'Call Back' call answered by the remote party should be routed:
 - Built-in Auto Attendant
 - PIN Authentication - Multiple Calls
 - CLI Authentication - Multiple Calls
 - CLI Authentication - Single Call - Answer Signaling
 - Operator

By default, Operator is selected as the Call Back Mode.

- **Call Back on:** This parameter allows you to select if the call back should be made to the same number that was received or to a different number. If you want the call back to be made to the same number select the 'CLI number'. If you want the call back to be made to a different number, select 'Alternate Number'.

By default, CLI number is selected for Call Back.

- **Incoming Number List:** Program the number strings that are eligible for Call Back in this List. By default, Number List 15 is assigned to Call Back Incoming Number List.

Number List 15 is also assigned to all BRI Ports as well as all other Trunk port types. If you want the same numbers strings to be programmed commonly for all BRI Ports and Trunk Port types, retain this list.

If you want a different set of number strings to be programmed for this BRI Port, select a different Number List, and assign it to the BRI Port.

You may program the Incoming Number List either from the 'Number List' page or by clicking the 'Incoming Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Outgoing Number List:** Program the number strings that are to be called back in this List. For each number string you programmed in the 'Incoming Number List', you must program in the corresponding index in the Outgoing Number List a number to which the call back is to be made. For example, for the number string programmed at Index 1 in the Incoming Number List, a corresponding number string at the same Index, Index 1, should be programmed in the 'Outgoing Number List'.

By default, Number List 16 is assigned to Outgoing Number List. The same Number List 16 is also assigned to all BRI Ports as well as all other Trunk port types.

You may program the default number list, or a different number list and assign it to this BRI Port.

You may program the Outgoing Number List either from the 'Number List' page or by clicking the 'Outgoing Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Call Back from:** This parameter determines the trunk port to be used to make the call back. The call back can be made using the same port or an "[OG Trunk Bundle Group](#)".

Select 'Same Port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTB Group, the call back will be made using the OGTB Group, which you have defined.

By default, Same Port is selected.

- **OGTB Group:** If you selected OGTB Group for making the call back in the previous parameter, you must define the OGTB Group that must be used in this parameter.

By default, OGTB Group 01 is assigned.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTB Group that you define here for Call Back.

- Configure **Pause Timer** for the BRI Port. Range of Pause Timer is from 1 to 9 seconds. By default, it is set to 3 seconds for all BRI Ports.

This Timer is required to insert delay between the digits while dialing out DTMF digits on the BRI port. One of the applications for using this parameter is Multi-stage dialing. Refer chapter [“Multi-Stage Dialing”](#).

For example, if PPP2 is to be outdialed and Pause timer is programmed as 3 seconds, the SARVAM UCS will out dial the digit 2 after 9 seconds i.e delay of individual P i.e 3+3+3 =9.

- Configure **DTMF On Time** for the BRI Port. Range of DTMF On Time is from 051 to 255 ms. By default, it is set to 102 ms for all BRI Ports.

The DTMF On Time is the time for which the DTMF digit which is to be outdialed by the SARVAM UCS remain On. One of the applications for using this parameter is Multi-stage dialing. Refer chapter [“Multi-Stage Dialing”](#).

- Configure **DTMF Inter Digit Pause Timer** for the BRI Port. Range of Inter Digit Pause Timer is from 051 to 255 ms. By default, it is set to 102 ms for all BRI Ports.
Inter Digit Pause Timer is the time for which the system will wait while receiving the dialing digits to consider it as end-of-dialing.

- Select **Category (Logical Partition)** for the BRI Port. You may select from the following options:
 - 1
 - 2
 - 3
 - 4

By default, 1 is selected for all BRI Ports. Refer the feature description [“Logical Partition”](#) to know more.

- If SARVAM UCS is to be used as a Gateway, enable **Gateway Application-Answer Signaling** on the BRI Port and configure **DTMF String**. By default, Gateway Application-Answer Signaling is disabled and CCC is configured as DTMF String.

For more details, see [“Gateway Application-Answer Signaling”](#).

- Enter appropriate **Debug Code (Level 1 to 4)** to obtain debug information of various parts of BRI Card on the COM Port. By default, debug is off for all BRI Ports for all levels.

Code is the value for the specified level to turn ON the debug for the parameters. Code range is from 000 to 255. Code value '000' for each level will turn off that level's debug.

Level and Code for BRI Port are as specified below:

Level 1

Unused	Flow	NLS	LAP	SVC Primitives	Variables	State	Primitives
--------	------	-----	-----	----------------	-----------	-------	------------

Code	Meaning
001	Primitives
002	State
004	Variables
008	SVC Primitives
016	LAP
032	NLS

Code	Meaning
064	Flow Debug
000	Debug Off

Level 2

Unused	Unused	Unused	DTMF Digit	Unused	Layer 4	Unused	Unused
--------	--------	--------	------------	--------	---------	--------	--------

Code	Meaning
004	Layer 4
016	DTMF Digit
000	Debug Off

Level 3

Unused	Unused	Unused	HDLC D-Channel	Unused	Unused	Unused	Unused
--------	--------	--------	----------------	--------	--------	--------	--------

Code	Meaning
016	HDLC D-Channel
000	Debug Off

Level 4

Unused	Unused	Unused	Unused	Unused	Unused	OS Task	NI
--------	--------	--------	--------	--------	--------	---------	----

Code	Meaning
001	Network Interface (NI)
002	OS Task
000	Debug Off

Example:

- If '004' decimal value is entered as Debug Code for Level 1, then its binary equivalent '100' (0000100) indicates that debug for "Variables" will get enabled.

If "007" decimal value is entered as a Debug Code for the Level 1, then its binary equivalent "111" (00000111) indicates that debug for "Primitives", "States" and "Variables" will get enabled.

Orientation Type - Network

If you select Network as Orientation Type, configure the following:

- Select **BRI-NT Interface Type** as Point-to-Point or Point-to-Multipoint according to your installation. By default, it is Point-to-Multipoint.
- The **TEI Negotiation** mode will be set automatically as per the Interface Type selected for the BRI Port.

- If the Point-to-Point is selected as the Interface Type, the **TEI Negotiation** will be set as **Fixed**.
- You must also configure **TEI Negotiation Value (for Fixed Mode)**. TEI Value range is from 00 to 63. By default, it is 00. TEI Value configured in the BRI (NT) should match with the TEI Value configured in the Terminal Equipment connected with it.
- If the Point-to-Multipoint is selected as the Interface Type, the **TEI Negotiation** will be set as **Auto**.

When you change the TEI mode on any port, the BRI Card will reset.

- You may configure the port to **Treat Incoming call as Trunk** or **Station**.

If you select **Trunk**, the system will treat all incoming calls as external calls landing on the trunk. The calls will be routed as per the **Trunk Feature Template** assigned to the BRI Port.

If you select **Station**, you must also assign a Station Basic Feature Template and Station Advanced Feature Template to the BRI Port.

When you select Station, the system will treat the calling party as an extension user. The user will have access to all the features and facilities of the system, as per the Station Basic Feature Template and Station Advanced Feature Template assigned to the BRI Port.

By default, Trunk is selected.

- *If Point-to-Point is selected as the Interface Type, you can select the option **Trunk** or **Station** for the parameter **Treat Incoming call as**.*
- *If Point-to-Multipoint is selected as the Interface Type, only **Station** can be set as the option for the parameter **Treat Incoming call as**.*
- *If **Station** is selected as the option for **Treat Incoming call as**, the user will only be able to:*
 - *Dial Flexible Numbers*
 - *Dial Operator Code*
 - *Dial Trunk Access Code for making outgoing calls*
 - *Access the Global Directory*
 - *Make calls within the Closed User Group*
- Different countries use specific type of ISDN switch. The type of switch determines various factors such as how many ISDN devices would be handled, which B-channel will support voice, video, data etc. Select **ISDN Switch Variant** supported by your country. You may select from the following options:
 - ATT_4ESS
 - ATT_5ESS
 - AUSTRALIA
 - AUTO CONFIG
 - DMS_100
 - ETSI_NET3
 - NTT_INS64
 - SWV_HONG_KONG
 - US_NI1
 - US_NI2
 - VN_X

By default, it is ETSI_NET3.

- Configure **Outgoing (OG) Reference ID** for working hours, non-working hours and break hours. By default, OG Reference ID is 00.
- Configure **Incoming (IC) Reference ID** for working hours, non-working hours and break hours. By default, IC Reference ID is 00.
- Assign **Trunk Feature Template** to the BRI Port. Trunk Feature Template is a set of general features that define the behavior of a Trunk Port. By default, Template 01 is assigned to all BRI Ports. For more details, see [“Trunk Feature Template”](#).
- Assign a **Cost Factor** to the BRI Port. By default, all the BRI Ports are assigned Cost Factor 01.

For more details, see [“Cost Factor”](#).

- **Station Basic Feature Template** assigned to the BRI Port is displayed in this field. Station Basic Feature Template is a set of general features that define the basic behavior of a station. By default, Template 01 is assigned to all BRI Ports.

For more details, see [“Station Basic Feature Template”](#).

- **Station Advanced Feature Template** assigned to the BRI Port is displayed in this field. Station Advanced Feature Template is a set of advanced features, to be applied on extensions such as CLIP, Floor Service, Walk-in Class of Service. By default, Template 01 is assigned to all BRI Ports.

For more details, see [“Station Advanced Feature Template”](#).

- If you want SARVAM UCS to display the called party number as the CLI for incoming calls, select the **Display Called Party Number as CLI** check box. By default, Display Called Party Number as CLI option is disabled.

This option is useful when a single BRI line connection and Operator are shared by more than one organization. If you enable this option, make sure:

- you configure the names and corresponding numbers of the organizations sharing the line in the Global Directory of SARVAM UCS.
- the Operator has a DKP or an Extended IP Phone or a Mobile UC Client.

With this option enabled the Operator will be able to handle calls more efficiently. When there is an incoming call, SARVAM UCS matches the number with the numbers in the Global Directory. If a match is found SARVAM UCS displays the company name configured for that entry to the Operator, that is, the CLI will display the called party number and name.

After the Operator answers the call, the CLI will change and display the calling party number and name (if configured in the Global Directory).

If you keep this option disabled, the calling party number and name will be displayed as the CLI, both during an incoming call and after the call is answered by the Operator.

You can configure the Display Called Party Number as CLI option only from Jeeves.

- Select the **Allow Incoming CLI Modification** check box if you want to apply 'Allow Incoming CLI Modification' on the BRI Port. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see [“Incoming CLI Modification”](#).

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*The Incoming CLI Modification will be applied only when both — **Allow Incoming CLI Modification** check box and **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- Select **Layer 1 Mode** depending upon the type of line terminated on BRI port of SARVAM UCS.

The Public ISDN provides different types of lines in different countries as mentioned below:

- On Demand
- Always ON

In 'On Demand' type of line, layer 1 (physical layer) remains 'down' when the line is idle. When the network places incoming call, it activates the layer 1 and places the call. When the terminal makes out going call, the layer 1 gets activated automatically.

In 'Always ON' type of line, layer 1 is always 'up', in normal condition. In this type of line, 'layer 1 down' indicates fault condition and calls get failed.

By default, Layer 1 Mode is 'Always ON'.

- *When Layer 1 mode is set as 'Always ON', the SARVAM UCS uses this BRI to place call only if the layer 1 is 'up'. When layer 1 goes 'down', SARVAM UCS considers the line as un-healthy and will not use this BRI as destination port. SARVAM UCS will place the call using the alternate port programmed in the same routing group.*
- *When Layer 1 mode is set as 'On Demand', SARVAM UCS will not check the Layer 1 condition while placing call through this BRI.*
- *The default Layer 1 Mode is 'Always ON'. Hence, if the interfaced line is of the type 'On Demand', the calls will not get routed through BRI port, unless the 'Layer 1 Mode' is changed to 'On Demand'.*
- *When the port is un-healthy, the SARVAM UCS routes the call using other healthy port. However, this depends upon the member selection method and other ports programmed in the OG Trunk Bundle Group (OGTBG). Refer chapter [“OG Trunk Bundle Group”](#) for more details.*
- Select **Priority** for the BRI Port. Priority is the precedence given to certain trunks and extensions over others in being answered by the destination extension. You can select from 1 to 9. By default, Priority 5-Normal is set for all BRI Ports.

For know more about Priority feature, see [“Priority”](#).

- Select **Return Call to Original Caller (RCOC)** check box to enable this feature on the BRI Port. By default, RCOC flag is disabled.

For know more about RCOC feature, see [“RCOC \(Return Call to Original Caller\)”](#).

- Set **Overlap Receiving Timer** for BRI Port. This timer is relevant while receiving the called party number information in overlap receiving mode. By default, it is set to 15 seconds.
- When the SETUP Message is sent by SARVAM UCS to the network (ISDN exchange), the exchange responds by sending SETUP ACK (Acknowledgment), and dial tone is played to the caller. The time taken by the exchange to respond to the SETUP message may vary from exchange to exchange. Set the **SETUP Response Timer (sec)** as per the time taken by the network to respond to the SETUP message and play dial tone to the caller.

Valid Range of the timer is 01 to 20 seconds. By default it is set to 4 seconds.

Change the default settings only if required. If the time you set is less than the time taken by the exchange to respond, no dial tone will be played to the caller.

You can configure the SETUP Message Timer only from Jeeves

- Configure **Idle Code** for the BRI Port. Range of Idle Code is from 000 to 255. By default, it is 127 (7F).

The binary equivalent of the configured value (000 to 255) is sent on the channel to signify that the channel is idle (or Used). This setting depends on the network. Most commonly applicable values are 7F and FF (Binary equivalent is 0111 1111 and 1111 1111, decimal equivalent is 127 and 255).

- Select the number of **Channels** to be **reserved** for **Data Communication**. Channel count is from 0 to 2. By default, number of channels reserved for Data Communication is 02.
- Select the number of **Channels** to be **reserved** for **Outgoing Calls**. Channel count is from 0 to 2. By default, number of channels reserved for Outgoing Calls is 02.
- Select the number of **Channels** to be **reserved** for **Incoming Calls**. Channel count is from 0 to 2. By default, number of channels reserved for Incoming Calls is 02.
- Select the required option for sending the **Caller- Type of Numbering Plan (TON)** from the following:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved

By default, Unknown is selected.

- Select the required option for sending the **Caller- Numbering Plan Identification (NPI)** from the following:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved

By default, ISDN Numbering is selected.

- Select the required option for sending the **Called-Type of Numbering Plan (TON)** from the following:
 - Unknown
 - International
 - National
 - Network Specific
 - Subscriber
 - Abbreviated
 - Reserved

By default, Unknown is selected.

- Select the required option for sending the **Called-Numbering Plan Identification (NPI)** from the following:
 - Unknown
 - ISDN Numbering
 - Data Numbering
 - Telex Numbering
 - National Numbering
 - Private
 - Reserved

By default, ISDN Numbering is selected.

- Select the **Bearer Service** supported by your service provider. You can select from:
 - Speech
 - 3.1 KHz Audio

By default, Speech is selected.

- Configure **Call Budget** parameters for the BRI Ports. Call Budget is an expense control feature of SARVAM UCS that allows you to keep track of the cost of phone calls made from the BRI Port.
 - **Type:** Select the type of Call Budget, that is, Amount or Minutes or Calls to be applied on the BRI Port. By default, no Call Budget type is selected.
 - **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 999999.
 - **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set to 999999.
 - **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of Calls in this field. By default the number of calls is set to 9999.
 - **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes/Number of Calls to be reset on a particular date of every month.
 - **Scheduled (Date):** Select the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be reset every month. You may select 'Daily' if your plan suggests so.
- Configure **Call Back** parameters for the BRI Ports. Call Back is used to respond to missed calls from particular numbers on the BRI Port.

- **Enable Call Back:** Enable this flag to activate the Call Back on Trunk Port feature. By default, the flag is disabled.
- **Call Back Timer (sec):** This is the duration for which the system waits for the caller to disconnect before applying the Call Back. The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds.
- **Call Back Mode:** From the following options select how a 'Call Back' call answered by the remote party should be routed:
 - Built-in Auto Attendant
 - PIN Authentication - Multiple Calls
 - CLI Authentication - Multiple Calls
 - CLI Authentication - Single Call - Answer Signaling
 - Operator

By default, Operator is selected as the Call Back Mode.

- **Call Back on:** This parameter allows you to select if the call back should be made to the same number that was received or to a different number. If you want the call back to be made to the same number select the 'CLI number'. If you want the call back to be made to a different number, select 'Alternate Number'.

By default, CLI number is selected for Call Back.

- **Incoming Number List:** Program the number strings that are eligible for Call Back in this List. By default, Number List 15 is assigned to Call Back Incoming Number List. Number List 15 is also assigned to all the BRI Ports as well as all other Trunk port types. If you want the same numbers strings to be programmed commonly for all the BRI Ports and Trunk Port types, retain this list.

If you want a different set of number strings to be programmed for this CO Trunk, select a different Number List, and assign it to the CO trunk port.

You may program the Incoming Number List either from the 'Number List' page or by clicking the 'Incoming Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Outgoing Number List:** Program the number strings that are to be called back in this List. For each number string you programmed in the 'Incoming Number List', you must program in the corresponding index in the Outgoing Number List a number to which the call back is to be made. For example, for the number string programmed at Index 1 in the Incoming Number List, a corresponding number string at the same Index, Index 1, should be programmed in the 'Outgoing Number List'.

By default, Number List 16 is assigned to Outgoing Number List. The same Number List 16 is also assigned to all BRI Ports as well as all other Trunk port types.

You may program the default number list, or a different number list and assign it to this BRI port.

You may program the Outgoing Number List either from the 'Number List' page or by clicking the 'Outgoing Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Call Back from:** This parameter determines the trunk port to be used to make the call back. The call back can be made using the same port or an [“OG Trunk Bundle Group”](#).

Select 'Same port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTBG, the call back will be made using the OGTBG, which you have defined.

By default, Same port is selected.

- **OGTB Group:** If you selected OGTBG for making the call back in the previous parameter, you must define the OGTBG that must be used in this parameter.
By default, OGTBG 01 is assigned.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTBG that you define here for Call Back.

- Configure **Pause Timer** for the BRI Port. Range of Pause Timer is from 1 to 9 seconds. By default, it is set to 3 seconds for all BRI Ports.

This Timer is required to insert delay between the digits while dialing out DTMF digits on the BRI port. One of the applications for using this parameter is Multi-stage dialing. Refer chapter [“Multi-Stage Dialing”](#).

For example, if PPP2 is to be outdialed and Pause timer is programmed as 3 seconds, the SARVAM UCS will out dial the digit 2 after 9 seconds i.e delay of individual P i.e $3+3+3 = 9$.

- Configure **DTMF On Time** for the BRI Port. Range of DTMF On Time is from 051 to 255 ms. By default, it is set to 102 ms for all BRI Ports.

The DTMF On Time is the time for which the DTMF digit which is to be outdialed by the SARVAM UCS remain On. One of the applications for using this parameter is Multi-stage dialing. Refer chapter [“Multi-Stage Dialing”](#).

- Configure **DTMF Inter Digit Pause Timer** for the BRI Port. Range of Inter Digit Pause Timer is from 051 to 255 ms. By default, it is set to 102 ms for all BRI Ports.

Inter Digit Pause Timer is the time for which the system will wait while receiving the dialing digits to consider it as end-of-dialing.

- Select **Category (Logical Partition)** for the BRI Port. You may select from the following options:
 - 1
 - 2
 - 3

By default, 1 is selected for all BRI Ports.

- If SARVAM UCS is to be used as a Gateway, enable **Gateway Application-Answer Signaling** on the BRI Port and configure **DTMF String**. By default, Gateway Application-Answer Signaling is disabled and CCC is configured as DTMF String.

For more details, see [“Gateway Application-Answer Signaling”](#).

- Enter appropriate **Debug Code (Level 1 to 4)**, to obtain debug information of various parts of BRI Card on the COM Port. By default, debug is off for all BRI ports for all levels.

Code is the value for the specified level to turn ON the debug for the parameters. Code range is from 000 to 255. Code value '000' for each level will turn off that level's debug.

Level and Code for BRI Port are as specified below:

Level 1

Unused	Flow	NLS	LAP	SVC Primitives	Variables	State	Primitives
--------	------	-----	-----	----------------	-----------	-------	------------

Code	Meaning
001	Primitives
002	State
004	Variables
008	SVC Primitives
016	LAP
032	NLS
064	Flow Debug
000	Debug Off

Level 2

Unused	Unused	Unused	DTMF Digit	Unused	Layer 4	Unused	Unused
--------	--------	--------	------------	--------	---------	--------	--------

Code	Meaning
004	Layer 4
016	DTMF Digit
000	Debug Off

Level 3

Unused	Unused	Unused	HDLC D-Channel	Unused	Unused	Unused	Unused
--------	--------	--------	----------------	--------	--------	--------	--------

Code	Meaning
016	HDLC D-Channel
000	Debug Off

Level 4

Unused	Unused	Unused	Unused	Unused	Unused	OS Task	NI
--------	--------	--------	--------	--------	--------	---------	----

Code	Meaning
001	Network Interface (NI)

Code	Meaning
002	OS Task
000	Debug Off

Configuring BRI Parameters using Commands

The commands explained below should be referred as:
To program a single port: XXXX-1
To program a range of ports: XXXX-2
To program all the ports: XXXX-*

Hardware Slot-Port

Use following command to assign hardware ID to a BRI software port:

1106-BRI-Slot-Port offset

Where,

BRI is from 01 to 32.

Slot is the number of the universal slot, where the BRI Card is installed, from 01 to 16.

Port is the number of the BRI port on the card, from 00 to 99.

Use following command to de-assign the hardware slot and the hardware port assigned to the BRI software port.

1106-BRI-00-00

Name

Use following command to assign a name to the BRI port:

5405-1-BRI-Name

5405-2-BRI-BRI-Name

5405-*-Name

Where,

BRI is from 01 to 32.

Name is an alpha-numeric string of 12 characters. Terminate the command with #*.

By default, Name field is Blank.

Enable BRI Port

This parameter is used to enable/disable the port. When the Port configured in TE mode is disabled, it will not be allotted to the user on grabbing the port. Instead the user will get error tone. Also no IC call will be allowed.

Likewise, when the port is configured in NT mode is disabled, the IC call will not be allowed to land on this port. The port will be treated as absent and accordingly other activities will be performed like routing the call to other stations in the group, etc.

Use following command to enable/disable BRI port:

6201-1-BRI-Flag

6201-2-BRI-BRI-Flag

6201-*-Flag

Where,

BRI is from 01 to 32.

Flag is 0 for disable, 1 for enable.

By default, the BRI Port is enabled.

Orientation Type

Use following command to program Orientation Type for the BRI port:

6204-1-BRI-Orientation Type

6204-2-BRI-BRI-Orientation Type

6204-*-Orientation Type

Where,

Orientation Type	Meaning
1	Terminal
2	Network
3	Tie Line

By default Type = 1.

When Orientation=Terminal, the port will be regarded as trunk. All the trunk related parameters will be applied.

When Orientation=Network, the port will be regarded as station. All the station related parameters will be applied.

When Orientation = Tie-line, the port will be regarded as station for all incoming calls on it and as a trunk for all outgoing calls made through it.

Power Feed

Use following command to Feed Power to the BRI port:

6227-1- BRI Port- Feed Power to Port

6227-2- BRI Port-BRI Port- Feed Power to Port

6227-*- Feed Power to Port

Where,

BRI Port is from 01 to 32

Feed Power to port is 0 for disable, 1 for enable.

Default it is disabled.

BRI NT Interface Type

This parameter is relevant only when BRI port is used as Network Interface, i.e BRI NT mode.

Use the following command to select the Interface type as Point-to-Point or Point-to-Multipoint:

6226-1-BRI - Interface Type

6226-2-BRI-BRI-Interface Type

6226-*-Interface Type

Where,

Interface Type is

1 for Point-to-Point

2 for Point-to-Multipoint

Default =Point to Point

When ISDN Phones are to be connected with BRI NT of the SARVAM UCS, this parameter should be set as 'Point to Multipoint'.

When an ISDN System is to be interfaced with BRI-NT of the SARVAM UCS, this parameter should be set as 'Point to Point'.

BRI ISDN Switch Variant

Use following command to program the ISDN BRI Switch Variant of the BRI port:

6203-1-BRI-ISDN BRI Switch Variant

6203-2-BRI-BRI-ISDN BRI Switch Variant

6203-*-ISDN BRI Switch Variant

Where,

BRI is from 01 to 32.

ISDN BRI Variant	Meaning
01	ATT_4ESS
02	ATT_5ESS
03	AUSTRALIA
04	AUTO CONFIG
05	DMS_100
06	ETSI_NET3
07	NTT_INS64
08	SWV_HONG_KONG
09	US_NI1
10	US_NI2
11	VN_X

By default, ISDN BRI Switch Variant is 06.

OG Reference ID-WH

Use following command to program an OG Reference ID to a BRI port:

6231-1-BRI-OG Reference ID

6231-2-BRI-BRI-OG Reference ID

6231-*-OG Reference ID

Where,

BRI is from 01 to 32.

OG Reference ID is from 00 or 01 to 99.

By default, OG Reference ID for BRI is 00.

This command is significant only if the BRI port is configured in TE mode.

OG Reference ID-BH

Use following command to program an OG Reference ID to a BRI port:

6241-1-BRI-OG Reference ID

6241-2-BRI-BRI-OG Reference ID

6241-*-OG Reference ID

Where,

BRI is from 01 to 32.

OG Reference ID is from 00 or 01 to 99.

By default, OG Reference ID for BRI is 00.

OG Reference ID-NH

Use following command to program an OG Reference ID to a BRI port:

6242-1-BRI-OG Reference ID

6242-2-BRI-BRI-OG Reference ID

6242-*-OG Reference ID

Where,

BRI is from 01 to 32.

OG Reference ID is from 00 or 01 to 99.

By default, OG Reference ID for BRI is 00.

This command is significant only if the BRI port is configured in TE mode.

IC Reference ID-WH

Use following command to program an IC Reference ID-WH on the BRI port:

6232-1-BRI-IC Reference ID

6232-2-BRI-BRI-IC Reference ID

6232-*-IC Reference ID

Where,

BRI is from 01 to 32.

IC Reference ID is from 01 to 99.

By default, IC Reference ID-WH for BRI is 00.

This command is significant only if the BRI port is configured in TE mode.

IC Reference ID-BH

Use following command to program an IC Reference ID-BH on the BRI port:

6233-1-BRI-IC Reference ID

6233-2-BRI-BRI-IC Reference ID

6233-*-IC Reference ID

Where,

BRI is from 01 to 32.

IC Reference ID is from 00 or 01 to 99.

By default, IC Reference ID-BH for BRI is 00.

This command is significant only if the BRI port is configured in TE mode.

IC Reference ID-NH

Use following command to program an IC Reference ID-NH on the BRI port:

6234-1-BRI-IC Reference ID

6234-2-BRI-BRI-IC Reference ID

6234-*-IC Reference ID

Where,

BRI is from 01 to 32.

IC Reference ID is from 00 or 01 to 99.

By default, IC Reference ID-NH for BRI is 00.

This command is significant only if the BRI port is configured in TE mode.

Trunk Feature Template

Use the following command to assign a Trunk feature Template to the BRI Port:

5804-1-BRI- Trunk Feature Template Number
5804-2-BRI-BRI- Trunk Feature Template Number.
5804-*- Trunk Feature Template Number.

Where,

BRI is from 01 to 32.

Template Number is the number of the customized Trunk Feature Template, from 01 to 50. Default: Template 01.

Cost Factor

Use following command to assign a Cost Factor to the BRI port:

6202-1-BRI-SP

6202-2-BRI-BRI-SP

6202-*-SP

Where,

BRI is from 01 to 32.

Cost Factory is from 01 to 99.

By default, all the BRI ports are assigned Cost Factor = 01.

This parameter is insignificant when BRI port is configured in NT mode.

Station Basic Feature Template

Use the following command to assign a Station Basic Feature Template to a BRI port:

5509-1-BRI-Template Number

5509-2-BRI-BRI-Template Number.

5509-*-Template Number

Where,

BRI is from 01 to 32.

Template is the number of the Station Basic Feature Template, from 01 to 50.

Default: Template 01 is assigned to all BRI ports.

Station Advanced Feature Template

Use the following command to assign a Station Advanced Feature Template to a BRI port:

5609-1-BRI-Template Number

5609-2-BRI-BRI-Template Number

5609-*-Template Number

Where,

BRI is from 01 to 32.

Template is the number of the Station Advanced Feature Template, from 01 to 50.

Default: Template 01 is assigned to all BRI ports.

Layer 1 Mode

- This parameter is applicable for BRI port, when orientation type is 'Terminal'.
- The Public ISDN provides different types of lines in different countries as mentioned below:
 - On Demand
 - Always ON
- In 'On Demand' type of line, layer 1 (physical layer) remains 'down' when the line is idle.
- When the network places incoming call, it activates the layer 1 and places the call.

- When the terminal makes out going call, the layer 1 gets activated automatically.
- In 'Always ON' type of line, layer 1 is always 'up', in normal condition.
- In this type of line, 'layer 1 down' indicates fault condition and calls get failed.

Use following command to program 'Layer 1 Mode' for BRI port:

6225-1-BRI-Layer 1 Mode

Where,

BRI is from 01 to 32.

Layer 1 Mode	Meaning
1	Always ON
2	On Demand

Select the 'Layer 1 Mode' parameter, depending upon the type of line, terminated on BRI port of SARVAM UCS.

By default, Layer 1 Mode is 'Always ON'.

TEI Negotiation

SE can select the Automatic or Fixed TEI negotiation for each BRI port as required. If Fixed TEI negotiation is selected, the value of fixed TEI negotiation is required to be programmed.

Use following command to select TEI Negotiation on a BRI port:

6238-1-BRI-TEI Negotiation Mode

6238-2-BRI-BRI-TEI Negotiation Mode

6238-*-TEI Negotiation Mode

Where,

BRI is from 00 to 32.

TEI Negotiation mode	Meaning
0	Automatic (Non-fixed)
1	Fixed

By default, TEI Negotiation Mode is Automatic.

TEI Value (for Fixed Mode)

Use following command to program TEI Negotiation value when programmed as Fixed:

6239-1-BRI-TEI Value

6239-2-BRI -BRI-TEI Value

6239-*-TEI Value

Where,

BRI is from 00 to 32.

TEI Value is from 00 to 63

By default, TEI Value is 00.

The System Engineer should take care of the following points when using the above commands for TEI negotiation:

- When you change the TEI mode on any port, the BRI Card will get reset.

- If you have selected 'Fixed' mode, program the value as per the value of port connected at remote end as explained below:
 - TEI Value programmed in the BRI (NT) should match with the TEI value programmed in the Terminal equipment connected with it.
 - TEI value of BRI (TE) port of SARVAM UCS should match with the TEI value expected by the NT equipment at other end.

Priority

This command is applicable when BRI port is configured to act as a station.

Use following command to assign priority to BRI:

3916-1-BRI-Priority

3916-2-BRI-BRI-Priority

3916-*-Priority

Where,

BRI is from 01 to 32

Priority is from 1 to 9

By default, Priority for BRI is 5-Normal.

Return Call to Original Caller (RCOC)

Use the following command to enable RCOC on BRI trunk:

6220-1-BRI-Code

6220-2-BRI-BRI-Code

6220-*-Code

Where,

BRI is from 01 to 32.

Code is

0 for Disable

1 for Enable

Default: Disabled

Overlap Receiving Timer

Use following command to set overlap receiving timer for BRI:

6208-1-BRI-Timer

6208-2-BRI-BRI-Timer

6208-*-Timer

Where,

BRI is from 01 to 32

Timer is from 00 to 99 seconds.

Default: 15 seconds.

This timer is relevant while receiving the called party number information in overlap receiving mode. It is not relevant for overlap sending mode.

Idle Code

Use following command to program the Idle Code for the BRI port:

6207-1-BRI-Idle Code

6207-2-BRI-BRI-Idle Code

6207-*-Idle Code

Where,

BRI is from 01 to 32.

Idle Code is from 000 to 255.

The binary equivalent of the programmed value (000 to 255) is sent on the channel to signify that the channel is idle. (or Unused) This setting depends on the network. Most commonly applicable values are 7F and FF (Binary equivalent is 0111 1111 and 1111 1111, decimal equivalent is 127 and 255).

Default: Idle Code for the BRI port is 127 (7F).

Channel Reserved for Data Communication

Use the following command to program number of channels reserved for data transmission:

6235-1-BRI-Channel Count

6235-2-BRI-BRI-Channel Count

6235-*-Channel Count

Where,

BRI is from 01 to 32.

Channel Count is from 00 to 02.

By default, Number of Channels is 02.

Channels Reserved for OG Calls

Use following command to reserve the number of channels for OG calls on a BRI port.

6236-1-BRI-Channel Count

6236-2-BRI-BRI-Channel Count

6236-*-Channel Count

Where,

BRI is from 01 to 32.

Channel Count is from 0 to 2.

By default, Channel is reserved for OG Calls for BRI is 2. Both the channels are used for receiving OG calls.

Channels reserved for IC Calls

Use following command to reserve the number of channels for IC calls on a BRI port.

6237-1-BRI-Channel Count

6237-2-BRI-BRI-Channel Count

6237-*-Channel Count

Where,

BRI is from 00 to 32.

Channel Count is from 0 to 2.

By default, Channel is reserved for IC Calls for BRI is 2. Both the channels are used for receiving IC calls.

Caller - Type of Number (TON)

Use following command to program a Caller TON for the BRI port:

6221-1-BRI-Caller TON

6221-2-BRI-BRI-Caller TON

6221-*-Caller TON

Where,

BRI is from 01 to 32.

Caller TON	Meaning
1	Unknown
2	International Number

Caller TON	Meaning
3	National Number
4	Network Specific Number
5	Subscriber Number
6	Abbreviated Number
7	Reserved Number

By default, Caller TON for BRI is Unknown.

Caller Numbering Plan Identification (NPI)

Use following command to program a Caller NPI for the BRI port:

6222-1-BRI-Caller NPI

6222-2-BRI-BRI-Caller NPI

6222-*-Caller NPI

Where,

BRI is from 01 to 32.

Caller NPI	Meaning
1	Unknown
2	ISDN Numbering
3	Date Numbering
4	Telex Numbering
5	National Numbering
6	Private
7	Reserved

By default, Caller NPI for BRI is ISDN Numbering.

Called - Type of Number (TON)

Use following command to program a Called Party destination TON for the BRI port:

6223-1-BRI-Called Party TON

6223-2-BRI-BRI-Called Party TON

6223-*-Called Party TON

Where,

BRI is from 01 to 32.

Called Party TON	Meaning
1	Unknown
2	International Number
3	National Number
4	Network Specific Number
5	Subscriber Number
6	Abbreviated Number

Called Party TON	Meaning
7	Reserved Number

By default, Called Party TON for BRI is Unknown.

Called Numbering Plan Identification (NPI)

Use following command to program a Called Party NPI for the BRI port:

6224-1-BRI-Called Party NPI

6224-2-BRI-BRI-Called Party NPI

6224-* -Called Party NPI

Where,

BRI is from 01 to 32.

Called Party NPI	Meaning
1	Unknown
2	ISDN Numbering
3	Date Numbering
4	Telex Numbering
5	National Numbering
6	Private
7	Reserved

By default, Called Party NPI for BRI is ISDN Numbering.

Call Budget

Refer the topic [“Call Budget on Trunk”](#) for command strings.

Call Back

Use the following commands to program Call Back on BRI Trunk ports. To know more about this feature, refer the topic Call Back on Trunk Ports.

To enable/disable Call Back on BRI port:

6242-1-BRI- Call Back Flag

6242-2-BRI-BRI-Call Back Flag

6242- * - Call Back Flag

Where,

BRI is from 01 to 32

Call Back Flag	Meaning
0	Disable
1	Enable

By default, Call Back flag is disabled.

To program Call Back Timer for BRI port:

6243-1-BRI-Call Back Timer

6243-2-BRI-BRI-Call Back Timer

6243-*-Call Back Timer

Where,

BRI is from 01 to 32

Pause Timer Range is from 01 to 99 Sec.

By default, Pause Timer is 10 Seconds

To program Call Back Mode on BRI port:

6244-1-BRI-Call Back Mode

6244-2-BRI-BRI-Call Back Mode

6244-*-Call Back Mode

Where,

BRI is from 01 to 32

Call Back Mode is 1 to 5

Call Back Mode	Meaning
1	Built-in Auto Attendant
2	PIN Auth. - Multiple Calls
3	CLI Auth. - Multiple Calls
4	CLI Auth. - Single Call - Ans. Sig.
5	Operator

By default, Call Back mode is Operator.

To program Call Back On method for BRI port:

6245-1-BRI-Call Back on selection

6245-2-BRI-BRI-Call Back on selection

6245-*-Call Back on selection

Where,

BRI is from 01 to 32

Call back on selection is

Call Back on	Meaning
1	CLI Number
2	Alternate Number

By default, Call Back on selection is CLI Number

To assign Call Back - Incoming Number List to a BRI port:

6246-1-BRI-Incoming Number List

6246-2-BRI-BRI-Incoming Number List

6246-*-Incoming Number List

Where,

BRI is from 01 to 32

Incoming Number List is from 01 - 16.

By default, Incoming Number List is 15.

To assign a Call Back - Outgoing Number List to a BRI port:

6247-1-BRI-Outgoing Number List

6247-2-BRI-BRI-Outgoing Number List

6247-*-Outgoing Number List

Where,

BRI is from 01 to 32

Outgoing Number List is from 01 - 16.

By default, Outgoing Number List is 16.

To define Call Back From for a BRI port:

6248-1-BRI-Call Back From

6248-2-BRI-BRI-Call Back From

6248-*-Call Back From

Where,

BRI is from 01 to 32

Call Back From is

1 for Same Port

2 for OGTB Group

By default, Same Port is selected as Call Back From.

To assign a Call Back - OGTB Group for a BRI port:

6249-1-BRI-OGTB Group

6249-2-BRI-BRI-OGTB Group

6249-*-OGTB Group

Where,

BRI is from 01 to 32

OGTB Group is from 01 to 32

By default, OGTBG is 01.

Pause Timer

Use following command to program Pause Timer:

6209-1-BRI- Pause Timer

6209-2-BRI-BRI-Pause Timer

6209- * - Pause Timer

Where,

BRI is from 01 to 32

Pause Timer is from 1 to 9 seconds

By default, Pause Timer is 3 seconds.

This Timer is used to provide delay for the number dialing by the BRI port. Pause timer will be applicable when any 'P' digit is configured in the DTMF number string which is to be outdialed as DTMF digits on BRI port. One of the applications for using this parameter is Multi-stage dialing. Refer chapter "[Multi-Stage Dialing](#)".

For example, if PPP2 is to be outdialed and Pause timer is programmed as 3 seconds, the SARVAM UCS will out dial the digit 2 after 9 seconds i.e delay of individual P i.e 3+3+3 =9.

DTMF ON Time (msec)

Use following command to program DTMF ON Time:

6210-1-BRI-DTMF ON Time

6210-2-BRI-BRI-DTMF ON Time

6210-*-DTMF ON Time

Where,

BRI is from 01 to 32

DTMF ON Time is from 051 to 255 msec.

By default, DTMF ON Time is 102 msec.

This parameter decides for how much time the DTMF digit will be ON, while out dialed by the SARVAM UCS. One of the applications for using this parameter is Multi-stage dialing. Refer chapter [“Multi-Stage Dialing”](#).

DTMF Inter digit Pause Timer

Use following command to program DTMF Inter digit Pause Timer:

6211-1-BRI- DTMF Inter digit Pause Time

6211-2-BRI-BRI- DTMF Inter digit Pause Time

6211-*-DTMF Inter digit Pause Time

Where,

BRI is from 01 to 32

DTMF Inter digit Pause Time is from 051 to 255 msec.

By default, DTMF Inter digit Pause Time is 102 msec.

This parameter decides how much time the pause (gap) should be present between two digits while dialed by the SARVAM UCS. One of the applications for using this parameter is Multi-stage dialing. Refer chapter [“Multi-Stage Dialing”](#).

Category (Logical Partition)

Use the following command to program 'Category (Logical Partition)' for BRI port:

6213-1-BRI- Category

6213-2-BRI-BRI- Category

6213-*-Category

Where,

BRI is from 01 to 32

Category is from 1 to 3.

1 for CO

2 for Leased

3 for Private.

By default, Category is CO.

Gateway Application-Answer Signaling

This command is used to enable Gateway Application-Answer Signaling on BRI trunk. Refer chapter [“Gateway Application-Answer Signaling”](#) for more details.

Use following command to set flag for Gateway Application-Answer Signaling on BRI trunk:

6206-1-BRI-Gateway Application-Answer Signaling Flag

6206-2-BRI-BRI-Gateway Application-Answer Signaling Flag

6206-*-Gateway Application-Answer Signaling Flag

Where,

BRI is from 01 to 32

Flag	Meaning
0	Disable
1	Enable

By default, Gateway Application-Answer Signaling Flag is 'disable'.

Use following command to program DTMF digits string to be dialed as Gateway Application-Answer Signaling:

6212-1-BRI-Gateway Application-Answer Signaling DTMF String

6212-2-BRI-BRI-Gateway Application-Answer Signaling DTMF String

6212-*-Gateway Application-Answer Signaling DTMF String

Where,

BRI is from 01 to 32.

DTMF Digits allowed for DTMF string are from (0 - 9), *, #, A, B, C, D.

Maximum 4 DTMF digits can be programmed. If you need less than 4 digits for DTMF string, terminate the command using #*.

To program #, *, A, B, C, D use following codes:

Digit	Code for programming through command
A	#4
B	#5
C	#6
D	#7
*	**
#	##

By default, Gateway Application-Answer Signaling DTMF String is 'CCC'.

Debug Code

Debug information of various parts of the card can be obtained on the COM port of the card.

Use following command to get appropriate debug information for the BRI port:

6291-1-BRI-Level-Code

6291-2-BRI-BRI-Level-Code

6291-*-Level-Code

Where,

BRI is from 01 to 32.

Level is from 1 to 4 (As shown below).

Code is the value for the specified level to turn ON the debug for the parameters Code range = 000 to 255. Code value '000' for each level will turn off that level's debug.

Level and Code for BRI port are as specified below:

Level 1

Unused	Flow	NLS	LAP	SVC Primitives	Variables	State	Primitives
--------	------	-----	-----	----------------	-----------	-------	------------

Code	Meaning
001	Primitives
002	State
004	Variables
008	SVC Primitives
016	LAP
032	NLS
064	Flow Debug

Code	Meaning
000	Debug Off

Level 2

Unused	Unused	Unused	DTMF Digit	Unused	Layer 4	Unused	Unused
--------	--------	--------	------------	--------	---------	--------	--------

Code	Meaning
004	Layer 4
016	DTMF Digit
000	Debug Off

Level 3

Unused	Unused	Unused	HDLC D-Channel	Unused	Unused	Unused	Unused
--------	--------	--------	----------------	--------	--------	--------	--------

Code	Meaning
016	HDLC D-Channel
000	Debug Off

Level 4

Unused	Unused	Unused	Unused	Unused	Unused	OS Task	NI
--------	--------	--------	--------	--------	--------	---------	----

Code	Meaning
001	Network Interface (NI)
002	OS Task
000	Debug Off

By Default Debug = off for all BRI ports for all levels.

Viewing BRI Port Status

You can view the status of BRI ports on Jeeves only. To do this,

- Under **BRI Configuration**, click **Status**.

BRI Port No.	Port Name	Layer-1	Layer-2
1		DOWN	DOWN
2		DOWN	DOWN
3		DOWN	DOWN
4		DOWN	DOWN
5		DOWN	DOWN
6		DOWN	DOWN
7		DOWN	DOWN
8		DOWN	DOWN
9		DOWN	DOWN

- For each BRI Port, the following settings will be displayed:
 - BRI Port Number
 - Port Name
 - Layer 1
 - Layer 2
 - Call Budget Type
 - Call Budget Reset Mode
 - Call Budget Reset Scheduled (Date)
 - Allotted Amount/Minutes/Calls
 - Consumed Amount/Minutes/Calls
 - Reset Consumed (this is not a status indicator. It is for resetting the Consumed Call Budget manually)

If you have assigned a DSS Key to the BRI Port/channel and when Layer 1 of BRI line is down or not connected, DSS key LED will glow 1 sec On and 3 sec Off in violet color to indicate the faulty condition.

*You can also view the BRI Port Status from the **Status** link. To view, click the BRI link under Status.*

Configuring Mobile Trunks

The system supports a maximum of 40 Mobile ports. Before you begin configuring the Mobile ports, ensure that the Mobile Card has been installed correctly. The system supports 2G, 3G as well as 4G LTE network thereby providing higher bandwidth, greater connection speed and better underlying technology for VoIP calls. Access to these networks is made possible by mounting any of these —2G, 3G or 4G— GSM modules on the Mobile card.

Configuration of Mobile Trunks involves:

1. Customizing the Mobile Port Parameters
2. Network Selection
3. Configuring VoLTE parameters. For details refer to “[VoLTE Configuration](#)”
4. Uploading MBN files, For details refer to “[MBN File Upload](#)”
5. Viewing Mobile Port Status

You can customize mobile port parameters and select the network using Jeeves and a Telephone. However, mobile port status can be viewed using Jeeves only.

Mobile Port Parameters

Configuring Mobile Port Parameters using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Mobile Configuration**.
- Click **Mobile Port Parameters** to open the page.

Port No.	H/w Slot-Port	Enable Port	Name	Band Selection (Freq in MHz) (GSM)
1	00 - 00	<input checked="" type="checkbox"/>		All Band
2	00 - 00	<input checked="" type="checkbox"/>		All Band
3	00 - 00	<input checked="" type="checkbox"/>		All Band
4	00 - 00	<input checked="" type="checkbox"/>		All Band
5	00 - 00	<input checked="" type="checkbox"/>		All Band
6	00 - 00	<input checked="" type="checkbox"/>		All Band
7	00 - 00	<input checked="" type="checkbox"/>		All Band
8	00 - 00	<input checked="" type="checkbox"/>		All Band
9	00 - 00	<input checked="" type="checkbox"/>		All Band

Configure the following port parameters:

- **Hardware Slot and Port:** 'Slot' is the number of the Universal Slot in which the Mobile Card has been inserted. 'Port' is the number of the Mobile port in which you have installed the SIM card.

The number of the Mobile Port depends on the configuration of the Mobile Card. For instance, if you have installed GSM8 Card, the number of the ports will be from 1 to 8.

By default the SARVAM UCS can detect and assign the hardware slot and port numbers automatically to the mobile (software) ports. However, if required, you may change the Hardware Slot and Port assigned to the mobile software port. In this case, enter the desired Hardware Slot and Port number in this field.

If you want to de-assign the Hardware Slot and Port, enter '00' in both fields.

- **Enable Port:** This flag is for enabling or disabling a Mobile Trunk port. When a Mobile Trunk port is disabled, neither incoming nor outgoing calls can be made from that port.

By default, the port is enabled. You may disable ports that are not functioning by clicking the check box.

- **Name:** You may assign a 'Name' to each Mobile Trunk to facilitate identification. Whenever there is an incoming call without CLI on this port, the Name you have programmed will be displayed on the landing extension.

The Name of the port may be the name of the Service Provider of the SIM card you have installed on this port (recommended) or the phone number assigned to the SIM card on this port.

The Name may comprise a maximum of 18 characters.

- **Band Selection¹⁹⁴ (Freq in MHz) (GSM):** The Frequency Band supported by the mobile networks varies from country to country. SARVAM UCS's mobile card supports frequency bands of most countries. Select the Frequency Band used by your GSM/ UMTS Provider for the mobile port.

By default, Mobile Frequency Band 'All Bands' is selected.

This is applicable only for GSM Mode.

When you change the Frequency Band, the change will be effected after the next system restart or the next Mobile Port restart.

- **Preferred Network Mode¹⁹⁵:** Select the Preferred Network Mode for the Mobile Port — Any (GSM/ UMTS/LTE), GSM only, UMTS only or LTE only. By default, Any (GSM/UMTS/LTE) is selected.

If you select the Preferred Network Mode as LTE only, calling functionality will be possible only if the Service provider supports calling through VoLTE.

^{194.} Not applicable if CDMA Mobile Card is installed in your system.

^{195.} Not applicable if CDMA Mobile Card is installed in your system.

- **SIM PIN**¹⁹⁶: If you have enabled PIN protection and changed the SIM PIN of the card to the default value '1234' using a mobile handset¹⁹⁷, you can assign a new PIN to the SIM card from the SARVAM UCS.

Make sure that the PIN stored on the SIM card and that of the system are the same.

- You must click 'Submit' after you enter the new PIN. Wait for 5 seconds, and then refresh this page to view the new SIM PIN.
- If you have enabled PIN protection, and the SIM PIN on the Card and the SIM PIN programmed in the SARVAM UCS are not the same, the SIM card may get blocked and would require the Personal Unblocking Number (PUK) from the Service Provider to reactivate it again.

The SIM PIN will not be set to default value, when you set the system to default.

- **Incoming Calls:** Select the Incoming Call Mode on the Mobile Port from the options:
 - **'Accept':** incoming calls will be allowed and incoming call logic is applied.
 - **'Ignore':** incoming calls will not be processed further and call logic will not be applied.
 - **'Reject':** incoming calls will be rejected immediately and mobile port will be freed (released).

By default, incoming calls are accepted. This feature is particularly useful in outbound call centers for blocking incoming calls on a SIM number (mobile port) of the SARVAM UCS.

- **Trunk Feature Template:** A Trunk Feature Template is a set of features like Time Table, Operator, Auto Attendant, DISA, Trunk Auto Answer, Trunk Landing Group, SMDR Storage, etc., that defines the behavior of a Trunk. Apply a Trunk Feature Template to the Mobile Trunk. By default, Trunk Feature Template 01 is applied on all Mobile Trunks as well as all other trunk types. Refer the topic "[Trunk Feature Template](#)" to know more.

Click the 'Trunk Feature Template' link to open the page. Check if the default Template 01 fulfills your requirement for the mobile port.

If the default Template 01 does not fulfill your requirement, prepare another Trunk Feature Template¹⁹⁸, and enter the newly prepared Template number for the Mobile port.

- **CLIR**¹⁹⁹: Enable this flag if you want to activate CLIR for all outgoing calls made through the Mobile Port.

When CLIR is enabled, the called party will not be able to see the subscriber number of the Mobile Port.

By default CLIR is disabled for all Mobile ports.

196. Not applicable if CDMA Mobile Card is installed in your system.

197. Refer the topic **Installing the Mobile Card** for instructions. If you have not enabled PIN protection before installing the GSM Card, you will not be able to change the SIM PIN.

198. The default template is applied on the ports of all trunk types supported by SARVAM UCS. Changes to the default template will be applied on all trunk types also. So, you are advised to prepare a new template and apply it to the desired trunk types.

199. Not applicable if CDMA Mobile Card is installed in your system.

This feature will work only if subscribed/supported by your mobile service provider.

- **Return Call to Original Caller (RCOC)**²⁰⁰: Enable this flag if you want to apply the RCOC feature.

If this feature is enabled on the Mobile trunk port, the system routes calls returned by remote parties back to the extensions that originally made the call from this port (the original callers' extensions). To know more, refer the feature description for Return Call to Original Caller (RCOC).

- **Cost Factor**: This parameter is of relevance only if 'Least Cost Routing' feature is applied on the mobile port.

Cost Factor is a number assigned to each trunk for identification. This number also serves as a preference number for the trunk. The Cost Factor can be from 1 to 99. Trunks having the same preference must be assigned the same Cost Factor. Different trunk types can also be assigned the same Cost Factor. These trunks are used for routing calls.

Assign a Cost Factor to the Mobile Trunk port, for example, 03 and program Least Cost Routing Table accordingly.

For example, if you want to route all outgoing calls starting with number '9' through the SIM installed in Mobile Port Number 01 only,

- You must first assign a Cost Factor (01-99) to Mobile Port 01, for example, 03.
- Click 'Least Cost Routing - Number Based' to open the page.
- Enter '9' in the 'Number' column, Cost Factor '03' as Preference 1, 2, 3 and 4.
- Click **Submit** at the bottom of the page to save your setting.

All outgoing calls assigned Cost Factor trunk 03 will be made from Mobile Port 01.

200. Not applicable if CDMA Mobile Card is installed in your system.

Advanced Configuration

The above listed parameters fulfill the basic mobile trunk port configuration requirements of most users. However, it is anticipated that some users may need to configure other less commonly used features on the mobile ports, such as Call Budget, Call Back on Mobile Port, or they may want to use the Mobile port as a Gateway application.

Port No.	H/w Slot-Port	Enable Port	Name	Band Selection (Freq in MHz) (GSM)	Preferred N/w Mode
1	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
2	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
3	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
4	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
5	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
6	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
7	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
8	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode
9	00 - 00	<input checked="" type="checkbox"/>		All Band	Dual Mode

For such users, you may click the 'Advance' button and program the following parameters:

- **N/w Registration Retry Count:** The mobile port is programmed to automatically locate and register with the Network that supports the SIM card installed on it. Also, at each power ON, the mobile port (SIM) will automatically register with the Network that supports the SIM on it.

However, if the Mobile port fails to register, it will restart the process of network registration on the expiry of the Network Registration Retry Timer²⁰¹. On the expiry of this timer, the system will retry registration for the programmed Count (number of times) and with each re-try attempt, the count will be decremented by one.

By default the Retry Count is set to 2. If required you may change the Count to the desired value.

- **Mobile Gain Settings Template:** You can increase or decrease the level of Incoming Speech (Receive Gain) and Outgoing Speech (Transmit Gain) on the Mobile port by changing the Rx Gain and Tx Gain to the desired level. Different levels can be set for each port type in the Mobile Gain Settings Template. By default, Mobile Gain Template 1 is assigned. If you want to assign a different Template, you must customize the Mobile Gain Settings Template first and then assign the number of the Mobile Gain Settings Template here. To customize the Mobile Gain Settings, see ["Gain Settings"](#).

If you change the Tx or Rx Gain during an active call, the change you made will not apply on the current call. It will be applied on the next call.

- **Call Back:** This parameter is related to the 'Call Back on Trunk Port' feature. If you want to enable the 'Call Back on Trunk Port' feature on this Mobile trunk, configure the following parameters:

201. The Network Registration Retry Timer defines the time for which the Mobile port, which has failed to register with the network, should wait before attempting to re-register with the network. Network registration retry timer is 2 minutes and is non-programmable.

- **Enable Call Back:** Enable this flag to activate the Call Back on Trunk Port feature. By default, this flag is disabled on all trunk port types. By default, the flag is disabled.
- **Call Back Timer:** This is the duration for which the system waits for the caller to disconnect before applying the Call Back. The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds.
- **Call Back Mode:** Select from the following options how a 'Call Back' call answered by the remote party should be routed:
 - Built-In Auto Attendant
 - PIN Authentication - Multiple Calls
 - CLI Authentication - Multiple Calls
 - CLI Authentication - Single Call - Answer Signaling
 - Operator

By default, Operator is selected as the Call Back Mode.

- **Call Back on:** This parameter allows you to select if the call back should be made to the same number that was received or to a different number. If you want the call back to be made to the same number select the 'CLI number'. If you want the call back to be made to a different number, select 'Alternate Number'.

By default, CLI number is selected for Call Back.

- **Incoming Number List:** Program the number strings that are eligible for Call Back in this List. By default, Number List 15 is assigned to Call Back Incoming Number List. Number List 15 is also assigned to all Mobile trunks as well as all other Trunk port types. If you want the same numbers strings to be programmed commonly for all Mobile trunks and Trunk Port types, retain this list.

If you want a different set of number strings to be programmed for this Mobile Trunk, select a different Number List, and assign it to the Mobile trunk port.

You may program the Incoming Number List either from the 'Number List' page or by clicking the 'Incoming Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Outgoing Number List:** Program the number strings that are to be called back in this List. For each number string you programmed in the 'Incoming Number List', you must program in the corresponding index in the Outgoing Number List a number to which the call back is to be made. For example, for the number string programmed at Index 1 in the Incoming Number List, a corresponding number string at the same Index, Index 1, should be programmed in the 'Outgoing Number List'.

By default, Number List 16 is assigned to Outgoing Number List. The same Number List 16 is also assigned to all Mobile trunks as well as all other Trunk port types.

You may program the default number list, or a different number list and assign it to this Mobile Trunk port.

You may program the Outgoing Number List either from the 'Number List' page or by clicking the 'Outgoing Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Call Back from:** This parameter determines the trunk port to be used to make the call back. The call back can be made using the same port or an "[OG Trunk Bundle Group](#)".

Select 'Same port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTBG, the call back will be made using the OGTBG, which you have defined.

By default, Same port is selected.

- **OGTB Group:** If you selected OGTBG for making the call back in the previous parameter, you must define the OGTBG that must be used in this parameter.

By default, OGTBG 01 is assigned.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTBG that you define here for Call Back.

- **Call Budget:** By default, Call Budget is enabled on the trunk. If you wish to change the default configuration or disable it for this Mobile trunk port, configure the parameters as per your requirement:
 - **Type:** Select the type of Call Budget on Trunk—Amount, Minutes or Number of Calls—to be applied on this mobile trunk port. By default, Minutes is selected as the Call Budget type. To disable select Type as None.
 - **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 999999.
 - **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set as 000300.
 - **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of calls in this field. By default, the number of calls is set to 9999.
 - **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes/Number of Calls to be on a particular date of every month.
 - **Scheduled (Date):** Enter the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be every month. You may select 'Daily' if your plan suggests so.

The consumed Call Budget Amount/Minutes/Number of Calls can be reset from SE and SA Mode, referred to as Manual Reset. Refer the feature description "[Call Budget on Trunk](#)".

- **Accept Anonymous Calls:** The check box is for accepting calls without CLI that land on the mobile port. By default the option is disabled, that is, calls without CLI will not be allowed on this Mobile port. Select the check box to enable.
- **Pause Timer:** This Timer is used for providing delay in number dialing from the Mobile port. The Pause Timer will be applicable when the digit 'P' is configured in the DTMF number string which is to be out dialed as DTMF digits on the Mobile port.

For example, if PPP2 is to be out dialed and Pause timer is programmed as 3 seconds, the SARVAM UCS will out dial the digit 2 after 9 seconds, that is, after a delay of individual P (3+3+3 =9). The range of this time is from 1 to 9. By default the Timer is set to 1 seconds.

This parameter is used for the “Multi-Stage Dialing” feature.

- **DTMF Outdial Option:** You can select whether to send the DTMF digits from the Mobile Ports **Inband** or through signaling, that is, **AT Command**. By default, DTMF Outdial Option is Inband.

When you select DTMF Outdial using AT Command, the length of the DTMF digits will be determined by the DTMF ON Time you set.

*If CDMA Mobile Card is installed in your system, select **DTMF Outdial option** as AT Command for efficient functionality.*

- **DTMF ON Timer:** This parameter determines the time for which the DTMF digit will remain ON, while being out dialed by the system. This parameter finds its application in the feature “Multi-Stage Dialing” and in *DTMF Outdialing using AT Command*. By default, DTMF ON Timer is 100 ms.
- **DTMF Detection Mode:** You can select whether to detect the DTMF digits using the GSM Modules or through DSP. Default: Using DSP.

When you select DTMF Detection Using Module, the length of the DTMF digits will be determined by the DTMF Detection Timer you set.

*If CDMA Mobile Card is installed in your system, select **DTMF Detection Mode** as Using Module (GSM) for efficient functionality.*

- **DTMF Detection Duration:** This is the minimum ON to consider the DTMF digit as a valid digit. The valid range of this timer is 20 to 100ms. Default: 30ms.

*If CDMA Mobile Card is installed in your system, set the **DTMF Detection Duration** as 20ms.*

- **Min. Level (dB):** This parameter signifies the minimum level (dB) of the DTMF digit to be considered as valid. By default, Minimum level is set to -30dB.

If the Min. Level set is very low, the DTMF digits might be detected in Voice and if it is very high, the DTMF digits may be lost.

If received DTMF digit level is higher than or equal to the set value of Min. Level (dB), the system will accept the DTMF.

If received DTMF digit level is lower than the set value of Min. Level (dB), the system will ignore the DTMF.

- **Category (Logical Partition):** This parameter assigns the Mobile Port to a trunk category for the purpose of Logical Partitioning. By default all Mobile Ports are assigned to Category 1. Do not change the default setting.

If you want to change the call permission between the mobile port and other trunks, click the 'Category' link to open the Logical Partitioning page. You may program the call permission between Category 1 (assigned to Mobile Trunk Ports) and other Categories. Refer the feature description “Logical Partition” to know more.

- **Gateway Application-Answer Signaling:** This parameter is to be programmed if the Mobile Trunk Port is being used in a gateway application as a source port (from where calls originate). The calls originated on

the source port (mobile port) are routed using another Trunk port, the terminating port, which may be any trunk port, for example: T1E1. When call made from the terminating port gets matured, this is signaled to the source port in the form of DTMF digits.

- **Enable:** Enable this flag if you want the Mobile port to be used in a Gateway Application.
- **DTMF String (max. 4 digits):** Program the DTMF digits to be sent to signal call maturity to the source port.
- **SMS Parameters²⁰²:** If you want to use this Mobile Trunk Port for the SMS Server application to send/receive SMS, configure the following parameters:
 - **SMS Center Number:** The system displays the default SMS Center Number of the network. If required, you can change the SMS Center Number. The SMS Center Number can be a maximum of 16 digits. Valid Range: 0 to 9 and +
 - **Send SMS:** Enable this check box if you want to use this Mobile Trunk Port to send SMS.
 - **Number of SMS to be sent (Total):** Enter the maximum number of SMS that can be sent using this Mobile Trunk Port. Default: 0999999999. Valid Range: 1 to 4294967296.
 - **Number of SMS to be sent (Daily):** Enter the maximum number of SMS that can be sent using this Mobile Trunk Port daily. Default: 20000. Valid Range: 1 to 20000.
 - **Receive SMS:** Enable this check box if you want to use this Mobile Trunk Port to receive SMS.
- **Debug:** Enable this flag by selecting the check box if you want to initiate debugging for the Mobile Port. By default, debugging is disabled.
- **Extended CLI:** Select this check box if the CLI of the current incoming call displays the last caller's CLI. When the flag is enabled, the current caller's CLI will be displayed. By default, it is disabled.
- **Allow Incoming CLI Modification:** Select the **Allow Incoming CLI Modification** check box if you want to apply Incoming CLI Modification on the Mobile trunk. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see "[Incoming CLI Modification](#)".

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*For an incoming call on the Mobile trunk, the Incoming CLI Modification will be applied only when both — the **Allow Incoming CLI Modification** check box and the **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- Repeat the same steps to configure other mobile ports.
- If you have completed configuration of all the above listed Mobile Port Parameters, click **Submit** at the bottom of the page to save your changes.

Configuring Mobile Port Parameters using a Telephone

²⁰². Not applicable if CDMA Mobile Card is installed in your system.

- Enter SE mode from a DKP/SLT.

To assign Hardware Slot and Port, dial:

- **1108-Mobile-Slot-Port Offset on the card**
Where,
Mobile Port Number is the number of the software port from 001 to 064
Slot is the number of the universal slot from 01 to 16
Port Offset on the card is 00, 01 to 99.

To de-assign the Hardware Slot and Port, dial:

- **1108-Mobile-00-00**

To enable/disable the Mobile Port, dial:

- **8000-1-Mobile-Flag** to enable/disable a single mobile port.
 - **8000-2-Mobile-Mobile-Flag** to enable/disable a range of mobile ports.
 - **8000-*-Flag** to enable/disable all mobile port.
- Where,
Mobile Port Number is the number of the software port from 001 to 064
Flag is
1 for Enable
0 for Disable

To assign a Name to the Mobile Port, dial:

- **5408-1-Mobile-Name-#*** to assign a name to a single mobile port.
 - **5408-2-Mobile-Mobile-Name-#*** to assign the same name to a range of mobile ports.
 - **5408-*-Name-#*** to assign the same name to all mobile ports.
- Where,
Mobile Port Number is the number of the software port from 001 to 064
Name is a string of a maximum of 18 alphanumeric characters. Terminate the command with #* if the number string is fewer than 18 characters.

To clear the Name of the Mobile Port, dial:

- **5408-1-Mobile-#*** to clear the name of a single mobile port.
- **5408-2-Mobile-Mobile-#*** to clear the names of a range of mobile ports.
- **5408-*-#*** to clear the names of all mobile ports.

To select the frequency Band²⁰³ for the Mobile Port, dial:

- **8009-1-Mobile Port Number-Mobile Frequency Band Code** to select the band for a single mobile port.
 - **8009-2-Mobile Port Number -Mobile Port Number -Mobile Frequency Band Code** to select the same band for a range of mobile ports.
 - **8009-*-Mobile Frequency Band Code** to select the same band for all mobile ports.
- Where,
Mobile Port is the software port number of the mobile port, from 001 to 064.
Mobile Frequency Band Code is
1 for 900
2 for 1800
3 for 1900
4 for 850+1900
5 for 900+1800
Default: 900 + 1800

203. Not applicable if CDMA Mobile Card is installed in your system.

To select the Preferred Network Mode²⁰⁴ for the Mobile Port, dial:

- **8038-1-Mobile Port Number-Preferred Network Mode** to select the band for a single mobile port.
- **8038-2-Mobile Port Number -Mobile Port Number -Preferred Network Mode** to select the same band for a range of mobile ports.
- **8038-*-Preferred Network Mode** to select the same band for all mobile ports.

Where,

Mobile Port is the software port number of the mobile port, from 001 to 064.

Preferred Network Mode is:

- 1 for Any (LTE/UMTS/GSM)
- 2 for GSM
- 3 for UMTS
- 4 for LTE

To assign SIM PIN²⁰⁵ to the Mobile Port, dial:

- **8006-1-Mobile Port Number-SIM PIN-#*** to assign SIM PIN to a single mobile port.

Where,

Mobile Port Number is the software port number of the mobile port, from 001 to 064.

SIM PIN is the new SIM PIN, any combination of 4 to 8 digits. Terminate the command with '#*' if SIM PIN is fewer than 8 digits.

To select Incoming Call mode on the Mobile port, dial:

- **8005-1-Mobile-Mode** to select the mode for a single mobile port.
- **8005-2-Mobile-Mobile-Mode** to select the same mode for a range of mobile ports.
- **8005-*-Mode** to select the same mode for all mobile ports.

Where,

Mode is

- 1 for Accept Incoming Calls.
 - 2 for Ignore Incoming Calls
 - 3 for Reject Incoming Calls
- Default: Accept

To assign a Trunk Feature Template to the Mobile Port, dial:

- **5807-1-Mobile Port Number-Template Number** to assign a template to a single mobile port.
- **5807-2-Mobile Port Number-Mobile Port Number-Template Number** to assign the same template to a range of mobile ports.
- **5807-*-Template Number** to assign the same template to all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Template Number is the number of the Trunk Feature Template from 01 to 50.

To enable/disable CLIR²⁰⁶ on the Mobile Port, dial:

- **8031-1-Mobile Port Number-CLIR** to enable/disable CLIR on a single mobile port.
- **8031-2-Mobile Port Number-Mobile Port Number-CLIR** to enable/disable CLIR on a range of mobile ports.
- **8031-*- CLIR** to enable/disable CLIR on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

CLIR is

204. Not applicable if CDMA Mobile Card is installed in your system.

205. Not applicable if CDMA Mobile Card is installed in your system.

206. Not applicable if CDMA Mobile Card is installed in your system.

0 for Disable
1 for Enable
Default: Disable

To enable RCOC²⁰⁷ on Mobile Port, dial:

- **8030-1-Mobile -Code** to enable the feature on a single mobile port.
- **8030-2-Mobile-Mobile-Code** to enable the feature on a range of mobile ports.
- **8030-*-Code** to enable the feature on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Code is

0 for Disable

1 for Enable

Default: Disabled

To assign Cost Factor to a Mobile Port, dial:

- **8001-1-Mobile-Cost Factor** to assign cost factor to a single mobile port.
- **8001-2-Mobile-Mobile-Cost Factor** to assign the same cost factor to a range of mobile ports.
- **8001-*-Cost Factor** to assign the same cost factor to all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Cost Factor is from 01 to 99.

- For Advanced Configuration of the Mobile Ports, use the following commands:

To set Network Registration Retry Count, dial:

- **8004-1-Mobile-N/w Registration Retry Count** to set the count for a single mobile port.
- **8004-2-Mobile-Mobile-N/w Registration Retry Count** to set the same count for a range of mobile ports.
- **8004-*-N/w Registration Retry Count** to set the same count for all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

N/w Registration Retry Count is from 001 - 255: Default: 002

- For commands to program Call Budget on Mobile Ports, refer the topic [“Call Budget on Trunk”](#).

To enable/disable Call Back on Mobile Port, dial:

- **8010-1-Mobile-Code** to enable/disable Call Back on a single mobile port.
- **8010-2-Mobile-Mobile-Code** to enable/disable Call Back on a range of mobile ports.
- **8010-*-Code** to enable/disable Call Back on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Code is

0 for Disable

1 for Enable

Default: Disabled

To change Call Back Timer for the Mobile Port, dial:

- **8011-1-Mobile-Call Back Timer** to change Call Back Timer for a single mobile port.
- **8011-2-Mobile-Mobile-Call Back Timer** to set the same Call Back Timer duration for a range of mobile ports.
- **8011-*-Call Back Timer** to set the same Call Back Timer duration for all mobile ports.

207. Not applicable if CDMA Mobile Card is installed in your system.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Call Back Timer is from 01 to 99 seconds.

Default: 010 seconds.

To select the Call Back Mode, dial:

- **8012-1-Mobile-Call Back Mode** to select Call Back Mode for a single mobile port.
- **8012-2-Mobile-Mobile Call Back Mode** to select the same Call Back Mode for a range of mobile ports.
- **8012-*-Call Back Mode** to select the same Call Back Mode for all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Call Back Mode is

1 for Built-In Auto Attendant

2 for PIN Authentication - Multiple Calls

3 for CLI Authentication - Multiple Calls

4 for CLI Authentication - Single Call - Answer Signaling

5 for Operator

Default: Operator

To program Call Back on for the Mobile Port, dial:

- **8013-1-Mobile-Call Back on** to program call back on for a single mobile port.
- **8013-2-Mobile-Mobile-Call Back on** to program the same call back on for a range of mobile ports.
- **8013-*-Number List** to program the same call back on for all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Call Back on is

1 for CLI Number

2 for Alternate Number.

To assign a Call Back - Incoming Number List to a Mobile Port, dial:

- **8034-1-Mobile-Incoming Number List** to assign a list to a single mobile port.
- **8034-2-Mobile-Mobile-Incoming Number List** to assign the same list to a range of mobile port.
- **8034-*-Incoming Number List** to assign the same list to all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Incoming Number List is from 01 to 16

Default: 15

To assign a Call Back - Outgoing Number List to a Mobile Port, dial:

- **8035-1-Mobile-Outgoing Number List** to assign a list to a single mobile port.
- **8035-2-Mobile-Mobile-Outgoing Number List** to assign the same list to a range of mobile port.
- **8035-*-Outgoing Number List** to assign the same list to all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Outgoing Number List is from 01 to 16

Default: 16

To select Call Back From for a Mobile Port, dial:

- **8036-1-Mobile-Call Back From** to select call back from for a single mobile port.
- **8036-2-Mobile-Mobile-Call Back From** to select the same call back from option for a range of mobile ports.
- **8036-*-Call Back From** to select the same call back from option for all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Call Back From is
1 for Same Port
2 for OGTB Group
Default: Same Port

To assign a Call Back - OGTB Group for a Mobile Port, dial:

- **8037-1-Mobile-OGTB Group** to assign an OGTBG to a single mobile port.
- **8037-2-Mobile-Mobile-OGTB Group** to assign the same OGTBG to a range of mobile ports.
- **8037-*-OGTB Group** to assign the same OGTBG to all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

OGTB Group is from 01 to 32

Default: 01

To enable/disable Accept Anonymous Calls on Mobile Port, dial:

- **8029-1-Mobile-Code** to enable/disable Anonymous Calls on Mobile Port on a single mobile port.
- **8029-2-Mobile-Mobile-Code** to enable/disable Anonymous Calls on Mobile Port on a range of mobile ports.
- **8029-*-Code** to enable/disable Anonymous Calls on Mobile Port on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Scheduled Reset Date is from 01 to 31.

To program the Pause Timer on Mobile Port, dial:

- **8014-1-Mobile-Pause Timer** to set the timer on a single mobile port.
- **8014-2-Mobile-Mobile-Pause Timer** to set the same timer on a range of mobile ports.
- **8014-*-Pause Timer** to set the same timer on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Pause Timer is from 1 to 9 seconds. Default: 1 second.

To program DTMF ON Time on Mobile Port, dial:

- **8015-1-Mobile-DTMF ON Time** to set the time on a single mobile port.
- **8015-2-Mobile-Mobile-DTMF ON Time** to set the same time on a range of mobile ports.
- **8015-*-DTMF ON Time** to set the same time on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

DTMF ON Time is

1 for 100 msec

2 for 200 msec

Default: 100 msec

To set DTMF Detection Mode on Mobile Port, dial:

- **8051-1-Mobile-Mode** to set the DTMF Detection Mode on a single mobile port.
- **8051-2-Mobile-Mode** to set DTMF Detection Mode on a range of mobile ports.
- **8051-*-Mobile-Mode** to set the same DTMF Detection Mode on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

DTMF Detection Mode is

1 for Using DSP

2 for Using Module

Default: Using DSP

To program DTMF Detection Duration on Mobile Port, dial:

- **8052-1-Mobile-Duration** to set the DTMF Detection Duration on a single mobile port.
- **8052-2-Mobile-Duration** to set the DTMF Detection Duration on a range of mobile ports.
- **8052-*-Mobile-Duration** to set the DTMF Detection Duration on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

DTMF Detection Duration range is from 20 to 100 msec.

Default: 30 msec

To assign the Mobile Port to a 'Category' for Logical Partition, dial:

- **8018-1-Mobile-Category** to assign a single mobile port to a category.
- **8018-2-Mobile-Mobile-Category** to assign a range of mobile ports to the same category.
- **8018-*-Category** to assign all mobile ports to the same category.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Category is from 1 to 3.

1 for Trunk ports interfaced with PSTN /PLMN (Public Land Mobile Network)

2 for Leased lines terminated in the trunk ports.

3 Trunk ports used to interconnect two Systems.

4 SIP Trunks interfaced with ISP/ITSP

Default: 1

To enable/disable Gateway Application on the Mobile Port, dial:

- **8016-1-Mobile-Gateway Application flag** to enable/disable on a single mobile port.
- **8016-2-Mobile-Mobile-Gateway Application flag** to enable/disable on a range of mobile ports.
- **8016-*-Gateway Application flag** to enable/disable on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Gateway Application flag is.

0 for Disable

1 for Enable

Default: Disable

To program the DTMF String for the Gateway Application on the Mobile Port, dial:

- **8017-1-Mobile-DTMF String** to program the string on a single mobile port.
- **8017-2-Mobile-Mobile-DTMF String** to program the same string on a range of mobile ports.
- **8017-*-DTMF String** to program the same string on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

DTMF String is a maximum of 4 digits. Default: CCC

To enable/disable Debug on a Mobile Port, dial:

- **8028-1-Mobile port number-Debug Code** to enable/disable debug on a single mobile port.
- **8028-2-Mobile port number-Mobile port number-Debug Code** to enable/disable debug on a range of mobile ports.
- **8028-*-Debug Code** to enable/disable debug all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Debug Code is

1 for Enable

0 for Disable

Default: Disable

To program SIP Rx Gain on the Mobile Port, dial:

- **8041-1-Mobile-SIP Rx Gain** to program the SIP Rx Gain on a single mobile port.
- **8041-2-Mobile-Mobile-SIP Rx Gain** to program the same SIP Rx Gain on a range of mobile ports.
- **8041-*-SIP Rx Gain** to program the same SIP Rx Gain on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Rx and Tx Gain is 01 to 63 dB: Default: 4.

For Rx and Tx Gain at SIP codes, see the tables below.

To program SIP Tx Gain on the Mobile Port, dial:

- **8042-1-Mobile-SIP Tx Gain** to program the SIP Tx Gain on a single mobile port.
- **8042-2-Mobile-Mobile-SIP Tx Gain** to program the same SIP Tx Gain on a range of mobile ports.
- **8042-*-SIP Tx Gain** to program the same SIP Tx Gain on all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Rx and Tx Gain is 01 to 63 dB: Default: 4.

For Rx and Tx Gain at SIP codes, see the tables below.

Code	Rx Gain at SIP	Tx Gain at SIP	Code	Rx Gain at SIP	Tx Gain at SIP	Code	Rx Gain at SIP	Tx Gain at SIP	Code	Rx Gain at SIP	Tx Gain at SIP
0	--	--	16	-16	-16	32	0	0	48	16	16
1	-31	-31	17	-15	-15	33	1	1	49	17	17

15	-17	-17	31	-1	-1	47	15	15	63	31	31

- Exit SE mode.

Network Selection

After the Mobile Card is successfully installed and powered on, the mobile port is programmed to automatically locate and register with the Network that supports the SIM card installed in. Also, at each power ON, the mobile port (SIM) will automatically register with the Network that supports the SIM on it. However, if the Mobile port fails to register, it will restart the process of network selection on the expiry of the Network Registration Retry Timer²⁰⁸.

If the SARVAM UCS is located in a border area where more than one Network Operator is available, it is possible that the SIM card may register with another available network and result in 'Roaming' charges. To avoid this, you must disable automatic network selection and program manual network selection.

When you enable manual network selection, you must program the Network Operator Priority Table. This table requires you to program the Network Operator Codes (MCC-MNC)²⁰⁹ in order of priority for a Mobile Port. So, whenever you register with the network manually, select the Network Operator that matches in order of priority. If

²⁰⁸. The **Network Registration Retry Timer** defines the time for which the Mobile port, which has failed to register with the network, should wait before attempting to re-register with the network. Network registration retry timer is 2 minutes and is non-programmable.

the Mobile port fails to register, it will restart the process of network selection on the expiry of the Network Registration Retry Timer.

If no match is found, the Mobile port (SIM) will not get registered with any of the available network operators and no calls can be made or received on this port.

Configuring Network Selection using Jeeves

While still logged in as System Engineer,

- Under **Mobile Configuration**, click **Network Selection**.

Mobile Port No.	Network Selection Mode	Network Operator Code (MCC-MNC)					
		Priority 1	Priority 2	Priority 3	Priority 4	Priority 5	Priority 6
1	Automatic	00000					
2	Automatic	00000					
3	Automatic	00000					
4	Automatic	00000					
5	Automatic	00000					
6	Automatic	00000					
7	Automatic	00000					
8	Automatic	00000					
9	Automatic	00000					
10	Automatic	00000					

- Set the **Network Selection Mode** to **Manual**.

If CDMA Mobile Card is installed in your system, keep the Network Selection Mode as Automatic. Manual mode is not applicable in this case.

- Enter the **Network Operator Codes (MCC-MNC)** in order of priority. The codes must not exceed 8 digits. You can store up to 9 Network Operator Codes in the order of priority.
- Repeat the same steps to set network selection mode for other mobile ports.
- Click **Submit** at the bottom of the page to save your settings.

When you change the Network Selection Mode to 'Manual' and the Network Operator Code manually, the change you made will not come into effect until you have restarted the Mobile Port.

- To restart the Mobile Port,
 - go back to **Mobile Port Parameters**.
 - Click the check box to disable the **Enable Port** flag.

209. **The Network Operator Code** comprises of the Mobile Country Code (MCC) appended by the Mobile Network Code (MNC). The MCC is usually a 3-digit code that identifies a country. A single country may be assigned more than one MCC. For example the MCC assigned to India is 404, but same code applies to all network operators in the country.

The MNC is usually a 2/3-digit code. The MCC-MNC combination uniquely identifies the home network of the mobile terminal or the mobile user. For example, AirTel, a GSM network operator in India, has different MNC assigned to its networks in various states. The MNC for AirTel in the state of Maharashtra is 90, while the same for the state of Gujarat is 98.

- Click **Submit** at the bottom of the page.
- Wait for the page to refresh.
- Click the check box to enable the **Enable Port** flag.
- Click **Submit** at the bottom of the page.
- The Mobile Port will be restarted.

Configuring Network Selection using a Telephone

- Enter SE mode from a DKP/SLT.

To select Network Selection mode, dial:

- **8007-1-Mobile Port Number-Code** to select network selection mode for a single mobile port.
- **8007-2-Mobile Port Number-Mobile Port Number-Code** to select the same network selection mode for a range of mobile ports.
- **8007-*-Code** to select the same network selection mode for all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Code is

1 for Automatic Selection

2 for Manual Selection

Default: Automatic Selection

For example, to program Manual Network Selection on Mobile Port number 1, dial **8007-1-01-2**

To program the network operator codes in order of priority for Mobile port, dial:

- **8008-1-Mobile-Priority-Network Operator Code-#*** to program network operator codes for a single mobile port.
- **8008-2-Mobile-Mobile-Priority-Network Operator Code-#*** to program the same network operator codes for a range of mobile ports.
- **8008-*-Priority-Network Operator Code-#*** to program the same network operator codes of all mobile ports.

Where,

Mobile Port Number is the number of the software port from 001 to 064.

Priority is from 1 to 9.

Network Operator Code is MCC-NCC maximum 8 digits. Terminate the command with #* if the number of digits is fewer than 8.

For example, following Network Operator Codes need to be programmed in the order of priority on

Mobile Port number 01:

Priority 1=40498

Priority 2 = 40425

Priority 3 = 40421

Dial:

8008-1-01-1-40498-#*

8008-1-01-2-40425-#*

8008-1-01-3-40421-#*

- Exit SE mode.

Viewing Mobile Port Status

You can view the status of Mobile ports on Jeeves only. To do this,

- Under **Mobile Configuration**, click **Status**.
- Wait for 4-5 seconds after the Port Status page is opened.
- Click **Refresh** at the bottom of the page for current view.

Mobile Port	Port Name	Port Status	IMEI
1			
2			
3			
4			
5			
6			
7			
8			
9			

- The Port status page will display the following parameters for all Mobile ports that have been enabled:
 - **Port Name:** This is the name by which the Mobile Port is programmed.
 - **Port Status:** This is the status of the connection - showing Initialization with the Network, Registering with the Network, Idle or Busy state of the network. It also shows errors and alerts when SIM is absent, the wrong SIM PIN has been entered, SIM PUK is required.
 - **IMEI:** This is the unique identification number of (the GSM engine) each Mobile port.

If CDMA Mobile Card is installed in your system, ESN No.(Electronic Serial Number) will be displayed as the parameter name instead of IMEI.

In absence of RUIM Card, "00000000" will be displayed as the ESN No.

- **Network Operator Code:** This is the MCC-MNC code of the network with which the mobile port is registered.
- **Network Operator Name:** This is the name of the service provider/network operator with which the Mobile Port is registered.
- **SMSC Number:** This is the number of the SMS Center of the network operator. If CDMA Mobile Card is installed in your system, SMSC Number status will be displayed as blank.
- **Signal Strength (dBm):** This is the signal strength in '-dBm' as received from the network with which the Mobile port is registered.

- **Bit Error Rate (BER):** BER is Bit Error Rate which defines the quality of the channel.
- **Ec/Io (dB)²¹⁰:** This is the ratio of the received energy per chip (= code bit) and the interference level, given in dB. In case no true interference is present, the interference level is equal to the noise level. This parameter is significant only when the GSM module is registered with the 3G network.

The range of this parameter can be from 0 to 63dB. A ratio of 10dB to 14dB is normal, numbers going higher than that is progressively worse.

- **Call Duration:** This is the total call duration of matured outgoing calls²¹¹ on the Mobile port. This data is used for calculating Answer Seizure Ratio (ASR) for the port. It is displayed in MMMMMM:SS format.
- **Dialed Calls:** This is the total number of outgoing calls²¹² made from the Mobile port. This data is used for calculating Answer Seizure Ratio (ASR) for the port.
- **Successful Calls:** This is the total number of matured outgoing calls made from the Mobile port. This data is used for calculating Answer Seizure Ratio (ASR) and Average Call Duration for the port.
- **ASR % :** This is the Answer Seizure Ratio (ASR) calculated by the system for the Mobile port, in terms of percentage. ASR is the sum of all outgoing matured calls from the Mobile port, divided by the total number of outgoing calls made from the Mobile port, multiplied by 100. The system calculates ASR after the completion of the outgoing call.
- **ACD:** This is the Average Call Duration (ACD) of outgoing calls made from the Mobile port. It is an indicator for monitoring the network condition. Decreasing ACD is indicative of trouble in the network condition.

The system calculates ACD after the completion of the outgoing calls, by dividing the total call duration by the number of outgoing matured calls.

- **Reset ASR and ACD:** This field allows the System Engineer to manually the ASR and the ACD of the Mobile port.

The parameters Total Call duration, Number of matured calls, Total Number of OG Calls, ASR and ACD are saved in the configuration, and are not on Power OFF condition. The system maintains the statistics for the last 999 calls. When the total number of outgoing calls exceeds 999, the system will stop calculating ACD and ASR and will display ASR and ACD calculated on the basis of the last 999 calls only.

Therefore, the System Engineer must manually ASR and ACD when the total number of calls reaches 999. When you ASR and ACD the number of call matured and the number of calls dialed is to 0.

ASR and ACD can be anytime, even when the total number of calls is less than 999.

When ACD is, only the 'Total Call Duration' maintained for the ACD calculation will be. The 'Total Call Duration' of the Call Budget, the consumed minutes maintained for the Call Budget on the mobile port will remain unaffected.

210. Not applicable if CDMA Mobile Card is installed in your system.

211. Matured calls are outgoing calls for which 'CONNECT' message was received from the network.

212. The total number of outgoing calls made includes the number of times the ATD has been sent from the Mobile port to the network.

- **SIM ID²¹³**: This is the Integrated Circuit Card ID (ICC-ID) of the SIM card inserted in the Mobile port. Each SIM is internationally identified by its ICC-ID. ICC-IDs are stored in the SIM card and are also printed on the SIM card body.
- **IMSI²¹⁴**: International Mobile Subscriber Identity (IMSI) is a unique number stored in the SIM card.
- **Cell ID**: This is the 16-bit identifier that identifies the cell. The cell is the radio coverage area given by one BTS (Base Transceiver Station).

If CDMA Mobile Card is installed in your system, NID (Network Identification) will be displayed as the parameter name instead of Cell ID.

- **Location Area Code (LAC)**: The LA (Location Area) is a group of cells defined by the Operator. The LAC (Location Area Code) uniquely identifies a LA within a PLMN (Public Land Mobile Network).

If CDMA Mobile Card is installed in your system, SID (System Identification) will be displayed as the parameter name instead of LAC.

- **Call Budget Type**: This shows the Call Budget Type, whether Amount, Minutes or Number of Calls, are set on the Mobile port.
- **Allotted Amount/ Minutes/Calls**: This shows the sum/number of minutes/number of calls allotted as Call Budget on the Mobile port.
- **Consumed Amount/ Minutes/Calls**: This shows the sum/number of minutes/number of calls of the allotted Call Budget that has been used up on the Mobile port.
- **Scheduled Reset**: This shows if you have enabled Scheduled Reset.
- **Call Budget Reset Schedule (Date)**: This shows whether the consumed Call Budget on the Mobile port is to be Daily or on a particular date of a month.
- **Reset Consumed Amount/Minutes/Calls**: This editable field allows the you to reset the consumed Call Budget Amount/Minutes/Calls at any time, manually.
- **SMS Budget Scheduled Reset**: This shows if you have enabled Scheduled Reset for the SMS budget.

If CDMA Mobile Card is installed in your system, any parameters related to SMS will not be supported.

- **SMS Budget Reset Schedule (Date)**: This shows the date on which the SMS Budget will be reset.
- **SMS Budget Consumed SMS (Total)**: This shows the number of SMS of the allotted SMS Budget that has been used up on the Mobile port.
- **Consumed SMS (Daily)**: This shows the number of SMS of the allotted Daily SMS Budget that has been used up on the Mobile port.
- **Reset Consumed SMS (Total) Budget**: This editable field allows the you to reset the consumed SMS Budget, manually. It will reset both **Consumed SMS (Total)** and **Consumed SMS (Daily)**.

213. Not applicable if CDMA Mobile Card is installed in your system.

214. Not applicable if CDMA Mobile Card is installed in your system.

The Consumed SMS Budget can be reset from the System Engineer mode as well as the System Administrator mode manually at any time or on a scheduled date from the System Administrator mode only. Refer *Resetting SMS Budget*.

- **Registered with Network:** This shows the type of network with which the Mobile port is registered, whether GSM, GSM Compact, 3G or UMTS, CDMA, 4G or LTE or Not Registered.
- **Firmware Version of Engine:** This shows the firmware version of the mobile Engine.

You can also view the Mobile Port Status from the **Status** link. To view, click the Mobile link under Status.

Resetting SMS Budget²¹⁵

You manually reset the Consumed SMS Budget from the SE mode from the **Status** page (as explained above) or from the SA mode.

To reset the SMS Budget from the SA mode, follow the steps given below:

- Log in as System Administrator.
- Under **Trunks Properties**, click the **Mobile** link.
 - **Consumed SMS (Total):** This shows the number of SMS of the allotted SMS Budget that has been used up on the Mobile port.
 - **Consumed SMS (Daily):** This shows the number of SMS of the allotted Daily SMS Budget that has been used up on the Mobile port.
 - **Scheduled reset consumed SMS (Total) budget:** Enable this check box if you want only the **Consumed SMS (Total)** Budget to be reset on a particular date of every month.
 - **Budget Reset Schedule (Date):** Select the date of the month (Daily or 1-31) on which you want the SMS Budget to be reset every month.
 - **Reset Consumed SMS (Total) Budget:** Enable this check box to reset the consumed SMS Budget, manually. It will reset both **Consumed SMS (Total)** and **Consumed SMS (Daily)**.

Resetting ASR and ACD using a Telephone

- Enter SE mode from a DKP/SLT.

To ASR and ACD calculation for Mobile Port, dial:

- **8032-1-Mobile-1** to ASR-ACD calculation for a single mobile port.
- **8032-2-Mobile-Mobile-1** to ASR-ACD calculation for a range of mobile ports.
- **8032-*-1** to ASR-ACD calculation for all mobile ports.
- Exit SE mode.

The System Administrator can also

²¹⁵. Not applicable if CDMA Mobile Card is installed in your system.

- view the ID of the Mobile Network Operator with which the Mobile Port is currently registered.
- check Signal Strength of a mobile port, whenever there is trouble placing calls over a Mobile port to rule out weak signal as the cause.
- Reset ASR and ACD calculation.

To do this,

- Enter SA mode from a DKP.
- Dial **1072-017-Mobile Port Number** to view ID of Network Operator.
You will get a confirmation tone.
If the port is successfully registered, the name of the network Operator will be displayed on the LCD of the DKP.
If the port is not registered, the message 'Error' will be displayed on the LCD.
- Dial **1072-032-Mobile Port Number** to check signal strength.
- Wait for the confirmation tone.
When the network responds, the Mobile Network Signal Strength will be displayed on the LCD of your DKP and programming beeps will be played.

The Signal Strength values are in -dBm. '-113' indicates weak signal, whereas '-51' indicates maximum signal strength.

- Dial **1072-022-Mobile Port Number**

You will get the confirmation tone and the confirmation message "ASR-ACD Reset" will appear on your phone's display.

Configuring CO Trunks

The SARVAM UCS supports a maximum of 64 Analog Two-Wire Trunk Lines. Before you begin configuring the CO trunk ports, ensure that the CO trunk Card has been installed correctly.

You may configure the CO ports from Jeeves and using a Telephone.

Configuring CO Trunks using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **CO Configuration**.
- Click **CO Parameters**.

Port No.	H/w Slot - Port	Enable Port	Name	CO Hardware Template	Trunk Features Template	Cost Factor
1	06 - 01	<input checked="" type="checkbox"/>		02	01	01
2	06 - 02	<input checked="" type="checkbox"/>		02	01	01
3	06 - 03	<input checked="" type="checkbox"/>		02	01	01
4	06 - 04	<input checked="" type="checkbox"/>		02	01	01
5	00 - 00	<input checked="" type="checkbox"/>		02	01	01
6	00 - 00	<input checked="" type="checkbox"/>		02	01	01
7	00 - 00	<input checked="" type="checkbox"/>		02	01	01
8	00 - 00	<input checked="" type="checkbox"/>		02	01	01
9	00 - 00	<input checked="" type="checkbox"/>		02	01	01
10	00 - 00	<input checked="" type="checkbox"/>		02	01	01

Configure the following port parameters:

- **CO No.:** This non-editable field is the number of the software port of the CO Trunk.
- **Hardware Slot and Port:** 'Slot' is the number of the Universal Slot in which the CO Card has been inserted. 'Port' is the number of the CO trunk port on that card.

By default the SARVAM UCS can detect and assign the hardware slot and port numbers automatically to the CO (software) ports. However, if required, you may change the Hardware Slot and Port assigned to the CO software port. In this case, enter the desired Hardware Slot and Port number in this field.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields.

- **Enable Port:** This flag is for enabling or disabling a CO Trunk port. When a CO Trunk port is disabled, neither incoming nor outgoing calls can be made from that port.

By default, the port is enabled. You may disable ports that are not functioning by clearing this check box.

You may disable CO port in case of trouble with the CO line.

- **Name:** You may assign a 'Name' to each CO Trunk to facilitate identification. Whenever there is an incoming call without CLI on this port, the Name you have programmed will be displayed on the landing extension.

The Name of the port may be the name of the Service Provider of this Trunk Line (recommended).

The Name may comprise a maximum of 18 characters.

- **CO Hardware Template:** A CO Hardware Template is a set of features that completely define the behavior of the hardware port of the CO, such as Type of CO Trunk, AC Termination Impedance, Pulse-Tone Dialing, Answer Supervision, Disconnect Supervision, DTMF detection, etc.

Apply a CO Hardware template to the CO trunk port. The SARVAM UCS offers 50 CO Hardware Templates. By default, CO Hardware Template number 01 is assigned to all CO Trunks. Refer the topic ["CO Hardware Template"](#) to know more.

Check if this default template fulfills the feature requirements of the CO Hardware Ports by clicking the 'CO Hardware Template' link.

If CO Hardware Template 02 fulfills your requirements, and if the same features are to be applied on all CO trunk ports, retain Template 02. Similarly, if you want only a few changes to be made to Template 02 and apply it on all CO Ports, make the changes and retain the template.

However, if different sets of features are to be allowed to different CO hardware ports, then prepare separate CO Hardware Templates and apply them on the ports as required. To do this,

- Click the **CO Hardware Template** link to open the page.
- Select a CO Hardware Template Number.
- Customize the CO Hardware Template.
- Click **Submit** at the bottom of the page.
- Go back to the **CO Parameters** page.
- Apply the CO Hardware Template you customized to the CO Port by entering the template number in the **CO Hardware Template** field of this port.
- Click **Submit** at the bottom of the page.
- Repeat the same steps to customize another template and apply it to the CO Port.

To know more about the hardware port features and customizing templates, refer the topic ["CO Hardware Template"](#).

- **Trunk Feature Template:** A Trunk Feature Template is a set of features like Time Table, Operator, Auto Attendant, DISA, Trunk Auto Answer, Trunk Landing Group, SMDR Storage, etc., that defines the behavior of a Trunk. Apply a Trunk Feature Template to the CO Trunk port. By default, Trunk Feature Template 01 is applied on all CO Trunks as well as all other trunk types like ISDN BRI, ISDN T1/E1/PRI, GSM, and VoIP. Refer the ["Trunk Feature Template"](#) topic to know more.

Click the **Trunk Feature Template** link to open the page. Check if the default Template 01 fulfills your requirement for the CO Trunk port.

If the default Template 01 does not fulfill your requirement, you may prepare a different Trunk Feature Template and apply on all CO Ports. For this,

- Click the **Trunk Feature Template** link.
- The Trunk Feature Template page will open.
- Prepare a new template, for example 02 to match your requirements.
- Click **Submit** at the bottom of the page to save changes.
- Go back to the **CO Parameters** page.
- Go to the CO Software Port Number you want to assign the Template you prepared.
- Enter the number of the Template you prepared (02) in the **Trunk Feature Template** field.
- Click **Submit** at the bottom of the page to save changes.

You may also prepare different Templates for different CO Ports, for example Template 02 for certain ports, Template 03 for others. In this case, follow the steps described above. For each CO Port, enter the number of the template you have prepared for that port.

To know more about customizing templates, refer the topic "[Trunk Feature Template](#)".

- **Cost Factor:** This parameter is of relevance only if 'Least Cost Routing' feature is applied on the CO Trunk port.

Cost Factor is a number assigned to each trunk for identification. This number also serves as a preference number for the trunk. The Cost Factor can be from 1 to 99. Trunks having the same preference must be assigned the same Cost Factor. Different trunk types can also be assigned the same Cost Factor. These trunks are used for routing calls.

Assign a Cost Factor to the CO Trunk port, for instance 02, and program Least Cost Routing Table accordingly.

For example, if you want to route all outgoing calls starting with number '6' through the CO Trunk Port 001 only,

- You must first assign a Cost Factor (01-99) to CO Port 001, for example, 02.
- Click the link **Least Cost Routing**.
- Click the **Least Cost Routing - Number Based** link to open the page.

- Enter '6' in the **Number** column, Cost Factor 02 as **Preference 1, 2, 3 and 4**.

Time Based **Number Based** Service Provider Based Time + Number Based

Least Cost Routing - Number based

Index	Number	Cost Factor			
		Preference 1	Preference 2	Preference 3	Preference 4
1	No Match Found	01	01	01	01
2		01	01	01	01
3		01	01	01	01
4		01	01	01	01
5		01	01	01	01
6		01	01	01	01
7		01	01	01	01
8		01	01	01	01
9		01	01	01	01
10		01	01	01	01

Submit Default

- Click **Submit** at the bottom of the page to save your settings.

All outgoing calls assigned Cost Factor trunk 02 will be made from CO Trunk Port 001.

Advanced Configuration

The above listed parameters fulfill the basic CO trunk port configuration requirements of most users. However, for users who need advanced features like Call Budget on the CO trunk ports, you may click the **Advance** button and program the following parameters:

Port No.	Call Budget						Enable Call Back
	Type	Amount (₹)	Minutes	Calls	Scheduled Reset	Scheduled (Date)	
1	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
2	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
3	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
4	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
5	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
6	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
7	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
8	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
9	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
10	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
11	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
12	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
13	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
14	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
15	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>
16	None	999999	999999	9999	<input type="checkbox"/>	01	<input checked="" type="checkbox"/>

- **Call Budget:** By default, Call Budget is enabled on the trunk. If you wish to change the default configuration or disable it for this CO trunk port, configure the parameters as per your requirement:
 - **Type:** Select the type of Call Budget on Trunk—Amount, Minutes or Number of Calls—to be applied on this CO trunk port. By default, Minutes is selected as the Call Budget type. To disable select Type as None.
 - **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 999999.
 - **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set as 000300.
 - **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of calls in this field. By default, the number of calls is set to 9999.
 - **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes to be reset on a particular date of every month.

- **Scheduled (Date):** Enter the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be reset every month. You may select 'Daily' if your plan suggests so.

The consumed Call Budget Amount/Minutes/Number of Calls can be reset from SE and SA Mode, referred to as Manual Reset. Refer the feature description "[Call Budget on Trunk](#)".

- **Call Back:** This parameter is related to the 'Call Back on Trunk Port' feature. If you want to enable the 'Call Back on Trunk Port' feature on this CO trunk, configure the following parameters:
 - **Enable Call Back:** Enable this flag to activate the Call Back on Trunk Port feature. By default, this flag is disabled on all trunk port types. By default, the flag is disabled.
 - **Call Back Timer:** This is the duration for which the system waits for the caller to disconnect before applying the Call Back. The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds.
 - **Call Back Mode:** Select from the following options how a 'Call Back' call answered by the remote party should be routed:
 - Built-in Auto Attendant
 - PIN Authentication - Multiple Calls
 - CLI Authentication - Multiple Calls
 - CLI Authentication - Single Call - Answer Signaling
 - Operator

By default, Operator is selected as the Call Back Mode.

- **Call Back on:** This parameter allows you to select if the call back should be made to the same number that was received or to a different number. If you want the call back to be made to the same number select the 'CLI number'. If you want the call back to be made to a different number, select 'Alternate Number'.

By default, CLI number is selected for Call Back.

- **Incoming Number List:** Program the number strings that are eligible for Call Back in this List. By default, Number List 15 is assigned to Call Back Incoming Number List.

Number List 15 is also assigned to all CO trunks as well as all other Trunk port types. If you want the same numbers strings to be programmed commonly for all CO trunks and Trunk Port types, retain this list.

If you want a different set of number strings to be programmed for this CO Trunk, select a different Number List, and assign it to the CO trunk port.

You may program the Incoming Number List either from the 'Number List' page or by clicking the 'Incoming Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Outgoing Number List:** Program the number strings that are to be called back in this List. For each number string you programmed in the 'Incoming Number List', you must program in the corresponding index in the Outgoing Number List a number to which the call back is to be made. For

example, for the number string programmed at Index 1 in the Incoming Number List, a corresponding number string at the same Index, Index 1, should be programmed in the 'Outgoing Number List'.

By default, Number List 16 is assigned to Outgoing Number List. The same Number List 16 is also assigned to all CO trunks as well as all other Trunk port types.

You may program the default number list, or a different number list and assign it to this CO Trunk port.

You may program the Outgoing Number List either from the 'Number List' page or by clicking the 'Outgoing Number List' link to reach the Number List page.

Refer the topic "[Number Lists](#)" to know more, and for configuration instructions.

- **Call Back from:** This parameter determines the trunk port to be used to make the call back. The call back can be made using the Same Port or an Outgoing Trunk Bundle Group (OGTBG).

Select 'Same Port' if you want the call back to be made using the same port on which the missed call is received. If you select OGTB Group, the call back will be made using the OGTB Group, which you have defined.

By default, Same Port is selected.

- **OGTB Group:** If you selected OGTB Group for making the call back in the previous parameter, you must define the OGTB Group that must be used in this parameter.

By default, OGTB Group 01 is assigned.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OGTB Group that you define here for Call Back.

- **Allow Incoming CLI Modification:** Select the **Allow Incoming CLI Modification** check box if you want to apply Incoming CLI Modification on the CO trunk. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see "[Incoming CLI Modification](#)".

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*For an incoming call on the CO trunk, the Incoming CLI Modification will be applied only when both — the **Allow Incoming CLI Modification** check box and the **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- If you have completed configuration of all the above listed CO Parameters, click 'Submit' at the bottom of the page to save your changes.

Viewing CO Trunk Status

You can view the status of CO Trunks on Jeeves only. To do this,

- Under **CO Configuration**, click **Status**.

CO Port No.	Port Name	Line Status	Call Budget Type	Allotted Amount (₹) /Minutes/Calls	Consumed Amount (₹) /Minutes/Calls
1		Up	None	0000	0000
2		Up	None	0000	0000
3		Up	None	0000	0000
4		Up	None	0000	0000
5		Down	None	0000	0000
6		Down	None	0000	0000
7		Down	None	0000	0000
8		Down	None	0000	0000
9		Down	None	0000	0000

- For each CO Trunk, the following settings will be displayed:
 - CO Port Number
 - Port Name
 - Line Status
 - Call Budget Type
 - Allotted Amount/Minutes/Calls
 - Consumed Amount/Minutes/Calls
 - Call Budget Reset Mode
 - Call Budget Reset Scheduled (Date)
 - Reset Consumed (this is not a status indicator. It is for resetting the Consumed Call Budget manually)

You can also view the CO Trunk Status from the **Status** link. To view, click the CO link under Status.

Configuring CO Trunks using a Telephone

- Enter SE mode from a DKP/SLT.

To assign Hardware Slot and Port to the CO Port, dial:

- **1104-CO-Slot-Port offset on the card**

Where,

CO is the Software port number of the CO port from 001 to 128.

Slot is Slot number in which the CO is inserted from 01 to 16

Port Offset is the number of the Port on the card from 01 to 99.

To clear the Hardware ID assigned to a CO Port, dial:

- **1104-CO-00-00**

To program a Name for a CO Port, dial:

- **5404-1-CO-Name-#*** to program a name for a single CO port.
- **5404-2-CO-CO-Name-#*** to program the same name for a range of CO ports.
- **5404-*.Name-#*** to program the same name for all CO ports.

Where,

CO is the Software port number of the CO port from 001 to 128.

Name is a string of alphanumeric characters (maximum) 18 characters.

Terminate the command with #* if the name string has fewer than 18 characters.

To clear the Name of a CO trunk, dial:

- **5404-1-CO-#*** to clear the name of a single CO port.
- **5404-2-CO-CO-#*** to clear the names for a range of CO ports.
- **5404-*-#*** to clear the names of all CO ports.

To enable/disable the CO Trunk, dial:

- **3307-1-CO-Flag** to enable/disable a single CO port.
- **3307-2-CO-CO-Flag** to enable/disable a range of CO ports.
- **3307-* -Flag** to enable/disable all CO ports.

Where,

CO is the Software port number of the CO port from 001 to 128.

Flag is

0 for Disable

1 for Enable

Default: Enable

To assign a Trunk Feature Template to a CO Port, dial:

- **5803-1-CO-Trunk Feature Template Number** to assign a feature template to a single port.
- **5803-2-CO-CO- Trunk Feature Template Number** to assign the same template to a range of ports.
- **5803-* -Trunk Feature Template Number** to assign the same template to all ports.

Where,

CO is the Software port number of the CO port from 001 to 128.

Trunk Feature Template number is from 01 to 50.

Default: Template 01.

To assign a CO Hardware Template to a CO Port, dial:

- **5903-1-CO-Hardware Template Number** to clear the name of a single port.
- **5903-2-CO-CO-Hardware Template Number** to clear the names for a range of ports.
- **5903-* -Hardware Template Number** to clear the names of all ports.

Where,

CO is the Software port number of the CO port from 001 to 128.

Hardware Template Number is CO Hardware Template from 01 to 50.

Default: Template 01.

To assign a Cost Factor to a CO Port, dial:

- **3308-1-CO-Cost Factor** to assign cost factor for a single CO port.
- **3308-2-CO- CO-Cost Factor** to assign cost factor for a range of CO ports.
- **3308-* -Cost Factor** to assign cost factor for all CO ports.

Where,

CO is the Software port number of the CO port from 001 to 128.

Cost Factor is from 01 to 99. Default: 01

- For commands to program Call Budget on CO trunks, refer the topic [“Call Budget on Trunk”](#).

To enable / disable Call Back on CO port, dial:

- **3310-1-CO-Code** to enable/disable Call Back on a single CO trunk.
- **3310-2-CO-CO-Code** to enable/disable Call Back on a range of CO trunks.
- **3310-* -Code** to enable/disable Call Back on all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

Code is

0 for Disable

1 for Enable

Default: Disabled

To program Call Back Timer on CO port, dial:

- **3311-1-CO-Call Back Timer** to set timer for a single CO trunk.
- **3311-2 -CO-CO-Call Back Timer** to set same timer duration for a range of CO trunks.
- **3311-* -Call Back Timer** to set the same timer duration for all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

Timer is from 01 to 99 Sec.

Default: 10 Seconds

To select Call Back Mode for CO port, dial:

- **3312 -1-CO-Call Back Mode** to set call back mode for a single CO trunk.
- **3312 -2-CO-CO-Call Back Mode** to set same call back mode for a range of CO trunks.
- **3312-* -Call Back Mode** to set the same call back mode for all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

Call Back Mode is from 1 to 5

1 for Built-in Auto Attendant

2 for PIN Auth. - Multiple Calls

3 for CLI Auth. - Multiple Calls

4 for CLI Auth. - Single Call - Ans. Sig.

5 for Operator

Default: Operator

To program Call Back On for CO port, dial:

- **3313-1-CO-Call Back on** to program call back on for a single CO trunk.
- **3313-2-CO-CO-Call Back on** to program the same call back on option for a range of CO trunks.
- **3313-* -Call Back on** to program the same call back on option for all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

Call back on is

1 for CLI Number

2 for Alternate Number

Default: CLI Number

To assign Call Back - Incoming Number List to a CO port, dial:

- **3314-1 -CO-Incoming Number List** to assign a list to a single CO trunk.
- **3314-2-CO-CO-Incoming Number List** to assign the same list to a range of CO trunks.
- **3314-* -Incoming Number List** to assign the same list to all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

Incoming Number List is from 01 to 16.

Default: 15

To assign Call Back - Outgoing Number List to a CO port, dial:

- **3315-1 -CO-Outgoing Number List** to assign a list to a single CO trunk.
- **3315-2-CO-CO-Outgoing Number List** to assign the same list to a range of CO trunks.
- **3315-* -Outgoing Number List** to assign the same list to all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

Incoming Number List is from 01 to 16.

Default: 16

To select Call Back From port for a CO Trunk port, dial:

- **3316-1-CO-Call Back From** to select Call Back From for a single CO trunk.
- **3316-2-CO-CO-Call Back From** to select the same Call Back From for a range of CO trunks.
- **3316-*-Call Back From** to select the same Call Back From for all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

Call Back From is

1 for Same Port

2 for OGTB Group

Default: Same Port

To assign Call Back - OGTB Group to a CO port, dial:

- **3317-1-CO-OGTB Group** to assign an OGTBG to a single CO trunk.
- **3317-2-CO-CO-OGTB Group** to assign the same OGTBG to a range of CO trunks.
- **3317-*-OGTB Group** to assign the same OGTBG to all CO trunks.

Where,

CO is the number of the software port of the CO trunk from 001 to 128.

OGTB Group is from 01 to 32.

Default: 01

- Exit SE mode.

Configuring E&M Lines

The SARVAM UCS supports E&M interface. A maximum of 32 ports are supported in SARVAM UCS.

If you have correctly installed the E&M Cards and observed the Reset Cycle, you may now program the E&M Ports using Jeeves or a Telephone, depending on your installation scenario.

An E&M port of SARVAM UCS can be programmed to take on the function of:

- a Subscriber (Station) - works like an extension interface, receiving incoming calls.

OR

- a Trunk - works like a trunk interface when any of the extensions of the System makes an outgoing call through it.

OR

- a Tie Line - takes on a dual personality: functioning as both a station and a trunk. The E&M port works like an extension interface for incoming calls. It works like a trunk interface when any extension makes an outgoing call through it.

This dual function is used in Systems that are used as Transit Exchanges as in a PLCC Network. Read [“PLCC-An Introduction”](#) to know more.

The E&M Card of SARVAM UCS supports the following features:

- E&M Interface - Types IV and V
- Speech Interface - Two-wire and four-wire.
- E&M Trunk Seizure Type²¹⁶: Immediate, Immediate with Ack, Immediate + Wink, Immediate with Ack+Wink (MFCR2)²¹⁷, Seizure Pulse, Seizure Pulse + Wink, Express, and Radio.
- Address Signaling: Pulse dial (Pulse 10PPS, Pulse 20PPS) and Tone Dial (DTMF).

The E&M Interface (Type IV and Type V connection) and the Speech Interface (2-wire speech or 4-wire) are selected at the time of installation by changing the Jumper settings.

Configuring the E&M using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **E&M Configuration**.

216. This is the line protocol that defines how the equipment seizes the E&M trunk. Also referred to as Start Dial Supervision Signaling Protocol.

217. Currently supported only on ETERNITY GENX E&M4 Card.

- Click the **E&M Parameters**.

Port No.	H/w Slot - Port	Enable Port	Name	E&M Features Template	Trunk Features Template
1	00 - 00	<input checked="" type="checkbox"/>		01	01
2	00 - 00	<input checked="" type="checkbox"/>		01	01
3	00 - 00	<input checked="" type="checkbox"/>		01	01
4	00 - 00	<input checked="" type="checkbox"/>		01	01
5	00 - 00	<input checked="" type="checkbox"/>		01	01
6	00 - 00	<input checked="" type="checkbox"/>		01	01
7	00 - 00	<input checked="" type="checkbox"/>		01	01
8	00 - 00	<input checked="" type="checkbox"/>		01	01
9	00 - 00	<input checked="" type="checkbox"/>		01	01
10	00 - 00	<input checked="" type="checkbox"/>		01	01
11	00 - 00	<input checked="" type="checkbox"/>		01	01
12	00 - 00	<input checked="" type="checkbox"/>		01	01
13	00 - 00	<input checked="" type="checkbox"/>		01	01
14	00 - 00	<input checked="" type="checkbox"/>		01	01
15	00 - 00	<input checked="" type="checkbox"/>		01	01
16	00 - 00	<input checked="" type="checkbox"/>		01	01

Configure the following parameters for each E&M port on this page:

- **E&M Port No.:** This non-editable field is the software port number of the E&M Port. Refer the topic [“Software Port and Hardware ID”](#) to know more.
- **H/w (Hardware) Slot - Port:** 'Slot' is the number of the number of the Universal Slot in which the E&M Card is inserted. 'Port' is the number of the E&M hardware port on which the Tie Line equipment (System, Router, Leased Line, etc.) is connected.

The SARVAM UCS can automatically detect and assign the hardware slot and port numbers automatically to the E&M software ports.

For example: if you have inserted the E&M8 Card in Slot 05 and E&M4 Card in Slot 06 of SARVAM UCS, the system will assign the Hardware Slot 05 and port numbers 01-08 to the E&M Software Ports from 001 to 008 respectively. The system will assign hardware Slot 6 and port numbers 01-04 to the E&M Software Ports 009 to 012. Refer the topic [“Software Port and Hardware ID”](#) to know more.

However, if required, you may change the Hardware Slot and Port assigned to the E&M software port. In this case, enter the desired Hardware Slot and Port number in this field.

If you want to de-assign the Hardware Slot and Port, Enter '00' in both fields.

- **Enable Port:** This flag is for enabling or disabling an E&M port. When an E&M port is disabled, neither incoming nor outgoing calls can be made from that port.

By default, the port is enabled. You may disable ports that are not functioning.

- **Name:** You may assign a Name to the E&M Port. Whenever there is an incoming call on this Port, this name will be displayed on the destination extension, while receiving the call.

The Name may comprise a maximum of 18 characters.

- **E&M Feature Template:** This parameter is applicable to all E&M Ports. The E&M Feature Template is a complete set of E&M features to be applied on E&M Ports according to their 'Orientation Type', whether they are Stations, Trunks or Tie-Lines.

By default E&M Feature Template 01 is applied on all E&M Ports. This template has 'Station' as the default Orientation Type.

If all the E&M Ports are to be programmed as 'Stations' retain this template.

If all the E&M Ports are to be programmed as 'Trunks' use the default E&M Feature Templates 09 and 10 which have 'Trunks' as Orientation Type.

If some of the E&M Ports are to be programmed as Stations, some as Trunks and yet others as Tie Lines, prepare different E&M Feature Template for each Orientation Type and apply them to the related ports.

- Under **Configuration**, click **E&M Feature Template** to open the page.
- Select an E&M Feature Template Number.
- Customize the E&M Feature Template.
- Click **Submit** to save changes.
- Go to the **E&M Parameters** page.
- Apply the E&M Feature Template you customized to the E&M Port by entering the template number in the 'E&M Feature Template' field of this port.
- Click **Submit** at the bottom of the page.
- Repeat the same steps to customize another template and apply it to another E&M Port.

Refer the topic "[E&M Feature Template](#)" for more details on customizing the templates and applying them on E&M Ports.

- **Trunk Feature Template:** This parameter is relevant only if the E&M Port is to be programmed to function as a Trunk or a Tie-Line²¹⁸. To know more, refer "[Trunk Feature Template](#)".

Assign an E&M Feature Template to the E&M Port. A Trunk Feature Template is a set of features like Time Table, Operator, Auto Attendant, DISA, Trunk Auto Answer, Trunk Landing Group, SMDR Storage, etc., that defines the behavior of a Trunk. Apply a Trunk Feature Template to the E&M Port.

By default, Trunk Feature Template 01 is applied on all E&M (trunk) Ports. This Template is also the default template commonly applied on all other trunk types (CO, ISDN BRI, ISDN T1E1PRI, GSM, and VoIP).

218. To program the E&M Port as a Trunk or a Tie-Line, you must set the 'Orientation Type' of the E&M Port to 'Trunk' or 'Tie-Line' in the "[E&M Feature Template](#)" applied on the port.

Click the link **Trunk Feature Template** to open the page. Check if the default Template 01 fulfills your requirement for the E&M Trunk port.

If not, you may prepare a different Trunk Feature Template and apply on all E&M Ports. For this, If the default Template 01 does not fulfill your requirement,

You may prepare a different Trunk Feature Template and apply on all E&M Ports. For this,

- Click the **Trunk Feature Template** link.
- The Trunk Feature Template page will open.
- Prepare a new template, for example 04 to match your requirements.
- Click **Submit** at the bottom of the page to save changes.
- Go to the **E&M Parameters**.
- Go to the E&M Software Port Number you want to which you want to assign the Template you prepared.
- Enter the number of the Template you prepared (04) in the **Trunk Feature Template** field.
- Click **Submit** at the bottom of the page to save changes.

You may also prepare different Templates for different E&M Ports, for example Template 04 for certain ports, Template 05 for others. In this case, for each E&M Port, enter the number of the template you have prepared for that port.

To know more about customizing templates, refer the topic "[Trunk Feature Template](#)".

- **Station Basic Feature Template:** This parameter is applicable when the E&M Port is to be programmed to function as a Station (Orientation type = Station or Tie-Line).

Assign a "[Station Basic Feature Template](#)" to the E&M Port functioning as a Station. By default, Station Basic Feature Template 01 is assigned to all extensions, that includes SLT and DKP ports.

Check if the default template fulfills the feature requirements (like "[Class of Service \(COS\)](#)", "[Toll Control](#)", "[OG Trunk Bundle Group](#)", etc.) of the E&M Ports functioning as Stations.

If the default Template 01 fulfills the feature requirements and if the same features are to be allowed to all E&M (station) ports, retain Template 01.

If different sets of features are to be allowed to different E&M (station) Ports, then prepare separate Station Basic Feature Templates and apply them on the ports. To do this,

- Click the link **Station Basic Feature Template** to open the page.
- Select a Template number, for example 05.
- Customize Template number 05 and click **Submit** at the bottom of the page.
- Now go back to the **E&M Parameters** page.

- Enter the number of the Template you customized, Template 05 in the 'Station Basic Feature Template' field of the E&M Port (for example: E&M No. 003) on which you want to apply this template. If you want to apply this template to other ports too, like E&M No. 004, 005, and 006, assign the Template 05 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another E&M port.

Also, refer the topic [“Station Basic Feature Template”](#) to know more about customizing the templates and applying on the ports.

- **Station Advanced Feature Template:** This parameter is applicable only when the E&M Port is to be programmed to function as a Station.

By default Station Advanced Feature Template 01 is assigned to all extensions, that includes SLT and DKP ports as well as E&M ports with the orientation type 'Station'.

Check if this default template fulfills the feature requirements of the E&M Ports (with 'station' as orientation type) by selecting the 'Station Advanced Feature Template' link.

If the default Template 01 fulfills the feature requirements, and if the same features are to be allowed to all E&M (station) ports, retain Template 01.

If different sets of features are to be allowed to different E&M (station) Ports, then prepare separate Station Advanced Feature Templates and apply them on the ports.

To do this,

- Click the **Station Advanced Feature Template** link to open the page.
- Select a Template number, for example 03.
- Customize Template number 03.
- Click **Submit** at the bottom of the page.
- Go to the **E&M Parameters** page.
- Enter the number of the Template you customized, Template 03 in the 'Station Basic Feature Template' field of the E&M Port (for example, E&M No. 003) on which you want to apply this template. If you want to apply this template to other ports too, like E&M No. 004, 005, and 006, assign the Template 03 to all these ports.
- Click **Submit** at the bottom of the page to save changes.
- Repeat the same steps to customize and assign a different Template to another E&M (Station) port.

Also refer the topic [“Station Advanced Feature Template”](#) for instructions on customizing these templates and applying them on the ports.

- **Priority:** This parameter is applicable only when the E&M Port is to be programmed to function as a Station²¹⁹. To know more, refer [“E&M Feature Template”](#).

Each station of the SARVAM UCS is assigned a Priority Level starting from 1, 2, 3... to 9, with '1' being lowest Priority and '9' being highest Priority. Whenever an extension (phone) with higher priority calls an extension with lower priority, a triple ring is placed on the called extension. To know more, read the feature description "[Priority](#)".

By default, the Priority of all E&M Ports functioning as Stations is set to '9-Highest'. So, decide what Priority Level you will assign to each of the E&M Ports functioning as Stations and set the desired level for each port.

- **Cost Factor:** This parameter is of relevance only if 'Least Cost Routing' feature is applied on the E&M Trunk port.

Cost Factor is a number assigned to each trunk for identification. This number also serves as a preference number for the trunk. The Cost Factor can be from 1 to 99. Trunks having the same preference must be assigned the same Cost Factor. Different trunk types can also be assigned the same Cost Factor. These trunks are used for routing calls.

Assign a Cost Factor to the E&M Trunk port, for example, 03 and program Least Cost Routing Table accordingly.

For example, if you want to route all outgoing calls starting with number '6' through the E&M Trunk Port 001 only,

- You must first assign a Cost Factor (01-99) to E&M Trunk Port 001, for example 03.
- Click the **Least Cost Routing - Number Based** link to open the page.
- Enter '6' in the 'Number' column, Cost Factor '03' as Preference 1, 2, 3 and 4.
- Click **Submit** at the bottom of the page to save your setting.

All outgoing calls assigned Cost Factor trunk 03 will be made from E&M Trunk Port 001.

- **Allow Incoming CLI Modification:** Select the **Allow Incoming CLI Modification** check box if you want to apply Incoming CLI Modification on the E&M trunk. By default, it is disabled.

Incoming CLI Modification is useful in countries where the Calling Line Identification (CLI) received by the System extension users must be suitably modified before it can be used to dial out the number. To know more, see "Incoming CLI Modification".

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled.

*For an incoming call on the E&M trunk, the Incoming CLI Modification will be applied only when both — the **Allow Incoming CLI Modification** check box and the **Enable Incoming CLI Modification** check box in System Parameters — are enabled.*

- Repeat the same steps to configure other E&M Trunk/Station ports.

219. Recall that E&M ports can function as trunks, as stations and have both functions. When an E&M Port is programmed as a Station Interface, it can only receive incoming calls. To program the E&M Port as a Station, you must set the 'Orientation Type' of the E&M Port to 'Station' in the E&M Feature Template applied on the port.

- If you have completed configuration of all the above listed E&M Parameters, click 'Submit' at the bottom of the page to save your changes.

Configuring the E&M using a Telephone

- Enter SE mode from a DKP/SLT.

To assign Hardware ID to an E&M Software Port, dial:

- **1105-E&M-Slot-Port offset on the card**

Where,

E&M is the Software Port number of the E&M port from 001 to 128.

Slot is Slot number in which the E&M Card is inserted from 01 to 16

Port Offset is the number of the E&M Port on the card from 01 to 99.

To clear the Hardware ID assigned to an E&M Software Port, dial:

- **1105-E&M-00-00**

To enable/disable an E&M Port, dial:

- **3321-1-E&M-Code** to enable/disable a single E&M port.
- **3321-2-E&M-E&M-Code-#*** to enable/disable a range of E&M ports.
- **3321-*-Code** to enable/disable all E&M ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Code is

0 for Disable

1 for Enable

Default: Enable

To program a Name for an E&M Port, dial:

- **5406-1-E&M-Name-#*** to program a name for a single E&M port.
- **5406-2-E&M-E&M-Name-#*** to program the same name for a range of E&M ports.
- **5406-*-Name-#*** to program the same name for all E&M ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Name is a string of alphanumeric characters 18 characters (maximum).

Terminate the command with **#*** if the name string has fewer than 18 characters.

To clear a name assigned to an E&M port, dial:

- **5406-1-E&M-#*** to clear the name of a single E&M port.
- **5406-2-E&M-E&M-#*** to clear the names for a range of E&M ports.
- **5406-*-#*** to clear the names of all E&M ports.

To assign an E&M Feature Template to an E&M Port, dial:

- **6003-1-E&M-Template Number** to assign a template to a single port.
- **6003-2-E&M-E&M-Template Number** to assign the same template to a range of ports.
- **6003-*-Template Number** to assign the same template to all ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Template Number is from 01 to 50.

Default: E&M Feature Template 01.

To assign a Trunk Feature Template to an E&M Port, dial:

- **5805-1-E&M-Template Number** to assign a template to a single port.

- **5805-2-E&M-E&M-Template Number** to assign the same template to a range of ports.
- **5805-*-Template Number** to assign the same template to all ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Template Number is from 01 to 50.

Default: Trunk Feature Template 01.

To assign a Station Basic Feature Template to an E&M Port, dial:

- **5505-1-E&M-Template Number** to assign a template to a single port.
- **5505-2-E&M-E&M-Template Number** to assign the same template to a range of ports.
- **5505-*-Template Number** to assign the same template to all ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Template Number is from 01 to 50.

Default: Station Basic Feature Template 01.

To assign a Station Advanced Feature Template to an E&M Port, dial:

- **5605-1-E&M-Template Number** to assign a template to a single port.
- **5605-2-E&M-E&M-Template Number** to assign the same template to a range of ports.
- **5605-*-Template Number** to assign the same template to all ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Template Number is from 01 to 50.

Default: Station Advanced Feature Template 01

To set a Priority Level for an E&M Port, dial:

This command is applicable only when the E&M Port is configured to function as a station!

- **3915-1-E&M-Priority** to set Priority for a single E&M Port.
- **3915-2-E&M-E&M-Priority** to set the same Priority for a range of E&M Ports.
- **3915-*-Priority** to set the same Priority for all E&M Ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Priority is from 1 to 9.

Default: 9-Highest

To assign a Cost Factor to an E&M port, dial:

- **3322-1-E&M-Cost Factor** to assign Cost Factor to a single E&M port.
- **3322-2-E&M-E&M-Cost Factor** to assign Cost Factor to a range of E&M ports.
- **3322-*-Cost Factor** to assign Cost Factor to all E&M ports.

Where,

E&M is the Software Port number of the port from 001 to 128.

Cost Factor is from 01 to 99. Default: 01

- Exit SE mode.

Configuring LCR

Least Cost Routing (also referred to as Automatic Route Selection) is an expense control feature of SARVAM UCS.

Least Cost Routing (LCR) is useful when there are different trunk lines for making outgoing calls, and the service providers of these trunks offer different tariffs for calls made to certain locations or numbers or during a particular time of the day.

When a call is made from an extension of the SARVAM UCS, LCR recognizes where the call is going. Depending upon how the LCR is programmed, the system routes the call through the assigned trunks.

The system can be programmed to select the most cost effective trunk for the time of the day when the call is made from the extension or to select the most cost effective trunk for the destination number dialed from the extension or to select the most cost effective trunk considering both time of the day and destination number.

Accordingly, SARVAM UCS supports four types of LCR which can be programmed, namely:

1. **Time-based LCR:** This type of LCR may be used when you have trunk lines of more than one service provider, and each offers a different tariff according to the time of the day.

For example, Service Provider 1 offers a lower tariff for calls made between 9am to 8pm, while Service Provider 2 offers a lower tariff for calls made between 8pm to 9am.

When Time-based LCR is programmed, the system uses the Online-dialing logic, whereby digits dialed by the user are directly passed on to the trunk.

2. **Number based LCR:** This type of LCR may be used when you have trunk lines of more than one service provider, and each offers different tariffs according to the area or distance, or phone numbers dialed. For instance, Service Provider 1 provides cheaper calling rates for calls made from City A to City B, than Service Provider 2 and Service Provider 3.

3. **Time and Number based LCR:** This type of LCR is a combination of number and time based LCR, that is, the service providers offer different tariffs according to the time of the day as well as area/distance.

For example, Service Provider 1 offers lower rates for calls made from City A to City B during peak hours 9am to 8pm, as compared to Service Provider 2, whereas Service Provider 2 offers cheaper rates for calls made from City A to City B during off peak hours (8pm to 9 am).

When Time+Number-based LCR is programmed, the system uses Store and Forward dialing logic, whereby digits dialed by the user are first stored at a memory location in the system, and then dialed out on the assigned trunk.

4. **Service Provider-based LCR:** This type of LCR may be used when the same Service Providers offer different rates for calls made to numbers within their own network and for calls made to numbers of another Service Provider's network. For example, Service Provider 1 offers lower rates to call a Service Provider1 number in City A and in City B, than for calling numbers of Service Provider 2 in the same cities.

This type of LCR may also be used when the same Service Providers apply different charges for different subscriber services provided by them. For example, Service Provider 1 offers both Fixed Line as well as GSM services and applies different charges for fixed line and GSM services.

When Service Provider-based LCR is programmed, whenever a number is dialed out, the system ignores the area code, checks the number in the 'Service Provider-based LCR table', and routes the call according to the trunk programmed for that number.

SARVAM UCS also supports LCR based on Carrier Pre-Selection. This type of LCR is useful where there exist different service providers for local and long distance calls. Refer the topic "[Least Cost Routing-Carrier Pre-Selection](#)" to know more.

Cost Factor

For LCR to work, all trunks that are allotted to extensions for making outgoing calls, must first be assigned a Cost Factor.

Cost Factor is a number assigned to each trunk for identification. This number also serves as a preference number for the trunk. The Cost Factor can be from 1 to 99. Trunks having the same preference must be assigned the same Cost Factor. Different trunk types can also be assigned the same Cost Factor. These trunks are used for routing calls.

By default all trunks are assigned Cost Factor number 01.

After assigning Cost Factor to Trunks, you must configure the Type of LCR to be used on Trunks in the Outgoing Trunk Bundle Group (OGTBG) allotted to the extensions for making calls.

Assigning Cost Factor to Trunks

- On a sheet of paper, make a list of all the trunks assigned to extensions for making outgoing calls.
- Make a table of the trunk types and assign a cost factor to each trunk type, as shown below.

Trunk Type and Number	Service Provider	Cost Factor
CO-001	BSNL	01
CO-002	BSNL	02
MOB-001	Reliance	03
MOB-002	BSNL	04
MOB-003	Airtel	05
MOB-004	Vodafone	06
BRI-01	BSNL	07
BRI-02	Reliance	08

- Program the Cost Factor number you assigned to the Trunk types in their respective trunk parameters. For instance, assign Cost Factor 01 to CO-001 and Cost Factor 002 to CO-002 in the "[Configuring CO Trunks](#)". Similarly, assign Cost Factor 03 to Mobile Trunk 001, Cost factor 04 to Mobile Trunk 002, Cost Factor 05 to Mobile Trunk port 003, and Cost Factor 06 to Mobile Trunk port 004 in the "[Mobile Port Parameters](#)". Assign Cost Factor 07 to BRI Trunk port 01 and Cost Factor 08 to BRI Trunk port 02 in "[Configuring BRI Trunks](#)".

Configuring Time-based LCR

- You can configure Time-based LCR for as many as 8 different Time Zones.
- On a sheet of paper, make a table for Time-based LCR.
- Define the Time Zone, that is, the start and end time, when the LCR should be applied for the outgoing calls. The Time Zone you define is stored at an Index number from 1 to 8.
- For each Time Zone that you define, select the Trunk as your first preference, that is, Preference 1. Select the trunk of your second, third and fourth preference. When the trunk you selected as first preference is busy, the system will route the call through the next trunk you have set that is free.
- Refer to the table you prepared for assigning Cost Factor to trunks.
- For example, you want calls made during 9am to 8pm to be routed through BSNL CO trunks (CO-001 and CO-002). If these trunks are busy, you want the system to route calls through the BRI line of BSNL trunk. When this line is busy, you want the system to attempt to route calls through the BRI line of Reliance.
- You want calls made between 8pm to 9am to be routed through BSNL CO trunk 001 only.
- At Time Zone Index 1, define the Time Zone start and end time in 24 Hours:Minutes format, enter the Cost Factor you assigned to CO-001 (01) and CO-002 (02) as Preference 1 and Preference 2 respectively. Enter the cost factor you assigned to BRI-01 (07) and BRI02 (08) as Preference 3 and Preference 4 respectively.

Time Zone Index	Time Zone		Cost Factor			
	Start Time (HH:MM)	End Time (HH:MM)	Preference 1	Preference 2	Preference 3	Preference 4
1	09:00	20:00	01	02	07	08
2	20:01	08:59	01	01	01	01
3						
4						
5						
6						
7						
8						

- Similarly, at Time Zone Index 2, define the Time Zone in 24 Hours: Minutes format. Enter the Cost factor you assigned to CO-001, that is, 01 as Preference 1, 2, 3, and 4. When calls are made during this time period, they will be routed through CO-001 only.
- If you have finished defining Time Zones and the preferred trunks for the time zones, configure the Time-based LCR using Jeeves or a Telephone.

Configuring Time-based LCR using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Least Cost Routing (LCR)**.

The links to the LCR options appear.

- Click **Time-based** to open the page.

Least Cost Routing - Time based

Time Zone Index	Start Time		End Time		Cost Factor			
	HH	MM	HH	MM	Preference 1	Preference 2	Preference 3	Preference 4
1	00	00	23	59	01	01	01	01
2	00	00	23	59	01	01	01	01
3	00	00	23	59	01	01	01	01
4	00	00	23	59	01	01	01	01
5	00	00	23	59	01	01	01	01
6	00	00	23	59	01	01	01	01
7	00	00	23	59	01	01	01	01
8	00	00	23	59	01	01	01	01

Note: When the Current Time does NOT match with any Time Zone Entry, the Call will be routed as per configurations of Time Zone Index 1.

Submit Default

- Enter the values of the Time-based LCR you prepared on the sheet of paper in the appropriate fields.
- Click **Submit** at the bottom of the page to save your settings.
- Log out of Jeeves or continue programming, as required.

Configuring Time-based LCR using a Telephone

- Enter SE mode.

To program Time Zone at a Time Zone index, dial:

- **3402-Time Zone Index-Start Time-End Time**

Where,

Time Zone Index is from 01 to 08.

Start Time is the time in HH:MM format when the Time zone starts.

End Time is the time in HH:MM format when the Time zone ends.

For example to program 09:00 to 20:00 hours at Time Zone Index 1, dial **3402-01-0900-2000**

By default, Time Zone is 00.00 to 23.59.

To program the Cost Factor (Service Provider preference) for the Time Zone, dial:

- **3403-Time Zone Index-CF1-CF2-CF3-CF4**

Where,

Time Zone Index is from 01 to 08.

CF1 is the first preferred (the cheapest) service provider.

CF2 is the second preferred (second cheapest) service provider.

CF3 is the third preferred service provider.

CF4 is the fourth preferred service provider.

For example, to program the preferred trunks for the Time Zone 09:00 to 20:00 hours, dial **3403-01-01-02-07-08**

It is mandatory to complete this command with CF1 to CF4. If you have only one service provider, program the same as CF1, CF2, CF3, CF4.

To default the Time Zone based LCR table, dial:

- **3401**
- Exit SE mode.

Configuring Number-based LCR

- You can configure Number-based LCR for as many as 99 different Numbers, which are stored against Index numbers from 01 to 99.
- On a sheet of paper, make a table for Number-based LCR.
- Enter each of the number strings at an Index number from 01 to 99. A Number string may be a complete telephone number, a truncated phone number or an area code. The number can be a maximum of 64 characters (Digits + Wildcards). Valid characters: 0 to 9, *, #, X, T, Comma [,], Hyphen [-], Caret [^]. See ["Wildcard Characters"](#) to know the various number patterns you can use.
- For each number string you enter, select a Trunk as your first preference, that is, Preference 1. Select the trunk of your second, third and fourth preference. When the trunk you selected as first preference is busy, the system will route the call through the next trunk you have set that is free.
- Refer to the table you prepared for assigning Cost Factor to trunks.

For example, you want all mobile numbers to be routed through the Mobile Trunk ports, all local numbers to be routed through the CO ports.

All mobile numbers start with the number '9', which is prefixed with a '0' when making long distance mobile calls, so enter '9' and '09' as the number strings. For '9' as well as '09', select the Mobile trunks through which the calls should be made in order of preference.

Similarly, all local numbers start with 2, so enter this number in the number string column, and select the CO trunk in the order of preference. As in this example, you have only two CO trunks, so you may keep the same two trunks as your preference.

Index	Number	Cost Factor			
		Preference 1	Preference 2	Preference 3	Preference 4
1	9	04	03	05	06
2	09	04	06	05	03
3	2	01	02	01	02
4					
5					

Index	Number	Cost Factor			
		Preference 1	Preference 2	Preference 3	Preference 4
:					
:					
99					

- If you have finished entering the number strings, and selecting the preferred trunks for the numbers, configure the Number-based LCR using Jeeves or a Telephone.

Configuring Number-based LCR using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Least Cost Routing (LCR)**.
- Click **Number-based** to open the page.

Index	Number	Cost Factor			
		Preference 1	Preference 2	Preference 3	Preference 4
1	No Match Found	01	01	01	01
2		01	01	01	01
3		01	01	01	01
4		01	01	01	01
5		01	01	01	01
6		01	01	01	01
7		01	01	01	01
8		01	01	01	01
9		01	01	01	01
10		01	01	01	01
11		01	01	01	01

- Enter the values of the Number-based LCR you prepared on the sheet of paper in the appropriate fields.
- In Number you can enter may be a complete telephone number, a truncated phone number or an area code. You may enter upto 64 characters (Digits + **Wildcard Characters**) in this field. Valid characters: 0 to 9, *, #, X, T, Comma [,], Hyphen [-], Caret [^]. Default: Blank.
- Click **Submit** at the bottom of the page to save your settings.

Wildcard Characters

SARVAM UCS supports following characters.

Character	Description
X (letter X)	X represents any single digit from 0 to 9.

#	When # is configured in a number string, it will not be considered as End of Dialing.
*	When * is configured in a number string, it will not be considered as End of Dialing.
+	+ (plus) can be configured as a first character of the Destination Number string in the <i>SIP Trunk</i> only.
[-]	Hyphen within the bracket, defines a range. Only digits 0-9 are allowed within a bracket.
[,]	Comma within a bracket is used as a separator between the groups of numbers.
[^]	Caret within a bracket is used to deny or restrict the number or range defined after the symbol. Only digits 0-9 are allowed after the caret.
T (letter T)	Character T can be configured only as a last character in a number string. When configured in a number string, the system waits for End of Dialing.

Refer the following table to understand how you can configure the Numbers.

Numbers	Description
1XX	Allows you to dial any number in a range from 100 to 199.
[2-5]XX	Allows you to dial any 3 digit number in a range from 200-599.
[2,3,8]XX	Allows you to dial any 3 digit number in the range from 200-299, 300-399, 800-899.
[2-9]XXXXXX	Allows you to dial any 7 digit number in the range from 2000000-9999999.
23[^2]1	Allows you to dial a 4 digit number: 2301, 2311, 2331, 2341, 2351, 2361, 2371, 2381, 2391.
2630[500-550]	Allows you to dial a 7 digit number in the range from 2630500-2630550.
[^6-7]X	Allows you to dial a 2 digit number in the range from 00 to 99 except the numbers from 60 to 79.
1234	Allows you to dial 1234 number only.
011T	Allows you to dial any number starting with 011. The number must be of minimum 3 digits and maximum digits must be as configured for the port.

Configuring Number-based LCR using a Telephone

- Enter SE mode.

To program Cost Factor (Service Provider preference) for the each Number, dial:

- **3412-Number Index-CF1-CF2-CF3-CF4**

Where,

Number Index is from 01 to 99.

CF1 is the first preferred (the cheapest) service provider.

CF2 is the second preferred (second cheapest) service provider.

CF3 is the third preferred service provider.

CF4 is the fourth preferred service provider.

For example, to program Cost Factor for number '9' at Index 01, dial 3412-01-04-03-05-06

It is mandatory to complete this command with CF1 to CF4. If you have only one service provider, program the same as CF1, CF2, CF3, CF4.

To default the Number-based LCR table, dial:

- **3410**

Configuring Time and Number-based LCR

- This is a combination of the Time Zone-based and Number-based LCR. You may use this feature if your service providers offer lower call rates for calls made to certain numbers during a certain time of the day.
- On a sheet of paper, make a table for Time and Number-based LCR.
- Define the Time Zones when the service providers offer lower tariff. You can define up to 8 time zones.
- For each Time Zone you define, specify the Number strings on which lower tariff is applied during that Time Zone. The number can be a maximum of 64 characters (Digits + Wildcards). Valid characters: 0 to 9, *, #, X, T, Comma [,], Hyphen [-], Caret [^]. See "[Wildcard Characters](#)" to know the various number patterns you can use.
- For each Number string you enter for a particular time zone, assign Cost Factor. Select a trunk as your first preference. Select trunks of your second, third and fourth preference. Refer to the table you prepared for assigning Cost Factor.
- You can enter up to 99 different number strings, which are stored at Index numbers from 01 to 99. The Number strings may be complete telephone numbers, truncated phone numbers or area codes.

When the trunk you selected as first preference is busy, the system will route the call through the next trunk you set as preference if it is free.

For example, service provider of CO-001 and CO-002 (assigned Cost Factor 01 and 02) offers the lowest rate for calls made to Area Code 022 between 8am to 12pm, followed by service providers of Mobile Trunk-02 (assigned cost factor 04) and Mobile Trunk-01 (assigned cost factor 03).

- Define Time Zone 1 Start and End time as 08 to 12:00 hours
- Enter area code 022 as Number string at Number Index 1

- Assign Cost Factor preference for the number string in this sequence: 01, 02, 04, 03

		Time Zone1				Time Zone2				Time Zone3				:	Time Zone 8
		HH	MM												
Start Time		08	00	12	00	09	00								
End Time		12	00	18	00	20	00								
		Cost Factor				Cost Factor				Cost Factor					
Index	Number	Preference 1	Preference 2	Preference 3	Preference 4	Preference 1	Preference 2	Preference 3	Preference 4	Preference 1	Preference 2	Preference 3	Preference 4		
1	022	01	02	04	03	04	03	02	01	03	05	06	04		
2	011	01	02	04	05										
3	080	01	02	05	06					03	05	06	04		
:															
99															

- If you have finished defining the time zones, entering the number strings, and selecting the preferred trunks for the number strings, configure the Number and Time-based LCR using Jeeves or a Telephone.

Configuring Time+Number-based LCR using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Least Cost Routing (LCR)**.
- Click **Time + Number based** to open the page.

- Enter the values of the Time+Number-based LCR you prepared on the sheet of paper in the appropriate fields.
- Click **Submit** at the bottom of the page to save your settings.

Configuring Time+Number-based LCR using a Telephone

- Enter SE mode.

To define Time Zone for Time+Number-based LCR, dial:

- **3421-Time Zone Index-Start Time-End Time**

Where,

Time Zone Index is from 01 to 08.

Start Time is the time in HH:MM format when the Time zone starts.

End Time is the time in HH:MM format when the Time zone ends.

By default, Time Zone is 00.00 to 23.59.

For example, to define 08:00 to 12:00 as start and end time of Time Zone 1, dial **3421-1-0800-1200**

To program Cost Factor (Service Provider preference) for the each Number and Time Zone, dial:

- **3423-Number Index-Time Zone Index-CF1-CF2-CF3-CF4**

Where,

Number Index is from 01 to 99.

Time Zone Index is from 01 to 08.

CF1 is the first preferred (the cheapest) service provider.

CF2 is the second preferred (second cheapest) service provider.

CF3 is the third preferred service provider.

CF4 is the fourth preferred service provider.

For example, to program Cost factor for Area code 022 during time zone 08 to 12:00 hours as entered in the sample table, dial **3423-01-1-01-02-04-03**

To default the Time and Number-based LCR table, dial:

- **3420**

Configuring Service Provider-based LCR

- In Service Provider-based LCR, whenever a number is dialed out, the system ignores the area code, and starts checking the numbers in the 'Service Provider-based LCR table' and routes the call according to the trunk programmed for that number. For this, you must program the two parameters Area Code and Ignore Digit Count in the Area Code Table.
- On a sheet of paper make a table for Service Provider-based LCR.

Index No.	Number	Area Code	Ignore Digit Count	Cost Factor			
				Preference 1	Preference 2	Preference 3	Preference 4
01	3	080	3	08	07	01	02
02	6	022	3	07	01	02	08
:	:		:				
99	2	03852	5	01	02	01	02

- As you can see, the Service Provider-based LCR Table is similar to the Number-based LCR table.
- You can program as many as 99 different numbers which are stored against Index numbers from 01 to 99.
- The number strings may be the complete telephone number, a truncated phone number or the first digit of the phone number. The number can be a maximum of 64 characters (Digits + Wildcards). Valid characters: 0 to 9, *, #, X, T, Comma [,], Hyphen [-], Caret [^]. See [“Wildcard Characters”](#) to know the various number patterns you can use.
- For each number string that you enter against an Index number, you must also specify the Area Code and the Ignore Digit Count.
- The Ignore Digit Count is the number of digits in the area code that the system should ignore before checking the Service Provider-based LCR table. For each area code that you enter, the corresponding Ignore Digit Count will be the number of digits in the area code. For example, the area code for the number starting with '3' is 080, which consists of 3 digits. So, the Ignore Digit Count for the number/area code 080 will be 3.
- For each number string and area code that you enter, assign the Trunk of the service provider that you prefer as your first, second, third and fourth preference for dialing that number/area code. Refer the table you prepared for assigning Cost Factor to trunks.
- If you have finished entering the number strings, their corresponding area codes and the Ignore Digit Count, and the preferred trunks, configure Service Provider-based LCR using Jeeves or a Telephone.

Configuring Service Provider-based LCR using Jeeves

- Log in as System Engineer.
- To program Area Code and Ignore Digit Count, Under **Configuration**, click **Call Cost Calculation**.
- Click **Area Code Table** to open the page.

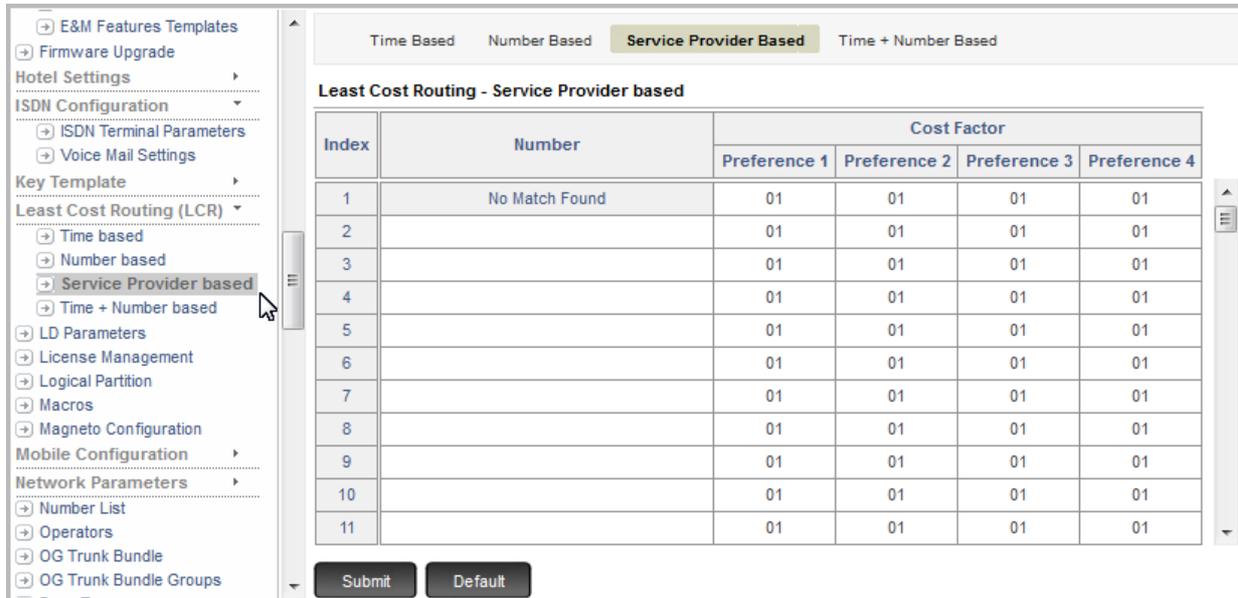

Call Cost Calculation (CCC) - Area Code Table

Index	Area Code	Name	Ignore Digit Count	Pulse Rate Type for Pulse Rate			
				Option - 1	Option - 2	Option - 3	Option - 4
1			0	01	01	01	01
2			0	01	01	01	01
3			0	01	01	01	01
4			0	01	01	01	01
5			0	01	01	01	01
6			0	01	01	01	01
7			0	01	01	01	01
8			0	01	01	01	01
9			0	01	01	01	01
10			0	01	01	01	01
11			0	01	01	01	01

Buttons: Submit, Default, Default One

Each area code is stored at an index number.

- Enter the Area Codes and the corresponding Ignore Digit Counts from the sheet you prepared for Service Provider based-LCR. You may also enter the respective name for each area code, if desired.
- Click **Submit** at the bottom of the page to save your changes.
- Now, click the **Least Cost Routing (LCR)**. The links for the LCR options appear.
- Click **Service Provider based** to open the page.

- Enter the values of the Service Provider-based LCR you prepared on the sheet of paper in the appropriate fields.
- Click **Submit** at the bottom of the page to save your settings.

Configuring Service Provider-based LCR using a Telephone

- Enter SE mode.

To program Area Code in the Area Code Table, dial:

- **2620-Area Code Index-Area Code-#***

Where,

Area Code Index is from 001 to 999.

Area Code is a string of maximum 7 digits. Terminate the command with #* if the number string has fewer than 7 digits.

By default, Area Code is 'Blank'.

For example, to program Number string '080' at Number Index 001, dial **2620-001-080-#***

To clear an Area Code in the Area Code Table, dial:

- **2620-Area Code Index-#***

To program Ignore Digit Count for an Area Code, dial:

- **2623-Area Code Index-Ignore Digit Count**

Where,

Area Code Index is from 001 to 999.

Ignore Digit Count is from 0 to 9.
By default, Ignore Digit Count is '0'.

Refer the topic "Area Code Table" under Call Cost Calculation to know more.

To program Cost Factor (Service Provider preference) for the each Number, dial:

- **3442-Number Index-CF1-CF2-CF3-CF4**

Where,

Number Index is from 01 to 99.

CF1 is the first preferred (the cheapest) service provider.

CF2 is the second preferred (second cheapest) service provider.

CF3 is the third preferred service provider.

CF4 is the fourth preferred service provider.

For example, to program Cost Factor for number '3' at Index 01, dial **3412-01-08-07-01-02**

It is mandatory to complete this command with CF1 to CF4. If you have only one service provider, program the same as CF1, CF2, CF3, CF4.

To default the Number-based LCR table, dial:

- **3440**
- Exit SE mode.

Configuring LCR Type on Trunks

After assigning Cost Factor to Trunks and programming the LCR Type - Time-based, Number-based, Time and Number-based, Service Provider-based - you must now apply the desired LCR Type on the Outgoing Trunk Bundle Group (OGTBG) allotted to the extensions. This can be done using Jeeves or a Telephone.

Configuring LCR Type in OGTB using Jeeves

- Log in as System Engineer.

- Under **Configuration**, click **Outgoing Trunk Bundle Group**.

Group No.	Rotation	LCR	OG Trunk Bundle Member 1	OG Trunk Bundle Member 2
1	<input checked="" type="checkbox"/>	None	001	002
2	<input checked="" type="checkbox"/>	None	001	000
3	<input checked="" type="checkbox"/>	None	001	000
4	<input checked="" type="checkbox"/>	None	001	000
5	<input checked="" type="checkbox"/>	None	001	000
6	<input checked="" type="checkbox"/>	None	001	000
7	<input checked="" type="checkbox"/>	None	001	000
8	<input checked="" type="checkbox"/>	None	001	000

- For each OGTBG number assigned to extensions, select the desired LCR Type: Time-based, Number-based, Time+Number based, Service Provider-based (Cost Factor).
- Click **Submit** to save your settings.

You can find the OGTBG number assigned to each extension from the Station Basic Feature Template assigned to the extension.

Configuring LCR Type in OGTB using a Telephone

- Enter SE mode.

To select LCR type in OG Trunk Bundle Group, dial:

- **1404-1-OGTBG-LCR Type** to select an LCR Type for a single group.
- **1404-2-OGTBG-OGTBG-LCR Type** to select the same LCR Type for a range of OGTB groups.
- **1404-*-LCR Type** to select the same LCR Type for all OGTB groups.

Where,

OGTBG is from 01 to 32.

LCR Type is

0 for No LCR

1 for Time zone-based LCR

2 for Number-based LCR

3 for Time+Number-based LCR

4 for Service Provider-based (Cost Factor) LCR

By default, 'No LCR' is selected as LCR Type.

- Exit SE mode.

Configuring Emergency Number Dialing

If you are using the system in the Hospitality mode, to dial the Emergency Number 911, you must purchase the E911 license. For details, refer [“License Management”](#).

SARVAM UCS supports dialing of Emergency Numbers immediately without any blocking.

The system will disregard features such as Toll Control, Call Budget, Automatic Number Translation, Call Duration Control on the extensions when dialing out Emergency Numbers. To know more, refer the topic [“Emergency Dialing”](#).

For Emergency Number Dialing, you need to configure the Emergency Number Table. In this table, each Emergency Number is to be assigned an Outgoing Trunk Bundle Groups (OGTB) through which the Emergency Number is to be routed.

The system loads the default Emergency Numbers and Outgoing Trunk Bundle Group (OGTBG) in the Emergency Number Table as per the [“Region”](#) you selected for the system. The Emergency Numbers loaded by default in the Emergency Number Table are non-editable, but you can re-assign the default OGTB, as per your requirement.

The OGTBG, by default do not have any OG Trunk Bundles assigned. Make sure these are assigned, as only then emergency calls will be routed through the OGTBG.

To use the feature [“Emergency Calls \(911\) - Reporting to PSAP”](#), make sure you assign only T1 PRI lines in the outgoing trunk bundle group for dialing the number 911.

The default Emergency table as per the Region you select is given below:

Feature	Emergency Number 1	Emergency Number 2	Emergency Number 3	Emergency Number 4	Emergency Number 5	Emergency Number 6	Emergency Number 7	Emergency Number 8	Emergency Number 9	Emergency Number 10
Australia	000	106	112							
OGTB Group Number	32	30	31	1	1	1	1	1	1	1
Bangladesh	999									
OGTB Group Number	1	1	1	1	1	1	1	1	1	1
Belgium	101	100	112

OGTB Group Number	1	1	1	1	1	1	1	1	1	1
USA	911									
OGTB Group Number	32	1	1	1	1	1	1	1	1	1

For example, if you selected USA as Region, the default Emergency Number Table would look like this:

Default Emergency Number Table for USA

Index	Emergency Number	OG Trunk Bundle Group
01	911	32
02		01
03		01
04		01
05		01
06		01
07		01
08		01
09		01
10		01

If you selected Australia as Region, the default Emergency Number Table would look like this:

Default Emergency Number Table for Australia

Index	Emergency Numbers	OG Trunk Bundle Group
01	000	32
02	106	30
03	112	31
04		01

Index	Emergency Numbers	OG Trunk Bundle Group
05		01
06		01
07		01
08		01
09		01
10		01

Each Number is stored at an index from 01 to 10. The Emergency Number fields from index 01 to 5 are non-editable, but you can select a different OGTBG for each of these default Emergency Numbers.

You can add Emergency Numbers at index 06 to 10 in the table, and select the OGTBG as required.

Configuring Emergency Number Table using Jeeves

- Log in as System Engineer.
- After you have selected the **Region**.
- Under **Configuration**, click **Emergency**.
- Click **Emergency Number** to open the page.

The screenshot shows the Jeeves configuration interface. On the left is a navigation menu with various configuration options. The 'Emergency' section is expanded, and 'Emergency Number' is selected. The main content area displays a table titled 'Emergency Number' with three columns: 'Index', 'Number', and 'OG Trunk Bundle Group'. The table contains 10 rows, with indices 1 through 10. The 'Number' column is empty for all rows, and the 'OG Trunk Bundle Group' column contains the value '01' for all rows. Below the table are two buttons: 'Submit' and 'Default'.

Index	Number	OG Trunk Bundle Group
1		01
2		01
3		01
4		01
5		01
6		01
7		01
8		01
9		01
10		01

Click the **Default** button, the system will upload the default Emergency Numbers as per the Region you have selected.

*If you upgrade the firmware make sure you click **Default**. The system will upload the default Emergency Numbers as per the Region.*

The first five entries, at Index 01 to 05 on this table, are uneditable. These fields will be populated with the default Emergency Numbers of your country (which you selected as *Region*).

If the Emergency Numbers loaded by default are applicable for your region/country, all you need to do is re-assign, if required, the **Outgoing Trunk Bundle Group** assigned by default to each number.

If the Emergency Numbers loaded by default are not applicable for your region/country, you may add the Emergency Numbers and their OGTBG at index 06 to 10 in this table.

Make sure that the trunks configured in the OGTBG for each Emergency Number belong to the correct network and the ports through which the calls are to be routed are not disabled. For example, '112' is the default Emergency Number for the mobile network. So, make sure that the Mobile Trunk to be used for dialing this number is included in the OGTBG you assign to this number in the Table.

- Click **Submit** to save changes.

Configuring Emergency Number Table using a Telephone

- Enter SE mode from DKP/SLT.

To add Emergency Numbers in the table, dial:

- **3116-Index-Emergency Number-#***

Where,

Index is the location at which the Emergency Number is stored in the table, from 06 to 10 (01 to 05 are reserved for default numbers).

Emergency Number is a string of 6 digits max. Use digits 0-9 only.

To assign an OG Trunk Bundle Group (OTBG) to an emergency number, dial:

- **3117-Index-OG Trunk Bundle Group**

Where,

Index is the location at which the Emergency Number is stored in the table, from 01 to 10.

OGTBG is from 01 to 32.

- Exit SE mode.

Configuring Voice Mail System

Before you begin configuration of the VMS related parameters, consider the following points:

- Make sure you have installed the VMS module correctly and observed the Reset Cycle. Refer the topic [“Installing the VMS Module”](#) for instructions on installing the VMS module on the CPU Card. Also refer the topic [“VMS Channels”](#) for license related information.
- The number of VMS channels will be considered as the maximum channels available for reservation for Voice Mail Auto-Attendant parameter.
 - The channel reserved for Voice Mail Auto-Attendant configuration will not be changed if the number of channels configured in *Channel Reserved for Voice Mail Auto Attendant* parameter is increased.
 - The channels reserved for Voice Mail Auto-Attendant configuration will be changed to the number of VMS channels if the number of VMS channels available are less than the number of channels configured in *Channel Reserved for Voice Mail Auto Attendant* parameter. To know more, refer [“Configuring VMS General Parameters”](#).
- Decide which extension users are to be provided voice mail. Make a list of these extensions by their port type and (software) port number, access codes. Configure the VMS parameters for these extensions. See [“Extension Voice Mail Settings”](#).
- If you intend to use the VMS Auto Attendant on trunks,
 - make a list of the trunks by their port type (SIP, T1E1 PRI, BRI, Mobile, CO and E&M) and (software) port number.
 - configure welcome and greeting messages. You may record custom welcome messages that meet your requirements. Refer to [“Voice Mail Auto-Attendant Menu”](#).
 - configure Voice Mail Auto Attendant (VMAA) Menu for the time zones in the Trunk Feature Template(s) of the trunks on which you want to use the VMS Auto Attendant. Refer to [“Trunk Feature Template”](#).
 - assign the desired Voice Mail Auto Attendant (VMAA) Menu to the trunks in their Trunk Feature Template.
- The prompts used to route the call using the Voice Mail Auto Attendant can be customized as per your requirement. Refer to [“Prompts Management”](#).

Configuring VMS General Parameters

VMS General Parameters allows you to customize VMS settings as per your requirement. You can:

- configure the VMS General Settings
- set the default language
- configure the Play Settings
- define the Filename format
- customize Voice Mail Notification Messages

Configuring VMS General Parameters using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **VMS General Parameters**.

VMS General Parameters	
General Settings	
Enable Extension Number Validation	<input checked="" type="checkbox"/>
Use SMTP Account	None
Memory Usage Notification to SE	<input type="checkbox"/>
SE Email ID	
Save Call Taping Files in	Common Mailbox
Common Mailbox for Call Taping (Enter Extension Number)	
Save Call Tapping Files as	Individual File before and after call transfer
Make Message Notification call using TAC	0
Channel Reserved for Voice Mail Auto Attendant	None
Date Format	DDMMYYYY
Time Format	24 Hour

- Check the default values of the following parameters, and change them, if required, to the desired values.

General Settings

- **Enable Extension Number Validation:** The VMS Auto Attendant allows callers to directly reach the desired party in an organization, by giving them the option of dialing the extension number.

When the Extension Number Validation flag is enabled, the VMS compares the extension number dialed by the external caller with the extension numbers configured in the system. If no match is found, the VMS responds with a message “Invalid Number”.

By default, Extension Number Validation is enabled when SARVAM UCS is operating in the Enterprise mode. This flag is disabled when SARVAM UCS is operating in the Hospitality mode.

- **Use SMTP Account:** Select the SMTP Account you wish to use for VMS Notifications.

The SMTP Account you configure will be used for all VMS Email Notifications — Message Notifications and Memory Usage Notifications.

You may add a new SMTP Account. To do so,

- Select *Add New* option for Use SMTP Account.

- Click **Settings**  to configure the parameters of the New SMTP Account you created. For more information, see “[SMTP Settings](#)”.

If you select None as the option, the system will not send any VMS Notifications — Memory Usage Notification to SE, VMS E-Mail Notification, Message Wait Notification via E-Mail — even if you have enabled and configured the respective notification.

- **Memory Usage Notification to SE²²⁰**: The VMS allows all the memory related notifications — VMS memory usage and mailbox memory usage — to be sent to the System Engineer via email. Enable this flag, if you want memory related notifications to be sent via email to the System Engineer.

You may customize the Notification Messages as per your requirement. For details, see “[VMS E-Mail Notification](#)”.

You must also specify the email address to which the notifications are to be sent in *SE Email ID*.

- **SE Email ID**: Enter the email address on which the notifications should be sent to the System Engineer. The System Engineer must have access to this email ID. The email ID may consist of a maximum of 64 characters.
- **Save Call Taping Files in**: When Call Taping feature is enabled on your extension, you can save the Call Taping files either in the Common Mailbox or in your Personal Mailbox. By default, Call Taping files are saved in the Common Mailbox.
- **Common Mailbox for Call Taping (Enter Extension Number)**: If you choose to save Call Taping files in Common Mailbox, you must specify the Access Code of any SLT, DKP, SIP Extension, Department Group or General Mailbox, whose mailbox you want to assign for Call Taping.

If Call Taping files are saved in Common Mailbox, only the extension users who have access to the Common Mailbox will be able to retrieve and listen to the recorded conversations.

- **Save Call Tapping Files as**: If you select Common Mailbox, then select the type of file you want the system to generate for saving the taped conversation. You may select — *Individual File before and after call transfer* or *Single File before and after call transfer* as per your requirement.

If you select *Individual File before and after call transfer*, the system will generate two separate files for saving the taped conversation, that is, one file containing the conversation taped before the call is transferred and another file containing the conversation taped after the call is transferred. However, if you select *Single File before and after call transfer*, the system will generate only one single file for saving the conversation taped before and after the call is transferred.

- **Make Message Notification calls using TAC**: Select the Trunk Access Code to be used by the system to make outgoing notification calls to external numbers.
- **Channel Reserved for Voice Mail Auto Attendant**: Select the number of channels of the VMS that you wish to reserve for the Voice Mail Auto Attendant. These channels will be used to answer incoming calls landing on Voice Mail Auto Attendant enabled Trunks only. These channels even if free will not be available to extension users to access their Mailbox.

220. This parameter will not function if you have selected None as the **Use SMTP Account** option. You may configure this parameter for future use.

- **Date Format:** Select the Date Format — DD-MM-YYYY or MM-DD-YYYY. The Date format selected here will be applicable for all the VMS features, VMS E-Mail Notifications, etc.

*This Date format is not applicable for **Message Profile**. The “Date Playback Format” will be applicable there.*

- **Time Format:** Select the Time Format — 24 Hour or 12 Hour. The Time format selected here will be applicable for all the VMS features, VMS E-Mail Notifications, etc.

Supported VMS Language

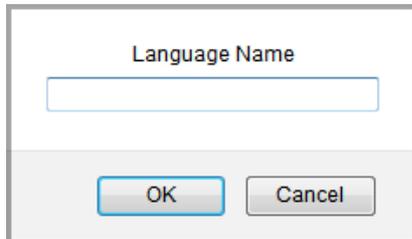

You may add a new language, edit or delete the existing languages.

To add a new language,

- Click the **Add Language** button.

A window will pop up, asking you the language name.

- Enter the language name in the field. The allowed characters are A to Z, a to z, 0 to 9, - and _.
- Click OK.

To Edit a Language Name,

- Click .
- A window will pop up. You can edit the language name here.
- Click OK.

To delete a language, click .

If the language you wish to delete is already configured for any other parameter, the system will set English as the default language for that parameter.

Play Settings

Play Settings	
Play '#' as	Hash
Play '*' as	Star
For all Options Menu, play digit	after each Option
For all Options Menu, for digit dialing play	Press

- **Play '#' as:** Select the desired option — Hash or Pound. The system will play the selected option when '#' is pressed.
- **Play '*' as:** Select the desired option — Star or Asterisk. The system will play the selected option when '*' is pressed.
- **For all Options Menu, play digit:** Select the desired option — after each Option, before each Option. The system will play the digit as per the selected option for all Menu options.
- **For all Options Menu, for digit dialing play:** Select the desired option — Press or Dial. The system will play the selected option for digit dialing.

Filename Format (.wav)

Filename Format (.wav)		
Mailbox	Date	Time
General Mailbox	Mailbox Extension Number	Date

You can define the Filename format for Mailbox (Personal) and General Mailbox by setting the sequence of the various parameters — None, Date, Time, Message Type, Calling Number, Called Number and Mailbox Extension Number²²¹— as per requirement.

While selecting the Filename format, make sure:

- None is not selected as the first two options.
- Date and Time are included in the filename.
- The same option (other than None) is not selected twice.

The table given below defines the parameters. You may sequence it as per your requirement.

Option	Meaning
None	The system will skip this option and move to the next option configured.
Date	Select this option if you want the system to add the Date ^a in the filename.
Time	Select this option if you want the system to add the Time ^b in the filename.
Message Type	Select this option if you want the system to add the Message Type ^c for the message stored.

²²¹. The **Mailbox Extension Number** parameter is only applicable for General Mailbox Filename Format.

Option	Meaning
Calling Number	Select this option if you want the system to add the calling number. If calling number is Blank, the system will add 'No Number'.
Called Number	Select this option if you want the system to add the called number. If Called number is not available, system will ignore this option and select the next option. This option is generally required when you wish to use the feature Call Tapping.
Mailbox Extension Number	This option is applicable only for General Mailbox. Select this option if you want the system to add the mailbox extension number from which the message is transferred to the General Mailbox.

- The Date Format here will be as per the Date Format you have selected in General Settings.
- The Time Format here will be as per the Time Format you have selected in General Settings.
- The Message Types supported by the system are: Call forward(CF), Call Taping(CT), Conversation Recording(CR), Broadcast Message(BM), Transfer to Mailbox(TM), Leave Message(LM), Send Message(SM), Call forward with LCS – No reply, all(LS), Redirect Message(RM), Message forward(MF).

The default sequential Filename Format is as given below:

- For Mailbox(Personal): *Date-Time-Message Type-Calling Number-Called Number.wav*
- For General Mailbox: *Mailbox Extension Number-Date-Time-Message Type-Calling Number-Called Number.wav*

VMS E-Mail Notification

VMS E-mail Notification	
Notification for Memory Usage	
VMS Memory consumption alert to SE	
USB is 80% consumed	[VMS] Warning! VMS USB memory usage is 80% consumed
USB is 100% consumed	[VMS] Alert! VMS USB memory usage is completely consumed

Mailbox consumption alert to SE	
Mailbox of user is 80% consumed	[VMS] Warning! Mailbox <ext> is 80% consumed
Mailbox of user is 100% consumed	[VMS] Alert! Mailbox <ext> is completely consumed

Make sure you have configured the user Email ID for sending the notifications to user. For details, see ["Message Wait Notification via E-Mail"](#) in ["Extension Voice Mail Settings"](#).

To know about the Message Wait Notification feature, see ["Email Based Notification"](#).

The table below displays the default events for which notifications will be sent to the SE. You may customize it as per your requirement.

Event	Message	Description
Notification for Memory Usage		
VMS Memory consumption alert to SE		

Event	Message	Description
USB 80% is consumed	[VMS] Warning! VMS USB memory usage is 80% consumed	This email will be sent to the SE, when 80% of the USB memory has been consumed.
USB 100% is consumed	[VMS] Alert! VMS USB memory usage is completely consumed	This email will be sent to the SE, when 100% of the USB memory has been consumed.
USB consumption is below 75%	[VMS] VMS USB memory usage is in limit	This email will be sent to SE, when USB memory consumption is below 70%.
Mailbox consumption alert to SE		
Mailbox of user is 80% consumed	[VMS] Warning! Mailbox <ext> is 80% consumed	This email will be sent to the SE, when 80% of the mailbox memory has been consumed, along with the Extension Number (if configured).
Mailbox of user is 100% consumed	[VMS] Alert! Mailbox <ext> is completely consumed	This email will be sent to the SE, when 100% of the mailbox memory has been consumed, along with the Extension Number (if configured).
Mailbox consumption alert to User		
Mailbox is 80% consumed	[VMS] Warning! Mailbox <ext> is 80% consumed	This email will be sent to the User, when 80% of the personal mailbox memory has been consumed, along with the Extension Number (if configured).
Mailbox is 100% consumed	[VMS] Alert! Mailbox <ext> is completely consumed, please delete old messages to allow storing of new messages	This email will be sent to the User, when 100% of the personal mailbox memory has been consumed, along with the Extension Number (if configured).
General Mailbox is 80% consumed	[VMS] Warning! General Mailbox <ext> is 80% consumed	This email will be sent to the User, when 80% of the general mailbox memory has been consumed, along with the Extension Number (if configured).
General Mailbox is 100% consumed	[VMS] Alert! General Mailbox <ext> is completely consumed, please delete old messages to allow storing of new messages	This email will be sent to the User, when 100% of the general mailbox memory has been consumed, along with the Extension Number (if configured).
Notification for New Message in Mailbox		
Normal Message	[VMS] <msg_type> Message received from <cli>	This email will be sent to user's personal mailbox, when a message is received along with the Message Type and the Caller Number ^a .
Conversation Recording Message	[VMS] Message received for conversation with <num1>	This email will be sent to user's personal mailbox, when the conversation between the extension user and the caller was recorded.
Call Tapping Message	[VMS] Message received for call recording between <num1> and <num2>	This email will be sent to user's personal mailbox, when the conversation between two Numbers was recorded.
Notification for New Message in General Mailbox		

Event	Message	Description
New Message	[VMS] <msg_type> Message received for <ext> from <cli>	This mail will be sent to the SE Email ID configured in the General Settings, when a message with the message type ^b is received for an Extension Number (if configured) from the Caller Number.
Conversation Recording Message	[VMS] Message received for <ext> and conversation was with <num1>	This mail will be sent to the SE Email ID configured in the General Settings, when a message is received for an Extension Number (if configured) and conversation was with the Number.

- a. If Caller Number is unavailable, Caller Name will be displayed. If both are unavailable, 'Unknown' will be displayed. The CLI Number can be an External Caller Number or an Internal Caller Number.
- b. Message Type may be Normal or Urgent.

General Mailbox Settings

A General Mailbox is a common mailbox in the VMS, with which more than one extension users are associated. When the personal mailbox of any extension user is full, all new messages are diverted to the General Mailbox.

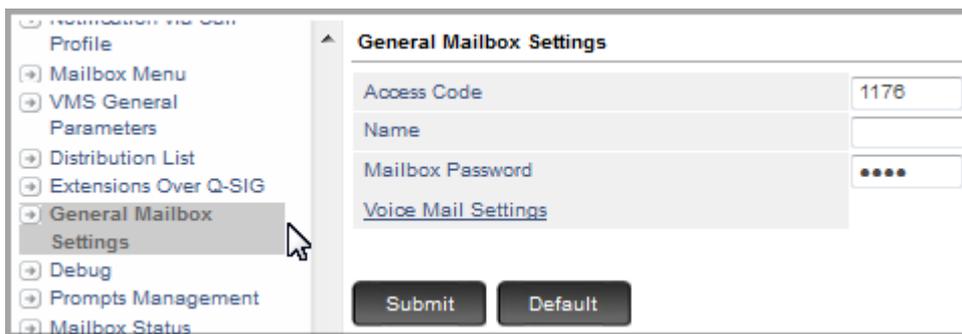

To access the General Mailbox, the extension users must have the feature General Mailbox enabled in their CoS.

The extension users can listen to the messages in the General Mailbox, by dialing the General Mailbox access code (programmable; default: 1176).

You can change the default settings of General Mailbox parameters using Jeeves.

Configuring General Mailbox Parameters using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **General Mailbox Settings**.

The screenshot shows the Jeeves configuration interface. On the left is a navigation tree with the following items: Profile, Mailbox Menu, VMS General Parameters, Distribution List, Extensions Over Q-SIG, General Mailbox Settings (highlighted), Debug, Prompts Management, and Mailbox Status. The main content area is titled 'General Mailbox Settings' and contains the following fields: 'Access Code' with the value '1176', 'Name' (empty), and 'Mailbox Password' (masked with dots). There is a link for 'Voice Mail Settings' and two buttons at the bottom: 'Submit' and 'Default'.

- Check the default values of the following parameters, and change them, if required, to the desired values:

- **Access Code:** By default, 1176 is the access code for the General Mailbox. Extension users must dial this number, if they want to access the General Mailbox.

If required, you may assign a different access code to the General Mailbox. The Access Code you assign may consist of a maximum of 16 digits. Digits 0-9, # and * are allowed.

- **Name:** You can assign a Name to the General Mailbox. The name you assign can be a maximum of 18 characters. The Name must not have space as it's first character.

<, >, :, ", /, \, |, ? and * characters are not allowed.

- **Mailbox Password:** If you have selected the **Ask Password to access Mailbox** check box in *Extension Voice Mail Settings*, extensions users can access the General Mailbox by dialing the default Password-1111.

To avoid unauthorized access, we recommend you to change the default password. The password you assign may consist of a maximum of 4 digits. Valid Range: 0000 to 9999. Make sure the new password is strong and is provided to the extension users who need to access the General Mailbox only.

- **Voicemail Settings:** Click on this link to configure the Voicemail Settings for the General Mailbox. The Extension Voicemail Settings window opens.

By default, the General Mailbox with access code-1176 will open. For information regarding the configuration, see [“Extension Voice Mail Settings”](#).

- Click **Submit** to save the settings.

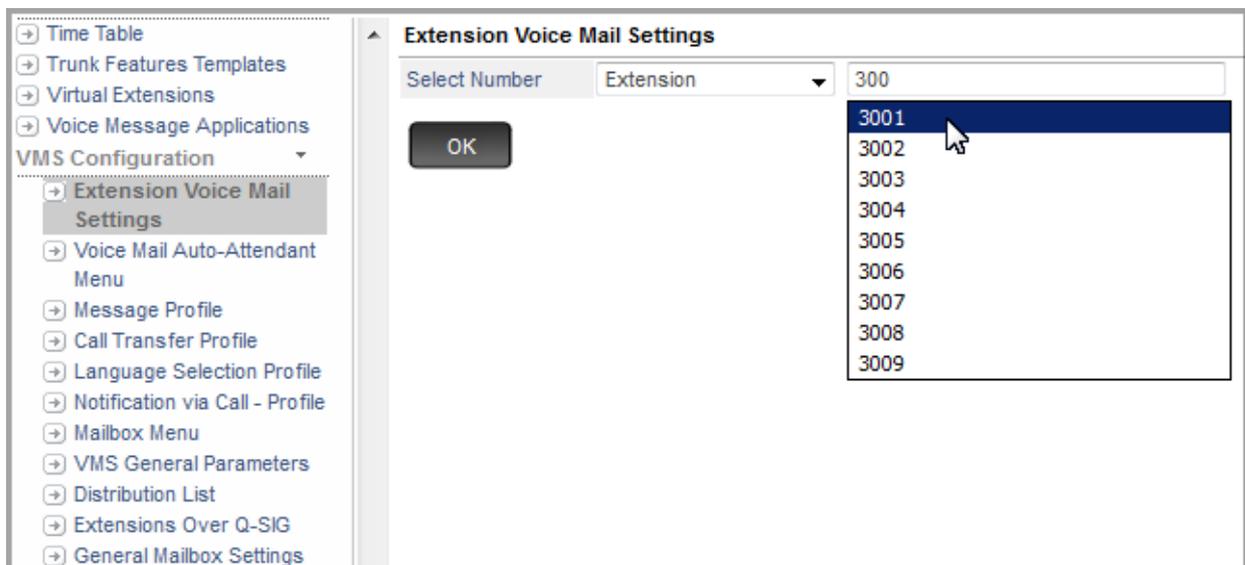

For more information and instructions on how to access the General Mailbox, see [“Accessing the General Mailbox”](#).

Extension Voice Mail Settings

Extension Voice Mail Settings allows you to configure the various VMS parameters assigned to — an Extension, a Department Group, an Operator or a General Mailbox.

Configuring Extension Voice Mail Settings

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **Extension Voice Mail Settings**.

- **Select Number:** You may select — Extension, Department Group, Operator or General Mailbox.
 - For **Extension**, enter the Extension Number/Name and then select the same from the drop down list.
 - For **Department Group**, select the desired Department Group Number from the drop down list.
 - For **Operator**, select the desired Operator from the drop down list.
- Click **OK**.

You may now configure the respective VMS parameters.

Extension Voice Mail Settings

Select Number Extension

3001

Access Code	3001
Name	<input type="text"/>
Abbreviated Name	<input type="text"/>

Department Group Mailbox	None ▼
VMAA Menu	Working Hour ▼
Personal Mailbox	<input checked="" type="checkbox"/>
Mailbox Number	Mb0242

Mailbox

Call Transfer Settings

Message Wait Settings

- **Access Code:** The Access Code of the respective Extension, Department Group or General Mailbox is displayed as a status.
- **Abbreviated Name:** You may configure the abbreviated name for the respective Extension or Department Group. It must be a minimum of 3 alphabetic characters and a maximum of 8 alphabetic characters.

Abbreviated Name is applicable when you use *Dial by Name* feature to transfer the call to any extension using VMAA Menu. For details, refer "[Dial By Name](#)".

- **Language:** Select the Language which you want the system to use when accessing the Personal Mailbox. The languages displayed as options in the drop down list is as per the *Supported VMS Language* you configure in VMS General Settings.

All the prompts related to Personal Mailbox will be played in the language you select here.

- **Department Group Mailbox:** Select the Department Group Mailbox Number which you want to assign to the respective Extension. You may select None or the Department Group Mailbox Number. The system will allow the access to the department group mailbox you select here.

If you select None, the department group mailbox will not be accessible by the Extension even if the Extension is a member of the Department Group.

- **VMAA Menu:** Select the VMAA Menu Number which you want to assign to the respective Extension or Department Group. For more information, see "[Voice Mail Auto-Attendant Menu](#)".
- **Personal Mailbox:** Keep the check box enabled if you want to assign the Personal Mailbox to the respective Extension, Department Group or General Mailbox. It allows you to access your Personal Mailbox.

For Extension and Department Group:

If you disable the check box, the Personal Mailbox will not be assigned and the system will not allow you to access your Personal Mailbox.

For General Mailbox:

If you disable the check box, the General Mailbox will not be assigned and the system will not allow you to access the General Mailbox.

- **Mailbox Number:** The Mailbox Number is displayed as a status when the Personal Mailbox is assigned to the respective Extension, Department Group or General Mailbox, if you have enabled the *Personal Mailbox* check box. If Personal Mailbox is not assigned, the Mailbox Number will be displayed as Blank.

Mailbox²²²

Mailbox	
Mailbox Size (min)	00005
Maximum Message Length (sec)	0120
New Message Delivery Option in Mailbox Full Condition	Overwrite Old Messages ▼
Auto Delete Messages	Old ▼
Days for Auto Delete Messages	30
Ask Password to Access Mailbox	<input checked="" type="checkbox"/>
Message Profile	User ▼
Mailbox Menu	User ▼

- In **Mailbox Size (min)**, configure the maximum allowed size for message storage. You may configure from 1 to 60000 minutes.
- In **Maximum Message Length (sec)**, configure the maximum time for which a message can be recorded by the caller. You may configure from 1 to 3600 seconds.

In case the Maximum Message Length is more than the Mailbox Size, the Mailbox size will be considered for recording.

- In **New Message Delivery Option in Mailbox Full Condition**, select an option for delivering the New Message when your Personal Mailbox is full.

You can select from any of the options described below:

- **Do not offer to leave message**, if you do not want the system to allow any new message to be delivered when the Personal Mailbox is full.
- **Deliver to General Mailbox**, if you want the system to deliver the new message to the General Mailbox when Personal Mailbox is full.
- **Overwrite Old Messages**, if you want the system to delete the old messages and allow the new message to be stored when the Personal Mailbox is full.

222. Not applicable when you select **Operator** as the "Select Number" option.

In case, the recorded message size is greater than the old message that is to be overwritten then the recorded message will not be delivered. A prompt will be played for the same. Note: The old message will be deleted.

The prompt will not be played in case of multiple recipients.

If the mailbox has no old messages, the recorded message will not be stored.

- **Overwrite New Messages**, if you want the system to delete the new messages to allow the new message to be stored when the Personal Mailbox is full.

The number of messages that will be deleted would be as per the *Maximum Message Length* allowed.

If the mailbox has no new messages, the recorded message will not be stored.

- **Overwrite All (Old + New)**, if you want the system to delete the old and new messages and allow the new message to be stored when the Personal Mailbox is full.
- In **Auto Delete Message**, select an option to delete the messages automatically by the system. You may select None, Old or All.
 - Select **None** if you do not want the system to delete the message automatically from the Personal Mailbox.
 - Select **Old** if you want the system to delete the old read messages automatically after the number of days you configure in *Days for Auto Delete Messages*.
 - Select **All** if you want the system to delete all messages — read or unread — automatically after the number of days you configure in *Days for Auto Delete Messages*.
 - In **Days for Auto Delete Messages**, configure the number of days after which you want the system to automatically delete the messages.
- In **Ask Password to Access Mailbox**, by default the access to the mailbox is password protected. The “[User Password](#)” is required to access the mailbox. Whenever the mailbox owner accesses the mailbox, the VMS will ask for the (user) password.

If you want to remove password protection, clear this check box.

Since a Mailbox can be accessed using the default User Password, 1111, extension users who are assigned a mailbox are recommended to change their User Password. To avoid unauthorized access, we recommend extension users to change the password regularly. Make sure it is strong and is kept confidential.

- In **Message Profile**, select the Message Profile you want to assign. For more information, see “[Message Profile](#)”.
- In **Mailbox Menu**, select the Mailbox Menu you want to assign. For more information, see “[Mailbox Menu](#)”.

Call Transfer Settings²²³

Call Transfer Settings	
Working Hour - WH	
Call Transfer Profile	Wait for Ring
Break Hour - BH	
Call Transfer Profile	Wait for Ring
Non-Working Hour - NH	
Call Transfer Profile	Wait for Ring

- Under **Working Hour - WH**, select the Call Transfer Profile you want system to use for transferring the calls during Working Hours. The drop down list will include the profiles you configure in the “[Call Transfer Profile](#)”.
- Under **Break Hour - BH**, select the Call Transfer Profile you want system to use for transferring the calls during Break Hours. The drop down list will include the profiles you configure in the “[Call Transfer Profile](#)”.
- Under **Non-Working Hour - NH**, select the Call Transfer Profile you want system to use for transferring the calls during Non-Working Hours. The drop down list will include the profiles you configure in the “[Call Transfer Profile](#)”.

Message Wait Settings²²⁴

Message Wait Settings	
Message Wait Indication	Stuttered Dial Tone + LED Lamp (High Voltage)
Message Wait Notification via Call	
Type	None
Schedule Profile	01
Destination Number	
Message Wait Notification via Email	
Notification	Do not send
Email Address	

- In **Message Wait Indication**, select the type of indication to be given to the extension user for new messages in the mailbox and message wait set by another extension user. This is only applicable when you select Extension as the “Select Number” option.

You can select from any of the four types of indicators described below for new messages:

- **Stuttered Dial Tone/Voice Message:** When the extension user goes OFF-Hook, s/he will hear a voice message, if a pre-recorded Voice Module has been assigned for Message Wait Notification. If no voice module is recorded and assigned, the extension user will hear a stuttered dial tone instead.

223. Not applicable when you select **General Mailbox** as the “Select Number” option.

224. Not applicable when you select **Operator** as the “Select Number” option.

If you want voice message to be played as message wait notification, record and assign a Voice Module. Refer [“Voice Message Applications”](#) for instructions.

SARVAM UCS can play only 9 Voice Modules simultaneously. The Voice Module for Message Wait Notification will not be played if there are already 9 being played simultaneously. In this case, Stuttered Dial Tone will be played as Message Wait Indication, when the extension user goes OFF-Hook.

- **Ring:** The extension will ring for the duration of the Message Wait Ring Timer (configurable; default: 30 seconds), for as many times as the Message Wait Ring Count (configurable; default: 10 times), at the interval set as the Message Wait Ring Timer Interval (configurable; default: 30 minutes).

When the extension user answers the call, the VMS informs the user of the new message and allows the extension user to access it.

The Ring option is not applicable for SIP Extensions.

- **Stuttered Dial Tone + LED Lamp (High Voltage):** When the extension user goes OFF-Hook, the extension user will hear a stuttered dial tone and if the SLT has a 'Message Wait' lamp, the lamp will blink continuously using High Voltage. When the extension user retrieves all the waiting messages, the LED will be turned off and the stuttered dial tone will stop.
- **Stuttered Dial Tone + LED Lamp (Polarity Reversal):** When the extension user goes OFF-Hook, the extension user will hear a stuttered dial tone and if the SLT has a 'Message Wait' lamp, the lamp will blink continuously using Polarity Reversal. When the extension user retrieves all the waiting messages, the LED will be turned off and the stuttered dial tone will stop.
- **LED Lamp (High Voltage):** If the SLT has a 'Message Wait' lamp, it will blink continuously using High Voltage. When the extension user retrieves all the waiting messages, the LED will be turned off.
- **LED Lamp (Polarity Reversal):** If the SLT has a 'Message Wait' lamp, it will blink continuously using Polarity Reversal. When the extension user retrieves all the waiting messages, the LED will be turned off.

Default: Stuttered Dial Tone + LED Lamp (High Voltage).

Refer the feature description [“Message Wait”](#) to know more.

Message Wait Notification via Call²²⁵

The message wait notification will be sent to a number(destination number). This number can be an internal or an external number.

- In **Type**, you may select — Immediate, Scheduled or None.
- Select **Immediate**, if you want the notifications to be sent as soon as a new message arrives in the mailbox of the extension user.
- Select **Scheduled**, if you want the notification to be sent at fixed time schedules.
- Select **None**, if you do not want to set message wait notification via call.
Default: None.

²²⁵. Applicable only when you select **Extension** as the “Select Number” option.

- In **Schedule Profile**, select the **Notification via Call - Profile** number according to which you want the system to send the notifications. The Notification via Call Profile determines how notification calls are to be made to the destination numbers. To know more, see [“Message Wait Notification via Call”](#).
- In **Destination Number**, configure the number that you want the system to use for sending the notification via calls.

The destination number can be an internal or an external number. The destination number can be a maximum of 16 digits. Valid digits are 0 to 9, # and *.

When the notification call is answered, the VMS informs the callee about the new message and allows the callee to access it.

Refer the feature description [“Message Wait Notification via Call”](#) to know more.

Message Wait Notification via E-Mail²²⁶

The message wait notification will be sent to the e-mail address of the extension user.

- In **Notification**, you may select — Do not send, Without Attachment, With Attachment or With Attachment and mark voicemail as read. Default: Do not send.
 - Select **Do not send**, if you do not want the system to send email notification to the user for new message even if the email ID is configured. In this case, the system will send the Mailbox Memory Usage notification.
 - Select **Without Attachment**, if you want the system to send email notification to the user for new message if the email ID is configured.
 - Select **With Attachment**, if you want the system to send email notification to the user for new message along with the message as attachment. Make sure the email ID is configured. The attachment will be sent only if the message size is less than or equal to 20 MB, else the email notification will be sent without the attachment.
 - Select **With Attachment and mark voicemail as read**, if you want the system to send email notification to the user for new message along with the message as attachment and also mark the voicemail as read. Make sure the email ID is configured. The attachment will be sent only if the message size is less than or equal to 20 MB, else the email notification will be sent without the attachment.
- **E-mail Address:** Enter the email ID of the extension user to which the notification is to be sent. Maximum allowable length of the email ID is 64 characters. Default: blank.

*Extension users will receive notifications only for the mailbox memory utilization, if you configure the **E-mail Address** and select **Do not send** as the **Notification** option.*

Refer the feature description [“Email Based Notification”](#) to know more.

- Click **Submit** to save Extension Voice Mail settings.
- Click **Copy** if you wish to copy the respective Extension’s Voice Mail settings to other extensions.

²²⁶. Not applicable when you select **Operator** as the “Select Number” option.

Copy Voice Mail Settings to window will open.

You can copy the Voice Mail Settings to a single Extension, multiple extensions or all extensions.

For single Extension, select **Extension Number** and enter the Extension Number.

For multiple extensions, select **Extension Numbers from** and enter the Extension Number range.

For all extensions, select **All Extensions**.

The Voice Mail Settings — Abbreviated Name, Message Wait Notification via Call parameters and Message Wait Notification via Email parameters will not be copied.

Voice Mail Auto-Attendant Menu

Voice Mail Auto-Attendant Menu is applicable when trunk call is directly routed to VMS.

Each trunk can be assigned a VMAA Menu. For details, see “[Trunk Feature Template](#)”.

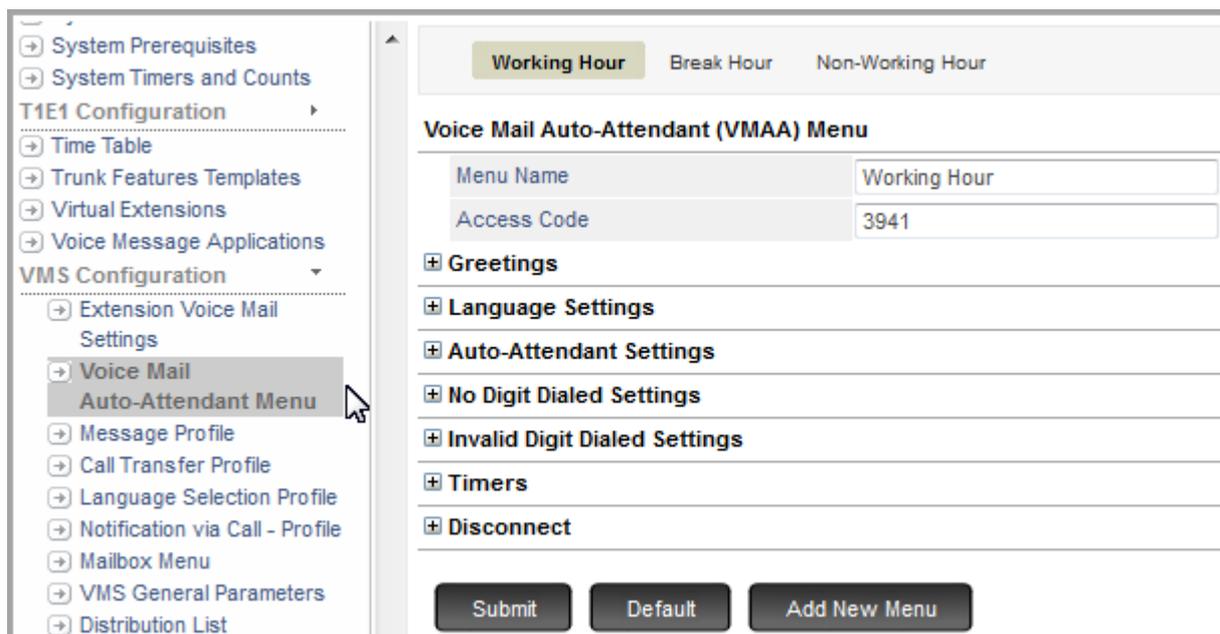

If VMAA Menu assigned to any action/trunk is deleted, the system will consider the first VMAA Menu for that action/trunk by default.

VMS supports a maximum of 128 VMAA Menu.

By default, three VMAA Menus — Working Hour, Break Hour and Non-Working Hour— are provided to you. These three VMAA menus cannot be deleted but you may edit their settings as per your requirement.

How to Configure

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **Voice Mail Auto-Attendant Menu**.

You may add a new menu, edit the default menus or delete a VMAA menu.

To add a new VMAA Menu,

- Click **Add New Menu**. A new *VMAA Menu xxx* will be created. You may now configure this as per your requirement.

To delete a menu, click **Delete**.

The default VMAA Menus cannot be deleted.

To edit a VMAA Menu,

- Click on the **VMAA Menu** tab you wish to edit.
- In **Menu Name**, configure the name of the VMAA Menu. By default, it is *VMAA Menu xxx* where xxx is the VMAA Menu Number from 001 to 128.
- In **Access Code**, configure the Access Code you wish to assign to the respective VMAA Menu. The caller can transfer the call to a VMAA Menu by dialing the respective access code. Access Code can be a maximum of 6 digits.

Make sure, the Access Codes assigned to the VMAA Menus do not conflict with the existing access codes. System will not save the configured VMAA access code if the same code is already assigned.

Greetings

Greetings allows you to select the prompts to greet the caller.

Greetings	
Morning Prompt	Greeting_01 
Afternoon Prompt	Greeting_02 
Evening Prompt	Greeting_03 

- In **Morning Prompt**, select the prompt which you wish to play to the caller as the Morning Greeting.

Select **Do Not Play**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Morning Prompt.

- In **Afternoon Prompt**, select the prompt which you wish to play to the caller as the Afternoon Greeting.

Select **Do Not Play**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Afternoon Prompt.

- In **Evening Prompt**, select the prompt which you wish to play to the caller as the Evening Greeting.

Select **Do Not Play**, if you do not wish to play any prompt.

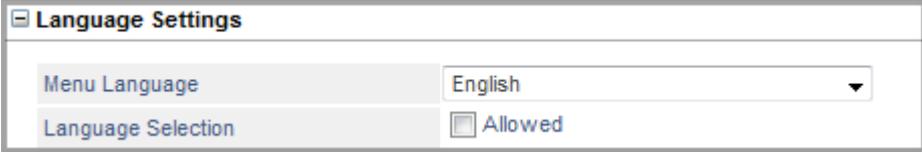

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Evening Prompt.

Language Settings

Language Settings allows you to set a menu language for the respective VMAA Menu and also gives the caller a choice to select the language.

Language Settings	
Menu Language	English
Language Selection	<input checked="" type="checkbox"/> Allowed

- In **Menu Language**, select the language which you wish to set as the default language for the respective VMAA Menu. For all the calls routed to the VMAA Menu, the prompts and greetings will be played as per the Menu Language set.
- Select the **Language Selection** check box if you wish to allow the caller to choose a language.
- In **Language Selection Profile**, select the language profile you want to assign to the respective VMAA Menu.
 - Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Language Selection Profile”](#).

From here, the caller can select a different language other than the Menu Language configured. All the VMS prompts henceforth will be played in the language selected here.

Auto-Attendant Settings

Auto-Attendant Settings allows you to customize the Auto-Attendant Actions.

Auto-Attendant Settings

Auto-Attendant Prompt: Auto_Attendant_01

Extension Number Dialing: Allowed

Confirm Name:

Call Transfer Profile: As configured for Dialed Extension

Auto-Attendant Actions

- Dial '6' to dial extension using Dial by Name
- Dial '7' to leave message for any extension
- Dial '8' to login into Personal Mailbox
- Dial '9' to transfer the call to Operator
- Dial # to disconnect

Add Action

Ignore Digit Dialed during Prompt: Yes

- In **Auto Attendant Prompt**, select the prompt which you wish to play to the caller according to the Auto-Attendant Actions.

Select **Do Not Play**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Auto Attendant Prompt.

To add more Auto-Attendant Prompts, click . You can add a maximum of 4 Auto Attendant Prompts in each VMAA Menu.

After playing all Auto-Attendant prompts, the system will wait for the input from the caller as per the timers configured. For details, see [“Timers”](#).

- Select the **Extension Number Dialing** check box to allow the caller to dial the Extension Number while the Auto-Attendant prompts are being played.
- Click **Settings** to configure the No Match Found Settings.
- In **No Match Found Prompt**, select the prompt which you wish to play when caller has dialed an invalid extension number.

Select **None**, if you do not wish to play any prompt.

You may add a new Prompt. To do so,

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these will appear as the options for No Match Found Prompt.

- Select the **No Match Found Retry** check box to prompt the caller to dial the Extension Number again.
- In **No Match Found Retry Count**, select the number of times you wish to prompt the caller for dialing the extension number. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Match Found Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.
- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- Select the **Confirm Name** check box, if you want the system to play the prompt asking the caller to enter the name of the called party, after dialing the extension number. To know more, refer to [“Dial by Extension Number”](#).
- In **Confirm Name Prompt**, select the prompt which you wish to play to the caller.
- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Confirm Name Prompt.

The system will place the call only when the entered name matches with the **Abbreviated Name** in *Extension Voice Mail Settings*. To know more, refer to [“Extension Voice Mail Settings”](#).

- In **Call Transfer Profile**, select the desired Call Transfer Profile you want the system to use. Make sure you have configured the parameters for this profile. By default, *As configured for Dialed Extension* is selected.
- Select **As configured for Dialed Extension** if you want the VMS Auto Attendant to use the Call Transfer Profile which is assigned to the dialed extension.
- Select **Wait for Ring** if you want the VMS Auto Attendant to wait for the extension to start ringing and then transfer the call.
- Select **Blind** if you want the VMS Auto Attendant to transfer the call on the extension without checking whether it is busy or free.
- Select **Attended** if you want the VMS Auto Attendant to transfer the call when the extension answers (goes OFF-Hook).
- Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).

When the Call Transfer Profiles are added, or any existing profile is edited, these changes will be reflected in the options displayed.

Auto-Attendant Actions

The default Auto-Attendant actions taken by the system, when there is an incoming trunk call on the VMS are displayed here.

Auto-Attendant Actions

Dial '6' to dial extension using Dial by Name

Dial '7' to leave message for any extension

Dial '8' to login into Personal Mailbox

Dial '9' to transfer the call to Operator Group "as per Caller"

Dial '#' to disconnect

Dial Digit Digit 1 ▾

Action on Digit Dialed Transfer to Operator ▾ Operator Group as per Caller ▾

Call Transfer Profile As Configured for Transfer Number ▾

You may add a new action, edit or delete the default actions.

To delete an Auto-Attendant action, mouse over on the respective action and click .

To add/edit an Auto-Attendant action,

- Click on the **Add Action** button to add a new action or click  to edit an action.
- In **Dial Digit**, select the digit to be dialed for the respective action.
- In **Action to Digit Dialed**, you can select any one of the following:

- Transfer to Operator
- Transfer to Extension
- Transfer to Department Group
- Go to VMAA Menu
- Play Information
- Dial Extension Number by Name
- Leave Voice Mail
- Personal Mailbox Access
- Change Language
- Repeat Prompt
- Go to Previous Menu
- Disconnect
- If you select **Transfer to Operator** or **Transfer to Extension** or **Transfer to Department Group**, select the respective Operator number or desired extension number or Department Group number.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.

- If you select **Play Information**, click **Settings**  to configure the parameters. For details, see [“Play Information”](#).

- If you select **Dial Extension Number by Name**, the system will allow caller to dial any extension number using name. Click **Settings**  to configure the parameters. For details, see [“Dial by Name”](#).

- If you select **Leave Voice Mail**, the system will allow caller to leave the message directly to the extension number or department group. Click **Settings**  to configure the parameters. For details, see [“Leave Voice Mail”](#).

- If you select **Personal Mailbox Access**, the system will provide the mailbox access to any user from remote location. Click **Settings**  to configure the parameters. For details, see [“Mailbox Access”](#).

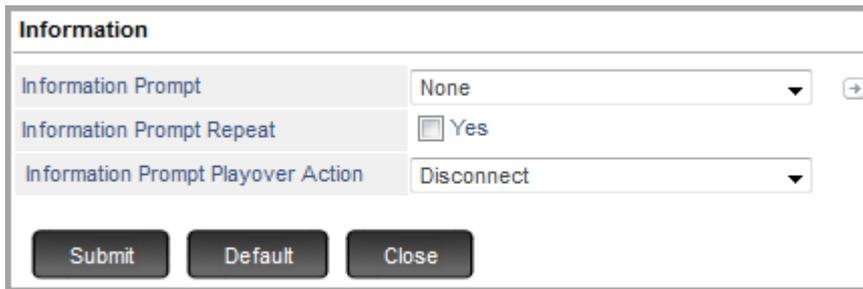

- If you select **Change Language**, select the Language which you want the system to use for the VMAA Menu instead of the previously selected Language.

Click **Settings**  to configure the parameters of the selected language profile. For more information, see [“Language Selection Profile”](#).

All the VMS prompts henceforth will be played in the language selected here.

- If you select **Repeat prompt**, the system will repeat all the Auto-Attendant prompts configured in sequence.
- If you select **Go to Previous Menu**, the system will provide an option to the caller to go back to the previous VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- Select the **Ignore Digit Dialed during Prompt** check box, if you want the system to ignore the digits dialed by the caller while the prompts are being played.

Play Information

Information	
Information Prompt	None
Information Prompt Repeat	<input checked="" type="checkbox"/> Yes
Information Prompt Playover Action	Disconnect

Submit Default Close

- In **Information Prompt**, select the prompt which has the information to be played to the caller. The information may be about the company or about the different products etc.

Select **None**, if you do not wish to play any information prompt to the caller.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Information Prompt.

- Select the **Information Prompt Repeat** check box to allow the Information prompt to be repeated to the caller.
- In **Information Prompt Repeat Count**, select the number of times you wish to play information prompt to the caller. The prompt will be played repeatedly till the Repeat Count expires.
- In **Repeat Count Expiry Prompt**, select the prompt you wish to play when the Information Prompt Repeat Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Repeat Count Expiry Prompt.

- In **Information Prompt Playover Action**, select — Transfer to Operator, Transfer to Department Group, Transfer to Extension, go to VMAA Menu or Disconnect.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.
 - In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- Click **Close** to close the window.

Dial by Name

Dial by Name

No Digit Dialed Settings

No Match Found Settings

Multiple Matched Found Settings

Note: Options will be played in sequence from digit 1-9,0,*,#.

Basic Settings

- In **Dial by Name Prompt**, select the prompt which you wish to play to the caller allowing him/her to dial the extension number using name.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** (+). The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Dial by Name Prompt.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings** (+) to configure the parameters of the selected profile. For more information, see "[Call Transfer Profile](#)".

- Select the **Play Dialed/Selected Name** check box, if you want the system to play the name dialed by the caller and check the option **Dialed/Selected Name Confirmation**.

If you disable the check box, the system will transfer the call directly to the extension number dialed by the caller as per the Call Transfer Profile configured.

- Select the **Dialed/Selected Name Confirmation** check box, if you want the system to confirm with the caller before transferring the call to the extension number dialed.
 - In **Confirm**, assign the Digit (0-9, *, # or None) that you want the system to play to the caller for confirming the Name dialed before transferring the call. If you assign *None*, the option will not be played.
 - In **Re-enter**, assign the Digit (0-9, *, # or None) that you want the system to play to prompt the caller to dial the extension number again.
 - In **No Digit Dialed Action**, select the option — Confirm or Re-enter. This is applicable when the caller has not dialed any digit for Selected Name Confirmation. The system will function as per the option you select.

No Digit Dialed Settings

No Digit Dialed Settings are applicable when caller has not dialed any digit and the first digit wait timer has expired.

No Digit Dialed Settings	
No Digit Dialed Prompt	No_Digit_Dialed_01
No Digit Dialed Retry	<input checked="" type="checkbox"/> Allowed
No Digit Dialed Retry Count	03
Retry Count Expiry Prompt	Expiry_Of_Count_01
No Digit Dialed Action	Disconnect

- In **No Digit Dialed Prompt**, select the prompt which you wish to play when caller has not dialed any digit. Select **None**, if you do not wish to play any prompt when caller has not dialed any digit.
 - Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Digit Dialed Prompt.
- Select the **No Digit Dialed Retry** check box to prompt the caller to dial the digit again.
 - In **No Digit Dialed Retry Count**, select the number of times you wish to prompt the caller for dialing the digit. The prompt will be played repeatedly till the Retry Count expires.
 - In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.
 - Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

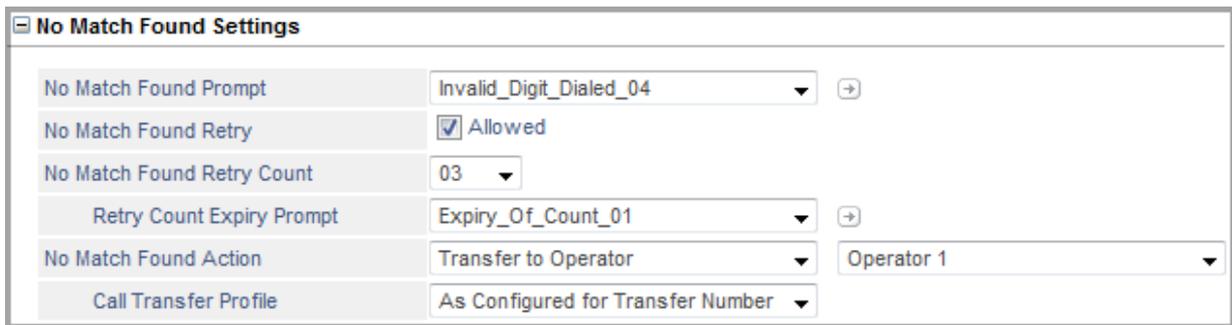

- In **No Digit Dialed Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

No Match Found Settings

-----------------------------	---

Note: Options will be played in sequence from digit 1-9,0,*,#.

Multiple Match Found Options

You can assign the Digits (0-9, *, # or None) to each of the options — Select Name, Next Name, Repeat Name, Repeat from First Name, Go to Dial by Name, Go to Previous Menu or Disconnect.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. These options will be played for each of the Names included in the Multiple Match Found list.

Brief description of each option is explained below:

- **Select Name:** The system will play a Name from the multiple match found list. The caller may select the this name for if he wishes to transfer the call to this Extension.
- **Next Name:** The system will play the next name from the multiple match found list.
- **Repeat Name:** The system will re-play the last name played from the multiple match found list.
- **Repeat from First Name:** The system will play the multiple match found list of names from the first matched name.
- **Go to Dial by Name:** The system will clear the multiple match found list and prompt caller to dial the Extension by Name again.
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the Previous Menu.
- **Disconnect:** The system will disconnect the call after playing the Disconnect prompt.

In **Select Name - Digit Wait Timer (sec)**, enter the time for which you want the system to wait to play the next name while playing the multiple match found list. Default: 03 seconds

No Name Selected Settings

- In **No Name Selected Prompt**, select the prompt you wish to play when no name is selected by the caller.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for No Name Selected Prompt.

- In **No Name Selected Action**, you can select — Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Go to Previous Menu or Disconnect.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Go to Previous Menu**, the system will go back to the previous menu.
- If you select **Disconnect**, the system will disconnect the call.

Invalid Digit Dialed Settings

- Clear the **Ignore Invalid Digit Dialed** check box, if you do not want the system to ignore the invalid digit dialed and prompt the caller for the same. By default, it is enabled.
- In **Invalid Digit Dialed Prompt**, select the prompt you wish to play when the caller has dialed an invalid digit for option selection.

Select **None**, if you do not wish to play any prompt when an invalid digit is dialed.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Invalid Digit Dialed Prompt.

- In **Invalid Digit Dialed Action**, you can select — Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Go to Previous menu or Disconnect.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Go to Previous Menu**, the system will go back to the previous menu.
- If you select **Disconnect**, the system will disconnect the call.
- Click **Close** to close the window.

Leave Voice Mail

Leave Voice Mail	
Leave Voice Mail to	Extension number dialed by caller ⚙
Override Message Leave Settings of Extension	<input type="checkbox"/> Yes
Action after Leaving Voice Mail	Disconnect ▾

Submit Default Close

- In **Leave Voice Mail to**, select an option where you want to leave the voice mail message.
 - If you select **Extension Number** or **Department Group**, the system will prompt the caller to leave the message for the Extension Number or Department Group configured.
 - If you select **Extension number dialed by caller**, the system will prompt the caller to enter the number to leave the message for the Extension Number or Department Group.

Click **Settings** ⚙ to configure the *Leave Voice Mail - Dialed Extension Number* parameters.

- In **Leave Voice Mail Prompt**, select the prompt you wish to play to prompt the caller to leave the message.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** ⚙. The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Leave Voice Mail Prompt.

- For **No Match Found Settings**, refer [“No Match Found Settings”](#).
- For **No Digit Dialed Settings**, refer [“No Digit Dialed Settings”](#).
- Select the **Override Message Leave Settings of Extension** check box, if you want the system to apply the Leave Voice Mail Settings configured on this page. Configure the [“Message Leave Settings”](#) and [“No Mailbox Action”](#).

Clear the check box, if you want the system to apply the Leave Voice Mail settings configured for the extension.

- In **Action after Leaving Voice Mail**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
 - If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.
Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).
- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

Message Leave Settings

Message Leave Settings is applicable if you have enabled *Override Message Leave Settings of Extension* parameter. It allows you to configure the settings for the messages you receive from the caller i.e the message left for you by the caller.

Leave Voice Mail	
Leave Voice Mail to	Extension number dialed by caller 
Override Message Leave Settings of Extension	<input checked="" type="checkbox"/> Yes
Action after Leaving Voice Mail	Disconnect
Message Leave Settings	
Play Personal Greeting	<input type="checkbox"/> Yes
Stop Record Message Code	<input type="text"/>
Message Verification	<input checked="" type="checkbox"/> Yes
Message Type	Set as Normal
Message Sensitivity	Set as Normal
Message Security	<input type="checkbox"/> Enable
Message Leave Confirmation Prompt	<input checked="" type="checkbox"/> Play
Message Leave Options	
Re-record	Digit 1
Confirm	Digit 2
Listen Recorded Message	Digit 5
Append to Recorded Message	Digit 6
No Digit Dialed Action	Normal + Normal

- Select the **Play Personal Greeting** check box to allow the personal greetings to be played to the caller.

If the personal greeting is not recorded or is unavailable, no prompt will be played.

Personal Greetings will not be applicable if your mailbox is defined as the destination for Call Tapping or Conversation Recording messages.

- Select the **Play Conditional Greeting** check box to allow the conditional greetings to be played to the caller.

If the conditional greeting is not recorded or is unavailable, no prompt will be played.

Conditional Greeting will be applicable only if your mailbox is defined as the destination for Call Transfer Unsuccessful.

- In **Stop Record Message Code**, enter the digits (0-9,* or #) that you want the caller to dial to stop the recording of the message. The system will play this to the caller along with the prompt before he starts recording the message. You may configure a maximum of upto 3 digits.

If you do not assign any digit and keep it blank, the system will play the prompt without the stop code.

- Select the **Message Verification** check box to allow the recorded message to be verified by the caller before storing it in the Personal Mailbox or re-record it. You must configure the ["Message Leave Options"](#).

If you disable the check box, the system will directly store the recorded message in the Personal Mailbox.

- In **Message Type**, select the option according to which you want the system to store the recorded messages. You may select — Set as Normal, Set as Urgent or Ask caller.
 - Select **Set as Normal**, if you want the system to store the recorded message in the mailbox as Normal.
 - Select **Set as Urgent**, if you want the system to store the recorded message in the mailbox as Urgent.
 - Select **Ask Caller**, if you want the system to ask the caller to select the message type before storing the recorded message in the mailbox.
- In **Message Sensitivity**, select the option according to which you want the system to prioritize the messages as per their importance. You may select — Set as Normal, Set as Private or Ask caller.
 - Select **Set as Normal**, if you want the system to store the recorded message in the mailbox as Normal.
 - Select **Set as Private**, if you want the system to store the recorded message in the mailbox as Private. The message received is considered as confidential and forwarding the message is restricted.
 - Select **Ask Caller**, if you want the system to ask the caller to select the message sensitivity before storing the recorded message in the mailbox.
- Select the **Message Security** check box, if you want the system to restrict the forwarding and downloading of the messages.

Message Security has higher priority than Message Type and Message Sensitivity set for the message.

If you disable the check box, the system will not set any security for the message.

- Select the **Message Leave Confirmation Prompt** check box if you want the system to play the Message Leave Confirmation prompt to the caller after leaving the message. The Message Leave Confirmation prompt plays the Message Type, Message Sensitivity and Message Security that you configured.

If you disable the check box, the system will not play the Message Leave Confirmation prompt to the caller after leaving the message.

Message Leave Options

You can assign the Digits (0-9, *, # or None) to each of the options — Re-record, Confirm, Urgent, Private(Confidential), Listen Recorded Message and Append to Recorded Message.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Given below is the brief description of each option:

- **Re-record:** The system will clear the recorded message and let the caller record a new message again. This is applicable only if you have enabled the Message Verification check box.
- **Confirm:** The system will save the recorded message as per the option set by you in No Digit Dialed Action. This is applicable only if you have enabled the Message Verification check box or selected the Ask Caller as the Message Type and/or Message Sensitivity option.
- **Urgent:** The system will save the recorded message along with the Message Type as *Urgent*. This is applicable only if you have selected the Ask Caller as the Message Type option.
- **Private(Confidential):** The system will save the recorded message along with the Message Sensitivity as *Private*. This is applicable only if you have selected the Ask Caller as the Message Sensitivity option.
- **Listen Recorded Message:** The system will play the recorded message to the caller and then play the message leave options again. This is applicable only if you have enabled the Message Verification check box.
- **Append to Recorded Message:** The system will let the caller record a new message again and add it to the existing recorded message. This is applicable only if you have enabled the Message Verification check box.

System will check — Maximum Message Length, New Message Delivery Option in Mailbox Full Condition etc — before allowing the caller to append the recorded message

The Message, that is, the recorded message along with the appended message cannot exceed the Maximum Message Length. Hence, the system will allow recording of the appending message only till it reaches the Maximum Message Length.

- In **No Digit Dialed Action**, if no digit is dialed by the caller, the system will take action as per the Message Type and Message Sensitivity configured.

If you have configured *Ask Caller* option in Message Type and/or Message Sensitivity, you can select the desired action — Normal+Normal, Urgent+Normal, Normal+Private or Urgent+Private.

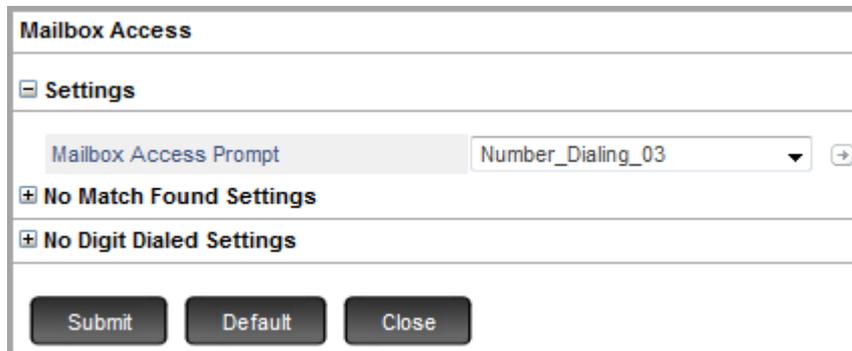

No Mailbox Action

No Mailbox Action is applicable if you have enabled *Override Message Leave Settings of Extension* parameter.

- In **No Mailbox Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.

- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.
- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.
Click **Settings**  to configure the parameters of the selected profile. For more information, see [“Call Transfer Profile”](#).
- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- Click **Close** to close the window.

Mailbox Access

Settings

- In **Mailbox Access Prompt**, select the prompt you wish to play when the caller has selected *Personal Mailbox Access* as the Action on Digit Dialed option.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Mailbox Access Prompt.

No Match Found Settings

- For details, refer [“No Match Found Settings”](#).

No Digit Dialed Settings

- For details, refer [“No Digit Dialed Settings”](#).
- Click **Close** to close the window.

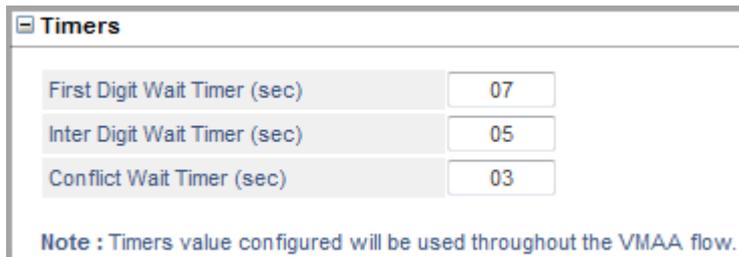

No Digit Dialed Settings

- For details, refer [“No Digit Dialed Settings”](#).

Invalid Digit Dialed Settings

- For details, refer [“Invalid Digit Dialed Settings”](#).

Timers

Timers	
First Digit Wait Timer (sec)	07
Inter Digit Wait Timer (sec)	05
Conflict Wait Timer (sec)	03

Note : Timers value configured will be used throughout the VMAA flow.

- In **First Digit Wait Timer**, enter the time for which you want the system to wait for the caller to dial the first digit for menu option selection or for entering the Extension or Department Group number. On the expiry of the First Digit Wait Timer, the system will apply [“No Digit Dialed Settings”](#). Default: 07 seconds
- In **Inter Digit Wait Timer**, enter the time for which you want the system to wait for the caller to dial the subsequent digit after the first digit is dialed. On the expiry of the Inter Digit Wait Timer, the system will apply [“No Match Found Settings”](#). Default: 05 seconds
- In **Conflict Wait Timer**, enter the time for which you want the system to wait for the extension user to dial the next digit to resolve conflicting access codes dialed by the extension user. Default: 03 seconds

Disconnect

Disconnect	
Disconnect Prompt	Disconnect_01

Note : Disconnect Prompt configured will be used whenever call is disconnected during VMAA flow.

- In **Disconnect Prompt**, select the prompt you wish to play when the caller has selected *Disconnect* as the Action on Digit Dialed option.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Disconnect Prompt.

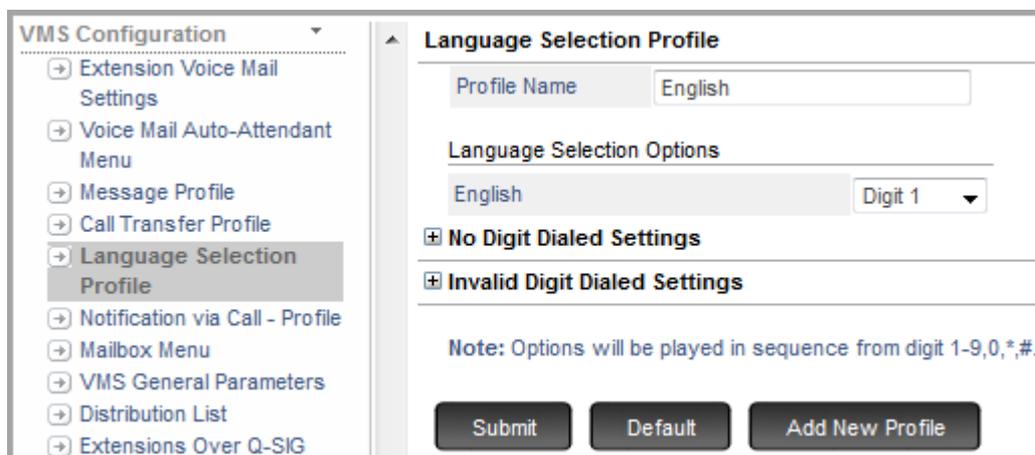

Language Selection Profile

Language Selection Profile is a menu which allows you to select the language. The languages you configure in the “Supported VMS Language” will be displayed under Language selection options. You may add a maximum of 8 profiles.

If Language Selection Profile assigned to any parameter is deleted, the system will consider the first Language Selection Profile.

How to Configure

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click the **Language Selection Profile**.

The screenshot shows the VMS Configuration interface. On the left is a navigation menu with the following items: Extension Voice Mail Settings, Voice Mail Auto-Attendant Menu, Message Profile, Call Transfer Profile, Language Selection Profile (highlighted), Notification via Call - Profile, Mailbox Menu, VMS General Parameters, Distribution List, and Extensions Over Q-SIG. The main content area is titled 'Language Selection Profile' and contains the following fields and options: a 'Profile Name' text box with 'English' entered; a 'Language Selection Options' section with a text box containing 'English' and a 'Digit 1' dropdown menu; two expandable sections, 'No Digit Dialed Settings' and 'Invalid Digit Dialed Settings'; a note stating 'Note: Options will be played in sequence from digit 1-9,0,*,#.'; and three buttons at the bottom: 'Submit', 'Default', and 'Add New Profile'.

You may add a new profile, edit the default profile or delete a Language Profile.

To add a new Language Profile,

- Click **Add New Profile**. A new *Language Profile x* will be created. You may now configure this as per your requirement.

To delete a profile, click **Delete**.

The default Language Profile cannot be deleted.

To edit a Language Profile,

- In **Profile Name**, you may assign a name to the Language profile. By default, it is *Language Selection x*, where x is the Language Profile Number from 1 to 8.

Language Selection Options

The languages that are added in the system are displayed here. For details, see [“Configuring VMS General Parameters”](#).

You can assign the Digits(0-9, *, # or None) to each of the Languages.

The digit you configure will be played as the digit to be dialed by the caller to select the respective language. The options will be played in the sequence — 1-9, 0, *, # — as per the Digits configured. The language for which the Digit selected is None will not be played.

The option you configure for a language will be played in the respective language.

For Example, you selected the Digit 5 to be played for Italian language. The option will be played along with the digit to dial (as configured) in Italian Language.

No Digit Dialed Settings

No Digit Dialed Settings are applicable when caller has not dialed any digit to select the desired Language and the first digit wait timer has expired.

The screenshot shows a configuration window titled "No Digit Dialed Settings". It contains five rows of settings:

No Digit Dialed Prompt	No_Digit_Dialed_02	+
No Digit Dialed Retry	<input checked="" type="checkbox"/> Allowed	
No Digit Dialed Retry Count	03	
Retry Count Expiry Prompt	Expiry_Of_Count_01	+
No Digit Dialed Language	English	

- In **No Digit Dialed Prompt**, select the prompt you wish to play when caller has not dialed any digit for option selection.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** (+). The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Digit Dialed Prompt.

- Select the **No Digit Dialed Retry** check box to allow the Language selection options to be played again if no digit has been dialed.
 - In **No Digit Dialed Retry Count**, select the number of times you wish to prompt the caller for language selection. The language selection options will be played repeatedly till the Retry Count expires.
 - In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** (+). The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Digit Dialed Language**, select — Use Language configured in Menu, Disconnect, or the language configured as Supported VMS Language.
 - Select **Use Language configured in Menu**, if you want the system to use the Language you configured as Menu Language in VMAA Menu.
 - Select **Disconnect**, if you want the system to disconnect the call.

If you select a language from the Supported VMS Languages you configured, the system will use the Language you select. See [“Supported VMS Language”](#).

Invalid Digit Dialed Settings

Invalid Digit Dialed Settings are applicable when caller has dialed an invalid digit — a digit which is not configured as the Language Selection option.

- Clear the **Ignore Invalid Digit Dialed** check box, if you do not want the system to ignore the invalid digit dialed and prompt the caller for the same. By default, it is enabled.
- In **Invalid Digit Dialed Prompt**, select the prompt you wish to play when the caller has dialed an invalid digit for option selection.

Select **None**, if you do not wish to play any prompt when an invalid digit is dialed.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Invalid Digit Dialed Prompt.

- Select the **Invalid Digit Dialed Retry** check box to allow the Language selection options to be played again if an invalid digit has been dialed.
 - In **Invalid Digit Dialed Retry Count**, select the number of times you wish to prompt the caller for language selection. The language selection options will be played repeatedly till the Retry Count expires.
 - In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **Invalid Digit Dialed Language**, select — Use Language configured in Menu, Disconnect, or the language configured as Supported VMS Language.
 - Select **Use Language configured in Menu**, if you want the system to use the Language you configured as Menu Language in VMAA Menu.
 - Select **Disconnect**, if you want the system to disconnect the call.
 - Select a language from the Supported VMS Languages you configured, if you want the system to use the Language you select. See [“Supported VMS Language”](#).

Message Profile

Message Profile allows you to customize the Message Leave Settings, Message Playback Settings and Message Sent/Forward Settings.

VMS supports a maximum of 24 Message Profiles.

By default, two Message Profiles — User and Executive — are provided to you. These two profiles cannot be deleted but you may edit their settings as per your requirement.

How to Configure

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **Message Profile**.

The screenshot displays the configuration interface for a Message Profile. On the left, a navigation menu lists various system settings, with 'Message Profile' highlighted under the 'VMS Configuration' section. The main content area shows the configuration for the 'User' profile. It includes sections for 'Message Leave Settings', 'Message Playback Settings', and 'Message Send/Forward Settings'. The 'Message Leave Settings' section is expanded, showing options for 'Play Personal Greeting', 'Play Conditional Greeting', 'Stop Record Message Code', 'Message Verification', 'Message Type', 'Message Sensitivity', 'Message Security', and 'Message Leave Confirmation Prompt'. The 'Message Playback Settings' and 'Message Send/Forward Settings' sections are currently collapsed. At the bottom, there are buttons for 'Submit', 'Default', and 'Add New Profile'.

You may add a new profile, edit the default profile or delete a message profile.

To add a new Message Profile,

- Click **Add New Profile**. A new *Message Profile xx* will be created. You may now configure this as per your requirement.

To delete a profile, click **Delete**.

The default Message Profiles cannot be deleted.

To edit a Message Profile,

- In **Profile Name**, you may configure the name of the Message profile you want. By default, it is *Message Profile xx* where xx is the Message Profile Number from 01 to 24.

Message Leave Settings

Message Leave Settings are applicable only when the external caller reaches to your mailbox or internal caller replies to your message.

- Select the **Play Personal Greeting** check box to allow the personal greetings to be played to the caller. The Personal Greetings will be played as per the timezone - Working Hours, Break hours or Non-Working hours.

If the personal greeting is not recorded or is unavailable, no prompt will be played.

- Select the **Play Conditional Greeting** check box to allow the conditional greetings to be played to the caller. The conditional greetings will be played when the call forward is set to VMS for Busy, No Reply or Unconditional.

If the conditional greeting is not recorded or is unavailable, no prompt will be played.

- In **Stop Record Message Code**, enter the digits (0-9,* or #) that you want the caller to dial to stop the recording of the message. The system will play this to the caller along with the prompt before he starts recording the message. You may configure a maximum of upto 3 digits.

If you do not assign any digit and keep it blank, the system will play the prompt without the stop code. In this case, you may dial any digit to stop recording.

- Select the **Message Verification** check box to allow the recorded message to be verified by the caller before storing it in the Personal Mailbox or to re-record it. You must configure the [“Message Leave Options”](#).

If you disable the check box, the system will directly store the recorded message in the Personal Mailbox.

- In **Message Type**, select the option according to which you want the system to store the received messages as per the priority. You may select — Set as Normal, Set as Urgent or Ask caller.
 - Select **Set as Normal**, if you want the system to store the messages received in the mailbox as Normal. The messages left by the external callers or replied by the internal callers will be considered as normal messages.
 - Select **Set as Urgent**, if you want the system to store the messages received in the mailbox as Urgent. This is useful when you want the messages left by the external callers or replied by the internal callers to be considered as urgent messages with higher priority.
 - Select **Ask Caller**, if you want the system to ask the caller to select the message type before leaving the recorded message on your extension. If the call gets disconnected before the caller selects the message type, the message will be set as normal by default. You must configure the [“Message Leave Options”](#).

While retrieving, the Urgent and Normal messages will be played separately.

- In **Message Sensitivity**, select the option according to which the system will decide whether the messages left by the external callers or replied by the internal callers are allowed to be forwarded or not.
- Select **Set as Normal**, if you want the system to store the messages received in the mailbox as Normal. The messages left by the external callers or replied by the internal callers will be considered as normal messages.
- Select **Set as Private**, if you want the system to store the messages received in the mailbox as Private. The message left by the external callers or replied by the internal callers will be considered as confidential and forwarding the message will be restricted.
- Select **Ask Caller**, if you want the system to ask the caller to select the message sensitivity before storing the recorded message in the mailbox. If the call gets disconnected before the caller selects the message sensitivity, the message will be set as normal by default. You must configure the [“Message Leave Options”](#).
- The **Message Security** parameter is reserved for future use. Keep this check box disabled.
- Select the **Message Leave Confirmation Prompt** check box if you want the system to play the prompt to the caller after leaving the message. The Message Type and Message Sensitivity that you configured will be played.

If you disable the check box, the system will not play the Message Leave Confirmation prompt to the caller after leaving the message.

Message Leave Options

Message Leave Options will be played based on the configuration of the parameters — Message Verification, Message Type and Message Sensitivity.

Message Leave Settings	
Play Personal Greeting	<input checked="" type="checkbox"/> Yes
Play Conditional Greeting	<input checked="" type="checkbox"/> Yes
Stop Record Message Code	<input type="text"/>
Message Verification	<input checked="" type="checkbox"/> Yes
Message Type	Ask Caller ▼
Message Sensitivity	Ask Caller ▼
Message Security	<input type="checkbox"/> Enable
Message Leave Confirmation Prompt	<input type="checkbox"/> Play
Message Leave Options	
Re-record	None ▼
Confirm	None ▼
Urgent	None ▼
Private(Confidential)	None ▼
Listen Recorded Message	None ▼
Append to Recorded Message	None ▼
No Digit Dialed Action	Urgent + Private ▼

You can assign the Digits (0-9, *, # or None) to each of the options — Re-record, Confirm, Urgent, Private(Confidential), Listen Recorded Message and Append to Recorded Message.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Given below is the brief description of each option:

- **Re-record:** The system will clear the recorded message and let the caller record a new message again. This is applicable only if you have enabled the Message Verification check box.
- **Confirm:** The system will save the recorded message as per the option set by you in No Digit Dialed Action. This is applicable only if you have enabled the Message Verification check box or selected the Ask Caller as the Message Type and/or Message Sensitivity option.
- **Urgent:** The system will save the recorded message as Urgent message. This is applicable only if you have selected the Ask Caller as the Message Type option.
- **Private(Confidential):** The system will save the recorded message as Private message. This is applicable only if you have selected the Ask Caller as the Message Sensitivity option.
- **Listen Recorded Message:** The system will play the recorded message to the caller and then play the message leave options again. This is applicable only if you have enabled the Message Verification check box.
- **Append to Recorded Message:** The system will let the caller record a new message again and add it to the existing recorded message. This is applicable only if you have enabled the Message Verification check box.

System will check — Maximum Message Length, New Message Delivery Option in Mailbox Full Condition etc — before allowing the caller to append the recorded message.

The Message, that is, the recorded message along with the appended message cannot exceed the Maximum Message Length. Hence, the system will allow recording of the appending message only till it reaches the Maximum Message Length.

- In **No Digit Dialed Action**, if no digit is dialed by the caller, the system will take action as per the Message Type and Message Sensitivity configured.

This is applicable only if you have enabled the Message Verification check box or selected the Ask Caller as the Message Type and/or Message Sensitivity option.

Based on the configuration, you may select the desired action — Normal+Normal, Urgent+Normal, Normal+Private or Urgent+Private.

Message Playback Settings

Message Playback Settings allows you to configure the settings applicable when extension user accesses his/her Personal Mailbox and plays the messages.

Message Playback Settings	
Message Playback Direction	Play new recorded message first ▼
New Message Playback	Play Urgent Messages first and there ▼
Old Message Playback	Play Urgent Messages first and there ▼
Date Playback Format	DD-MM-YYYY ▼
Message Type and Sensitivity	Do not Play ▼
Message Details	Play after Message ▼
Message Count	<input checked="" type="checkbox"/> Play

- In **Message Playback Direction**, select the option according to which you want the system to play the messages to the extension user. You may select — Play oldest recorded message first or Play new recorded message first.
 - Select **Play oldest recorded message first**, if you want the system to play the old messages first and then play the new messages.
 - Select **Play new recorded message first**, if you want the system to play the new messages first and then play the old messages.
- In **New Message Playback**, select the option defining the priority according to which you want the system to play the new messages to the extension user. You may select — Play Normal Messages and thereafter Urgent Messages or Play Urgent Messages first and thereafter Normal Messages.
 - Select **Play Normal Messages and thereafter Urgent Messages**, if you want the system to first play the new messages with message type as Normal and then play the new messages with the message type as Urgent.
 - Select **Play Urgent Messages first and thereafter Normal Messages**, if you want the system to first play the new messages with message type as Urgent and then play the new messages with the message type as Normal.
- In **Old Message Playback**, select the option defining the priority according to which you want the system to play the old messages to the extension user. You may select — Play Normal Messages and thereafter Urgent Messages or Play Urgent Messages first and thereafter Normal Messages.
 - Select **Play Normal Messages and thereafter Urgent Messages**, if you want the system to first play the old messages with message type as Normal and then play the old messages with the message type as Urgent.
 - Select **Play Urgent Messages first and thereafter Normal Messages**, if you want the system to first play the old messages with message type as Urgent and then play the old messages with the message type as Normal.
- **Date Playback Format**: Select the Date Playback Format — DD-MM-YYYY or MM-DD-YYYY— you want the system to play while playing the message details to the extension user.

*This Date Playback format is applicable only for **Message Profile**.*

- In **Message Type and Sensitivity**, select the option according to which you want the system to play the Message Type and Sensitivity of the stored messages to the extension user. You may select — Do Not Play, Play before Message or Play after Message.
 - Select **Do Not Play**, if you do not want the system to play the Message Type and Sensitivity.
 - Select **Play before Message**, if you want the system to play the Message Type and Sensitivity before playing the message.
 - Select **Play after Message**, if you want the system to play the Message Type and Sensitivity after playing the message.
- In **Message Details**, select the option according to which you want the system to play the Message Details of the stored messages to the extension user. You may select — Play before Message, Play after Message or Play on Demand.
 - Select **Play before Message**, if you want the system to play the Message Details before playing the message.
 - Select **Play after Message**, if you want the system to play the Message Details after playing the message.
 - Select **Play on Demand**, if you want the system to play the Message Details only when the caller wants. You must select the desired option to listen to the message details.

The System will first play the Message Type and Sensitivity and then play the Message Details.

- Select the **Message Count** check box if you want the system to play the Message sequence number to the extension user before playing the message. The message count is just to differentiate between various messages played to the caller.

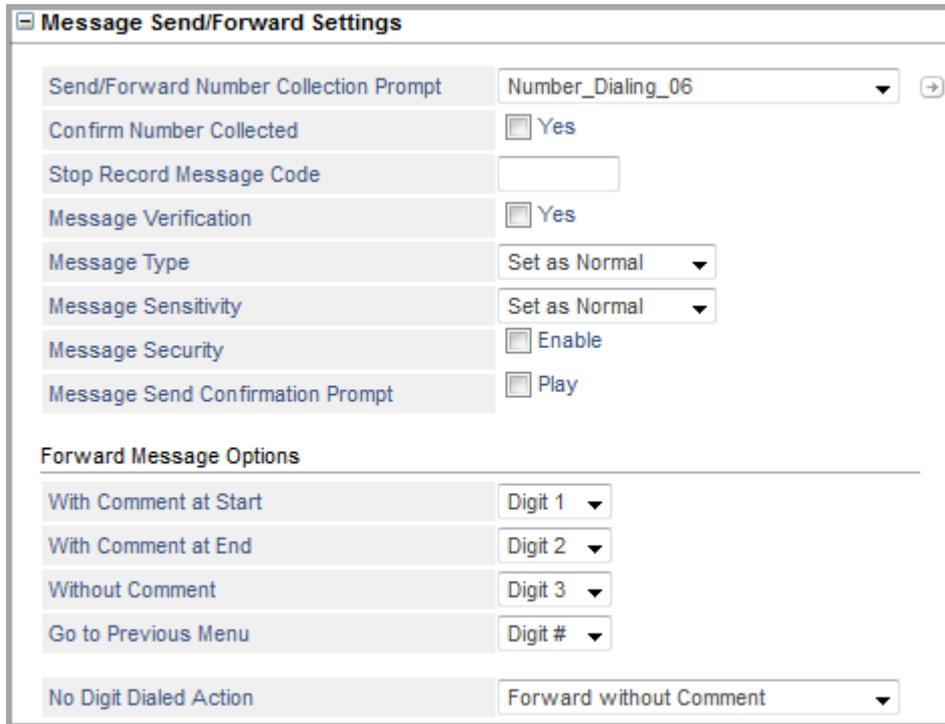

The message count has no interaction with the number of old/new/total messages present in the mailbox.

If you disable the check box, the system will not play the Message sequence number before playing the message to the extension user.

Message Send/Forward Settings

Message Send/Forward Settings allows you to configure the settings for the messages you send or forward.

The screenshot shows a configuration window titled "Message Send/Forward Settings". It contains several settings:

- Send/Forward Number Collection Prompt:** A dropdown menu set to "Number_Dialing_06".
- Confirm Number Collected:** A checkbox labeled "Yes" which is currently unchecked.
- Stop Record Message Code:** An empty text input field.
- Message Verification:** A checkbox labeled "Yes" which is currently unchecked.
- Message Type:** A dropdown menu set to "Set as Normal".
- Message Sensitivity:** A dropdown menu set to "Set as Normal".
- Message Security:** A checkbox labeled "Enable" which is currently unchecked.
- Message Send Confirmation Prompt:** A checkbox labeled "Play" which is currently unchecked.

Below these settings is a section titled "Forward Message Options" with the following options:

- With Comment at Start:** A dropdown menu set to "Digit 1".
- With Comment at End:** A dropdown menu set to "Digit 2".
- Without Comment:** A dropdown menu set to "Digit 3".
- Go to Previous Menu:** A dropdown menu set to "Digit #".
- No Digit Dialed Action:** A dropdown menu set to "Forward without Comment".

- In **Send/Forward Number Collection Prompt**, select the prompt which you wish to play when you have selected the Send Message or Forward Message option. This is to prompt the extension user for entering the destination number/s for sending/forwarding the message.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Send/Forward Number Collection Prompt.

- Select the **Confirm Number Collected** check box to allow the system to check the Destination Number/s collected by the extension user. Configure the "[Destination Number Confirmation](#)" settings.
- In **Stop Record Message Code**, enter the digits (0-9,* or #) that you want the extension user to dial to stop the recording of the message. The system will play this to the extension user along with the prompt before s/he starts recording the message. You may configure a maximum of upto 3 digits.

If you do not assign any digit and keep it blank, the system will play the prompt without the stop code. In this case, you may dial any digit to stop recording.

- Select the **Message Verification** check box to allow the recorded message to be verified by the extension user before storing it in the Personal Mailbox or re-record it.

If you disable the check box, the system will directly store the recorded message in the Personal Mailbox.

- In **Message Type**, select the option according to which you want the system to send/forward the recorded messages. You may select — Set as Normal, Set as Urgent or Ask caller.
- Select **Set as Normal**, if you want the system to send/forward the recorded message in the mailbox as Normal.
- Select **Set as Urgent**, if you want the system to send/forward the recorded message in the mailbox as Urgent with higher priority.
- Select **Ask Caller**, if you want the system to ask the extension user to select the message type before storing the recorded message in the mailbox. If the call gets disconnected before the message type is selected, the message will be set as normal by default. You must configure the “[Message Send Options](#)”.

While retrieving, the Urgent and Normal messages will be played separately.

- In **Message Sensitivity**, select the option according to which you want the system to prioritize the messages as per their importance. You may select — Set as Normal, Set as Private or Ask caller.
- Select **Set as Normal**, if you want the system to send/forward the recorded message in the mailbox as Normal.
- Select **Set as Private**, if you want the system to send/forward the recorded message in the mailbox as Private. The message received is considered as confidential and forwarding the message is restricted.
- Select **Ask Caller**, if you want the system to ask the extension user to select the message sensitivity before storing the recorded message in the mailbox. If the call gets disconnected before the message sensitivity is selected, the message will be set as normal by default. You must configure the “[Message Send Options](#)”.
- The **Message Security** parameter is reserved for future use. Keep this check box disabled.
- Select the **Message Send Confirmation Prompt** check box if you want the system to play the prompt to the extension user after sending the message on the destination number/s i.e. to the recipients. The Message Type and Message Sensitivity that you configured will be played.

If you disable the check box, the system will not play the Message Send Confirmation prompt to the extension user after sending the message.

Destination Number Confirmation

This option is applicable only if you have selected the **Confirm Number Collected** check box.

Destination Number Confirmation	
Confirm	Digit 2 ▼
Re-enter	Digit 1 ▼
No Digit Dialed Action	Confirm ▼

You can assign the Digits (0-9, *, # or None) to each of the options — Confirm, Re-enter.

Make sure you do not assign the same digit to both the options.

The digit you configure will be played as the digit to be dialed by the extension user to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Given below is a brief description of each option:

- **Confirm:** The system will save the destination number/s collected considering they are valid.
- **Re-enter:** The system will clear all the destination numbers collected and ask the extension user to record the destination number/s again.
- In **No Digit Dialed Action**, select the option — Confirm or Re-enter. This is applicable when the extension user has not dialed any digit for Destination Number Confirmation. The system will function as per the option you select.

Forward Message Option

Forward Message Options	
With Comment at Start	Digit 1 ▼
With Comment at End	Digit 2 ▼
Without Comment	Digit 3 ▼
Go to Previous Menu	Digit # ▼
No Digit Dialed Action	Forward without Comment ▼

You can assign the Digits (0-9, *, # or None) to each of the options — With Comment at Start, With Comment at End, Without Comment or Go to Previous Menu.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the extension user to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Given below is a brief description of each option:

- **With Comment at Start:** The system will provide an option to the extension user for recording a message in addition to the existing recorded message before forwarding the message to the destination number/s. The additional message will be added as the initial part of the message i.e. will be added at the beginning of the message.
- **With Comment at End:** The system will provide an option to the extension user for recording a message in addition to the existing recorded message before forwarding the message to the destination number/s. The additional message will be added as the final part of the message i.e. will be added at the end of the message.
- **Without Comment:** The system will provide an option to the extension user for sending the recorded message to the destination number/s without adding any additional comment to it.

- **Go to Previous Menu:** The system will provide an option to the extension user to go back to the Mailbox Access Main Menu.
- In **No Digit Dialed Action**, select the option — With Comment at Start, With Comment at End or Without Comment. This is applicable when the extension user has not dialed any digit for Forward Message Option. The system will carry out the function when no digit is dialed as per the option you select.

Message Send Options

Message Send Options will be played based on the configuration of the parameters — Message Verification, Message Type and Message Sensitivity.

Message Send Options	
Re-record	None ▼
Confirm	None ▼
Urgent	None ▼
Private(Confidential)	None ▼
Listen Recorded Message	None ▼
Append to Recorded Message	None ▼
No Digit Dialed Action	Urgent + Normal ▼

You can assign the Digits (0-9, *, # or None) to each of the options — Re-record, Confirm, Urgent, Private(Confidential), Listen Recorded Message and Append to Recorded Message.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the extension user to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Given below is the brief description of each option:

- **Re-record:** The system will clear the recorded message and let the extension user record a new message again. This is applicable only if you have enabled the Message Verification check box.
- **Confirm:** The system will save the recorded message as per the option set by you in No Digit Dialed Action. This is applicable only if you have enabled the Message Verification check box or selected the Ask Caller as the Message Type and/or Message Sensitivity option.
- **Urgent:** The system will save the recorded message as Urgent message. This is applicable only if you have selected the Ask Caller as the Message Type option.
- **Private(Confidential):** The system will save the recorded message as Private message. This is applicable only if you have selected the Ask Caller as the Message Sensitivity option.

- **Listen Recorded Message:** The system will play the recorded message to the extension user and then play the message leave options again. This is applicable only if you have enabled the Message Verification check box.
- **Append to Recorded Message:** The system will let the extension user record a new message again and add it to the existing recorded message. This is applicable only if you have enabled the Message Verification check box.

System will check — Maximum Message Length, New Message Delivery Option in Mailbox Full Condition etc — before allowing the extension user to append the recorded message.

The Message, that is, the recorded message along with the appended message cannot exceed the Maximum Message Length. Hence, the system will allow recording of the appending message only till it reaches the Maximum Message Length.

- In **No Digit Dialed Action**, if no digit is dialed by the extension user, the system will take action as per the Message Type and Message Sensitivity configured.

This is applicable only if you have enabled the Message Verification check box or selected the Ask Caller as the Message Type and/or Message Sensitivity option.

Based on the configuration, you may select the desired action — Normal+Normal, Urgent+Normal, Normal+Private or Urgent+Private.

Message Delivery Options

Message Delivery Options	
Request Read Receipt	Digit 1 ▼
Ignore Read Receipt	Digit 2 ▼
No Digit Dialed Action	Ignore Read Receipt ▼

You can assign the Digits (0-9, *, # or None) to each of the options — Request Read Receipt or Ignore Read Receipt.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the extension user to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Brief description of each option is explained below:

- **Request Read Receipt:** The system will provide an option to the extension user for requesting the read receipt to be played whenever the message is read by the destination number. In case of multiple destination numbers, it will be played individually for each number after the message has been read.

The read receipt includes the name, destination number and the first five seconds of the message sent or forwarded.

- **Ignore Read Receipt:** The system will provide an option to the extension user for ignoring the read receipt i.e. no read receipt will be played back to the extension user.
- In **No Digit Dialed Action**, select the option — Request Read Receipt, Ignore Read Receipt. This is applicable when the extension user has not dialed any digit for Message Delivery Option. The system will carry out the function when no digit is dialed as per the option you select.

No Match Found Settings (while collecting destination number)

No Match Found Settings are applicable when no valid match is found as the Destination Number.

No Match Found Settings (while collecting destination number)	
No Match Found Prompt	Invalid_Digit_Dialed_04

- In **No Match Found Prompt**, select the prompt which you wish to play when the extension user has dialed an invalid destination number/s for sending/forwarding the message.

Select **None**, if you do not wish to play any prompt when extension user has dialed an invalid destination number.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Match Found Prompt.

No Digit Dialed Settings (while collecting destination number)

No Digit Dialed Settings are applicable when extension user has not dialed the destination number and the first digit wait timer has expired.

No Digit Dialed Settings (while collecting destination number)	
No Digit Dialed Prompt	No_Digit_Dialed_01
No Digit Dialed Retry	<input checked="" type="checkbox"/> Allowed
No Digit Dialed Retry Count	03
Retry Count Expiry Prompt	Expiry_Of_Count_01
No Digit Dialed Action	Go to Previous Menu

- In **No Digit Dialed Prompt**, select the prompt which you wish to play when extension user has not dialed any digit for destination number.

Select **None**, if you do not wish to play any prompt when extension user has not dialed any digit.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Digit Dialed Prompt.

- Select the **No Digit Dialed Retry** check box to prompt the extension user to dial the Destination Number again.
- In **No Digit Dialed Retry Count**, select the number of times you wish to prompt the extension user for dialing the destination number. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Digit Dialed Action**, select — Go to Previous Menu or Disconnect.
- Select **Go to Previous Menu**, if you want the system to provide an option to the extension user to go back to the Mailbox Access Main Menu.
- Select **Disconnect**, if you want the system to disconnect the call.

Call Transfer Profile

Call Transfer Profile allows you can select the Call Transfer Type — Blind, Wait for Ring, Wait for Answer, Screened, None — and customize parameters related to it as per your requirement.

VMS supports a maximum of 64 Call Transfer Profiles.

By default, three Call Transfer Profiles — Wait for Ring, Blind and Attended — are provided to you. These three profiles cannot be deleted but you may edit their settings as per your requirement.

How to Configure

- Log into Jeeves.
- Under **Configuration**, click **VMS Configuration**.
- Click **Call Transfer Profile**.

Call Transfer Profile	
Profile Name	Wait for Ring
Call Transfer Type	Wait for Ring
Attended Transfer Prompt	Call_Transfer_Type_02
Extension Name	Play Always
Call Transfer - Music on Hold (MoH)	System MoH
+ Call Transfer Unsuccessful - Busy	
+ Call Transfer Unsuccessful - No Reply	
+ Call Transfer Unsuccessful - Unconditional	
+ No Mailbox Settings	

Note: Message Options will be played in sequence from digit 1-9,0,*,#.

Submit Default Add New Profile

You may add a new profile, edit the default profile or delete a Call Transfer Profile.

To add a new Call Transfer Profile,

- Click **Add New Profile**. A new *Transfer Profile xx* will be created. You may now configure this as per your requirement.

To delete a profile, click **Delete**.

The default Call Transfer Profiles cannot be deleted.

To edit a Call Transfer Profile,

- In **Profile Name**, you may configure the name of the Call Transfer profile you want. By default, it is *Transfer Profile xx* where *xx* is the Call Transfer Profile Number from 01 to 64.
- In **Call Transfer Type**, you can select — None, Blind, Wait for Ring, Wait for Answer or Screened.
 - If you select **None**, the caller will be transferred to the transferor's mailbox directly. You must configure the "[Leave Voice Mail](#)" parameters.
 - If you select **Blind**, the caller will be transferred to the transfer number directly.
 - If you select **Wait for Ring**, the caller will be transferred to the transfer number after the number starts ringing.
 - If you select **Wait for Answer**, the caller will be transferred to the transfer number only after the transferor answers the call.
 - If you select **Screened**, the caller will be transferred only after the transferor confirms to speak to the caller. You must configure the "[Call Transfer Type -Screened](#)" parameters.
- In **Attended Transfer Prompt**, select the prompt you want the system to play while the call is being transferred. This is applicable only if you have selected Wait for Ring or Wait for Answer as the Call Transfer Type option.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the prompts are uploaded these appear as options for Attended Transfer Prompts.

- In **Blind Transfer Prompt**, select the prompt you want the system to play when the call is being transferred. This is applicable only if you have selected Blind as the Call Transfer Type option.

Select **None**, if you do not wish to play any prompt. You may also add a new Prompt. To do so, follow the same steps as given in Attended Transfer Prompt.

- In **Screened Transfer Prompt**, select the prompt you want the system to play when the call is being transferred. This is applicable only if you have selected Screened as the Call Transfer Type option.

Select **None**, if you do not wish to play any prompt. You may also add a new Prompt. To do so, follow the same steps as given in Attended Transfer Prompt.

- In **Wait for Answer Timer (sec)**, configure the time for which you want the system to wait before transferring the call. This is applicable only if you have selected Wait for Answer or Screened as the Call Transfer Type option.

*If the Wait for Answer Timer value is greater than Ring Back Tone timer, then Ring Back Tone Timer will expire first and the next action will be taken as per the **Call Transfer Unsuccessful - Unconditional** configuration.*

- In **Extension Name**, you can select — Do not play or Play Always.

Select **Play Always**, if you want the system to play the recorded Extension Name as well as the respective Transfer prompt during the transfer.

Select **Do not Play**, if you want the system to only play the respective Transfer prompt and not the Extension Name during the transfer.

- In **Call Transfer - Music On Hold (MOH)**, you may select System MoH or add a new MoH. By default, System MoH will be played. This parameter is applicable only if you have selected Wait for Ring or Wait for Answer as the Call Transfer Type.

- Click **Settings** . The **Prompts Management** page opens.

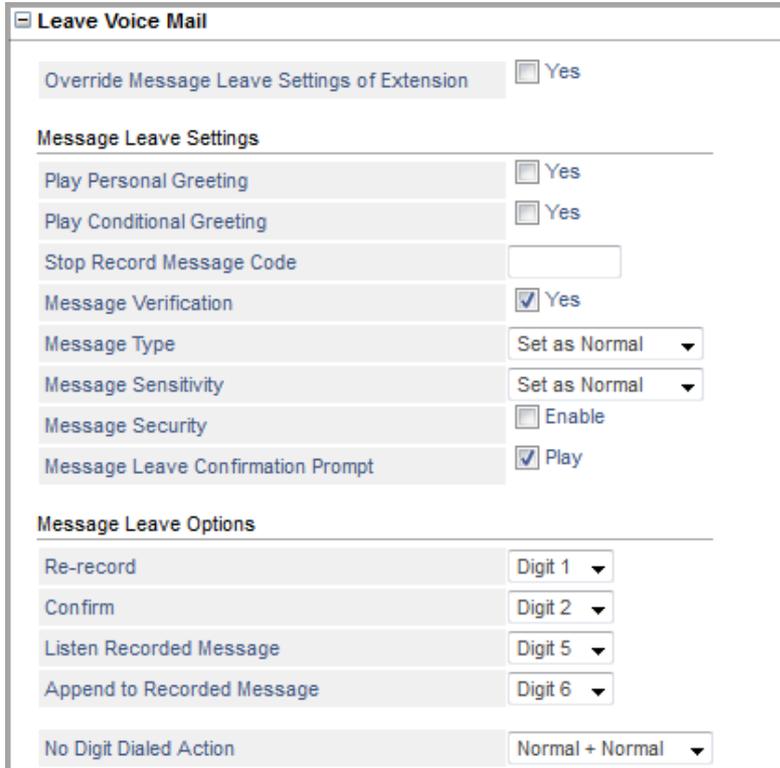

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded, these appear as options for Call Transfer - MoH.

- In **Action after Leaving Voice Mail**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group or Go to VMAA Menu. This parameter is applicable only if you have selected None as the Call Transfer Type.
 - If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**,
 - Select the respective Operator number/Department Group number or enter the desired extension number.
 - In Call Transfer Profile, select the desired Call Transfer Profile as per your requirement. By default, Call Transfer Profile for Transfer Number is selected.
 - If you select **Go to VMAA Menu**, select the desired VMAA Menu.
 - If you select **Disconnect**, the system will disconnect the call.

Leave Voice Mail

This option is applicable only if you select None as the Call Transfer Type.

Leave Voice Mail	
Override Message Leave Settings of Extension	<input type="checkbox"/> Yes
Message Leave Settings	
Play Personal Greeting	<input type="checkbox"/> Yes
Play Conditional Greeting	<input type="checkbox"/> Yes
Stop Record Message Code	<input type="text"/>
Message Verification	<input checked="" type="checkbox"/> Yes
Message Type	Set as Normal ▼
Message Sensitivity	Set as Normal ▼
Message Security	<input type="checkbox"/> Enable
Message Leave Confirmation Prompt	<input checked="" type="checkbox"/> Play
Message Leave Options	
Re-record	Digit 1 ▼
Confirm	Digit 2 ▼
Listen Recorded Message	Digit 5 ▼
Append to Recorded Message	Digit 6 ▼
No Digit Dialed Action	Normal + Normal ▼

- Select the **Override Message Leave Settings of Extension** check box, if you want the system to apply the Leave Voice Mail Settings configured on this page.

Clear the check box, if you want the system to apply the Leave Voice Mail settings configured for the extension.

Message Leave Settings

Message Leave Settings allows you to configure the settings for the messages you receive from the caller i.e the message left for you by the caller.

- Select the **Play Personal Greeting** check box to allow the personal greetings to be played to the caller.

If the personal greeting is not recorded or is unavailable, no prompt will be played.

Personal Greetings will not be applicable if your mailbox is defined as the destination for Call Tapping or Conversation Recording messages.

- Select the **Play Conditional Greeting** check box to allow the conditional greetings to be played to the caller.

If the conditional greeting is not recorded or is unavailable, no prompt will be played.

Conditional Greeting will be applicable only if your mailbox is defined as the destination for Call Transfer Unsuccessful.

- In **Stop Record Message Code**, enter the digits (0-9,* or #) that you want the caller to dial to stop the recording of the message. The system will play this to the caller along with the prompt before he starts recording the message. You may configure a maximum of upto 3 digits.

If you do not assign any digit and keep it blank, the system will play the prompt without the stop code.

- Select the **Message Verification** check box to allow the recorded message to be verified by the caller before storing it in the Personal Mailbox or re-record it. You must configure the [“Message Leave Options”](#).

If you disable the check box, the system will directly store the recorded message in the Personal Mailbox.

- In **Message Type**, select the option according to which you want the system to store the recorded messages. You may select — Set as Normal, Set as Urgent or Ask caller.
 - Select **Set as Normal**, if you want the system to store the recorded message in the mailbox as Normal.
 - Select **Set as Urgent**, if you want the system to store the recorded message in the mailbox as Urgent.
 - Select **Ask Caller**, if you want the system to ask the caller to select the message type before storing the recorded message in the mailbox.
- In **Message Sensitivity**, select the option according to which you want the system to prioritize the messages as per their importance. You may select — Set as Normal, Set as Private or Ask caller.
 - Select **Set as Normal**, if you want the system to store the recorded message in the mailbox as Normal.
 - Select **Set as Private**, if you want the system to store the recorded message in the mailbox as Private. The message received is considered as confidential and forwarding the message is restricted.
 - Select **Ask Caller**, if you want the system to ask the caller to select the message sensitivity before storing the recorded message in the mailbox.
- Select the **Message Security** check box, if you want the system to restrict the forwarding and downloading of the messages.

Message Security has higher priority than Message Type and Message Sensitivity set for the message.

If you disable the check box, the system will not set any security for the message.

- Select the **Message Leave Confirmation Prompt** check box if you want the system to play the Message Leave Confirmation prompt to the caller after leaving the message. The Message Leave Confirmation prompt plays the Message Type, Message Sensitivity and Message Security that you configured.

If you disable the check box, the system will not play the Message Leave Confirmation prompt to the caller after leaving the message.

Message Leave Options

You can assign the Digits (0-9, *, # or None) to each of the options — Re-record, Confirm, Urgent, Private(Confidential), Listen Recorded Message and Append to Recorded Message.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Given below is the brief description of each option:

- **Re-record:** The system will clear the recorded message and let the caller record a new message again. This is applicable only if you have enabled the Message Verification check box.
- **Confirm:** The system will save the recorded message as per the option set by you in No Digit Dialed Action. This is applicable only if you have enabled the Message Verification check box or selected the Ask Caller as the Message Type and/or Message Sensitivity option.
- **Urgent:** The system will save the recorded message along with the Message Type as *Urgent*. This is applicable only if you have selected the Ask Caller as the Message Type option.
- **Private(Confidential):** The system will save the recorded message along with the Message Sensitivity as *Private*. This is applicable only if you have selected the Ask Caller as the Message Sensitivity option.
- **Listen Recorded Message:** The system will play the recorded message to the caller and then play the message leave options again. This is applicable only if you have enabled the Message Verification check box.
- **Append to Recorded Message:** The system will let the caller record a new message again and add it to the existing recorded message. This is applicable only if you have enabled the Message Verification check box.

System will check — Maximum Message Length, New Message Delivery Option in Mailbox Full Condition etc — before allowing the caller to append the recorded message.

The Message, that is, the recorded message along with the appended message cannot exceed the Maximum Message Length. Hence, the system will allow recording of the appending message only till it reaches the Maximum Message Length.

- In **No Digit Dialed Action**, if no digit is dialed by the caller, the system will take action as per the Message Type and Message Sensitivity configured.

If you have configured *Ask Caller* option in Message Type and/or Message Sensitivity, you can select the desired action — Normal+Normal, Urgent+Normal, Normal+Private or Urgent+Private.

Call Transfer Unsuccessful - Busy

If the called party is busy and has set Call Forward-Busy to VMS, the Call Transfer Unsuccessful - Busy parameters will be applicable. You can customize these parameters as per your requirement.

The VMS allows you to:

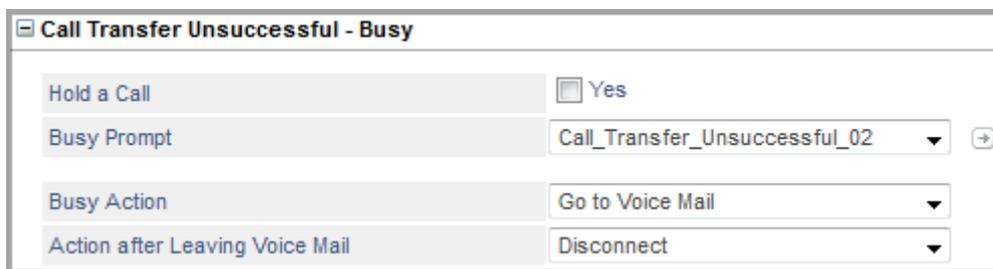

- process the call immediately for the busy condition as per the options you select.
- or
- process the call after being held for a certain duration as per the options you select.

Configure the following parameters, if you want the VMS to process the call immediately when the desired extension is busy,

- Busy Prompt
- Busy Action
- Action after Leaving Voice Mail

Configure the following parameters, if you want the VMS to put the call on hold when the desired extension is busy,

- Busy Prompt
- Busy Hold Prompt
- Provide Advanced Options during Hold
- Busy Extension Status check time interval (sec) and Time Interval Expiry Prompt
- Busy Extension Status check retry count and Retry Count Expiry Prompt
- Busy Hold - Music on Hold
- Busy Action
- Action after Leaving Voice Mail

- Select **Hold a Call** check box, if you want the call to be held. This option is applicable only for internal calls.
- In **Busy Prompt**, select the prompt you wish to play to the caller when the dialed extension is busy.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see ["Prompts Management"](#).

Once the files are uploaded these appear as options for Busy Prompt.

- In **Busy Hold Prompt**, select the prompt you wish to play to the caller when put on hold as the dialed extension is busy.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see ["Prompts Management"](#).

Once the files are uploaded these appear as options for Busy Hold Prompt.

- Select **Provide Advanced Options during Hold** check box, if you want the system to play Advanced options to the caller.

You can assign the Digits (0-9, *, # or None) to each of the options — Leave Voice Mail, Transfer to Operator, Transfer to Assistant, Transfer to Alternate/Mobile Number, Dial Extension Number, Go to Main Menu, Go to Previous Menu and Disconnect.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Brief description of each option is explained below:

- **Leave Voice Mail:** After you assign the digit, click **Settings**  to configure the parameters.
 - Select the **Override Message Leave Settings of Extension** check box, if you want the system to apply Message Leave Settings customized on this page and not that of the extension or department group number.

Clear the check box if you want the system to apply Message Leave Settings configured for the extension or department group number.
- **Transfer to Operator:** After you assign the digit, click **Settings**  to configure the parameters.
 - In **Operator Group**, select the desired Operator Group Number. Make sure you have configured the parameters for this group. For detailed instructions, see “[Extension Voice Mail Settings](#)”. By default, As Configured in Extension Settings is selected, that is, the system will use the Operator Group configured for the transfer number.
 - In **Call Transfer Profile**, select the desired Call Transfer Profile you want the system to use. By default, *As configured for Transfer Number* is selected.
 - Select **As configured for Dialed Extension** if you want the VMS Auto Attendant to use the Call Transfer Profile which is assigned to the dialed extension.
 - Select **Wait for Ring** if you want the VMS Auto Attendant to wait for the extension to start ringing and then transfer the call.
 - Select **Blind** if you want the VMS Auto Attendant to transfer the call on the extension without checking whether it is busy or free.
 - Select **Attended** if you want the VMS Auto Attendant to transfer the call when the extension answers (goes OFF-Hook).

Click **Settings**  to configure the parameters of the selected profile.

When the Call Transfer Profiles are added, or any existing profile is edited, these changes will be reflected in the options displayed.

- **Transfer to Assistant:** If you assign a digit for this option, make sure you have programmed the Assistant Number. For detailed instructions, refer “[Number Programming \(Assistant/Personal\)](#)” in “[Mailbox Menu](#)”.

Click **Settings**  to configure the parameter.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *Wait for Ring* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- **Transfer to Alternate/Mobile Number:** If you assign a digit for this option, make sure you have programmed the Alternate/Mobile Number. For detailed instructions, refer "[Number Programming \(Assistant/Personal\)](#)" in "[Mailbox Menu](#)".

- **Dial Extension Number:** After you assign the digit, click **Settings**  to configure the parameters.

- In **Dial Extension Number Prompt**, select the prompt you wish to play to the caller to dial the desired extension number.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Dial Extension Number Prompt.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Dialed Extension* is selected.

Click **Settings**  to configure the parameters of the selected profile.

No Match Found Settings: No Match Found Settings are applicable when a Extension Number is found invalid, the system will play the *No Match Found* prompt.

- In **No Match Found Prompt**, select the prompt which you wish to play when caller has dialed an invalid extension number.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for No Match Found Prompt.

- Select the **No Match Found Retry** check box to prompt the caller to dial the Extension Number again.

- In **No Match Found Retry Count**, select the number of times you wish to prompt the caller for dialing the extension number. The prompt will be played repeatedly till the Retry Count expires.

- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Match Found Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

No Digit Dialed Settings: No Digit Dialed Settings are applicable when caller has not dialed the extension number and the first digit wait timer has expired.

- In **No Digit Dialed Prompt**, select the prompt which you wish to play when caller has not dialed any digit.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for No Digit Dialed Prompt.

- Select the **No Digit Dialed Retry** check box to prompts the caller to dial the Extension Number again.
- In **No Digit Dialed Retry Count**, select the number of times you wish to prompt the caller for dialing the extension number. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Digit Dialed Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- **Go to Main Menu**: Assign a digit for this option if you want the system to re-direct the caller to the Main Menu.
- **Go to Previous Menu**: Assign a digit for this option if you want the system to re-direct the caller to the Previous Menu.
- **Disconnect**: Assign a digit for this option if you want the system to provide the option to disconnect the call.
- In **Busy Extension Status check time interval (sec)**, enter the interval of time after which you want the system to inform the caller that the extension number is busy. The system will play the Time Interval Expiry Prompt.
- In **Time Interval Expiry Prompt**, select the prompt you wish to play when the time interval expires.
Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Time Interval Expiry Prompt.

- In **Busy Extension Status check retry count**, select the number of times you wish the system to check if the transfer number is free. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.
Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **Busy Hold - Music on Hold**, select the prompt you wish to play. This option is applicable only if you have enabled the Hold a Call check box.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Busy Hold - Music on Hold.

- In **Busy Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Go to Voice Mail, Give Advanced Options.
 - If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- If you select **Give Advanced Option**, see [“Advanced Options”](#)
- In **Action after Leaving Voice Mail**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu. This option is applicable only if you select Go to Voice Mail or Give Advanced options as the Busy Action option.
 - If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

Call Transfer Unsuccessful - No Reply

If the called party has set Call Forward-No Reply to VMS, the Call Transfer Unsuccessful - No Reply parameters will be applicable. You can customize these parameters as per your requirement.

Call Transfer Unsuccessful - No Reply	
No Reply Prompt	Call_Transfer_Unsuccessful_01
No Reply Action	Go to Voice Mail
Action after Leaving Voice Mail	Disconnect

- In **No Reply Prompt**, select the prompt you wish to play to the caller if the dialed extension does not reply.
- In **No Reply Action**, you can select — Go to Voice Mail, Give Advanced Options, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Disconnect.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- If you select **Give Advanced Option**, see [“Advanced Options”](#)
- In **Action after Leaving Voice Mail**, you can select — Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Disconnect. This option is applicable only if you select Go to Voice Mail or Give Advanced options as the No Reply Action option.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

Call Transfer Unsuccessful - Unconditional

If the called party has set Call Forward-Unconditional to VMS, the Call Transfer Unsuccessful - Unconditional parameters will be applicable. You can customize these parameters as per your requirement.

Call Transfer Unsuccessful - Unconditional	
Unconditional Prompt	Call_Transfer_Unsuccessful_03 ▼
Action on Unconditional	Go to Voice Mail ▼
Action after Leaving Voice Mail	Disconnect ▼

- In **Unconditional Prompt**, select the prompt you wish to play to the caller.
- In **Action on Unconditional**, you can select — Go to Voice Mail, Give Advanced Options, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Disconnect.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- If you select **Give Advanced Option**, see [“Advanced Options”](#)
- In **Action after Leaving Voice Mail**, you can select — Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Disconnect. This option is applicable only if you select Go to Voice Mail or Give Advanced options as the No Reply Action option.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As Configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

Call Transfer Type -Screened

Screened Transfer is when the VMS connects the caller to the transfer number after confirmation from the transfer number. If you have selected Call Transfer Type as Screened, you may customize the Call Transfer Type - Screened parameters as per your requirement.

Screened Options	
Accept Call	Digit 1
Reject Call	Digit 2
Reject Call - Busy	None
Reject Call - No Reply	None

No Option Selected Settings	
Prompt if No option Selected	No_Digit_Dialed_02
Action if No Option Selected	Accept Call

Invalid Option Dialed Settings	
Ignore if Invalid Option Dialed	<input checked="" type="checkbox"/> Yes

Screened Options

The system will play Screened Options — Accept Call, Reject Call, Reject Call - Busy, Reject Call - NoReply — to the caller. You can assign the Digits (0-9, *, # or None) to each of the options.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Brief description of each option is explained below:

- Accept Call - When this option is selected, the system will transfer the call to the desired number.
- Reject Call - When this option is selected, system will consider it as Call Transfer Unsuccessful - Unconditional and process the call further as per the settings of [“Call Transfer Unsuccessful - Unconditional”](#).
- Reject Call - Busy - When this option is selected, system will consider it as Call Transfer Unsuccessful - Busy and process the call further as per the settings of [“Call Transfer Unsuccessful - Busy”](#).
- Reject Call - No Reply - When this option is selected, system will consider it as Call Transfer Unsuccessful - No Reply and process the call further as per the settings of [“Call Transfer Unsuccessful - No Reply”](#).

No Option Selected Settings

While the Screened Options are being played, if the caller does not select any options, the following parameters will be applicable.

- In **Prompt if No Option Selected**, select the prompt you wish to play to the caller, if no Screened Option is selected by the caller.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Prompt if No Option Selected.

- In **Action if No Option Selected**, you can select — Accept Call, Reject Call, Reject Call with Busy, Reject Call with No Reply, Disconnect.

Invalid Option Selected Settings

While the Screened Options are being played, if the caller dials a digit which is not programmed, the following parameters will be applicable.

- Clear the **Ignore if Invalid Option Dialed** check box, if you do not want the system to ignore the invalid digit dialed and prompt the caller for the same. By default, it is enabled.
- In **Prompt if Invalid Option Selected**, select the prompt which you wish to play when the caller has dialed an invalid digit.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Prompt if Invalid Option Selected.

- In **Action if No Option Selected**, you can select — Accept Call, Reject Call, Reject Call with Busy, Reject Call with No Reply, Disconnect.

No Mailbox Settings

If for any option *Leave Voice Mail* is selected and a mailbox is not assigned to the number, the system will play a prompt to the caller informing the caller that a mailbox is not assigned. The system will then proceed further as per the action you select here.

- In **No Mailbox Action**, you can select — Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Disconnect.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *Wait for Ring* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

Advanced Options

The system will play Advanced options— Leave Voice Mail, Transfer to Operator, Transfer to Assistant, Transfer to Alternate/Mobile Number, Dial Extension Number, Go to Main Menu, Go to Previous Menu, Stay on Hold, Disconnect — to the caller. You can assign the Digits (0-9, *, # or None) to each of the options.

Advanced Options	
Leave Voice Mail	Digit 1  
Transfer to Operator	Digit 2  
Transfer to Assistant	Digit 3  
Transfer to Alternate/Mobile Number	Digit 4 
Dial Extension Number	Digit 5  
Go to Main Menu	Digit 6 
Go to Previous Menu	Digit # 
Stay on Hold	None  
Disconnect	Digit 7 
No Digit Dialed Settings (during Advanced Options)	
No Digit Dialed Prompt	No_Digit_Dialed_01  
No Digit Dialed Action	Go to Voice Mail 
Invalid Digit Dialed Settings (during Advanced Options)	
Ignore Invalid Digit Dialed	<input checked="" type="checkbox"/> Yes

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Brief description of each option is explained below:

- Leave Voice Mail
- Transfer to Operator
- Transfer to Assistant
- Transfer to Alternate Number/Mobile Number
- Dial Extension Number
- Go to Main Menu
- Go to Previous Menu
- Stay on Hold
- Disconnect

Leave Voice Mail

Leave Voice Mail	
Override Message Leave Settings of Extension	<input type="checkbox"/> Yes
Message Leave Settings	
Play Personal Greeting	<input type="checkbox"/> Yes
Play Conditional Greeting	<input type="checkbox"/> Yes
Stop Record Message Code	<input type="text"/>
Message Verification	<input checked="" type="checkbox"/> Yes
Message Type	Set as Normal ▼
Message Sensitivity	Set as Normal ▼
Message Security	<input type="checkbox"/> Enable
Message Leave Confirmation Prompt	<input checked="" type="checkbox"/> Play
Message Leave Options	
Re-record	Digit 2 ▼
Confirm	Digit 1 ▼
Listen Recorded Message	Digit 5 ▼
Append to Recorded Message	Digit 6 ▼
No Digit Dialed Action	Normal + Normal ▼
Note: Options will be played in sequence from digit 1-9,0,*,#.	
<input type="button" value="Submit"/> <input type="button" value="Default"/> <input type="button" value="Close"/>	

After you assign the digit, click **Settings**  to configure the parameters.

- Select the **Override Message Leave Settings of Extension** check box, if you want the system to apply Message Leave Settings customized on this page and not that of the extension or department group number.

Clear the check box if you want the system to apply Message Leave Settings configured for the extension or department group number.

Transfer to Operator

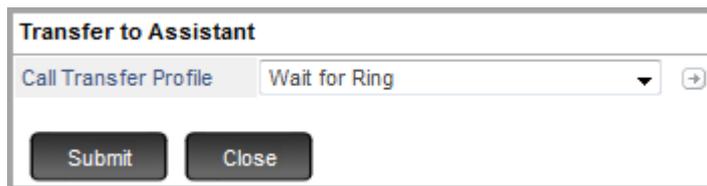

Transfer to Operator	
Operator Group	As configured in Extension Settings ▼
Call Transfer Profile	As Configured for Transfer Number ▼
<input type="button" value="Submit"/> <input type="button" value="Close"/>	

After you assign the digit, click **Settings**  to configure the parameters.

- In **Operator Group**, select the desired Operator Group Number. Make sure you have configured the parameters for this group. For detailed instructions, see [“Extension Voice Mail Settings”](#). By default, As Configured in Extension Settings is selected, that is, the system will use the Operator Group configured for the Transfer Number.
- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, As Configured for Transfer Number is selected.

Click **Settings**  to configure the parameters of the selected profile.

Transfer to Assistant

If you assign a digit for this option, make sure you have programmed the Assistant Number. For detailed instructions, refer [“Number Programming \(Assistant/Personal\)”](#) in [“Mailbox Menu”](#).

Click **Settings**  to configure the parameter.

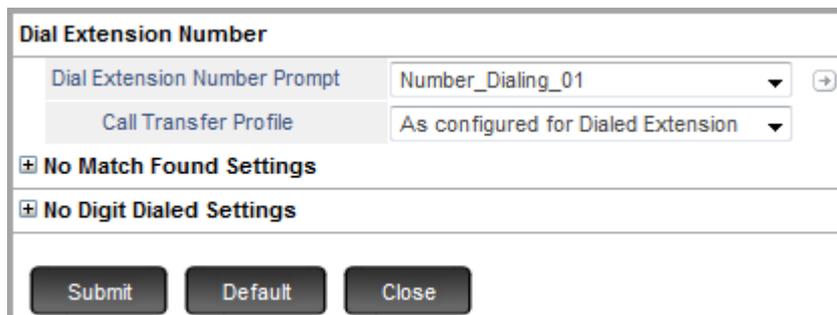

- In **Call Transfer Profile**, select the desired Call Transfer Profile you want the system to use. Make sure you have configured the parameters for this profile. By default, Wait for Ring is selected, that is, the system will use the Call Transfer profile configured for transfer number.
- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *Wait for Ring* is selected.

Click **Settings**  to configure the parameters of the selected profile.

Transfer to Alternate/Mobile Number

If you assign a digit for this option, make sure you have programmed the Alternate/Mobile Number. For detailed instructions, refer [“Number Programming \(Assistant/Personal\)”](#) in [“Mailbox Menu”](#).

Dial Extension Number

After you assign the digit, click **Settings**  to configure the parameters.

- In **Dial Extension Number Prompt**, select the prompt you wish to play to the caller to dial the desired extension number.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Dial Extension Number Prompt.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Dialed Extension* is selected.

Click **Settings**  to configure the parameters of the selected profile.

No Match Found Settings

No Match Found Settings are applicable when the caller has dialed a digit or a number which does not match the Extension Number list present in the system, the system will play the *No Match Found* prompt.

- In **No Match Found Prompt**, select the prompt which you wish to play when caller has dialed a digit that does not match the Extension Number List.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Match Found Prompt.

- Select the **No Match Found Retry** check box to prompt the caller to dial the Extension Number again.
- In **No Match Found Retry Count**, select the number of times you wish to prompt the caller for dialing the extension number. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Match Found Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.

- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.
- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

No Digit Dialed Settings

No Digit Dialed Settings are applicable when caller has not dialed the extension number and the first digit wait timer has expired.

- In **No Digit Dialed Prompt**, select the prompt which you wish to play when caller has not dialed any digit.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for No Digit Dialed Prompt.

- Select the **No Digit Dialed Retry** check box to prompts the caller to dial the Extension Number again.
- In **No Digit Dialed Retry Count**, select the number of times you wish to prompt the caller for dialing the extension number. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Digit Dialed Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.
- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

Go to Main Menu

Assign a digit for this option if you want the system to re-direct the caller to the Main Menu.

Go to Previous Menu

Assign a digit for this option if you want the system to re-direct the caller to the Previous Menu.

Stay on Hold

This option is applicable for Call Transfer Unsuccessful - Busy only.

Stay on Hold	
Busy Hold Prompt	Call_Transfer_Unsuccessful_02 
Provide Advanced Options during Hold	<input type="checkbox"/> Yes
Busy Extension Status check time interval (sec)	10
Time Interval Expiry Prompt	Call_Transfer_Unsuccessful_02 
Busy Extension Status check retry count	10
Retry Count Expiry Prompt	Expiry_Of_Count_01 
Busy Hold - Music on Hold	None 
Busy Action	Go to Voice Mail

After you assign the digit, click **Settings**  to configure the parameters.

- In **Busy Hold Prompt**, select the prompt to be played to the caller when put on hold.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see "[Prompts Management](#)".

Once the files are uploaded these appear as options for Busy Hold Prompt.

- Select **Provide Advanced Options during Hold** check box, if you want the system to play Advanced options to the caller.

You can assign the Digits (0-9, *, # or None) to each of the options — Leave Voice Mail, Transfer to Operator, Transfer to Assistant, Transfer to Alternate/Mobile Number, Dial Extension Number, Go to Main Menu, Go to Previous Menu and Disconnect.

Make sure you do not assign the same digit to multiple options.

The digit you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the Digit selected is None will not be played.

After the digits have been assigned, the system will proceed further as per the options selected by you. Brief description of each option is explained below:

- **Leave Voice Mail:** After you assign the digit, click **Settings**  to configure the parameters.
 - Select the **Override Message Leave Settings of Extension** check box, if you want the system to apply Message Leave Settings customized on this page and not that of the extension or department group number.

Clear the check box if you want the system to apply Message Leave Settings configured for the extension or department group number.

- **Transfer to Operator:** After you assign the digit, click **Settings**  to configure the parameters.
 - In **Operator Group**, select the desired Operator Group Number. Make sure you have configured the parameters for this group. For detailed instructions, see [“Extension Voice Mail Settings”](#). By default, As Configured in Extension Settings is selected, that is, the system will use the Operator Group configured for the Transfer Number.
 - In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- **Transfer to Assistant:** If you assign a digit for this option, make sure you have programmed the Assistant Number. For detailed instructions, refer [“Number Programming \(Assistant/Personal\)”](#) in [“Mailbox Menu”](#).

Click **Settings**  to configure the parameter.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- **Transfer to Alternate/Mobile Number:** If you assign a digit for this option, make sure you have programmed the Alternate/Mobile Number. For detailed instructions, refer [“Number Programming \(Assistant/Personal\)”](#) in [“Mailbox Menu”](#).
- **Dial Extension Number:** After you assign the digit, click **Settings**  to configure the parameters.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.
You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Dial Extension Number Prompt.

- In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Dialed Extension* is selected.

Click **Settings**  to configure the parameters of the selected profile.

No Match Found Settings: No Match Found Settings are applicable when a Extension Number is found invalid, the system will play the *No Match Found* prompt.

- In **No Match Found Prompt**, select the prompt which you wish to play when caller has dialed an invalid extension number.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Match Found Prompt.

- Select the **No Match Found Retry** check box to prompt the caller to dial the Extension Number again.
- In **No Match Found Retry Count**, select the number of times you wish to prompt the caller for dialing the extension number. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Match Found Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

No Digit Dialed Settings: No Digit Dialed Settings are applicable when caller has not dialed the extension number and the first digit wait timer has expired.

- In **No Digit Dialed Prompt**, select the prompt which you wish to play when caller has not dialed any digit.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Digit Dialed Prompt.

- Select the **No Digit Dialed Retry** check box to prompts the caller to dial the Extension Number again.
- In **No Digit Dialed Retry Count**, select the number of times you wish to prompt the caller for dialing the extension number. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **No Digit Dialed Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu.
- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.

- **Go to Main Menu:** Assign a digit for this option if you want the system to re-direct the caller to the Main Menu.
- **Go to Previous Menu:** Assign a digit for this option if you want the system to re-direct the caller to the Previous Menu.
- **Disconnect:** Assign a digit for this option if you want the system to provide the option to disconnect the call.
- In **Busy Extension Status check time interval (sec)**, enter the interval of time after which you want the system to inform the caller that the extension number is busy. The system will play the Time Interval Expiry Prompt.
- In **Time Interval Expiry Prompt**, select the prompt you wish to play when the time interval expires.
Select **None**, if you do not wish to play any prompt.
- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Time Interval Expiry Prompt.

- In **Busy Extension Status check retry count**, select the number of times you wish the system to check if the transfer number is free. The prompt will be played repeatedly till the Retry Count expires.
- In **Retry Count Expiry Prompt**, select the prompt you wish to play when the Retry Count expires.
Select **None**, if you do not wish to play any prompt.
- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Retry Count Expiry Prompt.

- In **Busy Hold - Music on Hold**, select the prompt you wish to play. This option is applicable only if you have enabled the Hold a Call check box.
Select **None**, if you do not wish to play any prompt.

You may add a new Prompt. To do so,

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Busy Hold - Music on Hold.

- In **Busy Action**, you can select — Disconnect, Transfer to Operator, Transfer to Extension, Transfer to Department Group, Go to VMAA Menu, Go to Voice Mail, Give Advanced Options.

- If you select **Transfer to Operator** or **Transfer to Department Group** or **Transfer to Extension**, select the respective Operator number/Department Group number or enter the desired extension number.

In **Call Transfer Profile**, select the desired Call Transfer Profile as per your requirement. By default, *As configured for Transfer Number* is selected.

Click **Settings**  to configure the parameters of the selected profile.

- If you select **Go to VMAA Menu**, select the desired VMAA Menu.
- If you select **Disconnect**, the system will disconnect the call.
- If you select **Give Advanced Option**, see [“Advanced Options”](#).

Disconnect

Assign a digit for this option if you want the system to provide the option to disconnect the call.

No Digit Dialed Settings (during Advanced Options)

No Digit Dialed Settings are applicable when caller has not dialed the extension number and the first digit wait timer has expired.

No Digit Dialed Settings (during Advanced Options)	
No Digit Dialed Prompt	No_Digit_Dialed_01 
No Digit Dialed Action	Go to Voice Mail 

- In **No Digit Dialed Prompt**, select the prompt which you wish to play when caller has not dialed any digit.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** . The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for No Digit Dialed Prompt.

- In **No Digit Dialed Action**, you can select — Disconnect, Go to Voice Mail, Transfer to Operator, Transfer to Assistant, Transfer to Alternate Number, Go to Main Menu, Go to Previous Menu, Stay on Hold. Refer to the details given above under [“Advanced Options”](#).

Invalid Digit Dialed Settings (during Advanced Options)

Invalid Digit Dialed Settings are applicable when caller has dialed an invalid digit — a digit which is not configured as the Advanced Options.

Invalid Digit Dialed Settings (during Advanced Options)	
Ignore Invalid Digit Dialed	<input checked="" type="checkbox"/> Yes

- Clear the **Ignore Invalid Digit Dialed** check box, if you do not want the system to ignore the invalid digit dialed and prompt the caller for the same. By default, it is enabled.

Invalid Digit Dialed Settings (during Advanced Options)	
Ignore Invalid Digit Dialed	<input type="checkbox"/> Yes
Invalid Digit Dialed Prompt	Invalid_Digit_Dialed_02 →
Invalid Digit Dialed Action	Go to Voice Mail ▼

- In **Invalid Digit Dialed Prompt**, select the prompt which you wish to play when the caller has dialed an invalid digit.

Select **None**, if you do not wish to play any prompt.

- Click **Settings** →. The **Prompts Management** page opens.

You may add a new prompt from here. For further details, see [“Prompts Management”](#).

Once the files are uploaded these appear as options for Invalid Digit Dialed Prompt.

- In **Invalid Digit Dialed Action**, you can select — Disconnect, Go to Voice Mail, Transfer to Operator, Transfer to Assistant, Transfer to Alternate Number, Go to Main Menu, Go to Previous Menu, Stay on Hold.

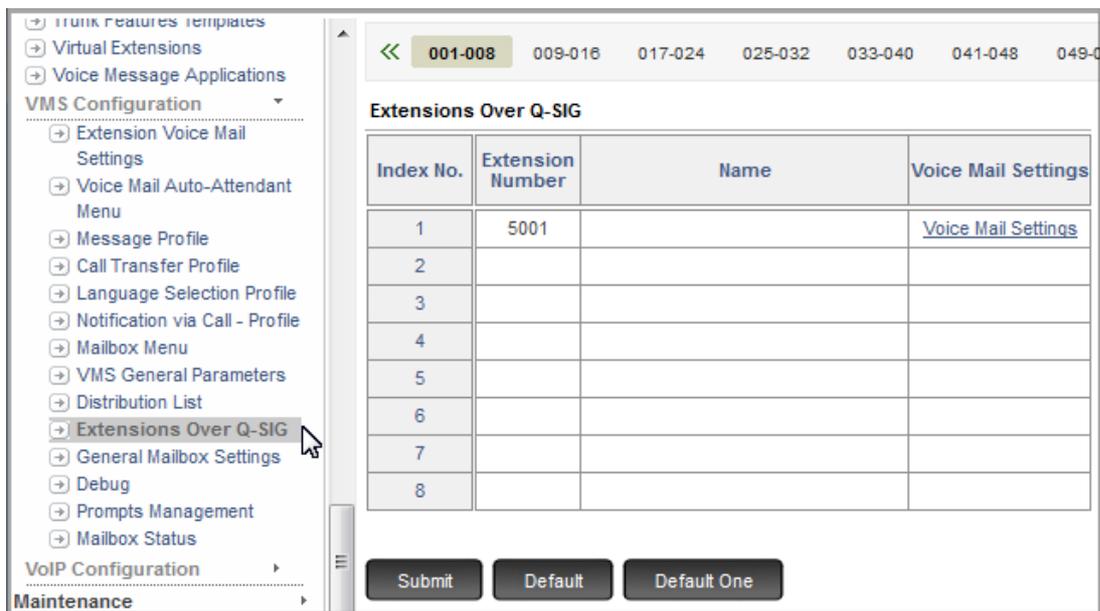

Refer to the details given above under [“Advanced Options”](#).

Extensions Over Q-SIG

SARVAM UCS supports Voice Mail for extension users connected over QSIG. These are extensions of the remote System (may be SARVAM UCS or any other system) connected with SARVAM UCS over QSIG.

To provide Voice Mail to the remote system extension users you must configure the Voice Mail Settings. To do so,

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **Extensions over Q-SIG**.

- For the extensions of the system you wish to assign voice mail, configure the following:
 - In **Extension Number**, enter the number assigned to the extensions of the remote System. The number must be entered along with the Exchange ID (if applicable).

The Extension Number can be a maximum of 6 digits max. Valid Digits are 0-9, *, # (*, # can be used as first digit only).
 - In **Name**, enter a name which you wish to assign to the extension. The name may be of the person using the extension number of the remote System or it can be the name of a department.

It can be a maximum of 18 alphanumeric characters. Default: Blank.
 - In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see "[Extension Voice Mail Settings](#)".

Click **Close** to close the window.
- Click **Submit** to save.

- Click **Default** to default the page.
- Click **Default One** to default only one entry.

A new window will open. Select the **Index Number** which you wish to default.

Click **OK**.

Notification via Call-Profile

What's this?

The VMS supports Notification via Call to inform the extension users about the arrival of new messages in their mailbox.

Extension users can receive new message notification calls on a phone number of their choice. This number may be another extension number or an external number. You can set the Type of notification calls as:

- **Immediate:** Users will receive notifications as soon as a new message arrives in their mailbox.
Or
- **Scheduled:** Extension users will receive notification at specified time intervals.

You can set the preferred time slots in a day during which notification calls should be made to extension users. In addition to the time slot preference, you can also choose to receive notification calls on a Holiday.

Message Notification via Call for Department Group will not work if the destination number is an external number.

How it works

For this feature to work, you must do the following configuration for the extension:

- Select the type of Notification call.
- Define the preferred time slots by configuring Time Zones. You can configure four different Time Zones, defining the Start Time and End Time for each Time Zone.
- Configure the phone number to which the notification call is to be made. If the number is an external number, configure the Trunk Access Code to be used for making the calls.

When **Immediate** is selected as the Type of notification,

- A new message arrives in the mailbox of the extension user.
- The system checks the preferred start and end time of the time zones configured for the extension. If the message has arrived within the preferred time slot (Start and End Time) it immediately makes the notification call on the number configured for the user.

If the number is an external number, the system dials out the number using the Trunk Access Code (TAC) assigned for making notification calls.

- When the call is answered, the extension user gets connected to the VMS and can listen to the message.
- If the notification call is not answered, by default, the system makes three attempts (Message Notification Retry Count; programmable) at an interval of 5 minutes (Message Notification Interval; programmable) between each attempt.
- If the notification call remains unanswered after the third attempt, the system will not make any more attempts to place this notification call. The next notification call will be made only when another new message arrives in the mailbox of the user between the start and end time of the configured time zone.

When **Schedule** is selected as the Type of notification,

- A new message arrives in the mailbox of the extension user.
- The system checks the start time of the time zone(s) configured and the notification call will be made on the number at the subsequent start time.

If the number is an external number the system dials out the number through the Trunk Access Code (TAC) assigned for making notification calls.

- When the call is answered the extension user gets connected to the VMS and can listen to the message.
- If the notification call is not answered, the system makes three attempts (Message Notification Retry Count; programmable) at an interval of 5 minutes (Message Notification Interval; programmable) for each time zone. The system will continue to make attempts to place the notification call till the call is answered.

Thus, when Notification type is Immediate, notification call is made for each message that is received within the start and end time configured in the time zone.

When Notification type is Scheduled, notification call is made for all messages received before the start time configured in the time zone. Where multiple time zones are configured, notification call will be made at the start time of the next time zone.

How to configure

For Message Wait Notification via Call, you need to configure:

- the parameters for **Message Wait Notification via Call** under Message Wait Settings in Extension Voice Mail Settings.
- select the desired profile in Schedule Profile. For instructions to configure the profile parameters, see [“Configuring Notification via Call - Profile”](#).
- Make Message Notification call using TAC for calls to be made to external numbers. See [“Configuring VMS General Parameters”](#).
- if required, the Message Notification Retry Count, Message Notification Interval and Message Notification Ring. See [“System Timers and Counts”](#).

Configuring Notification via Call - Profile

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VMS Configuration**.

- Click **Notification via Call - Profile** to open the page.

Profile Number	Message Notification							
	Time Zone 1				Time Zone 2			
	Start Time		End Time		Start Time		End Time	
	HH	MM	HH	MM	HH	MM	HH	MM
1	09	00	08	59				
2	09	00	08	59				
3	09	00	08	59				
4	09	00	08	59				
5	09	00	08	59				
6	09	00	08	59				
7	09	00	08	59				
8	09	00	08	59				
9	09	00	08	59				
10	09	00	08	59				

Note: End time shall not be effective for Scheduled Message Notification.

Submit Default Default One

- Select the **Profile Number** which you want to assign to Message Wait Notification via Call.

The Message Wait Notification Profile determines how notification calls are to be made to the desired numbers. You can configure upto 16 different profiles. In each profile, you can set different time zones according to the user preferences.

Configure the following parameters against the Profile Number you select:

- For Each Time Zone, **Time Zone 1 to 4**, configure the **Start Time** and **End Time**. The valid range is 00:00 to 23:59.
- If you want to receive notifications on a holiday, select the **Notify on Holiday** check box.
- Click **Submit** to save changes.
- Now, assign the profile numbers to the desired extensions. Make sure the Message Wait Notification via Call parameters have been configured in the Extension Voice Mail Settings of these extensions.

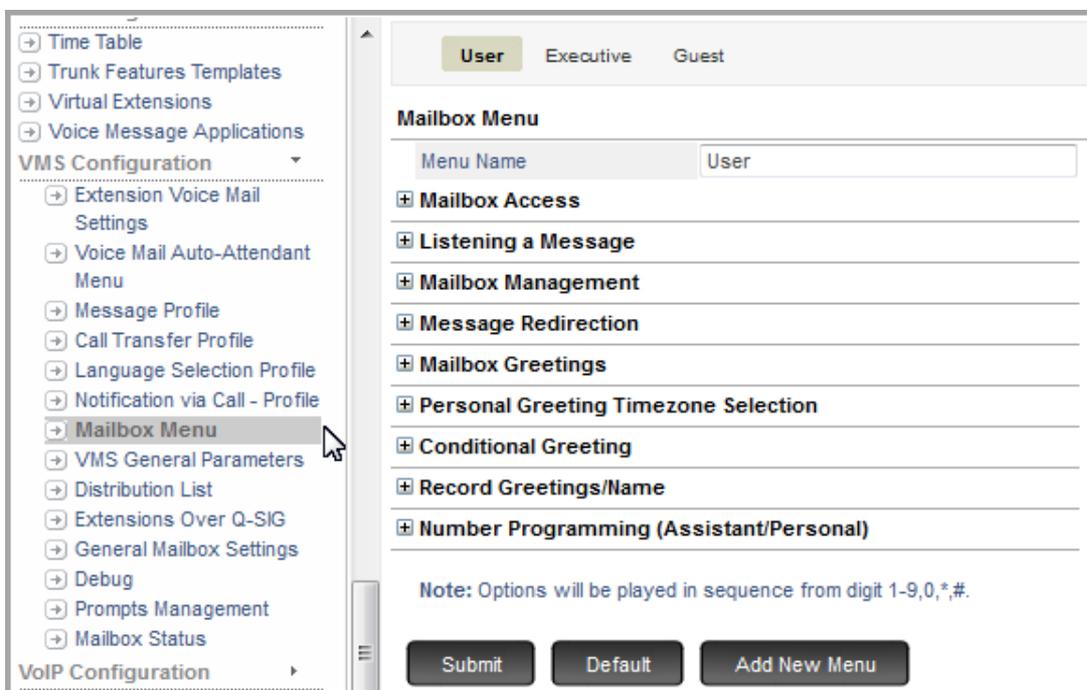

Mailbox Menu

Mailbox Menu offers you a group of parameters that will be used when the caller accesses his/her personal mailbox. VMS supports a maximum of 12 Mailbox Menus.

By default, three mailbox Menus — User, Executive and Guest— are provided to you. These three mailbox menus cannot be deleted but you can edit their settings as per your requirement.

How to Configure

- Log into Jeeves.
- Under **Configuration**, click **VMS Configuration**.
- Click **Mailbox Menu**.

You may add a new menu, edit the default menus or delete a Mailbox menu.

To add a new Mailbox Menu,

- Click **Add New Menu**. A new *Mailbox Menu xxx* will be created. You may now configure this as per your requirement.

To delete a menu, click **Delete**.

The default Mailbox Menus cannot be deleted.

To edit a Mailbox Menu,

- In **Menu Name**, configure the name of the Mailbox Menu you want. By default, it is *Mailbox Menu xx* where xx is the Mailbox Menu Number from 01 to 12.

Mailbox Menu Features

You can assign the Digits (0-9, *, # or None) to each of the options given under the features — Mailbox Access, Listening a Message, Mailbox Management, Message Redirection, Mailbox Greetings, Personal Greetings Timezone Selection, Conditional Greeting, Record Greetings/Name and Number Programming (Assistant/ Personal).

Make sure you do not assign the same digit to multiple options under the respective feature. For example, the digits assigned to various options under Listening a Message feature must be unique.

Select the **Play** check box to play the respective option.

If you assign the digit to an option but do not select the Play check box for the same, then the option will not be played to the caller.

The digits you configure will be played as the digit to be dialed by the caller to select the respective option. The options will be played in the sequence — 1-9, 0, *, #. The option for which the digit selected is None will not be played.

Brief description of each option in the respective features are given below:

Mailbox Access

Mailbox Access is the main menu which will be played to the caller whenever s/he accesses his/her Personal Mailbox.

Mailbox Access		
Listen New Messages	Digit 1	<input checked="" type="checkbox"/> Play
Listen Old Messages	Digit 2	<input checked="" type="checkbox"/> Play
Send Message	Digit 3	<input checked="" type="checkbox"/> Play
Mailbox Management	Digit 4	<input checked="" type="checkbox"/> Play

- **Listen New Messages:** The system will play the new(unread) messages present in the caller's personal mailbox. The new messages will be played as per the *Message Playback Settings* configured in the Message Profile. For details, refer "[Message Playback Settings](#)".
- **Listen Old Messages:** The system will play the old(read) messages present in the caller's personal mailbox. The old messages will be played as per the *Message Playback Settings* configured in the Message Profile. For details, refer "[Message Playback Settings](#)".
- **Send Message:** The system will play a prompt asking the caller to enter the Destination Number of the recipient for sending the message. The Destination Number may include a Distribution List. The Message will be send as per the *Message Send/Forward Settings* configured in the Message Profile. For details, refer "[Message Send/Forward Settings](#)".
- **Mailbox Management:** The system allows user to manage his/her personal mailbox. For further information, see "[Mailbox Management](#)".

Listening a Message

Listening a Message is a menu which will be played to the caller after every message (old/new).

Listening a Message		
Replay Message	Digit 1	<input checked="" type="checkbox"/> Play
Play Message Details	Digit 2	<input checked="" type="checkbox"/> Play
Reply Message	Digit 3	<input checked="" type="checkbox"/> Play
Delete Message	Digit 4	<input checked="" type="checkbox"/> Play
Listen Next Message	Digit 5	<input checked="" type="checkbox"/> Play
Forward Message	Digit 6	<input checked="" type="checkbox"/> Play
Save Message as New	Digit 7	<input checked="" type="checkbox"/> Play
Go to Previous Menu	Digit #	<input checked="" type="checkbox"/> Play

- **Replay Message:** The system will play the message again.
- **Play Message Details:** The system will play the message details — Message Date/Time and the Name of sender. The message details will be played as per the *Message Playback Settings* configured in the Message Profile. For details, refer [“Message Playback Settings”](#).
- **Reply Message:** The system will allow the caller to reply the sender with a message. The Message will be sent as per the *Message Leave Settings* configured in the Message Profile. For details, refer [“Message Leave Settings”](#).

After sending the reply message, the Mailbox Access menu will be played again.

Reply Message will not be played if:

- the message does not include the calling party number.
 - the message includes the calling party number but no Mailbox is assigned.
 - the message includes the calling party number as an external number.
 - it is a Broadcasted or a Call Tapping message.
- **Delete Message:** The system will delete the message and play the next message(old/new).
 - **Listen Next Message:** The system will play the next message(old/new) as per the last message played.

After playing the next message, the *Mailbox Access menu* will be played again.

- **Forward Message:** The system will play a prompt asking caller to enter the Destination Number of the recipient for forwarding the message.

The Destination Number may include a Distribution List. A maximum of 10 Destination Numbers can be added. The Message will be sent as per the *Message Send/Forward Settings* configured in the Message Profile. For details, refer [“Message Send/Forward Settings”](#).

After forwarding the message, the *Mailbox Access menu* will be played again.

The message will not be forwarded if the *Message Sensitivity* is set as *Private*. For details, refer [“Message Profile”](#).

- **Save Message as New:** The system will save the message as a New Message keeping all the message properties — Date and Time, Caller, Sensitivity and Security — unchanged.
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the [“Mailbox Access”](#) menu.

Mailbox Management

Mailbox Management is a menu used to manage the Personal Mailbox.

Mailbox Management		
Record Mailbox Name	Digit 1	<input checked="" type="checkbox"/> Play
Message Redirection	Digit 2	<input checked="" type="checkbox"/> Play
Delete all Old Messages	Digit 3	<input checked="" type="checkbox"/> Play
Delete all Messages	Digit 4	<input checked="" type="checkbox"/> Play
Record Mailbox Greetings	Digit 5	<input checked="" type="checkbox"/> Play
Assistant Number	Digit 6	<input type="checkbox"/> Play
Personal Number	Digit 7	<input type="checkbox"/> Play
Go to Previous Menu	Digit #	<input checked="" type="checkbox"/> Play

- **Record Mailbox Name:** The system will allow the caller to record, play or erase the Mailbox Name.

The *Record Greetings/Name* options will be played where the caller can choose whether s/he want to Record, Play or Erase the Name. For details, refer [“Record Greetings/Name”](#).

- **Message Redirection:** The system will allow the caller to set or cancel Message Redirection. Message Redirection is used when the caller wants to forward all the messages to the other user’s personal mailbox.

The *Message Redirection* options will be played where caller can choose if s/he wants to set or cancel this feature. For details, refer [“Message Redirection”](#).

- **Delete all Old Messages:** The system will delete all the old messages from the caller’s Personal Mailbox.
- **Delete all Messages:** The system will delete all the messages (old/new) from the caller’s Personal Mailbox.
- **Record Mailbox Greetings:** The system will allow the caller to record, play or erase the Mailbox Personal and Conditional Greetings.

The options will be played in the following sequence:

- The *Mailbox Greetings* options will be played asking the caller to select the type of greetings — Personal or Conditional — which he wishes to Record, Play or Erase. For details, refer [“Mailbox Greetings”](#).
 - If the caller selects *Personal*, the *Personal Greeting Time zone Selection* options will be played. The caller must select the timezone — Working Hour, Break Hour or Non-Working Hour for which s/he wishes to Record, Play or Erase the personal greeting. For details, refer [“Personal Greeting Timezone Selection”](#).

- If the caller selects *Conditional*, the *Conditional Greetings* options will be played. The caller must select the type of Conditional Greeting — Busy, No-Reply or Unconditional for which s/he wishes to Record, Play or Erase the greetings. For details, refer [“Conditional Greeting”](#).
- The *Record Greetings/Name* options will be played where the caller can choose whether s/he wants to Record, Play or Erase the Mailbox Greetings. For details, refer [“Record Greetings/Name”](#).
- **Assistant Number:** The system will allow the caller to enter, play or clear the Assistant Number.

The caller can call this number when the user is not available to answer the call.

The *Number Programming (Assistant/Personal)* options will be played from where the caller can choose whether s/he wants to Enter, Play or clear the Assistant Number. For details, refer [“Number Programming \(Assistant/Personal\)”](#)

- **Personal Number:** The system will allow the caller to enter, play or clear the Personal Number.

The Personal Number is used as an alternate number. The caller can call this number when the user is not available to answer the call.

The *Number Programming (Assistant/Personal)* options will be played from where the caller can choose whether s/he want to Enter, Play or clear the Personal Number. For details, refer [“Number Programming \(Assistant/Personal\)”](#).

- **Go to Previous Menu:** The system will provide an option to the caller to go back to the [“Mailbox Access”](#) menu.

Message Redirection

Message Redirection is a menu which is applicable if the caller selects the *Message Redirection* option in [“Mailbox Management”](#).

Message Redirection		
Set	Digit 1	<input checked="" type="checkbox"/> Play
Cancel	Digit 2	<input checked="" type="checkbox"/> Play
Go to Previous Menu	Digit #	<input checked="" type="checkbox"/> Play

- **Set:** The system will set the Message Redirection feature and play a prompt to the caller for entering the Message Redirect Number.

The Message Redirect Number must be a valid Extension Number, Department Group Number or Extension over QSIG Number. A Mailbox must be assigned to this Number.

- **Cancel:** The system will clear the Message Redirect Number programmed by the caller.
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the [“Mailbox Management”](#) menu.

Mailbox Greetings

Mailbox Greetings is a menu which is applicable if the caller selects the *Record Mailbox Greetings* option in the Mailbox Management.

Mailbox Greetings		
Personal	Digit 1	<input checked="" type="checkbox"/> Play
Conditional	Digit 2	<input checked="" type="checkbox"/> Play
Go to Previous Menu	Digit #	<input checked="" type="checkbox"/> Play

- **Personal:** The system will play the *Personal Greeting Timezone Selection* options. The caller must select the timezone — Working Hour, Break Hour or Non-Working Hour for which s/he wishes to Record, Play or Erase the Personal greetings. For details, refer [“Personal Greeting Timezone Selection”](#).
- **Conditional:** The system will play the *Conditional Greetings* option. The caller must select the type of Conditional Greeting — Busy, No-Reply or Unconditional for which s/he wishes to Record, Play or Erase. For details, refer [“Conditional Greeting”](#).
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the [“Mailbox Management”](#) menu.

Personal Greeting Timezone Selection

Personal Greeting Timezone Selection is a menu which is applicable if the caller selects the *Personal Greetings* option in the Record Mailbox Greetings. You can record the personal greetings like “Good Morning”, “Good Afternoon” or “ Good Evening” to greet the caller.

Personal Greeting Timezone Selection		
Working Hour	Digit 1	<input checked="" type="checkbox"/> Play
Break Hour	Digit 2	<input checked="" type="checkbox"/> Play
Non-Working Hour	Digit 3	<input checked="" type="checkbox"/> Play
Go to Previous Menu	Digit #	<input checked="" type="checkbox"/> Play

The various Timezones are:

- **Working Hour:** The system will play the *Record Greetings/Name* options and allow the caller to Record, Play or Erase a personal greeting for the Working Hour Timezone.
- **Break Hour:** The system will play the *Record Greetings/Name* options and allow the caller to Record, Play or Erase a personal greeting for the Break Hour Timezone.
- **Non-Working Hour:** The system will play the *Record Greetings/Name* options and allow the caller to Record, Play or Erase a personal greeting for the Non-Working Hour Timezone.
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the Record Mailbox Greetings Menu.

For details, refer [“Record Greetings/Name”](#).

Conditional Greeting

Conditional Greeting is a menu which is applicable if the caller selects the *Conditional* option in the Record Mailbox Greetings. Conditional Greetings are applicable if any call forward — Busy, No Reply or Unconditional — is set on the calling extension.

Conditional Greeting		
Busy	Digit 1	<input checked="" type="checkbox"/> Play
No Reply	Digit 2	<input checked="" type="checkbox"/> Play
Unconditional	Digit 3	<input checked="" type="checkbox"/> Play
Go to Previous Menu	Digit #	<input checked="" type="checkbox"/> Play

The various Conditional Greeting types are:

- **Busy:** The system will play the *Record Greetings/Name* options and allow the caller to Record, Play or Erase the Conditional Greeting of type — Busy.
- **No-Reply:** The system will play the *Record Greetings/Name* options and allow the caller to Record, Play or Erase the Conditional Greeting of type — No-Reply.
- **Unconditional:** The system will play the *Record Greetings/Name* options and allow the caller to Record, Play or Erase the Conditional Greeting of type — Unconditional.
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the Record Mailbox Greetings Menu.

For details, refer "[Record Greetings/Name](#)".

Record Greetings/Name

Record Greetings/Name is a menu which allows the caller to Record, Play or Erase the Mailbox Name or the Personal/Conditional Greetings.

Record Greetings/Name		
Record	Digit 1	<input checked="" type="checkbox"/> Play
Play	Digit 2	<input checked="" type="checkbox"/> Play
Erase	Digit 3	<input checked="" type="checkbox"/> Play
Go to Previous Menu	Digit #	<input checked="" type="checkbox"/> Play

- **Record:** The system will allow the caller to Record the Mailbox Name or the Personal/Conditional Greeting. Maximum allowed length for recording a name/greeting is 120 seconds.
- **Play:** The system will Play the Mailbox Name or the Personal/Conditional Greeting to the caller.
- **Erase:** The system will clear the recorded Mailbox Name or the Personal/Conditional Greeting.
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the Previous Menu — *Record Mailbox Name, Personal Greeting Timezone Selection or Conditional Greeting*.

Number Programming (Assistant/Personal)

Number Programming (Assistant/Personal) is a menu which allows the caller to program the Assistant Number or Personal Number.

Number Programming (Assistant/Personal)		
Enter Number	Digit 1 ▾	<input checked="" type="checkbox"/> Play
Play Number	Digit 2 ▾	<input checked="" type="checkbox"/> Play
Clear Number	Digit 3 ▾	<input checked="" type="checkbox"/> Play
Go to Previous Menu	Digit # ▾	<input checked="" type="checkbox"/> Play

- **Enter Number:** The system will allow the caller to program the Assistant Number or Personal Number. For Assistant Number, only the Assistant Number List present in the system will be allowed.

Make sure the Assistance Number is an extension number and the Personal Number is an external (Mobile) number.

Make sure you do not enter the Department Group Mailbox Number as the Assistant Number or the Personal Number.

- **Play Number:** The system will play the Assistant Number or Personal Number to the caller.
- **Clear Number:** The system will clear the Assistant Number or Personal Number programmed by the caller.
- **Go to Previous Menu:** The system will provide an option to the caller to go back to the ["Mailbox Management"](#).

Distribution List

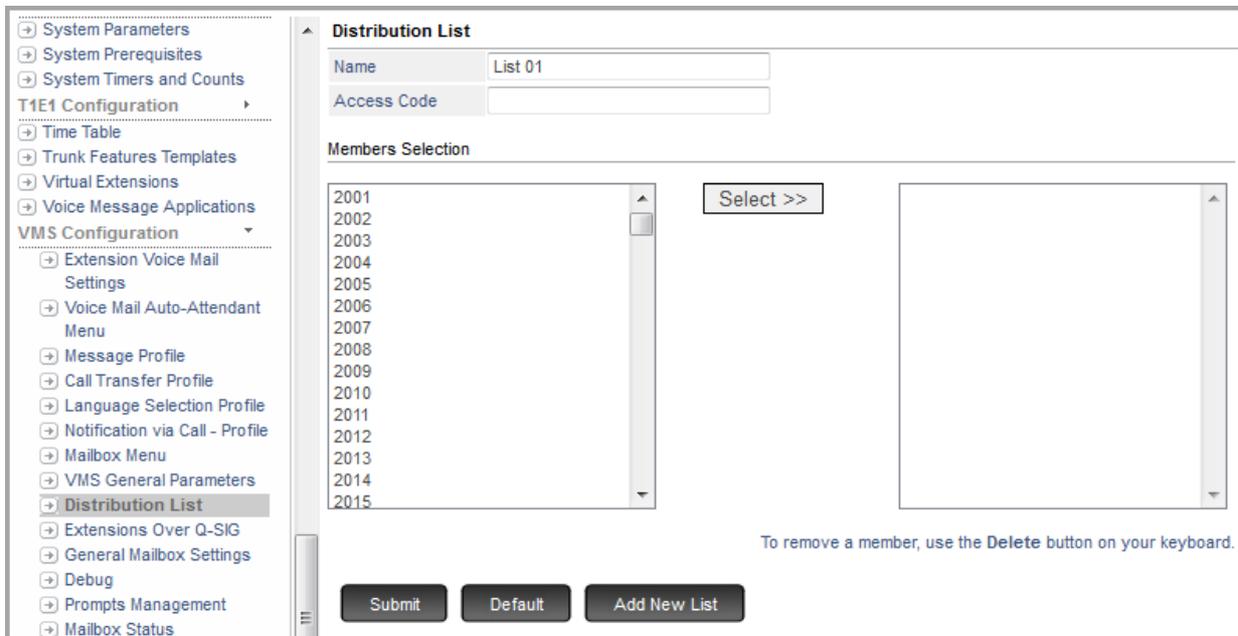

A Distribution List enables extension users to send the same message to a group of extensions at the same time.

Any extension with a mailbox can be included in a Distribution List. You can create upto 30 Distribution Lists of 50 members each.

How to configure

To configure Distribution List using Jeeves,

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **Distribution List**.

You may add a new list, edit the default list or delete a Distribution List.

To add a new List,

- Click **Add New List**. A new *List xx* will be created. You may now configure this as per your requirement.

To delete a list, click **Delete**.

The default Distribution List cannot be deleted.

To edit a Distribution List,

- In **Name**, configure the name of the Distribution List. By default, it is *List xx* where xx is the Distribution List Number from 01 to 30.
- In **Access Code**, configure the Access Code you wish to assign to the respective Distribution List. The caller can send or forward the message to a Distribution List by dialing the respective access code. It can be a maximum of 6 digits.

Make sure, the Access Codes assigned to the Distribution Lists do not conflict with the existing access codes. System will not save the configured Distribution List access code if the same code is already assigned.

Members Selection

- All the Extension Numbers appear in the left side box arranged sequentially in the increasing order.
- To select the members for the Distribution List,
 - Place your cursor on the desired Extension and click **Select>>** button. The selected extension will appear on the right side box. It is also possible to select a range of extensions at a time by pressing 'SHIFT' and 'Down' arrow keys.

A maximum of 50 extensions can be selected.

- To delete the members from the Distribution List,
 - Place your cursor on the desired Extension and click delete key from your keyboard. The selected extension will be deleted. It is also possible to select a range of extensions at a time by pressing 'SHIFT' and 'Down' arrow keys.
- Click **Submit** to save changes.

Recording Voice Messages

The VMS of SARVAM UCS supports voice messages for different functions, which are broadly classified as:

- **System Greetings:** These are messages are played to the caller when a new call lands on the VMS. Callers are greeted according to the time of the day - morning, afternoon, evening (Time Zone). You can customize the Time Zones as per your requirement. For detailed instructions, see [“Greeting Message Time”](#). A different System Greeting can also be played to callers on holidays.

System Greetings are played to callers when the VMS Auto Attendant feature is enabled on trunks.

- **Personal Greetings:** These messages are played to callers when they are diverted to the extension user’s mailbox to leave a message. Extension users can record personal mailbox greeting messages of their choice.
- **Conditional Greetings:** These messages are played to callers when they are diverted to the extension user’s mailbox for certain conditions—busy, no reply or unconditional/unregistered Call Forward. Extension users can record a different message for each condition.
- **Welcome Messages:** These are messages are played to callers who call the VMS. Welcome messages help the callers navigate through the VMS. Welcome messages are played according to the time of the day, that is, the Time Zone programmed in the system.

Welcome Messages are played to callers when the VMS Auto Attendant feature is enabled on trunks.

- **Holiday Messages:** These messages are played to callers who call the VMS on a Holiday. These messages are played in place of the Welcome messages and help the callers navigate through the VMS. A different message can be played for each holiday.

Holiday Messages are played to callers when the VMS Auto Attendant feature is enabled on trunks and the Holiday Table is configured.

- **Prompts/Responses:** These are voice guidance messages that are played to the caller in response to the action taken (that is, when the caller dials a digit).

For all of these message types, audio files containing the appropriate recorded voice guidance messages are loaded in the configuration of the VMS Module. The VMS plays the messages related to the function it is performing.

For example, if Voice Mail Auto Attendant (the VMS Auto Attendant feature) is enabled on a trunk, the VMS plays messages relevant to the Voice Mail Auto Attendant Menu programmed for the current Time Zone. This helps the caller navigate through various options as the VMS plays the related message, as explained below:

- The VMS plays the default System Greeting and Welcome message to the caller according to the time of the day, e.g.: *“Good Morning”*. *“Welcome! Please dial the extension number or To dial by name press ‘6’, To leave a message press ‘7’, To access your Personal Mailbox press ‘8’, For further assistance press ‘9’, To disconnect the call press ‘#’ (hash)”*.
- As the caller navigates, the VMS plays the pre-recorded voice messages related to the particular option selected by the caller. If the caller dials 6 to dial by name, the VMS plays relevant voice message, e.g.: *“Please enter first three letters of the name”* and then plays *“More than one match found. Matching Names*

will be played one by one. To Select the name press '1', to Skip the name press '2', To Repeat the last name press '3'."

- If the caller dials 1 to select the name, the VMS plays the prompt: "To confirm press '1', to Re-enter press '2'."
- If the caller dials 1 the VMS transfers the call as per the transfer type assigned to the selected station.

In the same way, when you set a voice guided alarm, the VMS plays the alarm-related voice prompts, like: "*Enter the time, HH MM in twenty four hour format*". Thus, for every voice mail related function or feature, the VMS plays the appropriate voice message.

The VMS gives you the option of either using the default voice guidance messages loaded in the VMS Module configuration, *or* recording custom messages that better suit your purpose.

All VMS default voice messages are in English only. If you want, you may record voice messages in your local language.

No special programming is required for using the default voice messages. However, if you want to use custom messages, you must first:

- record the message (Greetings, Welcome Messages, Holiday Messages, Voice Guidance prompt).
- upload the new recorded message file in the VMS configuration.

Recording Voice Messages

When you record messages of your choice, consider these important points:

- The custom messages must be in WAV format.
- Make sure the message files have the following attributes:
 - Audio Format: CCIT u-law
 - Channel: 1 (mono)
 - Sampling Frequency: 8 KHz
 - Audio Sample Size: 8 bit
- You must record the custom messages from an external source.
- You must verify the message and then these messages must be uploaded on to the VMS configuration files.
- Extension users can record their personal mailbox greetings on their own. Refer the topic "[Recording Personal Greetings](#)" to know more.
- Extension users can record the conditional greetings on their own. Refer the topic "[Recording Conditional Greetings](#)" to know more.

Uploading Custom Voice Messages

As mentioned earlier, when you record voice messages from an external source, make sure that:

- The audio file is recorded in the prescribed format (.wav) and attributes.

- The SARVAM UCS is connected to a computer (standalone or LAN).
- You can upload a single prompt or the entire folder. For detailed instructions, see [“Prompts Management”](#)

Prompts Management

Prompts Management allows you to view all the prompt folders present in the system for each of the configured languages. You may upload or download a prompt file to/from the VMS Prompt folders for any language. The default prompts recorded in English language are provided to you. See “[VMS Prompts](#)” for details.

You may overwrite the default prompts or upload new prompts. While uploading the prompts for other languages, you must record them with reference to the default prompts listed under the topic **VMS Prompts**.

There are 21 Prompt folders present in the system. The first 11 folders are flexible while the others are fixed.

The Flexible Folders are:

- Greeting
- Auto-Attendant
- Number Dialing
- No Digit Dialed
- Invalid Digit Dialed
- Expiry of Count
- Call Transfer Type
- Call Transfer Unsuccessful
- Information
- MoH
- Disconnect

The Fixed Folders are:

- Language
- Dial by Name
- Call Transfer
- Message Record
- Message Send Forward
- Mailbox Access
- Mailbox Access Menu
- Number
- Alarm
- Miscellaneous

The Flexible Folders include the prompt files which the system uses according to the configuration done by you. You may upload new prompt files, download and delete the existing files from the system.

The Fixed Folders include the prompt files which the system uses internally and are non-configurable. You may overwrite or download the existing files but cannot delete these from the system.

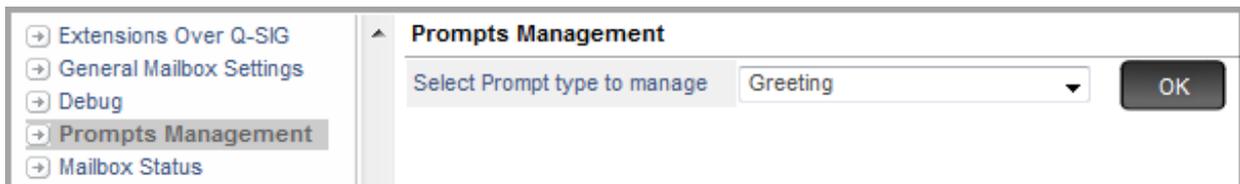

The following table defines the maximum number of prompt files supported in each folder.

Folder Name	Maximum Prompt files supported	Maximum length allowed for each prompt (seconds)
Greeting	24	180
Auto-Attendant	99	180

Folder Name	Maximum Prompt files supported	Maximum length allowed for each prompt (seconds)
Number Dialing	12	120
No Digit Dialed	12	120
Invalid Digit Dialed	12	120
Expiry of Count	12	120
Call Transfer Type	12	120
Call Transfer Unsuccessful	12	120
Information	24	180
MoH	12	180
Disconnect	12	120
Language	01	120
Dial by Name	13	120
Call Transfer	16	120
Message Record	19	120
Message Send Forward	30	120
Mailbox Access	29	120
Mailbox Access Menu	50	120
Number	46	120
Alarm	53	120
Miscellaneous	24	120

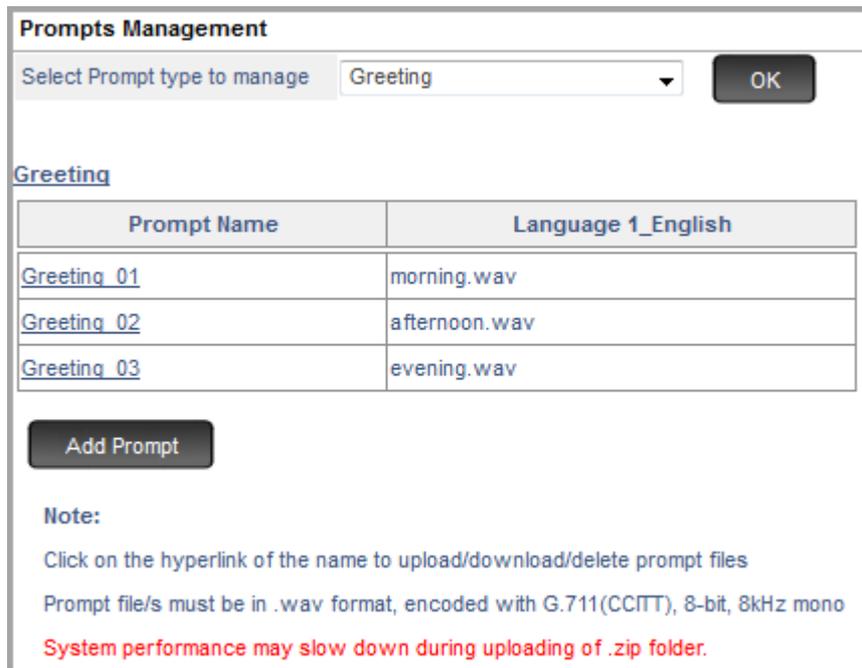

How to Configure

- Log into Jeeves.
- Under **Configuration**, click **VMS Configuration**.
- Click **Prompts Management**.

- In **Select Prompt type to manage**, select the desired folder.
- Click **OK**.

All the prompt files present in the respective language folders of the selected Prompt Type will be displayed.

Prompt Name	Language 1_English
Greeting_01	morning.wav
Greeting_02	afternoon.wav
Greeting_03	evening.wav

You can upload or download the entire folder for the respective Prompt Type for each of the languages.

To add a new prompt in a Flexible Folder,

- Click the **Add Prompt** button at the bottom of the page.

The **Add/Edit Prompt** window opens.

- Click the **Browse** button to reach the location on the local disk where the respective prompts are stored in your PC.
- Click  to upload.

Make sure the folder you upload is a zip file.

Make sure the prompt files within the folder are in .wav format and have the following attributes:

- *Audio Format: u-law*
- *Channel : 1 (mono)*
- *Sampling Frequency: 8 KHz*
- *Audio Sample Size: 8 bit*

To Upload or Download the entire Prompt Type folder,

- Click on the **Prompt Type** link.

Prompt Name	Language 1_English
Greeting_01	morning.wav
Greeting_02	afternoon.wav
Greeting_03	evening.wav

The **Upload/Download Prompt Type** Window opens.

English Browse... No file selected. [Upload] [Download]

Close

- The language-wise folders will be displayed.
- Click the **Browse** button of the desired language to reach the location on the local disk where the respective prompt folder is stored in your PC.
- Click  to upload.

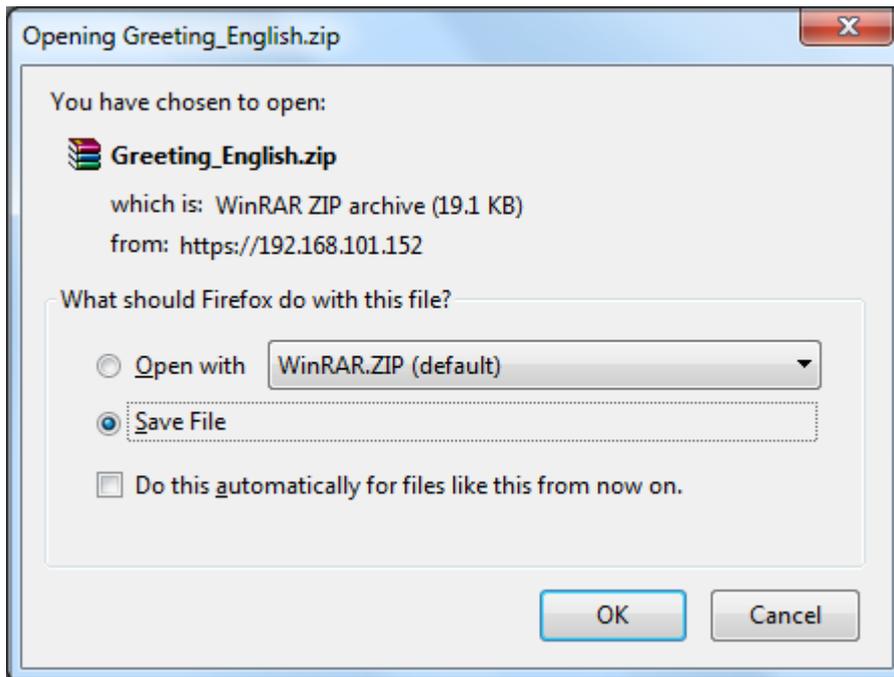

Make sure, the file to be uploaded is a zip file.

The filename can be a maximum of 64 characters.

The allowed characters for the filename are A to Z, a to z, 0 to 9, - and _.

To download all the prompts of the respective prompt type and language selected, click .

The **Opening Prompt Type_Language.zip** window will open.

- You can either open the zip file or save the file to a location.

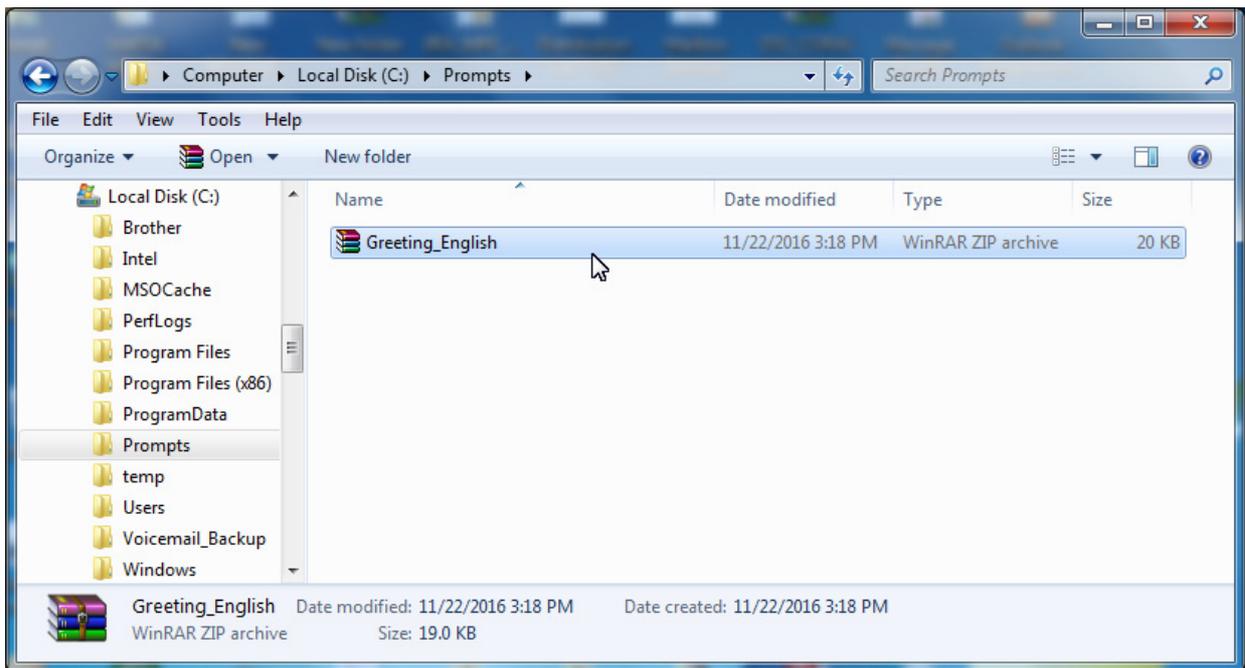

*The above window display depends upon the browser you are using. Check the **Download Settings** of your browser and set the **Download path** accordingly.*

OR

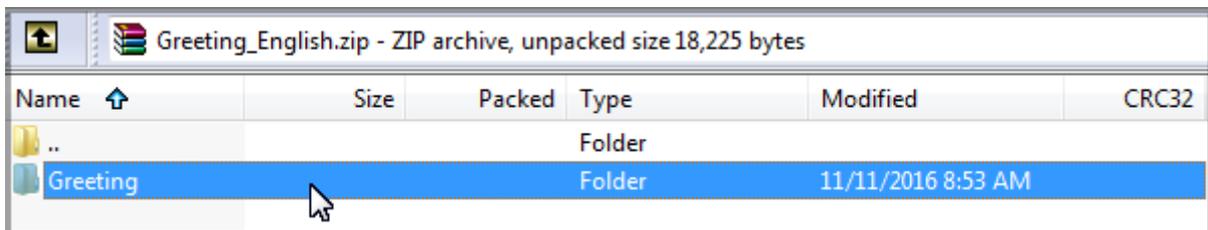

If your browser does not ask you for the location you want to save your file, it saves it in the default location according to the download path specified for that browser.

*If you are using Mozilla Firefox (version 3.5 recommended), before you save the configuration files, set the **Downloads** option of your browser as **Always ask me where to save files**.*

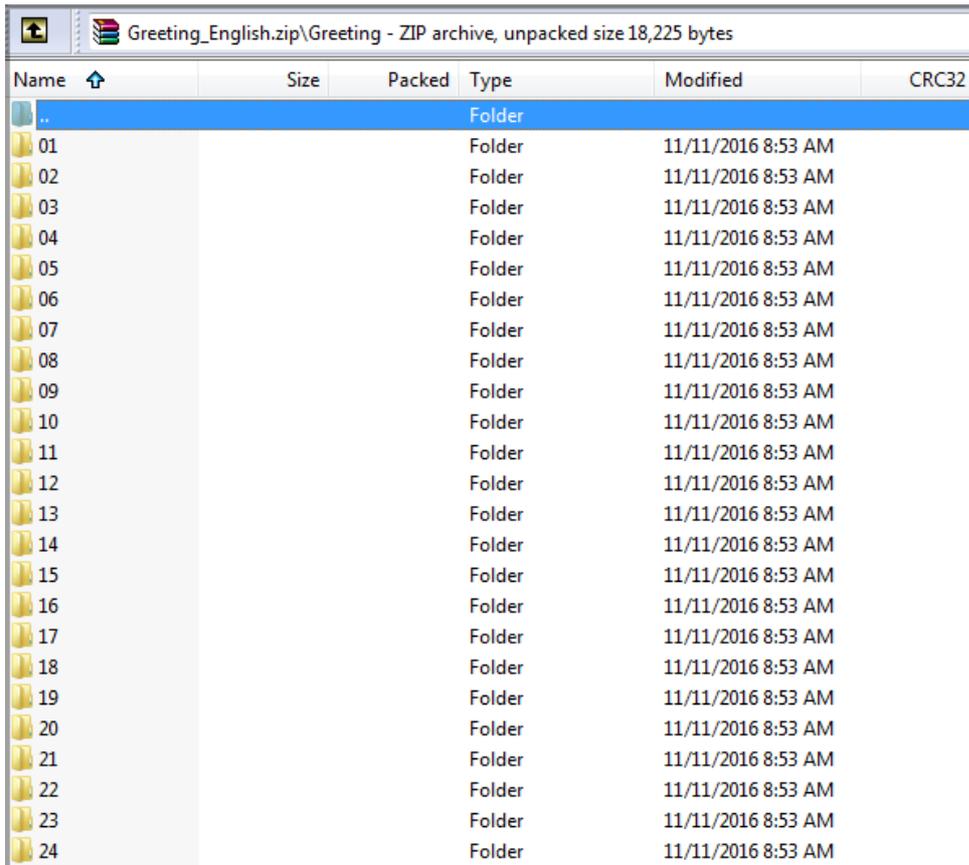

- Save the file on the local disk.

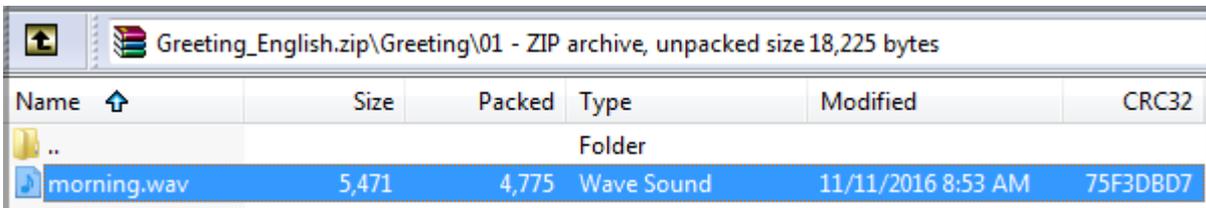

- To view the files,
 - Open the **Prompt Type_Language** folder.

- Now, open the **Prompt Type** folder to view all the subfolders containing the prompts.

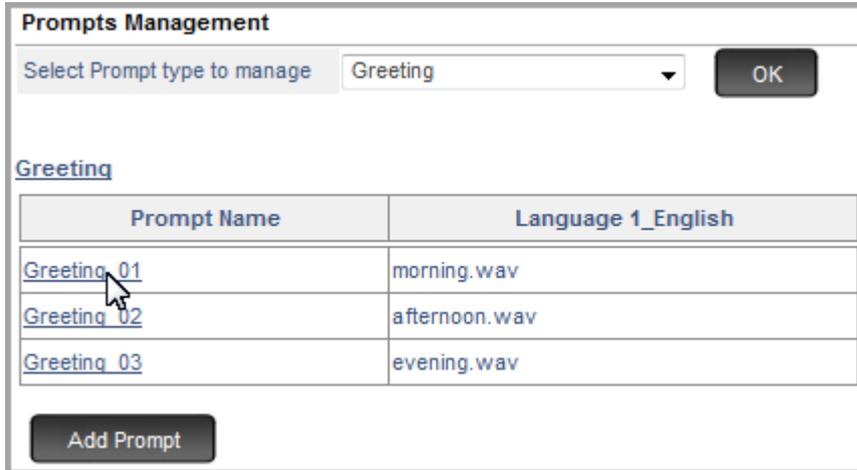

- Open the subfolder containing the prompt.

You may now upload, download or delete a prompt file to/from a folder. The files present in the Fixed Folders cannot be deleted or added, but the existing files can be overwritten by a new one.

To Upload or Download a Prompt,

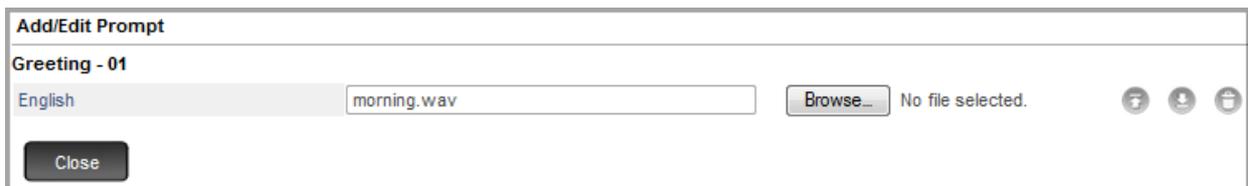

- Click on the respective **Prompt Name** link.

The 'Prompts Management' window features a title bar, a dropdown menu for 'Select Prompt type to manage' set to 'Greeting', and an 'OK' button. Below this is a section titled 'Greeting' containing a table with two columns: 'Prompt Name' and 'Language 1_English'. The table lists three prompts: 'Greeting_01' (morning.wav), 'Greeting_02' (afternoon.wav), and 'Greeting_03' (evening.wav). An 'Add Prompt' button is located at the bottom left of the window.

Prompt Name	Language 1_English
Greeting_01	morning.wav
Greeting_02	afternoon.wav
Greeting_03	evening.wav

The **Add/Edit Prompt** window will open.

The 'Add/Edit Prompt' window shows 'Greeting - 01' as the title. It includes a language dropdown set to 'English', a text field containing 'morning.wav', and a 'Browse...' button. To the right of the text field, it says 'No file selected.' and has three icons: a folder, a download arrow, and a trash can. A 'Close' button is at the bottom left.

- To upload or overwrite a prompt,
 - Click the **Browse** button to reach the location on the local disk where the respective prompts are stored in your PC.
 - Click  to upload.

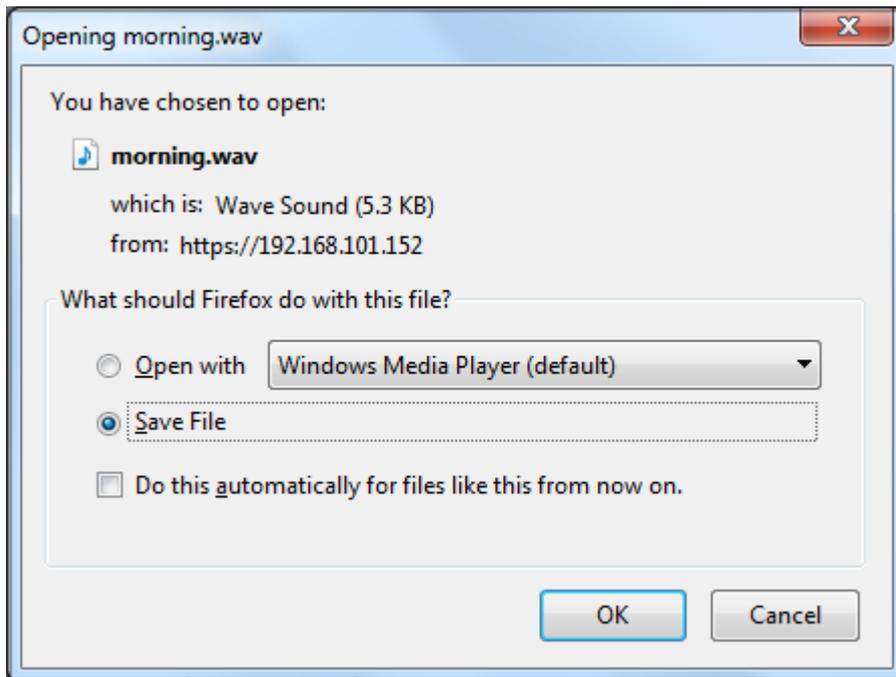

Make sure, the file to be uploaded is a wav file.

The filename can be a maximum of 64 characters.

The allowed characters for the filename are A to Z, a to z, 0 to 9, - and _.

- To download a prompt, click .

The **Opening Prompt Name_xx.wav** window will open; where xx signifies the prompt number.

- You can either open the wav file or save the file to a location.

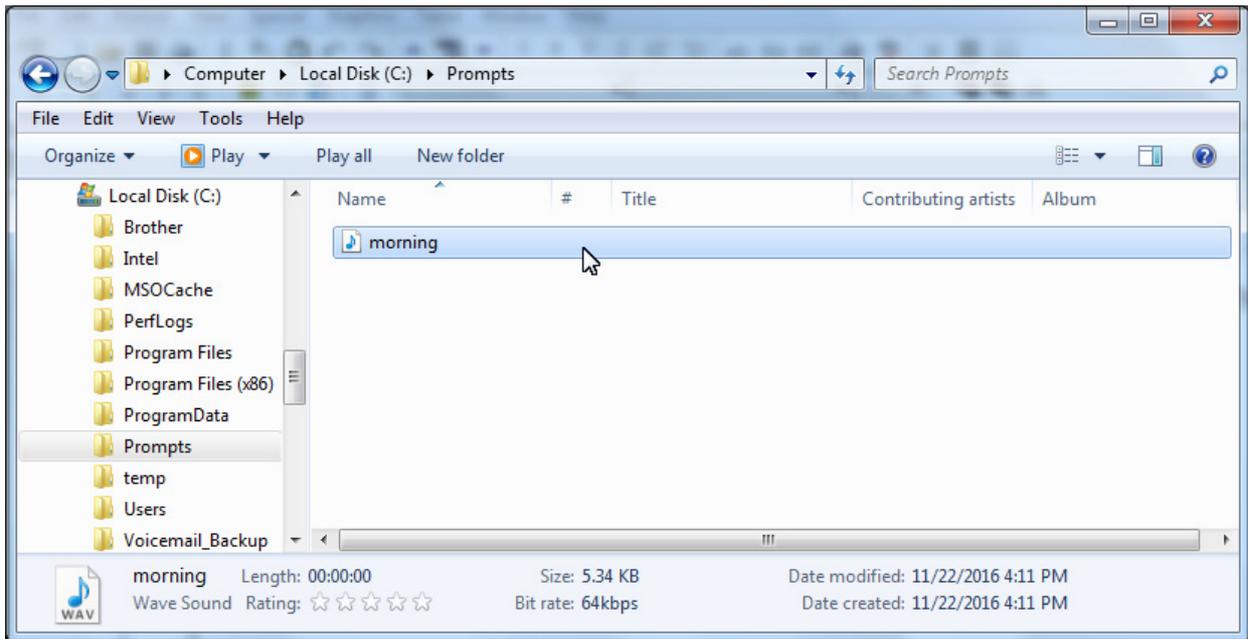

*The above window display depends upon the browser you are using. Check the **Download Settings** of your browser and set the **Download path** accordingly.*

OR

If your browser does not ask you for the location you want to save your file, it saves it in the default location according to the download path specified for that browser.

*If you are using Mozilla Firefox (version 3.5 recommended), before you save the configuration files, set the **Downloads** option of your browser as **Always ask me where to save files**.*

- Save the file on the local disk.

- To delete a prompt, click .

For Firmware Versions earlier than V1R7.1,

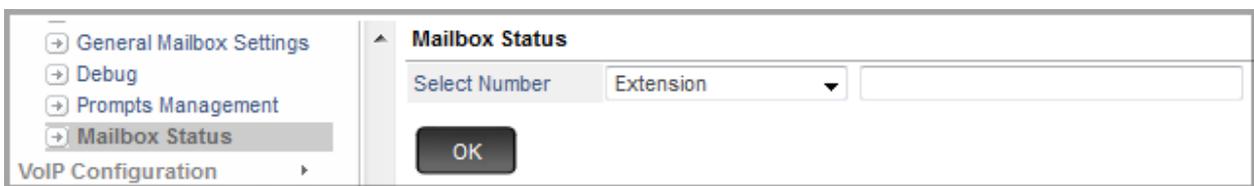

- If you wish to upload customized prompts in the Miscellaneous folder, follow the same instructions as mentioned above to download the folder and copy the customized prompts in the desired folders.
- You also need to make sure that the Folder number 01 has only one file you need, delete the other file. Only then you will be able to upload the folder again with customized prompts.

Mailbox Status

The Mailbox Status displays the mailbox details of the respective Extension, Department Group or General Mailbox.

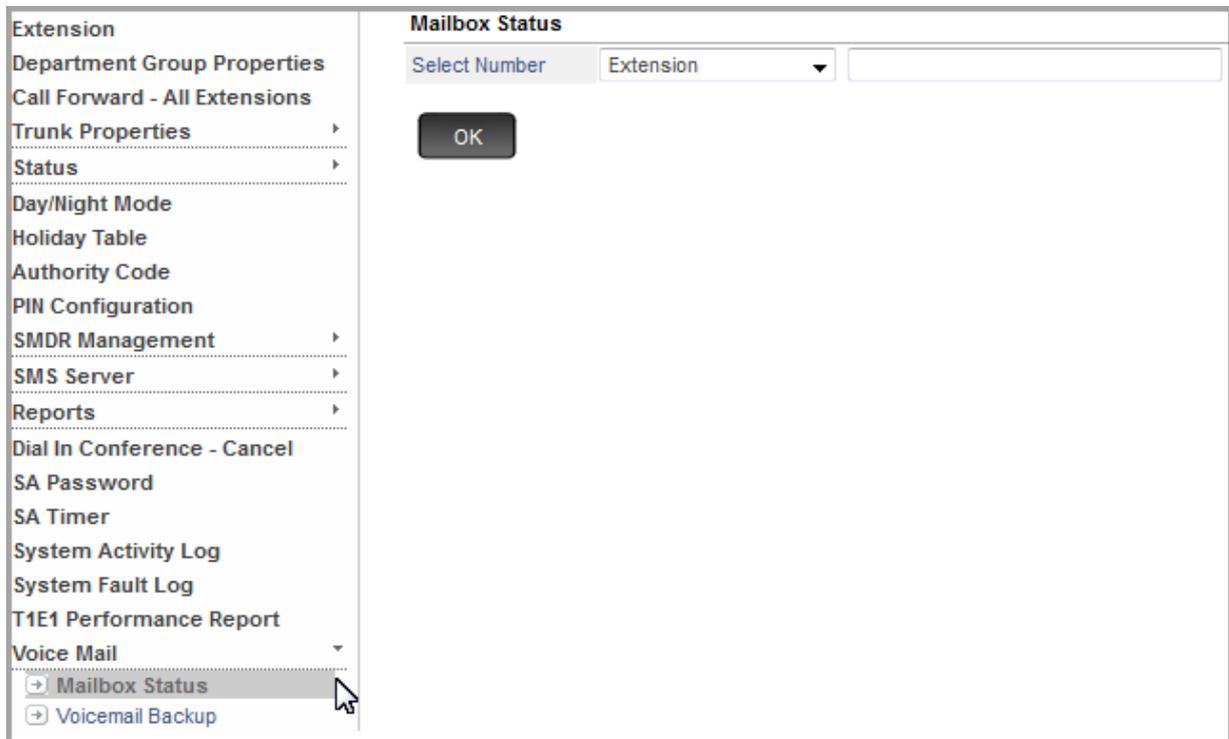

Viewing Mailbox Status

- Login as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **Mailbox Status**.

OR

- Log in as System Administrator.
- Under **Voice mail**, click **Mailbox Status**.

- **Select Number:** You may select — Extension, Department Group or General Mailbox — whose mailbox status you wish to view.
- For **Extension**, enter the Extension Number/Name and then select the same from the drop down list.
- For **Department Group**, select the desired Department Group Number from the drop down list.
- Click **OK**.
- Click **Mailbox Status** to expand.

Mailbox Status

Select Number Extension

3002

Mailbox Status

Mailbox Size Consumed/Allowed (minutes)	0/5
Mailbox Number	Mb0243
Redirect Set	No
Redirect Number	
Assistant Number	
Mobile/Alternate Number	
New Messages / Total Messages	10/20
Urgent New / Urgent Old Messages	2/0
Last Cleared On	
Last Accessed On	16-11-2016 at 12:48

The respective mailbox parameters along with their status will be displayed.

- **Mailbox Size Consumed / Allowed (minutes):** It displays the minutes consumed by the Mailbox messages out of the maximum minutes allowed for the Mailbox.
- **Mailbox Number:** It displays the mailbox number assigned to the respective Extension or Department Group or the General Mailbox.
- **Redirect Set:** It displays 'Yes' if the Redirect is set and 'No' if the Redirect is not set for the respective mailbox user.
- **Redirect Number:** It displays the Redirect number, if configured, for the mailbox user.
- **Assistant Number:** It displays the Assistant number, if configured, for the mailbox user.
- **Mobile/Alternate Number:** It displays the Mobile/Alternate number, if configured, for the mailbox user.
- **New Messages / Total Messages:** It displays the number of New Messages out of the Total Messages available in the respective mailbox.

- **Urgent New / Urgent Old Messages:** It displays the number of New Urgent Messages as well as the Old Urgent Messages available in the respective mailbox.
- **Last Cleared On:** It displays the date and time when all the Mailbox Messages (old and new) were last cleared by the user or SE.
- **Last Accessed On:** It displays the date and time when the Mailbox was last accessed.

Delete Voice Messages

Using Jeeves

Delete Voice Messages will be displayed only when the Mailbox is assigned and it contains old or new voice messages.

Delete Voice Messages from SE mode,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click **Mailbox Status**.

- **Select Number:** You may select — Extension, Department Group or General Mailbox — whose mailbox messages you wish to delete.
 - For **Extension**, enter the Extension Number/Name and then select the same from the drop down list.
 - For **Department Group**, select the desired Department Group Number from the drop down list.
 - For **General Mailbox**, select the General Mailbox Number from the drop down list.
- Click **OK**.
- Click **Delete Voice Messages** to expand.

- From the **Delete Voice Messages** list, select the type of messages you want to delete — None, All, New or Old. By default, None is selected.
- Click on the **Delete** button.
 - A confirmation message is displayed. Click **OK** to delete the messages.
- Log out of Jeeves, or continue as desired.

Delete voice messages is not applicable for Personal Greetings, Conditional Greetings and Extension Name.

After deleting voice messages, system will take some time to clear them. The time taken to clear the messages will vary depending upon the mailbox size. The USB Status will be updated only after these messages have been cleared.

Delete Voice Messages from SA mode

- Log into Jeeves as System Administrator.
- Click **Voice Mail** to expand.
- Under **Voice Mail**, click **Mailbox Status**.

- Follow the same steps as given above to delete the voice messages.
- Log out of Jeeves, or continue as desired.

Using SA Command²²⁷

You can delete voice messages using SA command also.

- Enter SA mode from a DKP/SLT.

To delete the messages, dial:

- **1072-315-Extension Number-Message type**

Where,

Extension Number can be the number of SLT, DKP or SIP Extensions, ISDN Terminals, Extension over QSIG, Department Group or the General Mailbox.

Message Type is

- 1 - All Messages
- 2 - Old Messages

²²⁷. SA Commands for deleting voice messages cannot be executed from VARTA UC Clients, SPARSH VP330 or SPARSH VP210.

3 - New Messages.

- Exit SA mode.

Voicemail Backup

The Voicemail Backup allows you to store the Backup of the desired — Extensions, Department Groups, General Mailbox— voicemail messages on the Network Drive. For details regarding the Network Drive configuration, see [“Network Drive Settings”](#).

SARVAM UCS allows you to take the voicemail backup of a single extension, range of extensions, all extensions or selected extensions.

You can take Voicemail Backup, either

- Manually: The backup is taken whenever you want.
Or
- as per Schedule: The backup is taken on a preset Day, Date and Time.

- *If you want to store the backup files in a PC having Windows as the Operating System, make sure it has IPv4 address.*
- *Backup is not possible in Apple PCs.*

How to Configure

Scheduled Backup

- Log in as System Administrator.
- Click the **Voice Mail** link.

- Under **Voice Mail**, click **Voicemail Backup**.

To schedule automatic Voicemail Backup configure the following:

- **Backup Status:** Displays the last scheduled/manual backup status (Successful or Failed) with date, time, type of backup done and location at which backup is stored. By default, this field is blank. When the Voicemail Backup is on-going, this displays the progress status of the backup. However, if you wish to abort the backup midway, you may click the **Abort** button.

Abort button will be visible only when the Voicemail Backup is in progress.

- **Scheduled Backup:** Allows you to schedule automatic Voicemail Backup on a specific day, date and time. To set a scheduled backup, enable this check box. By default, it is disabled.
- **Backup Location:** Displays the path of Network drive with the Folder Name configured in the Network Drive Settings through SE mode. If the parameters have not been configured for the Network Drive, it will display the error message here.

If storage capacity of the Network drive is full, then backup will not be taken and an error is displayed.

- **Backup Mailbox:** This allows you to select the mailbox/es for which the backup needs to be taken.
 - To backup voicemail of all extensions, select **All** Extensions. This would take the backup of all mailboxes — Extensions, Department Groups and General mailbox. By default, All option is selected.

- To backup voicemail of a single extension, select **Extension**. Enter the Extension Number/Name and then select the same from the drop down list.
- To backup voicemail of multiple extensions in sequence, select **Range**.

Select >>

To remove a member, use the **Delete** button on your keyboard.

- Select the required Extension numbers, Department Group or General mailbox from the **Member Selection** list and click **Select**. The selected mailboxes will be displayed in the right-side panel.
- To remove a selected member, click on the desired extension in the right-side panel and press Delete key on your keyboard.
- Select the **Delete messages after backup** check box if you want the system to delete the respective extension/s voicemail messages after their backup has been stored on the network drive.
- To set an automatic **Backup Schedule**, select the desired option — Hourly, Daily, Weekly or Monthly.

Voicemail Backup will be taken only when the System's time matches with the configured time in the **Backup Schedule**.

To receive Backup Notification, configure the following:

- You will receive **Backup Notification** only if this check box is enabled. By default, it is disabled.
- If you have opted for Backup Notification, then enter the desired email id in **Notification E-mail Address** to which the notification should be sent.

Voicemail Backup E-mail notification will be sent only when SMTP account is configured in System Log Notification. For instructions, see [“System Log Notification”](#) and [“SMTP Settings”](#).

- In **Notification of Backup Status**, select the desired status for which you require notification — Failure, Success or Success + Failure. By default, Failure is selected.
- In **Notification Text: Success**, enter the text you would like to receive as subject line in email when the Voicemail Backup has been successful. By default, the text is **Voicemail Backup completed successfully on <date> at <time>**.
- In **Notification Text: Failure**, enter the text you would like to receive as subject line in email when the Voicemail Backup has failed. By default, the text is **Voicemail Backup failed on <date> at <time>**.

Date-Time will be replaced with the date and time of the system when manual/scheduled Voicemail Backup was taken.

Manual Backup

If the Network drive is not configured, then Manual Backup option will not be displayed.

To take the Voicemail backup manually,

- Click on **Manual Backup** button. A new window for Manual Backup is opened.

The screenshot shows a dialog box titled "Manual Backup". It has a "Backup Mailbox" field with a dropdown menu currently set to "All". Below this is a "Delete messages after backup" checkbox, which is currently unchecked. At the bottom of the dialog are two buttons: "Backup" and "Cancel".

- **Backup Mailbox** allows you to select the mailbox/es of which the backup needs to be taken.
 - To backup voicemail of all extensions, select **All** Extensions. This would take the backup of all mailboxes — Extensions, Department Groups and General mailbox. By default, All option is selected.
 - To backup voicemail of a single extension, select **Extension**. Enter the Extension Number/Name and then select the same from the drop down list.

- To backup voicemail of multiple extensions in sequence, select **Range**.

The screenshot shows the 'Manual Backup' dialog box. At the top, 'Backup Mailbox' is set to 'Range'. Below this, there are two input fields for 'Extension/s' and 'Department Group', each followed by a 'to' field. There are two checkboxes: 'General Mailbox' and 'Delete messages after backup'. At the bottom, there are 'Backup' and 'Cancel' buttons.

- To backup voicemail of a range of Personal mailboxes, enter the starting and ending **Extension** Numbers and then select the same from the drop down list.
- To backup voicemail of a range of **Department Group** mailboxes, enter the starting and ending Department Group Numbers and then select the same from the drop down list.
- To backup voicemail of the **General Mailbox**, enable this check box.
- To backup voicemail of randomly selected extensions from the list, select **Custom**.

The screenshot shows the 'Manual Backup' dialog box with 'Backup Mailbox' set to 'Custom'. Below this is the 'Members Selection' section, which contains a list of extension numbers from 1176 to 2014 on the left, a 'Select >>' button in the middle, and an empty list on the right. There is a note: 'To remove a member, use the Delete button on your keyboard.' At the bottom, there are checkboxes for 'Delete messages after backup' and 'Backup'/'Cancel' buttons.

- Select the required Extension numbers, Department Group or General mailbox from the **Member Selection** list and click **Select**. The selected mailboxes will be displayed in the right-side panel.
- To remove a selected member, click on the desired extension in the right-side panel and press Delete key on your keyboard.
- Select the **Delete messages after backup** check box if you want the system to delete the respective extension/s voicemail messages after their backup has been stored on the network drive.

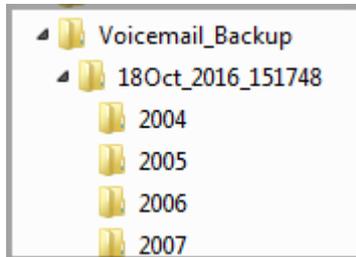

If you click **Backup** and a Scheduled Backup is in progress, then Manual Backup will not be taken and an error is displayed.

Folder Structure

The Voicemail Backup of the respective Extension/s will be stored in the *Shared Folder* you configure in Network Drive Settings.

The folder structure will be as shown below:

The **Voicemail_Backup** folder consists of the folders with the folder names defined as per the Date and Time of the backup.

The Folder Names will be as per the Date and Time Format you configure in *VMS General Parameters*.

Supported formats for folder names are *DDMonthname_YYYY_HHMMSS* and *DDMonthname_YYYY_HHMMSS_PM/AM*.

Where,

DDMonthname_YYYY represents the Date, *HHMMSS* represents the Time in 24 Hour format and *HHMMSS_PM/AM* represents the Time in 12 Hour format.

The sub-folders with the Extension Names contains the respective extension's voicemail files.

VMS Debug

The VMS supports debug for the VMS Application and SMTP. You can view debug messages on the Syslog Server²²⁸.

To be able to use Syslog for debug, you will need to:

- connect a PC to the LAN/WAN Port of the ETERNITY GENX.
- select the Ethernet Port as the Destination Port.
- configure the Syslog Server Address and the Server Port on which Syslog will listen for debug messages.

Configuring VMS Debug using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **VMS Configuration**.
- Click the **Debug**.

The screenshot shows the VMS Configuration interface. On the left is a navigation menu with categories like Recording, SMS Gateway, SMS Routing, SMS Server, System Log, System Parameters, System Prerequisites, System Timers and Counts, T1E1 Configuration, Time Table, Trunk Features Templates, Virtual Extensions, Voice Message Applications, and VMS Configuration. Under VMS Configuration, the 'Debug' option is selected. The main content area is titled 'VMS Debug' and contains several sections: 'Enable Debug' (checked), 'Syslog Server IP Address' (192.168.101.114), 'Syslog Server Port' (05511), 'Call' (checked), 'Mailbox' (checked), 'SMTP' (checked), 'Error' (checked), 'Configuration' (checked), and 'Status' (checked). Below this is the 'Protocol' section with 'Basic' and 'Extended' (checked). The 'Play' section has 'Host Application' and 'Slave Application' (checked). The 'Record' section has 'Host Application' and 'Slave Application' (checked). A 'Submit' button is at the bottom.

- Select the **Enable Debug** check box if you wish to view the VMS Debug
 - In **Syslog Server IP Address**, configure the IP Address of the Syslog Server.
 - In **Syslog Server Port**, configure the address of the Listening Port of the Syslog Server. Valid port range is: 1025 to 65535; 514. By default, the remote server port address is '514'.

If you disable the check box, the system will not send the VMS Debug to the Syslog Server.

228. The SARVAM UCS supports Syslog Client, which enables the VMS to send debug messages in syslog format to the remote 'Syslog Server' on the IP network. You can view the system debug messages on the remote Syslog server or any other application which can capture the Syslog debug messages.

The system supports following VMS Debug Levels. You may select the respective checkbox of the debug levels you wish to include in the VMS Debug.

- Select the **Call** check box to view the debug for all types of call flow.
- Select the **Mailbox** check box to view the debug for all operations related to Mailbox.
- Select the **SMTP** check box to view the debug related to the SMTP Client handled by VMS.
- Select the **Error** check box to view the debug for all types of errors.
- Select the **Configuration** check box to view the debug for configuration update.
- Select the **Status** check box to view the different status of all the VMS functions — total running calls, USB status, pending mail notification count, total messages, etc.

Protocol

- Select the **Basic** check box to view the debug for data received with its IE.
- Select the **Extended** check box to view the debug for data received in raw hex format.

Play

- Select the **Host Application** check box to view the debug related to play from VMS application side.
- Select the **Slave Application** check box to view the debug related to play from VMS Layer side.

Record

- Select the **Host Application** check box to view the debug related to the records from VMS application side.
- Select the **Slave Application** check box to view the debug related to the records from VMS Layer side.

Click **Submit**.

This feature is not applicable if CDMA Mobile Card is installed in your system.

The SMS Server Application enables you to:

- Send/ receive SMS to/from individuals or groups using the Mobile Port of SARVAM UCS.
- Forward SMS received on Mobile Port as Emails to users through the Email Client.
- Forward Email of the users as SMS to the Mobile users through the Mobile Port.
- Configure Personal Directory via Email. For details, see [“Configuring Personal Directory via Email”](#) under [“Abbreviated Dialing”](#).

The SMS Server application works as an intermediary between the GSM Short Message Service and the SARVAM UCS. The Server supports multipart, 7 bit text messages as well as UNICODE messages.

The Server functions as an SMTP Client to send emails and as a POP3 Client to receive emails. SMS Server supports three types of Emails—Plain Text, HTML and MIME— from its mail clients.

To use this feature, you must purchase the SMS Server License. Refer to the topic, [“License Management”](#) to know more.

Make sure your Email Server uses SMTP and POP3 to send/receive emails.

If you have activated both, the SMS Gateway license as well as the SMS Server license, the SMS Gateway will be given priority. If you disable the SMS Gateway functionality, you need to restart the system to resume the SMS Server functionality.

To forward SMS as IM on SIP Extensions and IM from SIP Extensions as SMS, see [“SMS over IP”](#).

How it works

For this feature to work,

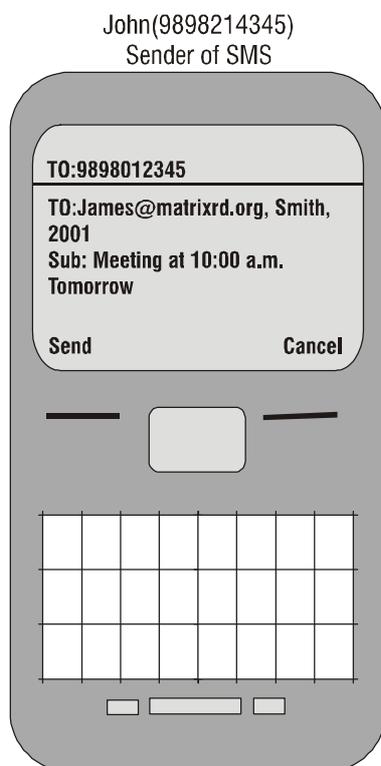

- you must have the SMS Server license. See [“License Management”](#).
- make sure your Email Server uses SMTP to send messages and POP3 to receive messages.
- you must configure the SMTP Client and POP3 Client parameters in SMS Server of SARVAM UCS. See [“SMS Server - Mail Settings”](#)
- the users must have valid Email ID's.
- you must configure the desired Groups and assign them to the extension users and/or Global/Personal Directory contacts. See [“SMS/Email Group”](#).
- configure the SMS parameters for the desired extension users and/or Global/Personal Directory contacts, that is, Mobile Number, Email ID and SMS/Email Group. See [“Configuring SLT Extensions”](#), [“Configuring](#)

DKP Extensions”, “Configuring ISDN Terminals”, “Configuring Matrix SPARSH VP330”, “Configuring Matrix VARTA ADR100/AMP100 UC Clients”, “Configuring Matrix SPARSH VP248”, “Configuring Matrix SPARSH VP310”, “Configuring Matrix SPARSH VP510”, “Configuring Matrix SPARSH VP210” “Configuring Personal Directory using Jeeves” and “Configuring Global Directory using Jeeves” under “Abbreviated Dialing”.

- you must define the Mobile port through which the messages are to be sent/received (Fixed/LCR). See “SMS Routing”.
- configure the SMS parameters and the SMS Budget parameters (if required) on the respective Mobile ports, see “Configuring Mobile Trunks”.
- you must configure the SMS Server parameters as well as the multipart SMS parameters for sending/receiving SMS (if required). See “How to Configure”.

Forwarding an incoming SMS as Email

- To forward an SMS to an Email ID, the SMS received on the Mobile Port must be in a specific format. Illustrated below is an example of the format.

Here,

- The sender of the SMS is John (9898214345).
- The sender must send the message to the SIM Number of the Mobile Port of SARVAM UCS, that is 9898012345.
- The body of the message must contain the following:
 - **To:** This is the destination where the Email is to be sent. In this case, James@matrixrd.org, Smith, 2001.
 - **Sub:** This is the message that will be displayed to the recipients. In this case, ‘Meeting at 10.00 a.m. tomorrow’.
- When the SMS is received on Mobile Port (9898012345) in the above format, the system checks the senders number (9898214345 - John) in the Denied numbers list of the SMS Server.

If the SMS is received in multiple parts the SMS Server combines it into a single SMS.

- If a match is found in the Denied list, the SMS will be rejected. If no match is found, then it checks the destination where the SMS is to be forwarded as an email.

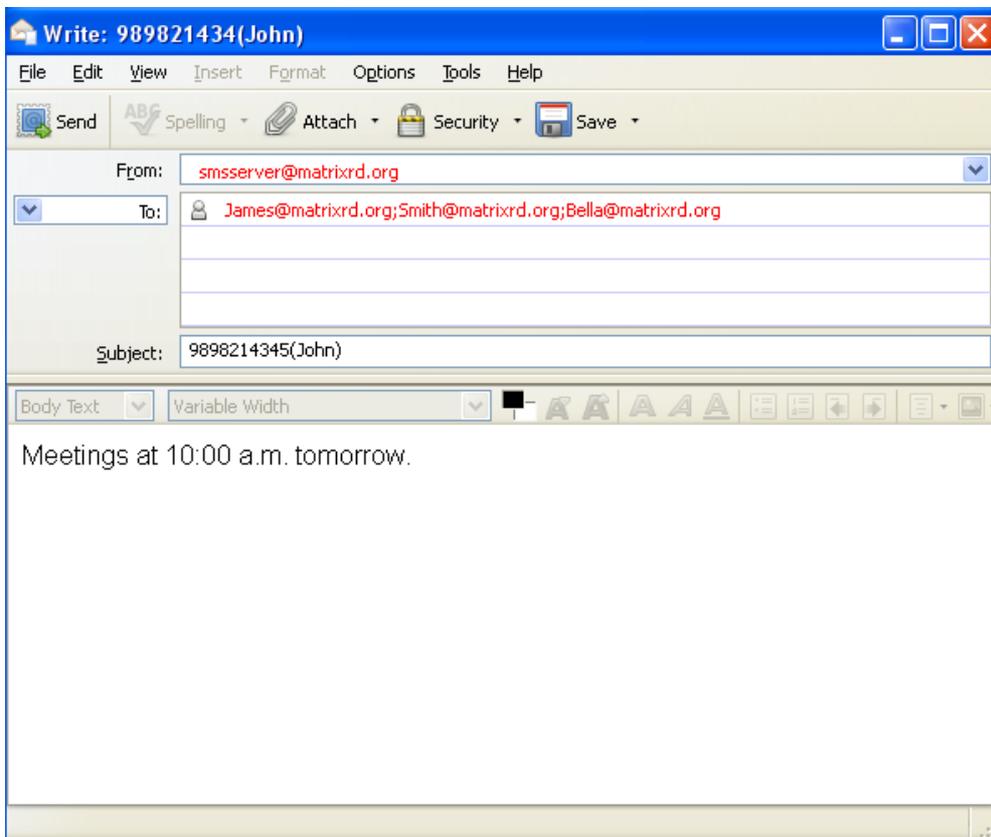

The destination can be the recipients Extension number, Name/Group Name or Email ID. The **To** field in the message body specifies the destination. To send the same message to multiple destinations, enter the destinations separating them with a comma or semicolon.

When the destination is an Email ID, the system will forward the SMS to the recipients Email ID. In this case, James@matrixrd.org

When the destination is a Name or Extension Number, the system will search for the Name/Number in its database. When a match is found, the message will be sent to their corresponding Email IDs. In this case the Email ID of Smith is Smith@matrixrd.org and the Email ID of the Extension user 2001 is Bella@matrixrd.org.

If a match is not found for the Email ID, Name/Group Name or Extension Number, by default the system rejects the message. The system also provides you the option to send the message to a specific recipient (Send to Default recipient), if you do not want to reject the message.

- The SMS Server will convert this SMS to an Email. The email will be sent by the SMS Server to the Email Server and the Email Server will finally deliver it to the recipients.
- When the recipients download their emails, it will be as per the format displayed below.

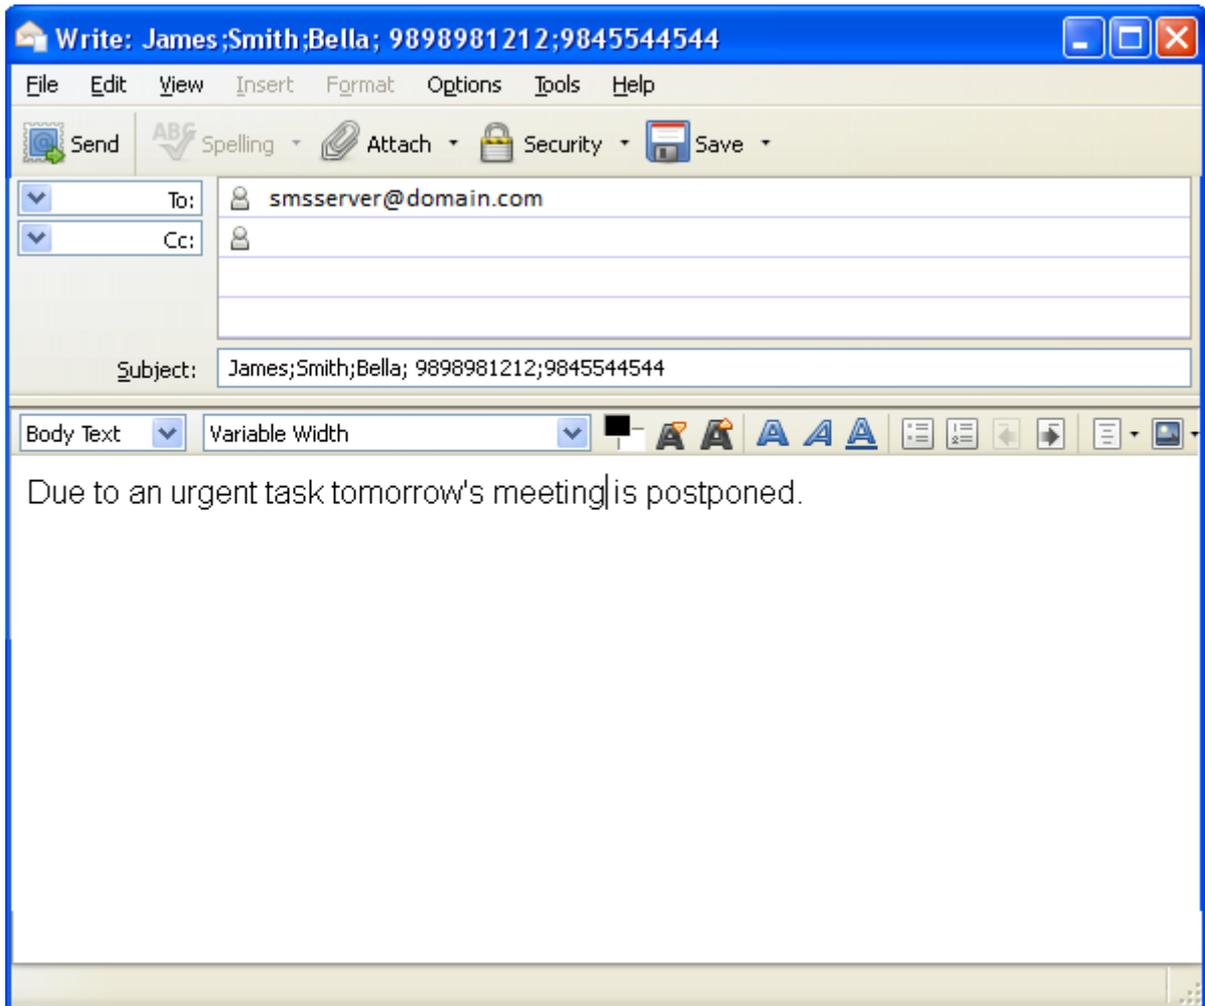

In this Email, the **From** field contains the Email address of the SMS Server. The **To** field contains the Email IDs of the recipients, the **Subject** contains the Name and/or Number of the sender and the **Body** of the message contains the message for the recipients.

The Name will be displayed only if it has been configured and it is found in the system database.

Forwarding an incoming Email as SMS

- To forward an Email as an SMS, the sender must send the Email to the SMS Server in a specific format. Illustrated below is an example of the format.

Here,

1. The sender of the Email is John, John@matrixrd.org.
2. The **To** field must be the Email ID of the SMS Server, smsserver@domain.com.
3. The **Subject** must contain the destination where the SMS to be delivered.

The destination can be a Name/Numbers of the users to whom the SMS is to be sent. To send the SMS to multiple destinations, enter the destinations separating them with a comma or semicolon. Here the destination, that is the recipients are James, Smith, Bella, 9898981212, 9845544544.

4. The **body** must contain the message to be sent to the recipients, that is 'Due to an urgent task tomorrow's meeting is postponed.'
5. The senders Email ID or Name will be displayed to the recipients, if you have configured the parameter **Send Footer/Signature in SMS**.

*It is recommended that you configure the parameter **Send Footer/Signature in SMS**, so that the recipient knows the sender of the message. If this parameter is not configured, only the mobile port SIM number will be displayed to the recipient.*

- This mail will be sent to the Email Server and then the Email Server forwards it to the SMS Server.
- The SMS Server can receive emails from extensions users (system users) or from external users. You can allow or deny emails from users as per your requirement.

If you want to receive Emails from extension users only, select the **Enable Email to SMS forwarding** check box.

If you want to receive emails from extension users as well as external users, select the **Enable Email to SMS forwarding for External Users** check box.

- Then, the Server checks the Email ID of the sender in the Denied Email list.
- If a match is found in the Denied list, the Email will be rejected. If no match is found, then it checks the destination where the SMS is to be forwarded.

The destination can be the recipients Number or Name. The **Subject** field of the message specifies the destination. To send the same SMS to multiple destinations, enter the destinations separated by comma or semicolon.

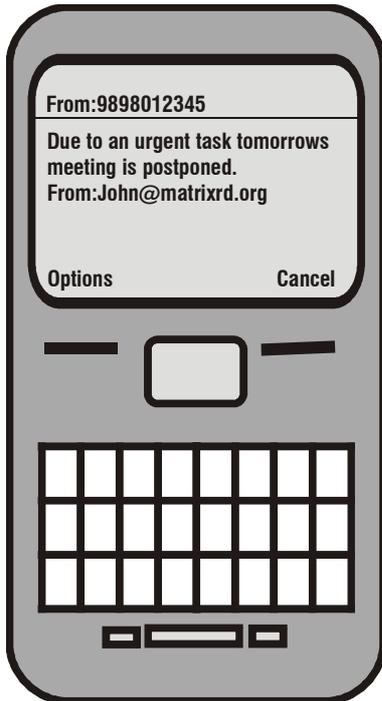

If the destination is a Number, the server will check the number in the Denied list. If a match is found the email will be rejected. If a match is not found, the Server will send the SMS directly to the number using the Mobile Port of SARVAM UCS.

If the destination is a Name, the system will search for the Name in its database. When a match is found, the SMS will be sent to the corresponding Number. In this case, the Numbers of James, Smith, Bella.

The Server sends a return email as well as a delivery status report to the SA/Sender or to Both, informing that the SMS has been delivered/not delivered.

If a match is not found for the Name, a reply mail is sent to the Sender, informing that the Name is not found.

The SMS Server converts the Email to a SMS. In this case the SMS delivered to each recipient, will appear as given below.

In the SMS sent to the recipients, the **From** field contains the SIM Number through which the SMS Server sent the SMS. The **Body** of the message contains the message for the recipients and the Footer/Signature that is, the Email ID/Name of the sender (if the Signature has been added).

*It is recommended that you configure the parameter **Send Footer/Signature in SMS**, so that the recipient knows the sender of the message. If this parameter is not configured, only the mobile port SIM number will be displayed to the recipient.*

Bulk SMS

The SMS Server supports Bulk SMS, that is a single message can be sent to multiple numbers. The message can be sent using the email client by specific users.

How it works

For this feature to work,

- make sure you have enabled Email to SMS Forwarding. See ["Email to SMS Forwarding"](#).
- configure the Minimum time delay required between sending two consecutive SMS. See ["SMS Configuration"](#).
- configure the Bulk SMS parameters and the Email IDs of the users allowed to send Bulk SMS. See ["Bulk SMS"](#)
- you must define the Mobile port through which the messages are to be sent (Fixed or LCR). See ["SMS Routing"](#)
- make sure your Email Server uses SMTP to send messages and POP3 to receive messages.
- you must configure the SMTP Client and POP3 Client parameters in the SMS Server of SARVAM UCS. See ["SMS Server - Mail Settings"](#)
- users must have valid Email IDs.

To send the Bulk SMS the email must be received in the following format:

- the email must be sent with the Subject "Bulk SMS".
- the content received in the email will be considered as the SMS text. The text in the email must not exceed 160 characters.
- the mail must contain an attachment of the numbers only or numbers and names in csv format. The csv file can have a maximum of 1000 numbers. The csv file can have two columns Name and Number or have only one column with numbers. Make sure the columns do not have any header.

When the system receives the email from the user who has requested for Bulk SMS, the system will check this Email ID in the Allowed Email IDs List for sending Bulk SMS. If a match is found, the system will serve the request. If a match is not found the Bulk SMS request will be rejected.

*The system will check the **Allowed Email IDs for sending Bulk SMS** list, only if you have enabled the **Allowed Email IDs to send Bulk SMS** check box. If the **Allowed Email IDs for sending Bulk SMS** option is disabled, all the system users (extension users) will be able to send Bulk SMS requests.*

The system will serve only one Bulk SMS request at a time. If one Bulk SMS is in progress and the system receives another request, the system will reject it. Bulk SMS supports a single SMS of 160 characters only. It does not support multi-part SMS.

While the Bulk SMS request is in progress, the system also provides you the option to stop the process at any point of time if required. The sender must contact the System Administrator to do so.

After the Bulk SMS request has been served, the system updates the csv file and adds another column, Status. For each entry the Status of the SMS is updated. The Status column may contain any one of the following:

- Sent - When any SMS is sent successfully by the system i.e OK is received from GSM engine.
- Failed - When GSM engine gives any error response
- Invalid - For any entry where data is found other than number in the .csv file
- Denied - When SMS number is found in the Denied list
- Limit Exceed - When Daily or Monthly limit is exceeded for all the Mobile ports used for sending the SMS for any entry.
- No Port Available - When all Mobile Ports are configured as "Not allowed to send SMS" which are to be used for sending the SMS for any entry.

This report is then emailed to the user who had requested for Bulk SMS. The Subject of the report email is the same as received for Bulk SMS request.

In certain cases the system may not be able to serve the Bulk SMS request. In such cases the system sends a reply email with the Error message to the user who requested for Bulk SMS. The possible Error conditions and messages are mentioned below:

Condition	Error Message
If Mail Subject is written as "bulk SMS" (case insensitive) but No file is attached in Mail	No attachment found to process bulk SMS. Please attach valid ".csv" file for Bulk SMS.
If multiple attached file is received	Only one attachment is allowed. Attached file format should be ".csv". Attachment file size should be less than 1 MB.
If multiple attached file is received and from that multiple attached file one file format is .csv	Only one attachment is allowed. Attached file format should be ".csv". Attachment file size should be less than 1 MB.

If attached file format is found to be other than .csv	No attachment found to process bulk SMS. Please attach valid ".csv" file for Bulk SMS.
If attached file is .csv but file size is more than we support. (i.e 2MB)	There is No such Error cause for this condition. In this case, the incoming email will get ignored.
If attached file format is found to be .csv but in subject it is not received as "Bulk SMS" (string required for this Bulk SMS feature) and not applicable for Master also.	Attachment is not allowed for normal Mail to SMS.
If attached file format is found to be .csv, subject is matched for Bulk SMS but feature is disable	Bulk SMS feature is disabled
If attached file format is found to be .csv, subject is matched for Bulk SMS but user is not allowed to send Bulk SMS (user means from which email is received)	User not allowed to send Bulk SMS
If attached file format is found to be .csv, subject is matched for Bulk SMS, user is allowed Bulk SMS feature (user means from which email is received) but Text data contains more than 160 characters (i.e consider that text data is such that sms is to be send in multi-part)	More than 160 character text is not supported for Bulk SMS
If attached file format is found to be .csv, subject is matched for Bulk SMS, user is allowed Bulk SMS feature (user means from which email is received), Text data is also for single part sms but attached file data is not as required.	Invalid ".csv" file.It should contain data only in first 2 columns (i.e.Name, Phone Number or Phone Number, Name) without any header.
If already one .csv file for Bulk sms is in process and other attached valid file is received.	Already one file is in process. Please send the file again after x minute(s) approximately. Here x is the time duration for which current csv file will be processed.
If Bulk SMS file is processed, send report	Please find the attached report of Bulk SMS file "xxx.csv" received on "Date-Time" . where xxx.csv should be replaced with filename Date-Time should be replaced with the date and time when email was received by system.

How to Configure

For the SMS Server to function, you need to configure the following parameters,

General Parameters

- Log in as System Engineer.
- Under **Configuration**, click **SMS Server**.
- Click **General Parameters**. The SMS Server-General Parameters page opens.

- By default, the **SMS Server** is disabled. To use the SMS Server feature, select **Enable**.

SMS Configuration

Click **SMS Configuration** to expand.

Configure the SMS related parameters:

- You can **Send SMS** through certain fixed Mobile Ports or through different Mobile Ports according to specific numbers and time.

To send messages through fixed Mobile Ports, select **Using Fixed Mobile Port** and configure the **SMS Routing-Fixed Port** table. For detailed information, see [“Fixed Port Routing \(SMS Server\)”](#).

To send messages to specific numbers through certain preferred Mobile Port/s during a defined time interval, select **Based on specific Time-Number** and configure the **SMS Routing-LCR** table. For detailed information, see [“Least Cost Routing”](#).

Default: Using Fixed Mobile Port.

- Configure the **Allowed-Denied Numbers for sending SMS** list, if you want to allow or restrict sending of messages on specific numbers. To do this,
 - Select the **Allowed-Denied Numbers for sending SMS** check box.
 - Click on **Allowed-Denied Numbers for sending SMS** and the **Allowed-Denied Numbers for sending SMS** table opens. You can configure upto 250 numbers.

- In the Allowed column, enter the numbers on which messages can be sent and in the Denied column, enter the numbers on which messages cannot be sent.
- You can also configure this list by clicking the **Allowed-Denied Numbers for sending SMS** link under **SMS Routing**.

Default: Disabled

- Configure the **Allowed-Denied Numbers for receiving SMS** list, if you want to allow or restrict receiving messages from specific numbers. To do this,
 - Select the **Allowed-Denied Numbers for receiving SMS** check box.
 - Click on **Allowed-Denied Numbers for receiving SMS** and the **Allowed-Denied Numbers for receiving SMS** table opens. You can configure upto 250 numbers.
 - In the Allowed column, enter the numbers from which messages can be received and in the Denied column, enter the numbers from which messages cannot be received.
 - You can also configure this list by clicking the **Allowed-Denied Numbers for receiving SMS** link under **SMS Routing**.

Default: Disabled

If you want to allow multipart messages configure the following parameters:

- Select the **Number of parts allowed for sending SMS** from the list. Default: 1
- If the **SMS length is more than number of parts allowed**, you can select either **Ignore remaining part of the SMS** or **Do not send SMS and send error report to sender**. Default: Do not send SMS and send error report to sender.
- If you select **Ignore remaining part of the SMS**, you can select the **Send error report to sender when SMS length is more than allowed parts** check box, if you want to send an error report to the sender.
- If you enable **Send error report to sender when SMS length is more than allowed parts**, enter the message you want to send to the sender in the email in **Reply error report as an Email to sender containing text**. Default text: Some texts of message are ignored as length of mail is more than allowed characters.
- Configure the **Minimum time delay between sending two consecutive SMS (sec)** as supported by the network. Default: 05.

Click **Submit** to save the changes you made.

SMS to Email Forwarding

Click **SMS to Email Forwarding** to expand.

The screenshot shows a configuration window titled "SMS to Email Forwarding". It contains several settings:

- Enable SMS to Email forwarding:** A checked checkbox.
- Default recipient of Email when recipient is not specified in SMS:** Five empty text input fields stacked vertically.
- When recipient is specified in SMS then forward Email to:** Two radio buttons: "Recipient specified in SMS" (selected) and "Default Recipient".
- If recipient (Name/Number/Email ID) not found in database:** Two radio buttons: "Reject SMS" (selected) and "Send Email to default recipient".
- If conflict occurs for recipient Name:** Two radio buttons: "Reject SMS" (selected) and "Send Email to default recipient".
- Send copy of each SMS to System Administrator as an Email:** An unchecked checkbox.

Configure the following parameters:

- By default the **Enable SMS to Email forwarding** is selected (enabled). If you do not want the SMS Server to forward the SMS as Emails to the users, clear the check box.
- Configure the **Default recipient of Email when recipient is not specified in SMS**. When an SMS is received without any recipient, the system delivers the SMS as an Email to the default recipient/s configured here. You can configure upto 5 Email IDs. Default: Blank.
- Select the desired option for, **When recipient is specified in SMS then forward Email to**. You can select **Recipient specified in SMS** or **Default Recipient**. Default: Recipient specified in SMS.

If you want all incoming SMS to be delivered as Email to a specific recipient only, select **Default Recipient**.

If you want the incoming SMS to be delivered as Email to the recipients specified in the SMS, select **Recipient specified in SMS**.

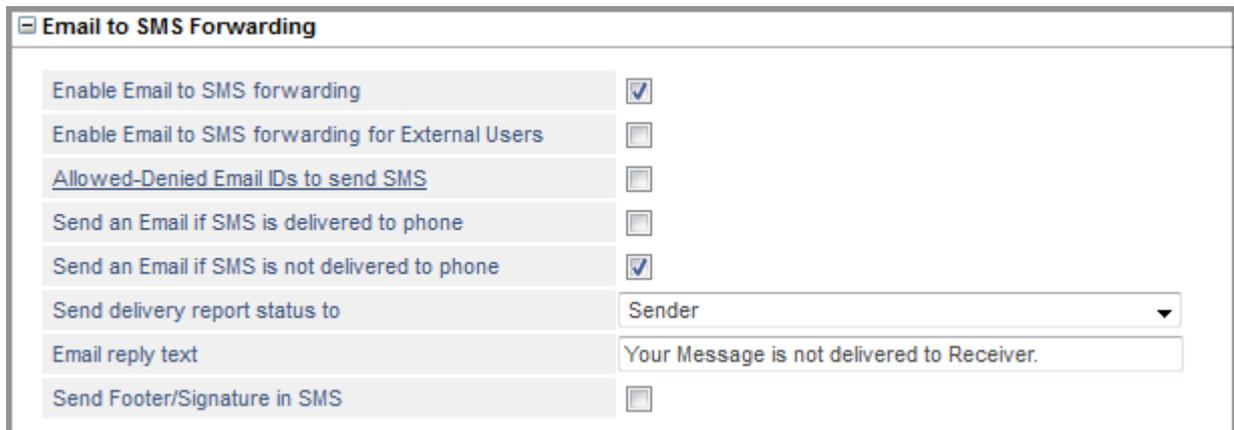

- Select the desired option for, **If recipient (Name/Number/Email ID) not found in database**. You can select **Reject SMS** or **Send Email to default recipient**. Default: Reject SMS.
- Select the desired option for, **If conflict occurs for recipient Name**. You can select **Reject SMS** or **Send Email to default recipient**. Default: Reject SMS.
- Enable the **Send copy of each SMS to System Administrator as an Email** check box, if you want to send a copy of SMS as an Email to the System Administrator. Default: Disabled.

If you enable this check box, you must configure atleast one Email address of the System Administrator under "[System Administrator Email ID](#)".

Click **Submit** to save the changes you made.

Email to SMS Forwarding

Click **Email to SMS Forwarding** to expand.

The screenshot shows a configuration panel titled "Email to SMS Forwarding". It contains several settings:

Enable Email to SMS forwarding	<input checked="" type="checkbox"/>
Enable Email to SMS forwarding for External Users	<input type="checkbox"/>
<u>Allowed-Denied Email IDs to send SMS</u>	<input type="checkbox"/>
Send an Email if SMS is delivered to phone	<input type="checkbox"/>
Send an Email if SMS is not delivered to phone	<input checked="" type="checkbox"/>
Send delivery report status to	Sender
Email reply text	Your Message is not delivered to Receiver.
Send Footer/Signature in SMS	<input type="checkbox"/>

Configure the following parameters:

- By default the **Enable Email to SMS forwarding** check box is selected (enabled). Emails received from extension users only will be forwarded as SMS. If you do not want the SMS Server to forward Emails as SMS to the users, clear the check box.
- By default the **Enable Email to SMS forwarding for External Users** check box is clear (disabled). Select this check box, if you want the SMS Server to receive Emails from extension users as well as external users and then forward them as SMS.
- Configure the **Allowed-Denied Email IDs to send SMS** list, if you want to allow or restrict certain Email IDs to send SMS. To do this,
 - Select the **Allowed-Denied Email IDs to send SMS** check box.
 - Click on **Allowed-Denied Email IDs to send SMS** and the **Allowed-Denied Email ID list** table opens. You can configure upto 500 Email IDs.
 - Select the desired option **Allow all except programmed in Denied List** or **Deny all except programmed in Allowed List**.
 - If you select **Allow all except programmed in Denied List**, in **Denied Email ID** column, enter the Email IDs from which SMS cannot be sent.
 - If you select **Deny all except programmed in Allowed List**, in **Allowed Email ID** column, enter the Email IDs from which SMS can be sent.
 - You can also configure this list by clicking the **Allowed-Denied Email ID List** link under **SMS Server**.

Default: Disabled.

- Select the **Send an Email if SMS is delivered to phone** check box, if you want a confirmation email to be sent when the delivery report is received by the Server from the network. Default: Disabled.
 - If you have enabled **Send an Email if SMS is delivered to phone**, in **Send delivery report status to**, select the recipient to whom the delivery status report must be sent. You can select **Sender**, **System Administrator** or **Both**. Default: Sender.
 - If you select **System Administrator**, the email will be sent to the email IDs configured in "[System Administrator Email ID](#)".

- In **Email Reply Text**, enter the message you want to send in the Email. The message can a maximum of 100 characters. Default text: Your Message is delivered to Receiver.
- Select the **Send an Email if SMS is not delivered to phone** check box, if you want a confirmation email to be sent when the delivery report is not received by the Server from the network. Default: Disabled.
- If you have enabled **Send an Email if SMS is not delivered to phone**, in **Send delivery report status to**, select the recipient to whom the delivery status report must be sent. You can select **Sender**, **System Administrator** or **Both**. Default: Sender.
- If you select **System Administrator**, the email will be sent to the email IDs configured in "[System Administrator Email ID](#)".
- In **Email Reply Text**, enter the message you want to send in the Email. The message can a maximum of 100 characters. Default text: Your Message is not delivered to Receiver.
- Enable the **Send Footer/Signature in SMS** check box and select the desired option to be sent:
 - Specific Text: Enter the text/message to be sent to the recipient as signature in the SMS.
 - Send Email ID of Sender: Enter the Email ID of the Sender to be sent to the recipient as signature in the SMS.
 - Send Name of Sender: Enter the Name of the Sender to be sent to the recipient as signature in the SMS.

It is recommended that you configure the parameter Send Footer/Signature in SMS, so that the recipient knows the sender of the message. If this parameter is not configured, only the mobile port SIM number will be displayed to the recipient.

Click **Submit** to save the changes.

Bulk SMS

Click **Bulk SMS** to expand.

Bulk SMS

Allow Bulk SMS

[Allowed Email IDs to send Bulk SMS](#)

Note: Bulk SMS feature would work if "Enable Email to SMS forwarding" is enabled.

Configure the following parameters:

- By default **Bulk SMS** is disabled. If you want the SMS Server to send Bulk SMS, select the check box.
- Select the **Allowed Email IDs to send Bulk SMS** check box and configure the **Allowed Email IDs to send Bulk SMS** list. Default: Disabled. Only these users will be able to send Bulk SMS. To configure the Email IDs,
 - Click on **Allowed Email IDs to send Bulk SMS** and the **Allowed Email IDs for sending Bulk SMS** table opens. You can configure upto 64 Email IDs.
 - Enter the **Email IDs** of the users who can send Bulk SMS.
 - You can also configure this list by clicking the **Allowed Email IDs for sending Bulk SMS** link under **SMS Server**.

- Click **Submit** to save the entries.

Error Cause List

There are different activities/events/error conditions handled by the SMS Server. The Server sends an SMS/Email as reply for each of these to the sender.

Refer to the table below, to know the possible Condition/Activity/Event:

Error Cause	Condition/ Activity/Event	Email reply text
Error Cause 1	When Email user sends Email to SMS Server for sending SMS and Email ID is programmed in Denied List, then reject Email.	You are not allowed to access SMS Server features. Please consult your administrator.
Error Cause 2	When Number is programmed in Denied List for Sending SMS/Receiving SMS, then reject Email (for email to SMS query) or Reject SMS (for SMS to email query).	You are not allowed to send SMS on this Number <X>. Please consult your administrator. Where <X> is the number.
Error Cause 3	When Email user sends Email to SMS Server for sending SMS and Name is written in mail but name is not found in any Directory; then reject Email.	"Name <X>" is not found in Directory Where <X> is name written as recipient in subject line.
Error Cause 4	If conflict occurs for the Recipient Name in Directory (SMS to Email or Email to SMS), then reject it.	Conflict occurred for "Name <X>" in Directory. Please check the Name. Where <X> is the Name written as recipient by sender.
Error Cause 5	If Number is not programmed for the Recipient Name in Directory request (SMS to Email or Email to SMS), then reject it.	Number is not found for Name <X> in the Directory.
Error Cause 6	When there is an Email for SMS forwarding but there is no port is programmed for sending SMS, request for sending SMS is rejected.	No port is programmed to send SMS. Consult your System Administrator.
Error Cause 7	When Email User sends Mail to SMS Server having subject line blank, reject this mail.	No contact is added. Please add at least one contact.
Error Cause 8	When Email user sends Email to SMS Server for sending SMS and length of message body is more than allowed characters. The email will be rejected or the remaining part will be ignored, depending on the configuration.	Your mail is large to send the SMS, please shorten your mail or contact your administrator.
Error Cause 9	When SMS credit exceeds, send email to sender informing about the status.	SMS Limit Exceeds. Please consult your System Administrator.
Error Cause 10	When Daily SMS credit exceeds, send email to sender informing about the status.	Daily SMS Limit Exceeds. Please consult your System Administrator.

If required you can modify the Email reply text as per your requirement. To do this,

- Click the **Error Cause List** link to expand.

Error Cause List

Error Cause No.	Email reply text
1	You are not allowed to access SMS Server features.Please consult your system administrator.
2	You are not allowed to send SMS on this Number - <X>. Please consult your system administrator.
3	Name - <X> is not found in Directory.
4	Conflict occurred for Name - <X> in Directory. Please check the name.
5	Number is not found for Name - <X> in Directory.
6	No port is programmed or available to send SMS. Consult your system administrator.
7	No contact is added. Please add at least one contact.
8	Your mail is large to send the SMS, please shorten your mail or contact your system administrator.
9	SMS limit exceeds. Please consult your system administrator.
10	Daily SMS limit exceeds. Please consult your system administrator.

Note: <X> or <x> will reflect actual Name or Number received in Email and System will send reply mail containing error message to sender. E.g. if Error Cause 5 is programmed as 'Number is not found for Name - <x>'. Let's say SMS is received for name 'Joseph' and number is not programmed in directory then reply mail will be sent to sender with text 'Number is not found for Name - Joseph'

System Administrator Email ID

Note: To use SMS Server, make sure 'SMPP Server' is not enabled.

- The Error Cause table displays the Error Cause number with the corresponding Email reply text.
- Select the Error Cause Number for which you need to edit/change the reply text.
- In **Email reply text**, enter the desired text.
- Click **Submit**.

You can generate a report of all the errors, see [“SMS Server Reports”](#) for more information. These Error Causes are also logged into the Fault Log. See [“System Fault Log”](#) for more information.

System Administrator Email ID

Click the **System Administrator Email ID** link to expand.

System Administrator Email ID

System Administrator Email ID	<input type="text"/>
	<input type="text"/>

- You must Configure the **System Administrator Email ID** to which a copy of SMS must be sent by the SMS Server, if you have enabled **Send copy of each SMS to System Administrator as an Email** check box under [“SMS to Email Forwarding”](#).

You can configure upto 5 Email ID's. The Email IDs can be of maximum 64 characters.

- Click **Submit** to save changes.

SMS Routing

The SMS Server can send SMS using any of the following methods:

- Fixed Port Routing - through a single/fixed group of Mobile Ports.
- Least Cost Routing - through selective preferred Mobile Ports grouped together in order to utilise the benefits offered by the service providers, such as 1000 free SMS in a month, reduced rates to send messages etc.

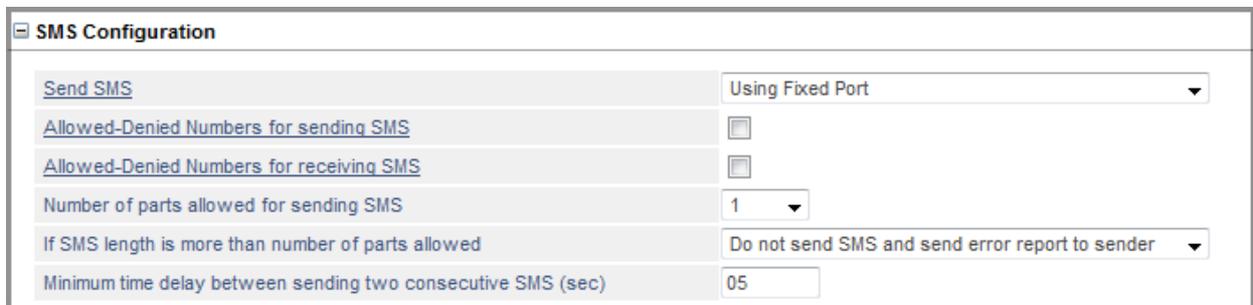

The system allows you to configure different Fixed Port Routing Tables for the SMS Server application and SMS over IP application. But, the Least Cost Routing table is common for both these applications.

Fixed Port Routing (SMS Server)

You can route the SMS through a single or fixed group of ports. To do this, you must determine the ports through which you want to send the SMS and then configure the SMS Routing-Fixed Port table.

Configuring Fixed Port Routing

- Log in as System Engineer.
- Under **Configuration**, click **SMS Server**.
- Click **General Parameters**.
- Click **SMS Configuration** to expand.
- As the **Send SMS** option select **Using Fixed Port**.

The screenshot shows the 'SMS Configuration' window with the following settings:

Parameter	Value
Send SMS	Using Fixed Port
Allowed-Denied Numbers for sending SMS	<input type="checkbox"/>
Allowed-Denied Numbers for receiving SMS	<input type="checkbox"/>
Number of parts allowed for sending SMS	1
If SMS length is more than number of parts allowed	Do not send SMS and send error report to sender
Minimum time delay between sending two consecutive SMS (sec)	05

- Click on the **Send SMS** link, the **SMS Routing-Fixed Port** table opens.

SMS Routing - Fixed Port

Rotation

Port No.	Port Name	Enable Port
1		<input type="checkbox"/>
2		<input type="checkbox"/>
3		<input type="checkbox"/>
4		<input type="checkbox"/>
5		<input type="checkbox"/>
6		<input type="checkbox"/>
7		<input type="checkbox"/>
8		<input type="checkbox"/>
9		<input type="checkbox"/>
10		<input type="checkbox"/>
11		<input type="checkbox"/>
12		<input type="checkbox"/>
13		<input type="checkbox"/>
14		<input type="checkbox"/>
15		<input type="checkbox"/>
16		<input type="checkbox"/>
17		<input type="checkbox"/>
18		<input type="checkbox"/>
19		<input type="checkbox"/>
20		<input type="checkbox"/>

Submit Default

The number of Mobile Ports displayed, depend on the variant of SARVAM UCS.

- Configure the following parameters:

- **Rotation:** By default, all the messages will be sent using the first Mobile Port enabled by you.

Select the **Rotation** check box, when you want the first SMS to be sent through the first Mobile Port, the subsequent SMS through the next Mobile Port and so on. For example, if three Ports MOB Port 1, MOB Port 2, MOB Port 3 are selected and there is a request to send 5 SMS. Then, the first SMS will be sent through MOB Port 1, second SMS through MOB Port 2, third SMS through MOB Port 3, fourth SMS through MOB Port 1 and so on.

If the Rotation check box is cleared, all the SMS will be sent using the first Mobile Port enabled by you. For example, if three Ports MOB Port 1, MOB Port 2, MOB Port 3 are selected and there is a request to send 5 SMS. Then, each SMS will be sent through MOB Port 1 only.

- **Port No.:** This is the Mobile Port number.
- **Name:** This is the name assigned to the Mobile Port. This will be displayed only if you have assigned a name to the Mobile Port on the Mobile Port Parameters page. See [“Configuring Mobile Trunks”](#).

- **Enable:** Select the Enable check box corresponding to the Mobile Port you want to use for sending the SMS.
- Click **Submit**.

Make sure that you have selected the **Send SMS** check box for this Mobile Port. See “[Configuring Mobile Trunks](#)”.

Fixed Port Routing (SMS over IP)

You can route the SMS through a single or fixed group of ports. To do this, you must determine the ports through which you want to send the SMS and then configure the SMS over IP-Fixed Port table.

Configuring Fixed Port Routing

- Log in as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SMS over IP Settings**.
- As the **Send SMS** option select **Using Fixed Mobile Port**.

- Click on the **Send SMS** link.
- The **SMS over IP-Fixed Port Routing** table opens

Port No.	Port Name	Enable Port
1		<input type="checkbox"/>
2		<input type="checkbox"/>
3		<input type="checkbox"/>
4		<input type="checkbox"/>
5		<input type="checkbox"/>
6		<input type="checkbox"/>
7		<input type="checkbox"/>

The number of Mobile Ports displayed, depend on the variant of SARVAM UCS.

- Configure the following parameters:
 - **Rotation:** By default, all the messages will be sent using the first Mobile Port enabled by you.

Select the **Rotation** check box, when you want the first SMS to be sent through the first Mobile Port, the subsequent SMS through the next Mobile Port and so on. For example, if three Ports MOB Port 1, MOB Port 2, MOB Port 3 are selected and there is a request to send 5 SMS. Then, the first SMS will be sent through MOB Port 1, second SMS through MOB Port 2, third SMS through MOB Port 3, fourth SMS through MOB Port 1 and so on.

If the Rotation check box is cleared, all the SMS will be sent using the first Mobile Port enabled by you. For example, if three Ports MOB Port 1, MOB Port 2, MOB Port 3 are selected and there is a request to send 5 SMS. Then, each SMS will be sent through MOB Port 1 only.

- **Port No.:** This is the Mobile Port number.
- **Name:** This is the name assigned to the Mobile Port. This will be displayed only if you have assigned a name to the Mobile Port on the Mobile Port Parameters page. See [“Configuring Mobile Trunks”](#).
- **Enable:** Select the Enable check box corresponding to the Mobile Port you want to use for sending the SMS.
- Click **Submit**.

Make sure that you have selected the **Send SMS** check box for this Mobile Port. See [“Configuring Mobile Trunks”](#).

Least Cost Routing

Least Cost Routing (also referred to as Automatic Route Selection) is an expense control feature of SARVAM UCS.

Least Cost Routing (LCR) is useful when there are different Mobile Ports for sending messages, and the service providers offer different schemes for SMS. These schemes may be for certain numbers or during a particular time of the day.

When an SMS is sent from the system, LCR recognizes where the SMS is going to be delivered. It selects the lowest cost port from among all the ports allotted for sending SMS, depending upon how the LCR is configured.

The system can be configured to select the most cost effective trunk for the time of the day when the SMS is sent, or to select the most cost effective trunk for the destination number to which the SMS is sent, or to select the most cost effective trunk considering both time of the day and destination number.

You can configure Time or Number or both as per your requirement.

- If you have configured only the Time, the system will check the time while sending the SMS and then route it according to the selected preference. For example you want to send SMS from one group of trunks during 9:00 a.m. to 2:00 p.m. and from 3:00 p.m. to 8:00 a.m. through another group.
- If you have configured only the Numbers, the system will check the destination number while sending the SMS and then route it according to the selected preference. For example SMS to numbers that begin with 99 and 97 can be routed through different trunk groups.

- If you have configured both, the time and number, the system will check the time as well as the destination number while sending the SMS and then route it according to the selected preference.

Configuring LCR

- Log in as System Engineer.
- Under **Configuration**, click **SMS Routing**.
- Click **Least Cost Routing**. The SMS Routing - LCR table opens.

		Time Zone 1		
		HH		
Start Time		00		
End Time		23		
Index	Number	Preference 1	Preference 2	Preference 3
1	No Match Found	Mobile-1	Mobile-1	Mobile-1
2		Mobile-1	Mobile-1	Mobile-1
3		Mobile-1	Mobile-1	Mobile-1
4		Mobile-1	Mobile-1	Mobile-1
5		Mobile-1	Mobile-1	Mobile-1
6		Mobile-1	Mobile-1	Mobile-1
7		Mobile-1	Mobile-1	Mobile-1
8		Mobile-1	Mobile-1	Mobile-1
9		Mobile-1	Mobile-1	Mobile-1
10		Mobile-1	Mobile-1	Mobile-1

The number of Mobile Ports displayed, depend on the variant of SARVAM UCS.

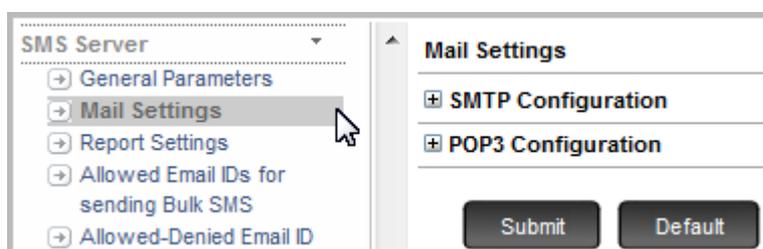

- Configure the following parameters:
- **Time Zone 1 to 4:** Configure the **Start Time** and **End Time** for each time zone. You can configure four different time zones—Time Zone1, 2, 3 and 4 as per your requirement.
- **Number:** Configure the destination numbers to which the messages are to be sent.
- **Preference1 to 4:** Select the trunks in the order of preference through which you want to send the SMS. You can select upto 4 preferences.
- Click **Submit** to save your settings.

SMS Server - Mail Settings

The Server functions as an SMTP Client to send emails and as a POP3 Client to receive emails. The SMS Server will be able to send/receive emails only after you have configured the relevant SMTP and POP3 parameters in the SMS Server.

How to configure

- Log in as System Engineer.
- Under **Configuration**, click **SMS Server**.
- Click **Mail Settings**.

SMTP Configuration

Contact your Network Administrator for the following information and configure the parameters as per the configurations done in the Email Server to register the SMS Server as an SMTP Client.

Click the **SMTP Configuration** link to expand.

- In **Use SMTP Account** select the account you want the SMS Server application to use.

You may add a new SMTP Account. To do so,

- Select *Add New* option for Use SMTP Account.
- Click **Settings**  to configure the parameters of the New SMTP Account you created. For more information, see "[SMTP Settings](#)".

Click **Submit** to save settings.

POP3 Configuration

Contact you Network Administrator for the following information and configure the parameters as per the configurations done in the Email Server to register the SMS Server as a POP3 Client.

Click the **POP3 Configuration** link to expand.

POP3 Configuration	
Requires Authentication	No ▼
Enable Secure Socket Layer (SSL)	No ▼
User ID	<input type="text"/>
Password	<input type="text"/>
POP3 Server Address	<input type="text"/>
POP3 Server Port	00110
Timer	
Download interval Timer (min)	01

- If the Email Server uses authentication, select **Requires Authentication** as **Yes**. Default: No. If your Email Server uses authentication, you must also configure the *User ID* and the *Password*.
- To transport all data in a secure manner, select **Enable Secure Socket Layer (SSL)** as **Yes**. All the data to the Email Server will be transported over secure layer. Default: No.
- If you have enabled authentication, configure the **User ID** and the Authentication **Password** as provided to you by your network administrator. The User ID may consist of a maximum of 40 characters and the Password can be a maximum of 24 characters. Default: Blank.
- Configure the **POP3 Server Address** and **POP3 Server Port**. This is the Server's IP Address and Port number that is used to download incoming mails. Both IPv4 and IPv6 addresses are supported. For example, Email Server address is 192.168.1.1 and port is 1400, then configure the Server Address as 192.168.1.1 and port as 1400. If port is not programmed, use the default port value equal to 110. Valid Port range: 110;995;1025 to 65535. The Server Address can be a maximum of 46 characters.

Click **Submit** to save settings.

Timer

- **Download interval Timer (min.)** is the time interval after which the POP3 Client of the SMS Server retries to fetch new mail from the Email Server. Valid Range is 01 to 99 minutes. Default: 01 minute.

Test POP3 Settings

- After you have configured the POP3 parameters and submitted them, the **Click to Test POP3 Settings** button appears.
- Click the '**Click to Test POP3 Settings**' button to check if the POP3 parameters have been configured correctly.

When you click this button, the alert message appears: *"Testing POP3 can take up to 99 seconds. Would you like to continue?"* Click the **OK** button.

The message *"Please refresh the web browser after few seconds to check the test mail status"* appears. Click **OK** button.

Refresh the web browser after a few seconds. The Test Result will be displayed in the 'Test Status' field.

- **Test Status:** Any one of the results listed below may appear in this field:

Test Status Message	Description
"Login to POP3 Mail Server is Successful"	When connection to POP3 server is established successfully.
"Login to POP3 Mail Server is Failed"	When connection to POP3 server is not established successfully

SMS Server Reports

The SARVAM UCS maintains a database with details of all the Email and SMS transactions as well as the Errors that occurred during these transactions.

The system has a buffer for 999 successful SMS/Email transactions and 100 Error transactions. When the buffer is full, the system overwrites these transactions on First In First Out (FIFO) basis. The buffer can be cleared at any time from the System Administrator mode.

You can generate different type of reports by setting the desired filters. SARVAM UCS can generate reports whenever you want or you can obtain it Online, immediately after the Email or SMS has been sent/received.

You can generate Reports, either

- Manually: The report is generated whenever you want.
Or
- as per Schedule: The report is generated on a preset Day, Date and Time.

SARVAM UCS allows you to set a variety of filters for printing the SMS Server Reports. SARVAM UCS supports Syslog Client for SMS Server Reports. The Syslog Client enables the system to send records in syslog format to the remote 'Syslog Server'. You can view the records on the remote server and print.

The Report contains the following information for each transaction:

- Index
- Email
 - Direction
 - Email Address
 - Status
 - Date
 - Time
- SMS
 - Direction
 - Number
 - Status
 - Date
 - Time
 - Part of SMS
- Mobile Port
- Text

To generate the reports you must configure the following parameters:

- General Report Settings
- Scheduled Report Settings
- Error Report Settings
- Report Backup Parameters
- Report Filters

Configuring Report Parameters

- Log in as System Engineer.
- Under **Configuration**, click **SMS Server**.
- Click **Report Settings**.

The screenshot displays the configuration interface for the SMS Server. On the left, a navigation menu is visible with categories: SMS Server, System Log, T1E1 Configuration, and VMS Configuration. Under SMS Server, 'Report Settings' is selected. The main panel shows 'Report Settings' with three sections: 'General Report Settings', 'Scheduled Report Settings', and 'Error Report Settings'. 'General Report Settings' includes 'Destination Port' (None), 'Destination IP Address' (empty), and 'Port' (00514). 'Scheduled Report Settings' includes 'When scheduled backup is done, send an email to' (empty). 'Error Report Settings' includes 'Destination Port' (None), 'Generate online error report on' (empty), and 'Port' (00514). At the bottom are 'Submit' and 'Default' buttons.

- Under **General Report Settings**,
 - Select **Ethernet** as the **Destination Port**.
 - In **Destination IP Address**, enter the IP Address of the remote Syslog Server. Both IPv4 and IPv6 addresses are supported.
 - In **Port**, enter the port of the remote Syslog Server. Valid port range is: 514; 1025 to 65535. Default: 514.
- Under **Scheduled Report Settings**,
 - If you have opted for Scheduled Reports, in **When scheduled backup is done, send an email to**, enter the desired email ID. The report will be generated and sent to this email ID.

To select the Scheduled Report options log into the SA mode.

- Under **Error Report Settings**,
 - Select **Ethernet** as the **Destination Port**.
 - In **Destination IP Address**, enter the IP Address of the remote Syslog Server. Both IPv4 and IPv6 addresses are supported.

- In **Port**, enter the port of the remote Syslog Server. Valid port range is: 514; 1025 to 65535. Default: 514.

How to use

You can print Reports whenever you want or schedule printing of the report from the System Administrator mode.

You must set the filters as per your requirement before you print the Report. To do this,

- Open Jeeves.
- Log in as System Administrator.
- Click **SMS Server** to expand.

Settings Report Filters

- Click **Filter Report** to set the various filters as per your requirement:
 - Select the **Direction**. You can select **SMS to Email** or **Email to SMS** or **Both**.
 - Select the **Mobile Port/s** using which the SMS are sent/received. You can select the desired range in the **From** and **To** fields.
 - Select the **Dates** during which the SMS/Emails are sent/received. You can select the desired range in the **From** and **To** fields.

- Select the **Time** duration during which the SMS/Emails are sent/received. You can set the desired range in the **From** and **To** fields.
- Select the type of **SMS Status**. You can select from the following:
 - All
 - Pending
 - Sent
 - Delivered
 - Not Delivered
 - Received
 - Failed
- Select the type of **Mail Status**. You can select from the following:
 - All
 - Sent
 - Received
 - Pending
 - Failed
- The minimum and maximum number of parts in which an SMS can be sent is from 1 to 8. Select the **Part of SMS** for which you want to generate the report. After you have selected the Part of SMS value, select the desired filter—**All**, **Equal to**, **Less Than** or **More than**—to be applied to that value. For example if you select 5 as the Part of the SMS and More than as filter, the report will be generated for all the SMS sent in more than 5 parts.
- If you want reports to be generated for certain numbers, select the **Filter Numbers** check box and configure the desired numbers in the table.
- If you want reports to be generated for certain Email IDs, select the **Filter Email Ids** check box and configure the desired Email IDs in the table.
- Click **Submit**.
- To view the report, click the **Generate Report** button.
- The report is displayed in a new window.

Online Report Generation

- Click the **Report** under **SMS Server**.

- To **Generate online report**, click the **Start** button.

- To stop printing, click the **Stop** button.

Scheduled Report Generation

- Click the **Report** under **SMS Server**.
- To **Generate schedule backup**, select the desired option a particular day, day of the week, or day of the month.

- Click **Submit** to save.

Manual Report Generation

- To generate the report manually, click the **Report** under **SMS Server**.
- To **Generate report now**, click the **Generate** button.
- The report is generated and appears in a new window.

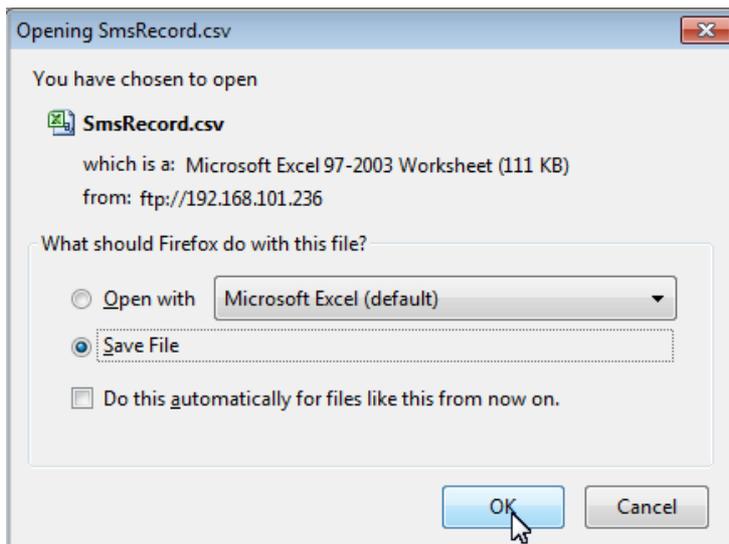

<< 001-050 051-100 101-150 151-200 201-250 251-300 301-350 351-400 401-450 451-500 >>

Bulk SMS Status

Current status of Bulk SMS process **Not running...**

- To stop printing, click the **Stop** button.

Bulk SMS Status

- Click the **Report** under **SMS Server**.
- In **Current status of Bulk SMS process**, the status of the Bulk SMS process is displayed.
- If the **Current status of Bulk SMS process** displays *Running*, click the **Abort** button to stop the ongoing process midway.

To clear all the database, click the **Clear Database** button.

SMS over IP

The Unified Messaging Functionality of SARVAM UCS includes SMS over IP.

SMS over IP allows you to:

- Forward SMS received on Mobile Port from any extension user as IM to Matrix VARTA UC Users/ Extended SPARSH VP710 Users.
- Forward IM from Matrix VARTA UC Users/Extended SPARSH VP710 Users as SMS to any extension user through the desired Mobile Port.

How it works

For this feature to work,

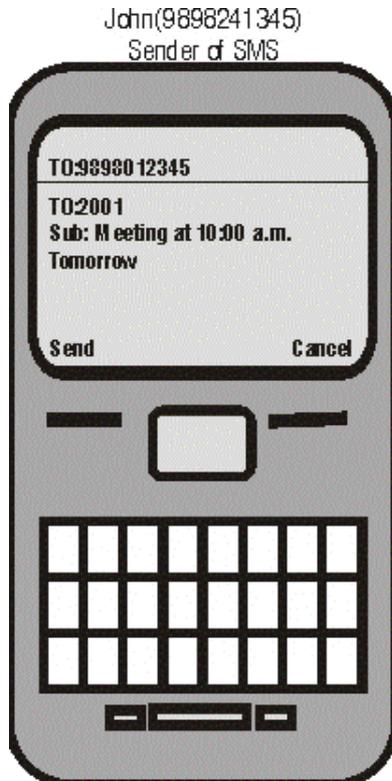

- you must define the Mobile port through which the messages are to be sent/received (Fixed/LCR). See [“SMS Routing”](#).
- configure the SMS parameters and the SMS Budget parameters (if required) on the respective Mobile ports, see [“Configuring Mobile Trunks”](#).
- enable **SMS over IP** for Matrix VARTA UC Users. See [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#) and [“.Configuring Matrix Extended SPARSH VP710”](#).
- configure the **SMS over IP Settings**. See [“How to Configure”](#).

SMS over IP Functionality requires SMS Server License. Make sure you purchase the license for using this feature. For more information, see [“License Management”](#).

Forwarding an incoming SMS as an IM

- To forward SMS as an IM, the SMS received on the Mobile Port must be in a specific format. Illustrated below is an example of the format.

Here,

- The sender of the SMS is John (9898214345).
- The sender must send the message to the SIM Number of the Mobile Port of SARVAM UCS, that is 9898012345.
- The body of the message must contain the following:
 - **To:** This is the destination where the IM is to be sent. In this case 2001.
 - **Sub:** This is the message that will be displayed to the recipients. In this case, 'Meeting at 10.00 a.m. tomorrow'.
- When the SMS is received on Mobile Port (9898012345) in the above format, the system checks the sender's number (9898214345 - John) in the Denied numbers list of the SMS Server.

If the SMS is received in multiple parts, the first 160 characters only will be sent as an IM.

- If a match is found in the Denied list, the SMS will be rejected. If no match is found, then it checks the destination where the SMS is to be forwarded as an IM.

The destination can be the recipient's Extension number or Name. The **To** field in the message body specifies the destination.

You cannot send the same message to multiple destinations at the same time. You must send the same message to individual recipients separately.

- When the destination is an Email ID, the further handling of the SMS will be done by the SMS Server Application. See “[SMS Server](#)” for more details.
- When the destination is an Extension Number, the system will search for the Extension Number in its database. When a match is found and it is a SIP extension, the system will check if the option **SMS over IP** is enabled for this SIP extension. If it is enabled the SMS will be forwarded as an IM. If this option is disabled, the further handling of the SMS will be done by the SMS Server Application. See “[SMS Server](#)” for more details.

When the destination is an Extension Number other than SIP extension, the further handling of the SMS will be done by the SMS Server Application. See “[SMS Server](#)” for more details.

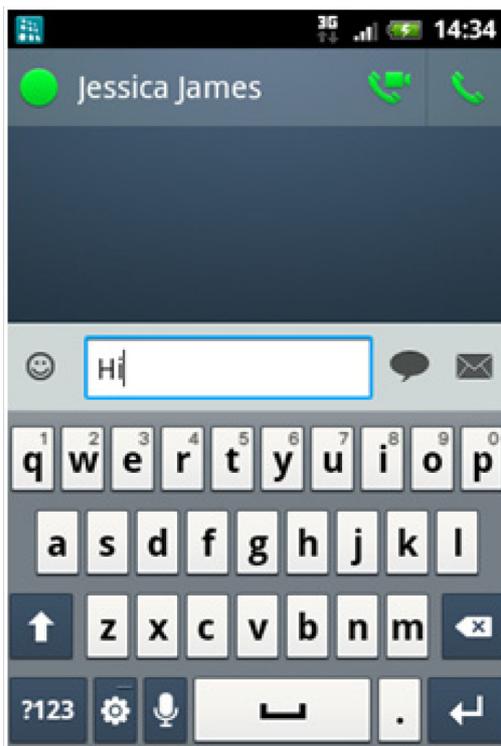

- When the destination is a Name, the system will search for the Name in its database. When a match is found, the system will check the corresponding Extension number. If it is a SIP extension the SMS will be forwarded as an IM. If the Extension Number is any other extension or if a match is not found the further handling of the SMS will be done by the SMS Server Application. See “[SMS Server](#)” for more details.

Forwarding an IM as an SMS

You can send a message as an IM or SMS using Matrix VARTA Mobile UC Clients only.

To forward an IM as an SMS, refer to the illustration below:

Here,

- The SIP extension user is typing a message to Jessica James. This message can either be sent as an IM or an SMS.

- To send an SMS, user taps **Message** .
- The system will check if the SMS is sent by a SIP extension. If it is a SIP extension, then it checks if the **SMS over IP** option is enabled for the SIP extension. If it is enabled then the SMS will be sent using the desired Mobile Port. The Mobile Port using which the SMS will be sent to the destination will depend on the configurations— Fixed/LCR— in SMS over IP Settings.
- When the SMS is received on Mobile Port, the system checks the **Send SMS** and the **Call Budget** parameters configured for the Mobile Port.

If Send SMS is disabled or the Call Budget exceeds the SMS will be rejected.

If **Send SMS** is enabled and the **Call Budget** has not exceeded, the system checks the senders number in the Denied numbers list as configured in the SMS over IP Settings.

- If a match is found in the Denied list, the SMS will be rejected. If no match is found, then it checks the destination where the SMS is to be delivered. The destination can be an Extension Number/ External Number or Name.

When the destination is an Extension Number/Name the system will search for the Extension Number in its database and then send an SMS to its corresponding Mobile Number.

When the destination is a Mobile number the system will send the SMS to this Mobile number.

- The senders Name and/or Number will be displayed to the recipients, if you have enabled **Add Footer in SMS** and configured the parameter **Footer text**.

*It is recommended that you configure the parameters **Add Footer in SMS** and **Footer text**, so that the recipient knows the sender of the message. If this parameter is not configured, only the mobile port SIM number will be displayed to the recipient.*

How to Configure

You need to configure the following SMS over IP parameters,

- Log in as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **SIP over IP Settings**.

- Configure the following parameters:

- You can **Send SMS** through certain fixed Mobile Ports or through different Mobile Ports according to specific numbers and time.

To send messages through fixed Mobile Ports, select **Using Fixed Mobile Port** and configure the **SMS over IP - Fixed Port Routing** table. For detailed information, see [“Fixed Port Routing \(SMS over IP\)”](#).

To send messages to specific numbers through certain preferred Mobile Port/s during a defined time interval, select **Based on LCR Table** and configure the **SMS Routing-LCR** table. For detailed information, see [“Least Cost Routing”](#).

Default: Using Fixed Mobile Port.

- Configure the **Allowed-Denied Numbers for sending SMS** list, if you want to allow or restrict sending of messages on specific numbers. To do this,
 - Select the **Allowed-Denied Numbers for sending SMS** check box.
 - Click on **Allowed-Denied Numbers for sending SMS** and the **Allowed-Denied Numbers for sending SMS** table opens. You can configure upto 999 numbers.
 - In the Allowed column, enter the numbers on which messages can be sent and in the Denied column, enter the numbers on which messages cannot be sent.
 - You can also configure this list by clicking the **Allowed-Denied Numbers for sending SMS** link under **SMS Routing**.

Default: Disabled

- Configure the **Allowed-Denied Numbers for receiving SMS** list, if you want to allow or restrict receiving messages from specific numbers. To do this,
 - Select the **Allowed-Denied Numbers for receiving SMS** check box.
 - Click on **Allowed-Denied Numbers for receiving SMS** and the **Allowed-Denied Numbers for receiving SMS** table opens. You can configure upto 999 numbers.
 - In the Allowed column, enter the numbers from which messages can be received and in the Denied column, enter the numbers from which messages cannot be received.
 - You can also configure this list by clicking the **Allowed-Denied Numbers for receiving SMS** link under **SMS Settings**.

Default: Disabled.

- Enable the **Add Footer in SMS** check box and in **Footer text** enter the desired text/message to be sent to the recipient as signature in the SMS. By default, the senders Name and Number will be sent.
- Click Submit to save the changes.

SMS/Email Group

What's this?

In an organization you can group together extension users as per your requirements. Groups can be made according to the departments, project-wise, product-wise, according to a particular task. The system clubs together the extension users assigned the same Group.

You can reach all the members simultaneously in a Group, by sending a SMS or an Email.

How to configure

To use SMS/Email Group feature,

- Decide the type of groups you want to create.
- Make a list of extensions to be assigned to a particular group.
- Configure the type of Groups at each index in the SMS/Email Group table. For instructions, see ["Configuring SMS/Email Group table"](#).
- Assign the desired extensions to the SMS/Email Group you created as per your requirement. For instructions, see ["Configuring SLT Extensions"](#), ["Configuring DKP Extensions"](#), ["Configuring ISDN Terminals"](#), ["Configuring Matrix SPARSH VP330"](#), ["Configuring Matrix SPARSH VP248"](#), ["Configuring Matrix VARTA ADR100/AMP100 UC Clients"](#), ["Configuring Matrix SPARSH VP310"](#), ["Configuring Matrix SPARSH VP510"](#), ["Configuring Matrix SPARSH VP210"](#)
- Assign a Global/Personal Directory contact to the SMS/Email Group you created as per your requirement. For instructions, see ["Configuring Personal Directory using Jeeves"](#) and ["Configuring Global Directory using Jeeves"](#) under ["Abbreviated Dialing"](#).

Configuring SMS/Email Group table

- Log in as System Engineer.
- Under **Configuration**, click **SMS Server**.

- Click **SMS/Email Group**.

The screenshot shows a web-based configuration interface. On the left, a sidebar menu is expanded to show 'SMS/Email Group' under the 'SMS Server' section. The main content area is titled 'SMS/Email Group' and features a table with 10 rows. The first column is labeled 'Index' and contains numbers 1 through 10. The second column is labeled 'Type of Group' and is currently empty. Below the table, there are two buttons: 'Submit' and 'Default'.

Index	Type of Group
1	
2	
3	
4	
5	
6	
7	
8	
9	
10	

You can configure maximum 99 Groups,

- At the desired index, in **Type of Group** configure the Group Name. The Group Name can be a maximum of 16 characters. Default: Blank.
- Click **Submit** to save your entries.

Computer Telephony Integration (CTI)

CTI stands for Computer Telephony Integration. CTI is a technology that integrates a telephone and a computer. Using CTI, you can control your telephone with your computer and vice versa. This technology contributes to the success of a modern business.

The Matrix TAPI Service Provider (TSP) acts as a link to integrate the interactions between your telephones and your computers. The computer in which you install this application functions as a Client and SARVAM UCS functions as a Server. In an organization, it may happen that the data is stored in different computers. In this scenario, the Matrix TAPI Service Provider can be installed in three (maximum) different computers, if required.

Connecting your telephone with your computer has advantages such as — initiate a call at a click of a mouse directly from a CRM system (Customer Relationship Management) or from a database, view missed calls directly on your screen and can call back with just one click, transfer and call recording can be initiated via a mouse click.

- The Matrix TAPI Service Provider (TSP) is developed using TAPI Standard 2.2.
- To use this feature, you must purchase the CTI License. Refer “[License Management](#)” for more details.
- To develop your own TAPI Application, refer to the **Matrix TAPI Developer’s Guide**. The documentation can be found at <https://www.matrixcomsec.com/support/telecom-product-manuals/>

How it works

Using CTI, only following features and facilities of SARVAM UCS can be accessed:

Features	SLT	DKP/Extended IP Phone	MATRIX VARTA WIN200 Desktop UC Client	Standard IP Phone
Make a call	✓	✓	✓	x
Answer/receive a call	x	✓	✓	x
Put a call on hold	x	✓	✓	x
Retrieve a held call	x	✓	✓	x
Toggle between two calls	✓	✓	✓	x
Transfer a call	✓	✓	✓	x
Disconnect/Release a call	✓	✓	✓	✓

Features	SLT	DKP/Extended IP Phone	MATRIX VARTA WIN200 Desktop UC Client	Standard IP Phone
Conference - Add/Remove a party	✓	✓	✓	x
Dial digits for Multi-Stage dialing	✓	✓	✓	x

For CTI to work:

- You must install the Matrix TAPI Service Provider (TSP) in your computer (Client). For instructions refer to the TAPI User Guide. The documentation can be found at <https://www.matrixcomsec.com/support/telecom-product-manuals/>
- Configure the Matrix TSP parameters. For instructions refer to the TAPI User Guide.
- Configure the CTI parameters in SARVAM UCS. See “[Configuring CTI Parameters](#)”.
- Make sure the necessary third party TAPI applications are installed.

This is how CTI works,

- After successful installation of the Matrix TSP in your Computer (Client) and configuring the necessary parameters, a binding (CTI link) is established between the Client and SARVAM UCS. The SARVAM UCS communicates with the Client via Matrix TSP.
- All the information is passed by SARVAM UCS to the Matrix TSP and vice versa.
- The third party softwares in the Client can also communicate with the Matrix TSP to get the required information.
- You can handle calls from your computer (desktop application) as well as your extension phone.

Configuring CTI Parameters

You must configure the following CTI parameters in SARVAM UCS. To do so,

- Log in as System Engineer.
- Under **Configuration**, click **CTI**.
- Click **CTI Parameters**.

The screenshot shows the SARVAM UCS configuration interface. On the left is a navigation menu with the following items: Communication Port, Configuration Upload, CO Configuration, COSEC Integration, CTI (expanded), CTI Parameters (highlighted), Resource, Status, Date & Time, DDI Routing, Default the System, Dial Plan for SIP Extension, Department Groups, DISA - CLI Authentication, and DKP Configuration. The main content area is titled 'CTI Parameter' and contains the following settings:

- CTI Server: Disable
- Server Listening Port: 04000
- Make Call Ring On SLT: Enable

Below these settings is a 'Debug Parameter' section with a 'Debug' checkbox that is currently unchecked. A note states: 'Note: System Supports Maximum 3 CTI Link/s.' At the bottom of the configuration area are two buttons: 'Submit' and 'Default'.

- Enable **CTI Server**.
- Enter **Server Listening Port**. When the CTI Link is to be established between Matrix TSP and SARVAM UCS, then the binding will be done on this port.

*Make sure the same port is configured as the **Listening Port of System— SARVAM UCS** in the Client. For more details, see **Matrix TSP User Guide**.*

- Enable **Make Call Ring on SLT**, if you want the SLT to ring when an outgoing call is initiated from the CTI Client.

If Extended IP Phone or DKP is connected as an extension, the speaker of the phone is automatically turned on when an outgoing call is initiated from the CTI Client.

- Select the **Debug** check box to log the CTI Server events.
- Click **Resources**, to view the details of the CTI events and activities. These details are used by the Technical Team only.
- Click **Status**. It displays the following details of each Client:
 - **IP Address:** It displays the IP Address of the Client in which you have installed the Matrix TSP.
 - **Port:** It displays the Port of the Client on which the CTI binding with the Server is established.
 - **TSP Version:** It displays the Software Version of the Matrix TSP installed in the Client.
 - **Status:** It displays the status of the Client and Server binding, that is whether the link is up or down.

Incoming and Outgoing Call Routing

Incoming Call Routing

What's this?

SARVAM UCS offers various options for routing incoming calls on trunks. You can configure incoming call routing in the following ways:

- Land the call on a group of extensions, referred to as “[Trunk Landing Group \(TLG\)](#)”.
- Route the call to the Built-In Auto Attendant.
- Route call to the Voice Mail Auto Attendant.
- Greet the caller with Trunk Auto Answer, and then route the call to the Trunk Landing Group.
- Route the call to a specific extension on the basis of the CLI received.
- Route the call according to the DDI numbers²²⁹.
- Route the call to a group of trunks to use the Gateway functionality of SARVAM UCS.

It is also possible to configure a different routing option for each time zone—Working Hours, Break Hours, Non-working hours—according to your call routing requirement.

Besides the type of routing you configure, there are certain features supported by SARVAM UCS on trunks that also determine how an incoming call will be routed, when these features are enabled on the trunk. These features are:

- “[Call Back on Trunk Ports](#)”: Missed calls received on a trunk are returned to the same or to an alternative number.
- “[Direct Inward System Access \(DISA\)](#)”: From a remote location, users can make a call to an extension of SARVAM UCS. The call is routed to an extension after authentication and the users can use the system resources (make calls, access features, configure the system).
- “[RCOC \(Return Call to Original Caller\)](#)”²³⁰: When an unanswered outgoing call is made by an extension is returned by the called party, this call is routed to the very extension that originally made the outgoing call.

229. Supported on ISDN and SIP trunks only.

230. Supported on digital trunks—BRI, T1E1PRI, Mobile and SIP.

How it works

When a call lands on a trunk, the system checks the trunk features and the routing option configured for the current time zone on the trunk in the following sequence and accordingly routes the call.

1. Call Back on Trunks
2. DISA - CLI Authentication
3. RCOOC (Return Call on Original Caller)
4. DDI Routing and DISA - CLI Authentication
5. DDI Routing and DISA - PIN Authentication
6. DDI Routing
7. DISA - PIN Authentication
8. Auto Attendant - Built-In or Voice Mail
9. Trunk Auto Answer
10. Trunk Landing Group

In the default Incoming Call Routing configuration, incoming calls on a trunk of SARVAM UCS are routed to a [“Trunk Landing Group \(TLG\)”](#).

Routing to a Trunk Landing Group

A Trunk Landing Group (TLG) is a [“Routing Group”](#), consisting of a group of extension types. These extensions may be Digital Key Phones (DKP), Single Line Telephone (SLT), SIP, ISDN Terminals or Virtual Extensions. A Routing Group can have a single extension type or as many as 32 extension types as members.

A Routing Group can also have a Voice Mail Auto Attendant and an Outgoing Trunk Bundle Group as members, the significance of which is described later in this topic under *Routing to the Voice Mail Auto Attendant* and *Routing to an Outgoing Trunk Bundle Group*.

- The call is landed on the The Trunk Landing Group (TLG) assigned to the trunk for the current time zone.

By default, Trunk Landing Group number 01 assigned to all trunks for all time zones and has DKP software port 001, SLT software ports 001 and 002 as members.

- The member extensions in the TLG start ringing in the sequence in which they are arranged in the TLG.
- Each member extension rings for the duration of the *Ring Timer* (programmable; default: 15 seconds).
- If *Continuous Ring* is enabled, each extension will ring continuously till the call is answered. The extension continues to ring even as other extensions in the group are hunted.

If the call remains unanswered even after the last extension in the group has been hunted, the system will loop back and start hunting from the first extension, all over again.

- If *Rotation* is enabled on a TLG, for each new call on a trunk, the system will land the call on the extension next to the one that received the last call. Thus, ensuring an equal distribution of incoming calls on all member extensions of the TLG.

When Rotation is disabled, for each new call on a trunk, the system will land the call on the first free extension of the TLG.

To know more about how TLG works, see [“Trunk Landing Group \(TLG\)”](#).

You can also route calls that remain unanswered by extensions in the Trunk Landing Group to the Voice Mail Auto Attendant.

Routing Calls to the Auto Attendant

- When a call lands on the trunk, the system checks the trunk features and the routing option configured for the current time zone on the trunk in the sequence mentioned earlier.
- When Auto Attendant is configured for the current time zone, the system checks for the type of Auto Attendant configured for the current time zone.

Built-In Auto Attendant

- If Built-In Auto Attendant is configured,
 - The system greets the caller with a pre-recorded voice message and prompts the caller to dial the desired number.
 - The call is placed on the extension number dialed by the caller.
 - If the caller fails to dial any extension number the call is routed to the TLG configured for the current time zone.
 - If the caller dials '9' for Operator, the call is routed to the Operator group assigned to the trunk. To know more, see ["Configuring 'Operator'"](#).

For a detailed description of how the Built-In Auto Attendant works, see ["Auto Attendant"](#).

Voice Mail Auto Attendant

- If Voice Mail Auto Attendant is configured,
 - The call is routed to the Voice Mail System (VMS).
 - The VMS greets the caller with the Welcome message and the Greeting message selected for the current time zone.
 - The VMS processes the call as per the Voice Mail Auto Attendant Menu assigned to the trunk.

For a detailed description of how the Voice Mail Auto Attendant works, see ["Auto Attendant"](#).

You can also route calls that remain unanswered by extensions in the Trunk Landing Group to the Voice Mail Auto Attendant.

Delayed Auto Attendant

- If Delayed Auto Attendant is configured,
 - The system first places the call on the TLG.
 - It waits for the configured *Auto Attendant Delayed Timer* to expire.
 - If the call remains unanswered by the TLG, on the expiry of the Auto Attendant Delayed Timer, the system checks for the type of Auto Attendant selected for the current time zone.
- If Built-In Auto Attendant is selected, the call is routed accordingly. See description for ["Built-In Auto Attendant"](#) in this topic.
- If Voice Mail Auto Attendant is selected the call is processed as per the Voice Mail Auto Attendant Menu assigned to the trunk.

To know more about Delayed Auto Attendant, see ["Auto Attendant"](#).

Greeting with Trunk Auto Answer

- When a call lands on the trunk, the system checks the trunk features and the routing option configured for the current time zone on the trunk in a sequence mentioned earlier.
- When Trunk Auto Answer is enabled on a trunk, the system checks for the type of Trunk Auto Answer set on the trunk.
- If **Trunk Auto Answer - For All Calls** is selected,
 - the call immediately answered with a Greeting message, known as the *Trunk Auto Answer Greeting*.
 - The call is then routed to the landing destination selected for the current time zone.
 - The system waits for the duration of the *Built-In Auto Attendant Inactivity Timer* (default: 60 seconds) as it waits for the call to be answered.
 - If the call is answered by the landing destination, within this timer, the caller is connected to the answering extension.
 - If the call remains unanswered until the expiry of this timer, the system plays the *Trunk Auto Answer Busy Bye* message or a Busy Tone and releases the trunk port.
- If **Trunk Auto Answer - When Busy** is selected,
 - the system checks will first check the state of the landing destination for the current time zone.
 - If the landing destination is busy, the system answers the call with the *Trunk Auto Answer Greeting* message.
 - The system waits for the duration of the *Built-In Auto Attendant Inactivity Timer* (default: 60 seconds) for the landing destination to become free.
 - If the landing destination is free before the timer expires, the call is placed.
 - If the landing destinations is busy till the end of this timer, the system plays the Trunk Auto Answer Busy Bye message or a Busy tone to the caller and releases the trunk port.
- If **Trunk Auto Answer - Delayed** is selected,
 - the system first routes the incoming calls to the TLG selected for the current time zone.
 - It waits for the duration of the *Delayed Trunk Auto Answer Timer* (programmable; default:10 seconds) for any of the extensions in the TLG to answer the call.
 - If the call is not answered by any of the extensions within this timer, the system answers the call with the *Trunk Auto Answer Greeting* message, and rings the landing destination.
 - The system starts the *Built-In Auto Attendant Inactivity Timer* (default: 60 seconds) as it waits for the call to be answered and repeatedly plays the *Ring Back Tone* message or tone to the caller.
 - If the call is answered before the Inactivity Timer by the landing destination, the system stops the timer and the Ring Back tone message/tone and connects the caller to the destination.
 - If the call remains unanswered till the expiry of the Inactivity Timer, the system plays the Trunk Auto Answer Busy Bye message or a Busy tone to the caller and releases the trunk port.

Feature Interactions

As mentioned earlier, certain trunk features also determine incoming call routing. Consider the following feature interactions between Trunk Auto Answer and other trunk features when configuring Trunk Auto Answer as a routing option on a trunk.

- **Call Back on Trunks:** This feature should be disabled when using Trunk Auto Answer.
- **DISA - CLI Authentication:** This feature should be disabled when using Trunk Auto Answer.
- **Return Call to Original Caller (RCOC):** If both Trunk Auto Answer and RCOC are enabled on the same trunk, the call will first be answered as per Trunk Auto Answer, and then placed on the destination as per RCOC.

- **CLI Based Routing:** If both Trunk Auto Answer and CLI Based Routing are enabled on the same trunk, the call will first be answered as per the Trunk Auto Answer, and then placed on the destination as per the CLI Based Routing Table.
- **DISA - PIN Authentication:** If both Trunk Auto Answer and DISA PIN Authentication are enabled on the same trunk, only DISA - PIN Authentication will work. The call will be treated as a DISA call and routed as per the DISA logic.
- **Auto Attendant:** If both Trunk Auto Answer and Auto Attendant are enabled on the same trunk, only Auto Attendant will work. The call will be processed by the Auto Attendant.

Routing Calls based on CLI Received

It is possible to land calls from a particular telephone number on a particular extension or group of extensions using [“CLI Based Routing”](#) on the trunk. For this, you need to configure the CLI of the calling parties and their corresponding landing destinations in the *CLI Based Routing Table*.

- When CLI Based Routing is configured for the current time zone, the system checks the entries of the CLI Based Routing Table.
- If the calling party’s number is found in the CLI Based Routing Table, the call is placed on the corresponding landing destination.
- If the calling party’s number does not exist in the CLI Based Routing Table, the call will be routed according to the incoming call routing option you have configured.

For a detailed feature description, see [“CLI Based Routing”](#).

Routing Calls on the basis of DDI Numbers

Direct Dialing-In (DDI) is a feature of ISDN (T1E1PRI and BRI) and SIP trunks which enables calls to be directly placed to the desired extensions without operator intervention. The DDI Numbers given by the Service Provider are mapped to extensions. Callers can reach the extensions directly by dialing the DDI number of the respective extension.

- DDI Routing works on the basis of the *IC Reference Table* and the *DDI Routing Table*.
- The T1E1PRI, BRI and SIP trunks ports are assigned IC Reference ID, which may be different for each time zone. The IC Reference ID is the reference number that acts as an identifier to the translation logic programmed in the IC Reference Table. When a call lands on the ISDN/SIP trunk, the system checks the IC Reference ID assigned to it. It checks the IC Reference Table for the corresponding DDI Routing Reference ID for call resolving.
- Using the DDI Routing Reference ID, the system checks the DDI Routing Table for mapping the received DDI number to a flexible number (target extension).
- The system first compares the received DDI number (called party number) with the DDI numbers programmed in the DDI Routing Table.
- Once a perfect match is found, the system checks for the Route on First Destination flag in the IC reference table. If the flag is enabled, the call lands on the first extension of the MSN number in the DDI Routing Table. If the flag is disabled, the call is routed to the identified target extension.

- Once the target extension is identified, the system checks the *DDI IC routing* flag of the extension in its [“Station Advanced Feature Template”](#). If the flag is enabled, the call lands on the extension else the call is routed to the TLG assigned to the trunk.
- When the call lands on the DDI extension, the caller gets the Ring Back Tone. The extension rings for duration of the *DDI Ring Timer*.
- If the call is not answered within the DDI Ring Timer, the system checks for the *When No reply* option in the IC reference Table for action to be taken.
- Similarly, if the DDI extension is busy, the caller gets Busy Tone. The system checks the *When Busy* option in the IC Reference Table for action to be taken.
- The options for action to be taken the DDI extension does not No Reply or is Busy are:
 - Disconnect the call
 - Route the call to Trunk Landing Group
 - Answer the call automatically, greet the caller with a voice message, and on completion of message disconnect the call.
 - Answer the call, greet the caller with a voice message, and on completion of the message route the call to Trunk Landing Group.
 - Route the call to Voice Mail; to the DDI extension’s Mail Box.

To know more, refer the topics [“Direct Dialing-In \(DDI\)”](#) .

DDI Routing will not work if Auto Attendant or DISA are enabled on a trunk.

Routing Calls to Outgoing Trunk Bundle Groups

To use SARVAM UCS’s gateway functionality, you can route incoming calls on a trunk to a group of outbound trunks, referred to as [“OG Trunk Bundle Group”](#). The Called Number (number dialed by the caller) received in the incoming call is out dialed from Outgoing Trunk Bundle Groups.

Routing to Outgoing Trunk Bundle Groups is supported only on SIP, ISDN T1E1PRI, ISDN BRI and E&M Trunks (except Express line), as they support Called Number. CO and Mobile trunks support only CLI.

To do this, you must configure the desired outbound trunks in an “Outgoing Trunk Bundle” and create an “Outgoing Trunk Bundle Group (OGTB)”. You must then include this OGTB as a member of the Trunk Landing Group you assign to the SIP/ISDN T1E1PRI/ISDN BRI/E&M trunk.

When there is an incoming call on the SIP/ISDN T1E1PRI/ISDN BRI/E&M trunk,

- the system checks the trunk features and the routing option configured for the current time zone on the trunk in a sequence as mentioned earlier.
- On finding OGTB as member in the TLG of the current time zone, the call is routed to the OGTB number assigned.
- The system out dials the Called Number received in the incoming call from the OGTB.

How to configure

Incoming call routing options for a trunk are to be configured on the Trunk Feature Template assigned to the trunk.

Configuring Trunk Landing Group

To land calls on a group of extensions, you must do the following:

- First configure a Trunk Landing Group. You may configure the same Trunk Landing Group for working, break and non-working hours or you different Trunk Landing Group for all three time zones.
- To land calls on the Operator extension first, make sure the Operator extension is included in the TLG you configure. Also make sure that the Operator extension is the first member in the group.

You can also keep the same Routing Group you configured as Operator group as the Trunk Landing Group.

- Assign the Trunk Landing Group to the trunk in the Trunk Feature Template for each time zone.
- To have a number of extensions in the group ring simultaneously, enable *Continuous Ring* on these extensions and set the *Ring Timer* for these extensions to '00' seconds.
- To set equal distribution of incoming calls on all extensions in the group, enable *Rotation* for the entire group (default: disabled).

For detailed instructions, see [“How to configure”](#) in *Trunk Landing Group*.

If you want incoming calls to be routed to Trunk Landing Group only, do not enable any other incoming call features on the trunk.

Configuring Auto Attendant

To route calls to the **Built-In-Auto Attendant**, you must do the follow:

- Make a list of the trunks by their port type (CO, Mobile, SIP, BRI, T1E1PRI) and port number on which you want to use the Built-In Auto Attendant.
- Configure a Trunk Feature Template with Built-In Auto Attendant enabled for the desired time zones.
- Assign this Trunk Feature Template to the desired trunks. The calls landing on this trunk will be answered by the Built-In Auto Attendant. See [“Trunk Feature Template”](#), for more information.
- Set the Start Time for the Morning, Afternoon and Evening Greeting Messages. Refer [“Greeting Message Time”](#) in *System Parameters* for instructions.
- Assign *Voice Modules* for Built-In Auto Attendant Messages. To play to callers pre-recorded voice messages as Built-In Auto Attendant greetings and to play voice prompts at each stage of the call, you need to assign Voice Modules for the following Built-In Auto Attendant Messages:

For detailed instructions, see [“How to configure”](#) in [“Auto Attendant”](#).

- If you want the incoming calls to first land on extensions, you must configure the Auto Attendant Delayed Timer (sec). The call will be placed fist on the extensions in the Trunk Landing Group. If the call remains

unanswered till the expiry of the timer, it shall be answered by the Built-In Auto Attendant. This is known as **Delayed Auto Attendant** on trunks.

For detailed instructions, see [“How to configure”](#) in [“Auto Attendant”](#).

To route the call to the Voice Mail Auto Attendant, you need to configure:

- Make a list of the trunks by their port type (CO, Mobile, SIP, BRI, T1E1PRI) and port number on which you want to use the Voice Mail Auto Attendant.
- Configure a Trunk Feature Template with Voice Mail Auto Attendant. enabled for the desired time zones and assign the Voice Mail Auto Attendant (VMAA) Menu.
- Assign this Trunk Feature Template to the desired trunks. The calls landing on this trunk will be answered by the Voice Mail Auto Attendant. See [“Trunk Feature Template”](#), for more information.

For detailed instructions, see [“How to configure”](#) in [“Auto Attendant”](#).

- Complete the VMS related configuration.
 - Configure Welcome and Greeting messages. You may either use the default, pre-recorded welcome messages of the VMS, or record the custom welcome messages that meet your requirements, in .WAV file format.
 - Configure the parameters of the Voice Mail Auto Attendant (VMAA) Menu.

For more information and instructions, see the [“Configuring Voice Mail System”](#).

- If you want the incoming calls to first land on extensions, you must configure the Auto Attendant Delayed Timer (sec). The call will be placed fist on the extensions in the Trunk Landing Group. If the call remains unanswered till the expiry of the timer, it shall be answered by the Voice Mail Auto Attendant. This is known as **Delayed Auto Attendant** on trunks.

For detailed instructions, see [“How to configure”](#) in [“Auto Attendant”](#).

Configuring CLI Based Routing

To route the call to a specific extension on the basis of the CLI received:

- Select the trunk on which to want to enable CLI Based Routing.
- Configure the CLI Based Routing Table. Enter the numbers of the calling parties and the numbers of the corresponding destination extensions.
- Enable CLI Based Routing on the desired trunks according to time zones in their [“Trunk Feature Template”](#).

For more details, see [“How to configure”](#) in *CLI Based Routing*.

Configuring Trunk Auto Answer

- Select the trunk on which you want to enable Trunk Auto Answer.
- Enable Trunk Auto Answer in the Trunk Feature Template of the desired trunk.
- Select the **Trunk Auto Answer Greeting message**, the **Trunk Auto Answer Ring Back Tone Message**, and the **Trunk Auto Answer Busy Bye Message** for the Working Hours, Break Hours and Non-Working Hours. Create a Trunk Landing Group with the desired extensions.
- Configure the Trunk Auto Answer related **Timers**, if required. The following Timers are of relevance to the Trunk Auto Answer Feature:
 - The DID Inactivity Timer (default: 60 seconds)
 - The Ring Back Tone Timer (default: 45 seconds)
 - The Busy Tone Timer (default: 7 seconds)
- You may change the duration of these timers from the [“System Timers and Counts”](#) page.

The Ring Back Timer and the Busy Tone Timer are also applicable for the Ring Back Tone and the Busy Tone played for internal calls.

- Record and assign Voice Modules for the following Voice Messages related to this feature:
 - Trunk Auto Answer Greeting Message
 - Trunk Auto Answer Ring Back Tone Message
 - Trunk Auto Answer Busy Bye Message

For each of these messages, you can record four different messages.

See the topic [“Voice Message Applications”](#) for instructions on recording and assigning voice modules to greeting messages.

For detailed instructions, see [“How to configure”](#) in *Trunk Auto Answer*.

Configuring Direct Dial-In (DDI)

- DDI can be enabled on ISDN T1E1PRI, BRI as well on SIP Trunks. Select the trunks on which you want to enable DDI.
- Make a list of the Extensions to whom you want to assign DDI Numbers.
- Assign an Incoming (IC) Reference ID in the respective port parameters of the trunks. For instructions, see [“Configuring E1 Trunks”](#), [“Configuring T1 Trunks”](#), [“Configuring BRI Trunks”](#) and [“Configuring SIP Trunks”](#).
- Configure the DDI Routing Table and Incoming Reference Table. For instructions, see [“Direct Dialing-In \(DDI\)”](#).

Configuring Routing to OGTB

To route the call to an outgoing trunk, when using the gateway functionality of SARVAM UCS,

- You must make the Outgoing Trunk Bundles. See [“Outgoing Trunk Bundle”](#)
- Make an Outgoing Trunk Bundle Group by assigning these Outgoing Trunk Bundles. See [“OG Trunk Bundle Group”](#) for detailed instructions.

- Select OTBG as member in the [“Routing Group”](#).
- Assign this Routing Group Number in the Trunk Landing Group.
- You may configure the same Trunk Landing Group for working, break and non-working hours or you different Trunk Landing Group for all three time zones.
- Assign the Trunk Landing Group to the trunk in the Trunk Feature Template for each time zone.
- For detailed instructions, see [“How to configure”](#) in Trunk Landing Group.

Outgoing Call Routing

What's this?

SARVAM UCS provides you a platform wherein you can integrate and use the services from different networks - VoIP, ISDN, GSM, CO.

The extensions users (UC/SIP Users, DKP, ISDN Terminals, SLT) of SARVAM UCS can make outgoing calls to external numbers or to internal numbers. The process of identifying the call and then routing the call through the most economical network, constitutes Outgoing Call Routing.

An outgoing call can be a call:

- to another extension number, that is a number dialed without grabbing a trunk line.
- to an external number, that is a number dialed after grabbing a trunk line.
- to a number in a closed user group, that is a number which is a part of a private network. A private network is when a few Systems are connected to each other using SIP, T1/E1 QSIG, T1/E1 PRI, E&M etc.

When an outgoing call is made by the extension user, the system simultaneously checks for:

- the features and facilities enabled for the extension user.
- the features enabled on the trunk assigned in the OG Trunk Bundle Group, for the Trunk Access Code dialed by the user.

With the default setting in the system, outgoing calls (except calls between extensions) will not be routed. Follow the steps below to ensure call routing:

- **enable the desired features in class of service assigned to the extensions. For details, see [“Class of Service \(COS\)”](#).**
- **assign the desired toll control level to the extensions for making outgoing calls. For details, see [“Toll Control”](#).**
- **assign the OGTBG to the extensions through which the calls can be routed. For details, see [“Outgoing Trunk Bundle”](#) and [“OG Trunk Bundle Group”](#).**
- **by default Call Duration Control is enabled on the trunks and extension, hence the calls will be disconnected after the expiry of the timer. You can change these settings as per your requirement. For details, see [“Call Duration Control \(CDC\)”](#).**
- **by default Call Budget is enabled on the Trunks. After the expiry of the budget outgoing calls will not be routed through the trunks. You can change these settings as per your requirement. For details, see [“Call Budget on Trunk”](#).**

If you have purchased a new system with Firmware later than V1R6.7, the new default settings will be applied automatically. Refer to [“Modified default parameter values for Firmwares later than V1R6.7”](#).

If you are upgrading the system, refer to [“After updating Firmware later than V1R6.7”](#) and [“Modified default parameter values for Firmwares later than V1R6.7”](#).

Features and Facilities that can be enabled in the Station Basic Features Template assigned to the extension user:

- The **Class of Service** assigned to the extension user. Class of Service (CoS) defines the permission an extension will have on a System. It defines the set features of the System that the extension is to be allowed access to.

Feature requirements vary among users and with time. Similarly, certain features that are required during working hours may not be required during break or non-working hours.

For details, see [“Class of Service \(COS\)”](#).

- The **Call Budget** assigned to the extension user: The system keeps a tab on the total cost of phone calls made by extension users. If the budget assigned to the user has been consumed, the system will not allow the user to make further outgoing calls, but will be able to make internal calls.

The extension user can be assigned a fresh budget, after which s/he can resume making calls.

Call Budget can be enabled on all the extensions as well as on selected extensions. Each extension can be assigned a different amount depending on the user requirement.

For details, see [“Call Budget on Extension”](#).

- The **Call Privilege** assigned to the extension. In Call Privilege you can define the Toll Control Levels. Toll Control (or Toll Restriction) is an expense control feature of SARVAM UCS. It enables you to program the system so that each extension has a designated calling permission referred to as 'Call Privilege'.

Each type Call Privilege allows the extension to call certain areas and restricts it from calling others. The extension can also be restricted from the dialing of specific telephone numbers.

By default, the No Calls is assigned to all the Toll Control levels. You must configure the parameters as per your requirement to ensure calling.

For details, see [“Toll Control”](#).

Features enabled on the trunk:

- A Trunk Access Code is a short digit sequence dialed from an extension phone instructing the System to assign a trunk line or any trunk line from a group of trunks ([“OG Trunk Bundle Group”](#)) to the user to dial an external number. For making outgoing calls each extension user must dial a Trunk Access Code.
- The outgoing calls are routed through the OG Trunk Bundle Groups assigned to the extensions in the Station Basic Features Template. All the trunks connected to the system can be bunched in different groups called OG Trunk Bundle Groups and these OG Trunk Bundle Groups can be allotted to each extension.

Each OG Trunk Bundle Group consists of a single OG Trunk Bundle or multiple OG Trunk Bundles. The Outgoing (OG) Trunk Bundle is set of parameters that completely define the grouping of similar channels/trunks. Bundles of similar trunks/channels only can be formed. The system can hunt for a free trunk within the bundle as per the set option - Ascending, Descending or Cyclic. For more information, see [“Outgoing Trunk Bundle”](#).

With the default OGTBG assigned outgoing calls will not be possible. Refer to the instructions in [“Outgoing Trunk Bundle”](#) and [“OG Trunk Bundle Group”](#).

An Extension can be allotted different OG Trunk Bundle Group during different timings of the day.

- Since there are different trunk lines for making calls and the service providers of these trunks offer different tariffs for calls made to certain locations or numbers or during a particular time of the day, you can enable Least Cost Routing on the trunks.

When a call is made from an extension of the SARVAM UCS, using LCR the system selects the lowest cost trunk from among all the trunks allotted to that extension to make the outgoing call, depending upon the type of LCR configured.

For more information, see [“Configuring LCR”](#).

- For LCR to work, all trunks that are allotted to extensions for making outgoing calls, must first be assigned a **Cost Factor**.

Cost factor is used for grading trunks in the order of increasing cost of routing calls, from 01 to 99, where 01 signifies least cost and 99 signifies the highest cost. Thus you can grade up to 99 trunks according to the increasing cost of routing calls.

After assigning Cost Factor to Trunks, you must configure the Type of LCR to be used on Trunks in the Outgoing Trunk Bundle Group (OGTBG) allotted to the extensions for making calls.

If LCR is not enabled, the outgoing call will be routed through the free trunk from the OG Trunk Bundle Group.

For more information, see [“Cost Factor”](#) in *Configuring LCR*.

- The **Call Budget** assigned to the Trunk. Each trunk can be allotted a 'budget' limit for outgoing calls. This budget limit can be programmed to be reloaded manually each time it is exceeded or at a scheduled date, either daily or at a particular date of the month.

By default Call Budget Type - Minutes is enabled for 300 Minutes.

For more information, see [“Call Budget on Trunk”](#).

How it works

When the user dials a number without grabbing a trunk, that is, without dialing a Trunk Access Code, the system checks:

- The Closed User Groups table, if a match is found the call is routed through the OGTBG assigned in the table. For more information, see [“Closed User Group \(CUG\)”](#).
- If no match is found, the checks for an internal extension number. For the Extension user it checks for the features enabled in the Class of Service (CoS). If Basic Features are disabled the extension user will not be able to make internal calls. If in the CoS the Basic Features are enabled and a match is found in the internal group, the call is placed on the dialed extension.
- If still the system is unable to find a match, the systems plays an error tone to the caller.

When the user dials a number after grabbing a trunk line, that is after dialing a Trunk Access Code, the system checks:

- The Station Basic Feature Template assigned to the user. In this template it checks for the type of Toll Control and Call Budget.
- The Outgoing Trunk Bundle Group assigned to the user for making outgoing calls, for the Trunk Access Code dialed.

- The features enabled on the Trunks in the OGTBG, that is Least Cost Routing and Call Budget.
- If LCR is not enabled the system allots a free trunk from the OG Trunk Bundle Group to route the call.
- If LCR is enabled, the system checks for the type of LCR enabled and routes the call using the cheapest free trunk from the group. If the cheapest trunk is not free, the system hunts for the second cheap trunk in group and routes the call. If none of the trunks are free, the system plays a busy tone to the user.
- After checking LCR, for the free trunk the system checks the type of Call Budget enabled on the trunk. The calls will be routed using this trunk as long as the budget limit set for the trunk (i.e. the Amount or Minutes or the maximum number of Calls) is not crossed. As soon as the limit is crossed the Trunk is automatically disabled.

How to configure

For the extension user configure the following in the Station Basic Features Template:

- The Basic Features are enabled in the Class of Service (CoS). If you want to restrict dialing of internal calls by the user, disable the Basic Features. Select a CoS group number, for example 19 and disable the Basic Features. In the Station Basic Features Template assigned to the user, enter 19 as the CoS for each time zone.
- To restrict calling, enable Call Budget and configure the following parameters for the feature to work:
 - select the Call Budget check box to enable
 - select the Toll Control-Call Budget Consumed option
 - set the Preset Call Budget Amount
- Set the Call Privilege for the different time zones.
- For each the Trunk Access Code in each time zone, assign an Outgoing Trunk Bundle Group.

For detailed instructions to assign a CoS, Call Budget, Call Privilege and Outgoing Trunk Bundle Group to an extension user, see [“Station Basic Feature Template”](#) and [“Configuring DKP Extensions”](#), [“Configuring SLT Extensions”](#), [“Configuring ISDN Terminals”](#), [“Configuring SIP Extensions”](#).

You need to provide access of the trunks to the users for making calls, to do so, follow the steps given below:

- To create an Outgoing Trunk Bundle put similar trunk types are put together.
- Assign the Outgoing Trunk Bundles as members in an Outgoing Trunk Bundle Group. For detailed instructions, see [“OG Trunk Bundle Group”](#).
- For the Outgoing Trunk Bundle Group, enable Least Cost Routing, if required. Select the type of LCR required and also configure the respective LCR tables. For detailed instructions, see [“Configuring LCR”](#).
- Enter this Outgoing Trunk Bundle Group number, as per the time zone in the Station Basic Features Template assigned to the extension user.
- Determine the cost factor you want to assign each trunk. Assign the Cost Factor to each trunk type in their respective trunk parameters.

- Enable Call Budget on Trunks. Select the type of Call Budget you want to set on the trunk, in their respective trunk parameters.

For detailed instructions on assigning the Cost Factor and Call Budget to the trunk, see [“Configuring CO Trunks”](#), [“Configuring Mobile Trunks”](#), [“Configuring E1 Trunks”](#), [“Configuring T1 Trunks”](#), [“Configuring BRI Trunks”](#), [“Configuring SIP Trunks”](#).

If you have CDMA Mobile Card installed in your system, it is recommended to avoid using features that support DTMF Detection.

The features where the caller is asked to dial digits and the system has to detect it, for example, DID, Voice Mail Auto Attendant etc might not work efficiently.

Abbreviated Dialing

What's this?

Abbreviated Dialing is the use of short codes (abbreviated numbers), to dial out long-digit numbers. It is also referred to as Memory Dialing.

Abbreviated Dialing allows you to dial quickly and easily, frequently called, long-digit numbers.

This feature requires you to store the frequently called, long-digit numbers²³¹ and their corresponding short codes in special lists, known as 'directories'. These directories may be 'personal' or 'global'.

SARVAM UCS supports two types of Abbreviated Dialing based on the type of directory used: Personal Abbreviated Dialing and Global Abbreviated Dialing.

Abbreviated Dialing forms the basis of two other features of the SARVAM UCS: [“Dialed Number Directory”](#) and [“Quick Dial”](#).

Personal Abbreviated Dialing

This variation of Abbreviated Dialing makes use of the Personal Directory.

Personal Directories can be programmed and assigned to groups of extensions. The use of Personal Directories is limited to the extensions to which they are assigned.

A personal directory accommodates 25 numbers. Each number may be up to 16 digits long. A personal directory has Index numbers from 001 to 025²³² against which the frequently dialed telephone numbers are stored along with their corresponding names and trunk access code ID.

²³¹. These may be numbers of your branch offices, your clients, as also numbers of emergency services such as fire, police.

²³². For ETERNITY LENX/MENX it is 0001 to 0025.

As many as 50 different personal directories, numbered from 01 to 50 can be created and assigned to SLT, DKP and SIP extensions.

With a personal directory assigned to an extension, the extension user simply dials out the Feature Access Code for Abbreviated Dialing and the Index Number at which the desired number is stored in the personal directory.

For example: personal directory number 02 is assigned to extension 2001. The number 02652630555 is stored at Index number 16 of this directory. The user of extension 2001 can call this number by simply dialing '8' (feature access code) followed by '016' (the index number).

The system will automatically dial out the number using the trunk access code ID specified for this number in the personal directory.

- *When an extension user dials an abbreviated number from the Personal Directory, the system first checks OG Trunk Bundle Group (OGTBG) and Toll Control Level (Call Privilege) of that extension and then dials out the number.*
- *Each extension can access only the personal directory assigned to it.*
- *Personal Directory can be programmed by the System Engineer, as well as extension users. Extension users can add contacts to the Personal Directory assigned to them from their extensions phones (DKP/SLT/ISDN phone/IP Phone).*

Global Abbreviated Dialing

This variation of Abbreviated Dialing makes use of a system-wide list of numbers stored in the memory of the SARVAM UCS, known as the Global Directory.

Being a system-wide list, the Global Directory can be accessed by any extension connected to the system.

The Global Directory has the capacity to store up to 900²³³ numbers of a maximum of 16 digits each. The Global Directory is divided into three parts:

- Part 1 - contains Memory Location codes 100 to 799.
- Part 2 - contains Memory Location codes 800 to 899.
- Part 3 - contains Memory Location codes 900 to 999.

The Global Directory has Memory Location codes starting from 100 to 999. The telephone numbers along with their corresponding names are stored against Memory Location codes.

Whenever extension users of the system want to use Global Abbreviated Dialing, all they need to do is dial the feature access code ('8' or '6') and the Memory Location code at which the desired number is stored.

For example: the number 02652630566 is stored at Memory Location 102 of the Global Directory. Now, extension users of the system can call this number by simply dialing the '8' or '6' (feature access code for Abbreviated Dialing) followed by '102' (Memory Location code at which the desired number, 02652630566, is stored).

The system will dial out the number using any of the trunks in the “OG Trunk Bundle Group” assigned to it in the Memory Location.

²³³. ETERNITY LENX/MENX stores up to 2900 numbers in the Global Directory; Part 1 - 100 to 2399, Part 2 - 2400 to 2699 and Part 3 - 2700 to 2999.

Extensions can use Global Abbreviated Dialing only if this feature is included in the “Class of Service (COS)” allowed to them.

- Further, an extension can access only that part of the Global Directory which is allowed to it in the CoS. For instance, if extension 2001 is allowed Global Directory Part 1 in its CoS, the user of extension 2001 can dial out only those numbers contained in Global Directory Part 1.
- So, to be able to access the entire Global Directory, extensions must be assigned all three parts of the directory in their Class of Service. By default, none of the Global Directory Parts are included in the CoS of all extensions.
- Global Directory can be programmed by the System Engineer, and by Digital Keyphone extension users who have Global Directory Programming allowed to them in the Class of Service.
- While the System Engineer can program all three parts of the Global Directory, digital keyphone extension users who are allowed Global Directory Programming in their Class of Service can configure only Global Directory Part 1.

How to configure

For both Personal and Global Abbreviated Dialing to work, the System Engineer must:

- Program the Personal Directories and the Global Directory.
- Assign Personal Directory to the desired extensions (which may be different: SLT, DKP, ISDN Terminals, IP Phones).
- Enable Global Directory Part 1/2/3 as desired in the Class of Service (CoS) group allowed to the extensions.
- Enable ‘Global Directory Part 1’ and ‘Global Directory Programming’ in the CoS group of the digital key phone extension users, who are to be allowed to program (add, delete, edit) contacts in the Global Directory Part 1 from their digital key phones.

All the above parameters can be programmed by the System Engineer using Jeeves as well as a telephone.

Preparing Numbers Lists for Personal and Global Directories

In consultation with the extension users, you may:

- Find out the number of personal directories that need to be programmed.
- Make a list of numbers frequently dialed by the extension.
- Ask the extension users the numbers they would like to be included in the personal directory of their extension.
- Make separate lists of numbers along with their corresponding names, email id, group, trunk access codes, for each personal directory. You may draw five-column tables on paper and enter the Numbers and corresponding names, email ids, groups and trunk access codes against each Index number. For example:

Personal Directory 01

Index No.	Number	Name	Email ID (optional)	Group (optional)	TAC ID
01					
02					
:	:	:			:
:	:	:			:
25					

Personal Directory 02

Index No.	Number	Name	Email ID	Group (optional)	TAC ID (optional)
01					
02					
:	:	:			:
:	:	:			:
25					

- Compile the numbers to be included in the global directory. Numbers that are commonly dialed by all extensions can be included in the global directory.
- Draw a five-column table on paper and enter the telephone numbers along with their names, the Outgoing Trunk Bundle Group (OGTBG), email id and group at each Memory location. For example:

Global Directory

Memory Location	OGTBG	Number	Name	Email ID (optional)	Group (optional)
100					
101					
:	:	:	:		
:	:	:	:		
999					

- Prepare the Global Directory keeping in mind that it is divided into three parts: Part 1 (100 to 799), Part 2 (800 to 899), and Part 3 (900 to 999).

Uploading Personal and Global Directory Contacts

If you have personal and global directory contacts database in an excel sheet, you can convert the same into a CSV file and upload it through Jeeves.

For Personal directory contacts, the format of the CSV file must be as follow: For example 21, 9867985489, Sean Gilbert, Sean@hotmail.com, 1, 0

Where,

21 is the Index Number at which you want the entry to be stored (mandatory)

9867985489 is the Contact Number (mandatory)

Sean Gilbert is the Contact Name (optional)

Sean@hotmail.com is the Email ID (optional)

1 is the Group Index number (optional), see ["SMS/Email Group"](#)

0 is the Trunk Access Code (TAC) to route the call (optional)

To upload Personal Contacts CSV file using Jeeves, see ["Upload Personal Directory CSV files"](#) .

For Global directory contacts, the format of the CSV file must be as follow: For example 121, 9867985489, Sean Gilbert, Sean@hotmail.com, 1, 01, 000

Where,

121 is the Index Number at which you want the entry to be stored (mandatory)

9867985489 is the Contact Number (mandatory)

Sean Gilbert is the Contact Name (optional)

Sean@hotmail.com is the Email ID (optional)

1 is the Group Index number (optional), see ["SMS/Email Group"](#)

01 is the Outgoing Trunk Bundle Group (OTBG) to route the call (optional)

000 is the Alternate Number Group (optional)

To upload Global Contacts CSV file using Jeeves, see ["Upload Global Directory CSV file"](#).

Update Personal Directories via Email

You can update the Personal Directory contacts via Email, if you have enabled the SMS Server Application. You can Add, View, Edit and Delete contact/s via Email. For more details, see ["Configuring Personal Directory via Email"](#).

Configuring Personal Directory using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Abbreviated Dialing**.
- Click **Personal Directory** to open the page.

Configuration

- Abbreviated Dialing
 - Global Directory
 - Personal Directory**
 - Upload/Download
- Access Codes
 - Account Name
 - Authority Code
 - Automatic Number Translation
- BRI Configuration
- Call Cost Calculation
- Call Duration Control
- Change SA P/w
- Change SE P/w
- CLI Based Routing
- Class of Service
- Closed User Groups
- Communication Port
- Configuration Upload
- CO Configuration
 - COSEC Integration
- CTI
 - Date & Time
- DDI Routing
 - Default the System
 - Dial Plan for SIP Extension
 - Department Groups
 - DISA - CLI Authentication
- DKP Configuration
 - E1-Data Settings
- Emergency
 - Extension Search

Abbreviated Dialing - Personal Directory-1

Index	Number	Name	TAC
1			0
2			0
3			0
4			0
5			0
6			0
7			0
8			0
9			0
10			0
11			0
12			0
13			0
14			0
15			0
16			0
17			0
18			0

Submit Default Advance

You can configure upto 50 Personal Directories. Select the directory number by clicking the required number tab above the table.

For each directory configure the following parameters,

- Enter the **Number** you wish to store against an Index Number. and enter the contact's **Name** against the number.

The length of the Number field is limited to 16 digits. The length of the Name field is limited to 18 alphanumeric characters. All ASCII characters except < > and " (double quote) are allowed. Ensure that the number and the name are programmed within this limit.

The Name can be configured upto 18 characters using Jeeves and CSV file only.

From the Extended Phones — SPARSH VP210 and SPARSH VP510, you will be able to view 18 characters Name configured from the Server as well as you will be able to add or edit Name of contact to a maximum of 18 characters.

From all other Extended Phones, you will be able to view 18 characters Name configured from the Server. But from these Phones you will be able to add or edit Name of contact to a maximum of 12 characters only.

Each directory has a limit of 25 entries. You may enter up to 25 Numbers and Names in each Personal Directory.

Change the **TAC** Index (TAC ID), if required.

- Click **Advance** to configure the **Email ID** and select the **Group** for the contact.
- Enter the **Email ID** of the contact you wish to store. The Email ID can be a maximum of 64 characters.
- You can assign the contact to a Group. Select the desired **Group** Type from the list. The system clubs together contacts assigned the same Group. Default: None. For details, see [“SMS/Email Group”](#).
- Click **Submit** to save the entries.
- Repeat these steps to program each Personal Directory.
- Click **Submit** at the bottom of the page to save your entries.

Keep a print of each personal directory for your record and for the record of the extension user to whose phone the personal directory is assigned. This will also help you take care of overlaps and include some of the numbers that are dialed by all users in the Global Directory instead of the Personal Directory.

Assigning Personal Directories to Extensions

To assign Personal Directory to SLT extensions,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **SLT Configuration**.
- Click **SLT Parameters** to open the page.
- Click the **Advance** button. Go to **Personal Directory** column of the SLT to which the directory is to be assigned.
- Enter the number of the Personal Directory. For example, to assign Personal Directory No. 02 to SLT 2001 (software port 001, connected on hardware slot 03, hardware port 09), enter '02' in the 'Personal Directory' column for SLT 2001.
- Similarly, enter the Personal Directory number to be assigned to each SLT.
- Click **Submit** at the bottom of the page to save changes.

To assign Personal Directory to DKP extensions,

- Under **Configuration**, click **DKP Configuration**.
- Click **DKP Parameters** to open the page.
- Click the **Advance** button. Go to **Personal Directory** column of the DKP to which the directory is to be assigned.
- Enter the number of the Personal Directory. For example, to assign Personal Directory No. 01 to DKP 3001 (software port 001, connected on hardware slot 17, hardware port 01), enter '01' in the 'Personal Directory' column for DKP 3001.
- Similarly, enter the Personal Directory number to be assigned to each DKP.

- Click **Submit** at the bottom of the page to save changes.

To assign Personal Directory to ISDN Terminal extensions,

- Under **Configuration**, click **ISDN Terminal Parameters** to open the page.
- Click the **Advance** button. Go to **Personal Directory** column of the ISDN Terminal to which the directory is to be assigned.
- For each ISDN Terminal that is to be assigned a Personal Directory, enter the number of the directory in this column.
- Click **Submit** at the bottom of the page to save changes.

To assign Personal Directory to SIP Extensions extensions,

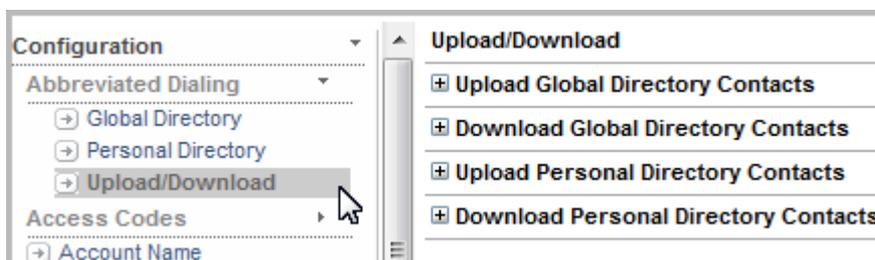

- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings** to open the page.
- Select the software port number of the SIP extension you want to assign the Personal Directory.
- Click the **Advance** button.
- Scroll to Personal Directory, and select the **Personal Directory** number you want to assign to this extension.
- Click **Submit** to save.

It is possible to assign the same personal directory to multiple extensions.

Upload Personal Directory CSV files

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Abbreviated Dialing**.
- Click **Upload/Download** to open the page.

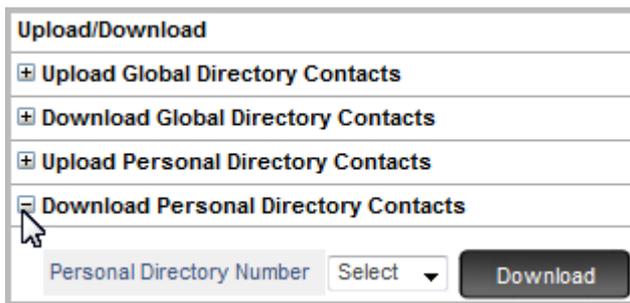

- Click **Upload Personal Directory Contacts** to expand.

- In **Personal Directory Number**, select the number of the personal directory in which you want to upload the contacts from the CSV file.
- Select the **Clear all other indices of the selected Personal Directory, which are not specified in the .csv file being uploaded** check box, to overwrite the existing contacts in the Personal directory with the contacts of CSV file. Default: Disabled.
- Click the **Browse** button to **Select the .csv file to be uploaded** from the location on the local disk.
- Click the **Upload** button.
- All the contacts of the CSV file will be uploaded in the selected Personal Directory. To view, click the respective Personal Directory link.

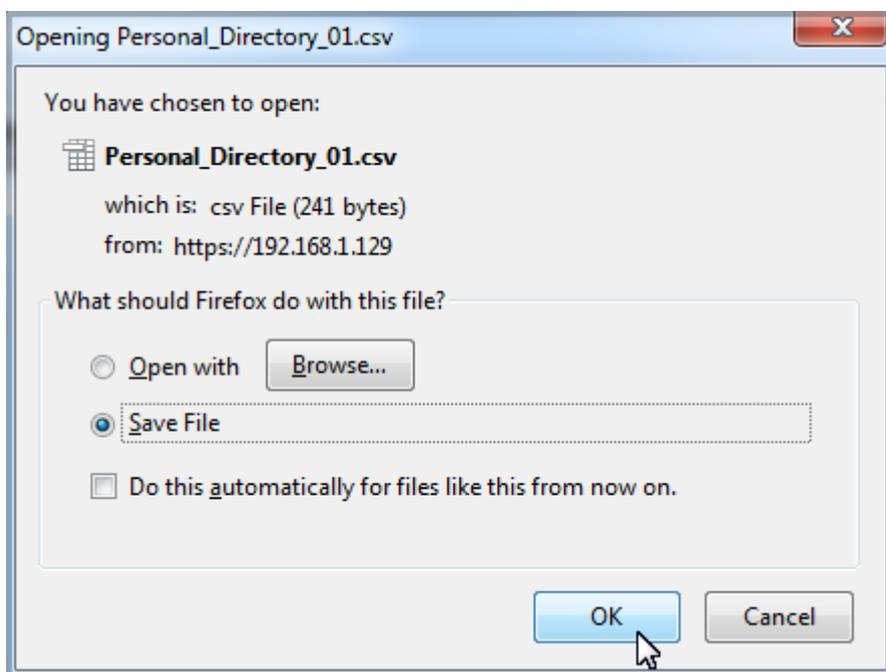

Download Personal Directory CSV files

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Abbreviated Dialing**.
- Click **Upload/Download** to open the page.

- Click **Download Personal Directory Contacts** to expand.

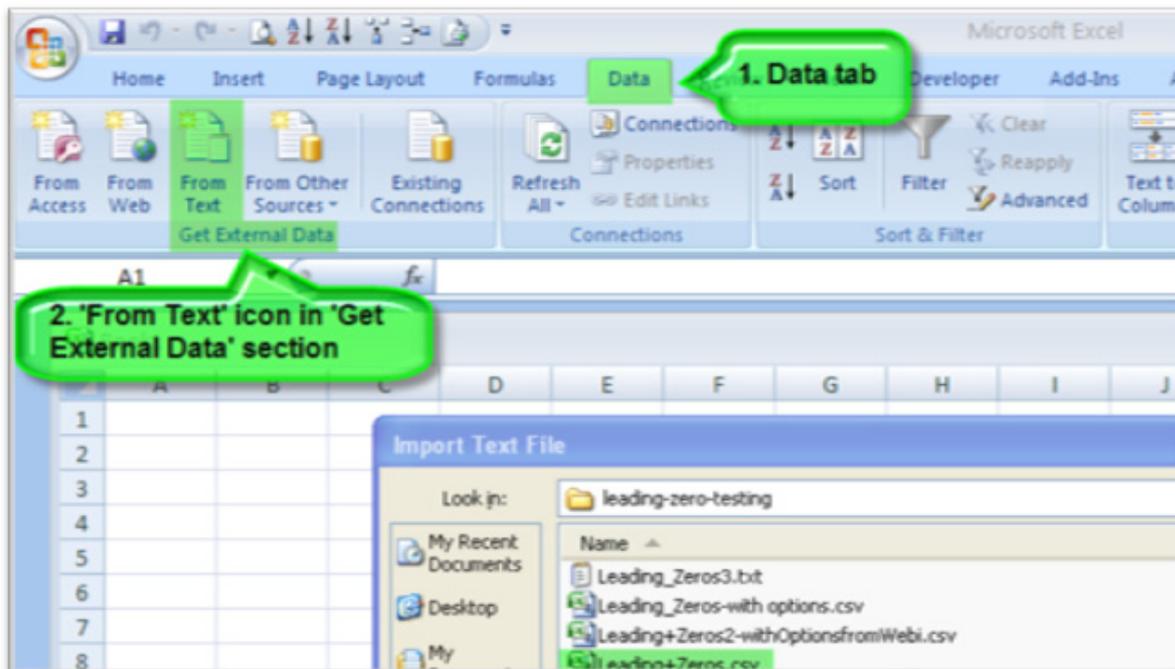

- In **Personal Directory Number**, select the number of the personal directory from which you want to download the contacts.
- Click the **Download** button.

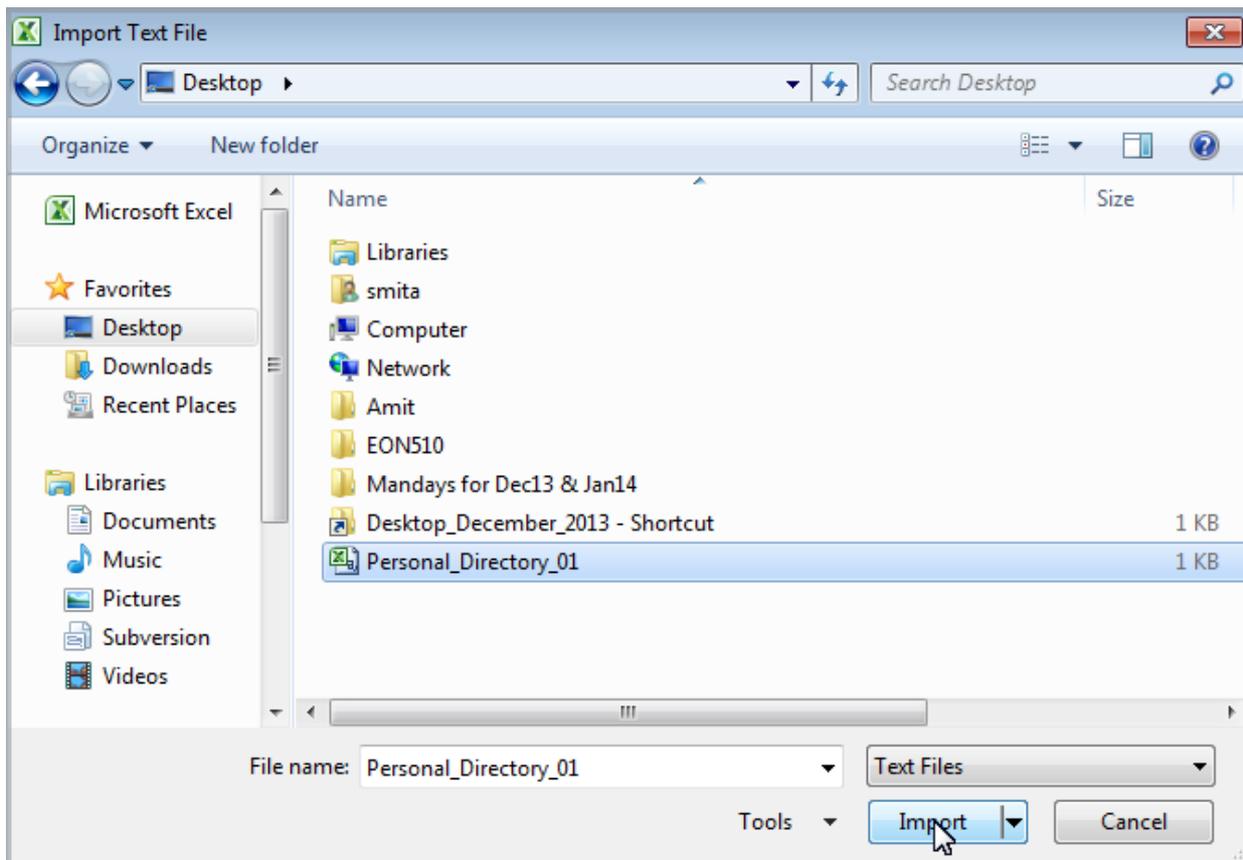

- You will get a prompt with an option to open the **Opening Personal_Directory_01.csv** file or save the file to a location. Save the file on the local disk.
- To Open the **Personal_Directory_01.csv** file from the location on the local disk, follow the steps given below:
 - **DO NOT OPEN THE CSV FILE DIRECTLY WITH EXCEL!**
 - Open a **New** worksheet in Excel.

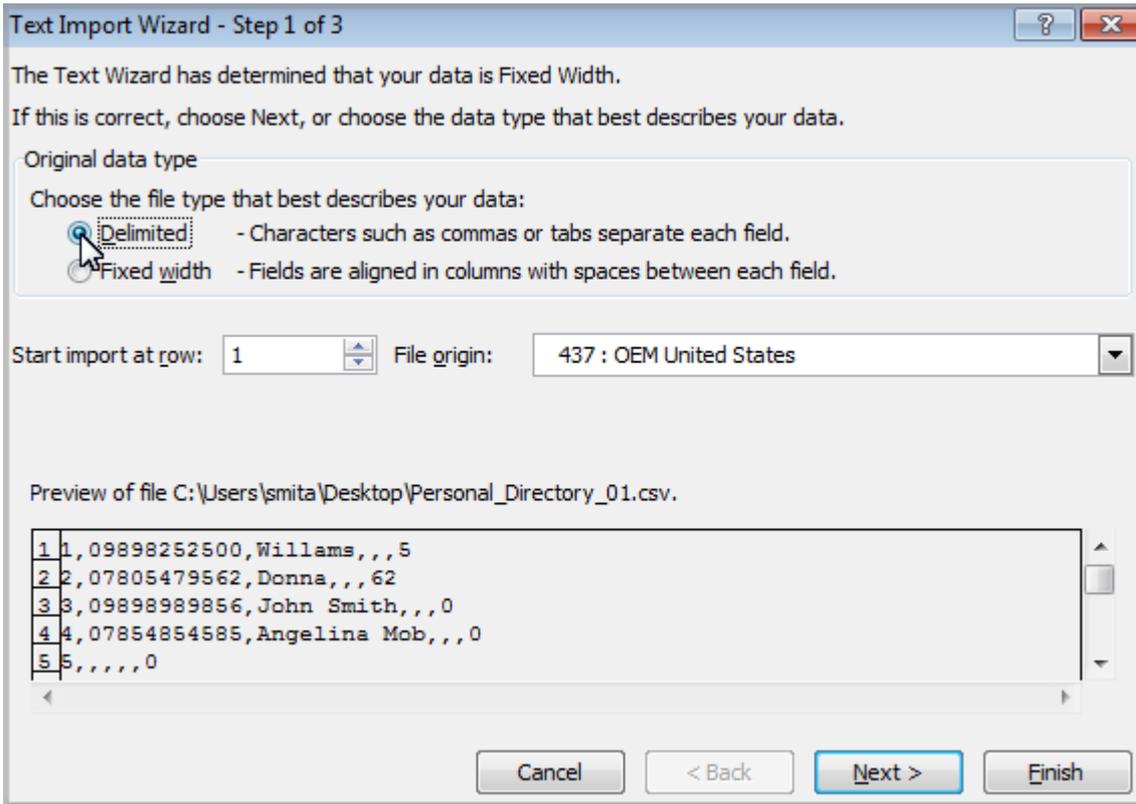

- Open the **Data** tab and select **From text** button in the **Get External Data**.

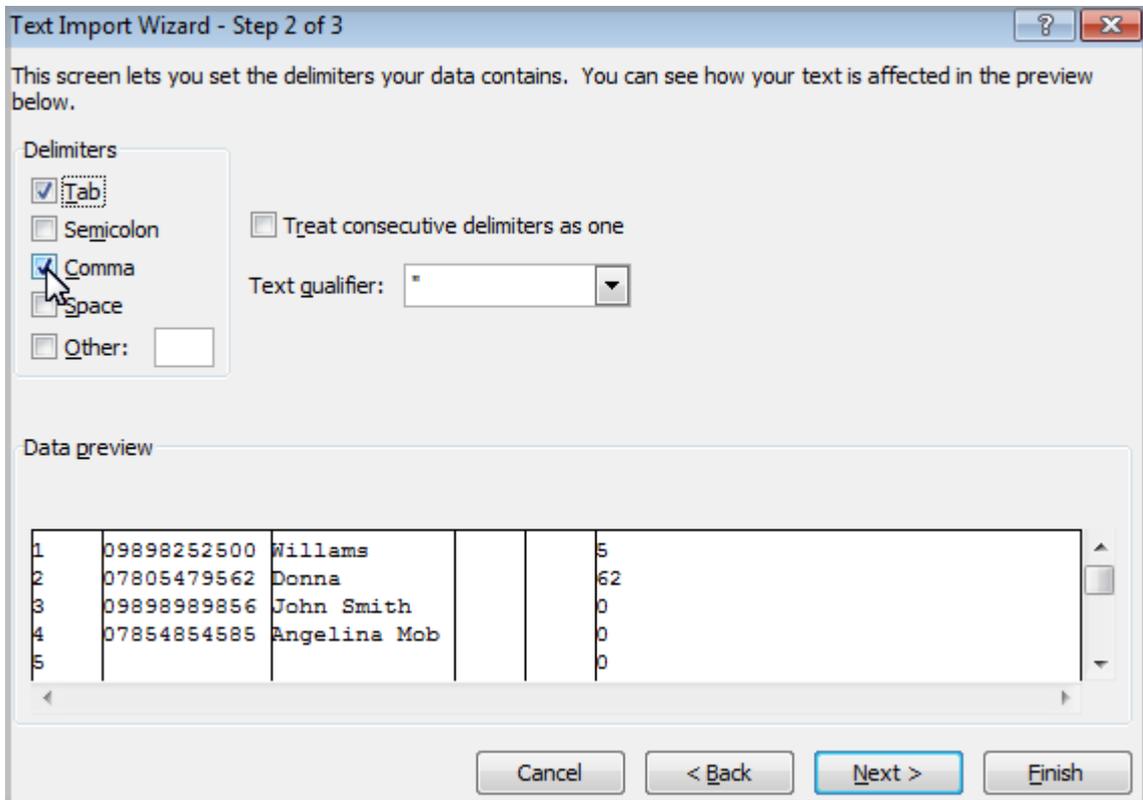

- Select your CSV file from the location on the local disk to import.

- In **Original data type** section, select **Delimited** radio button and click **Next**.

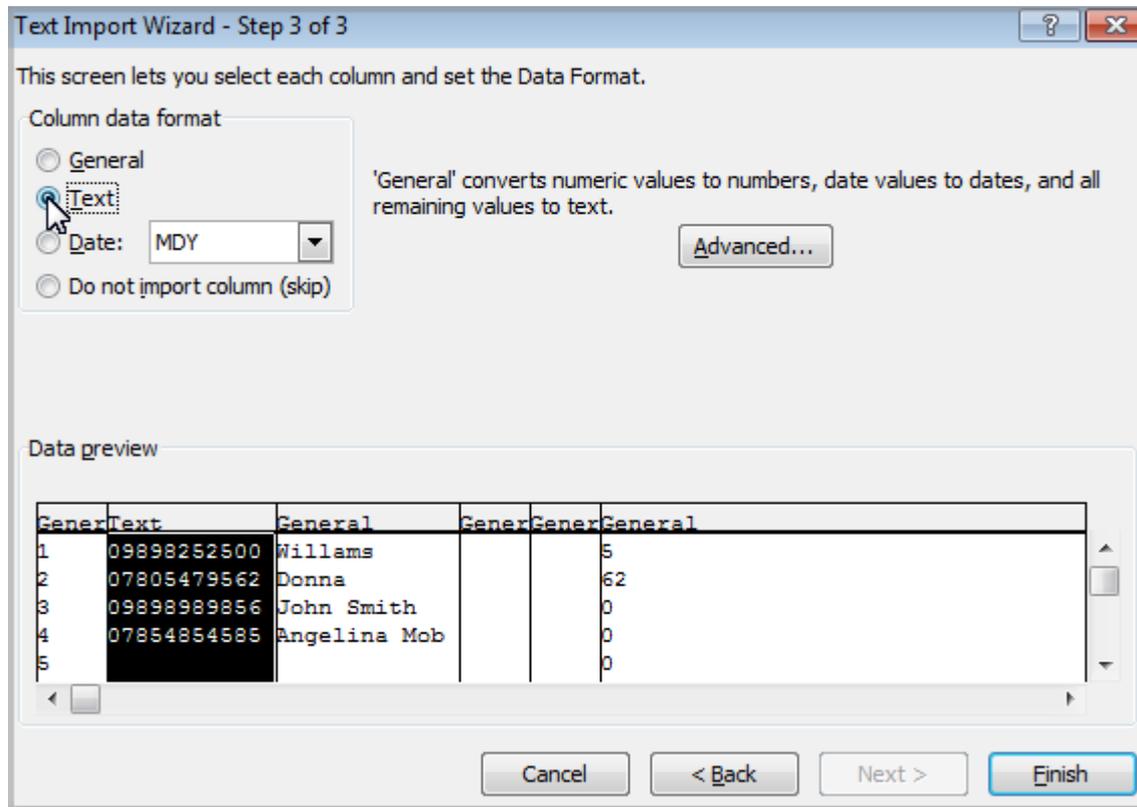

- In **Delimiters** select the **Comma** check box (column dividers will appear in preview) and click **Next**.

- Select the column with leading zeros and in **Column data format** select the **Text** radio button.

You will have to do this for each column where the data contains leading zeros.

- Click **Finish**.
- The leading zeros will still be there in the new worksheet with the imported data.

Configuring Personal Directory via Email

You can configure the Personal Directory via Email, if you have enabled the SMS Server Application. To know more, see ["SMS Server"](#).

If you have enabled SMS Server Application, you can configure contacts in the Personal Directory via Email. The SMS Server Application of SARVAM UCS allows you to Add, View, Edit and Delete contact/s via Email.

When the SMS Server receives an Email for configuring the Personal Directory, the system searches for the Email ID in the system users lists.

If a match is not found, the system sends a reply mail to the sender, with the Subject: *SMS Server Personal Directory Configuration* and the message in the body: *Not a valid user!*.

If a match is found, the system checks for the Personal Directory assigned to the user.

If a Personal Directory is not assigned, for the extension user then the system sends a reply mail to the sender with the subject: *SMS Server Personal Directory Configuration* and the message in the body: *Personal Directory is not assigned, can't add contact Name: XXXXX Number: XXXXX*. Where name/number is as received in mail for directory configuration.

If a match is found for the user and the user is assigned a Personal Directory, the system accepts and takes the necessary action as requested by the user. The request may be for adding, viewing, deleting or editing a contact.

The following validations are applicable when you want to configure contacts via Email:

The **Number** can be a maximum of 16 digits.

The **Name** can be a maximum of 12 characters.

The **Email ID** can be a maximum of 64 characters.

The **Group** can be a maximum of 16 characters.

While configuring Personal Directory via Email, make sure you have configured the Type of Group in the "SMS/Email Group" topic under SMS Server.

Adding a contact

You can add a single/ multiple contacts via Email. To add a contact you must send an Email to the SMS Server in a specific format. Given below are the various examples and formats of adding a contact.

To add a single contact

Given below is the format of the mail to be sent to the SMS Server, to add a single contact.

To: smssever@domain.com (this is the Email ID of the SMS Server)

Subject: James Smith=+919898985400 (The name and number of the contact you wish to add)

Here,

The To field contains the Email ID of the SMS Server.

The Subject contains the details of the contacts.

The name of the contact is James Smith

The number of the contact is +919898985400

The contact is added at a first free index, between 0001 to 0025 in the Personal Directory and a confirmation mail is sent to the sender, with the Subject: *SMS Server Personal Directory Configuration* and the message in the body: *New entry is added successfully at index-XXXX.*

To add multiple contacts

To add multiple contacts via single mail, you must enter the contacts by separating them with a comma(.). Given below is the format of the mail.

To: smssever@domain.com

Subject: James Smith=+919898985400, Steve D=898954045

Here,

The To field contains the Email ID of the SMS Server.

The Subject contains the details of the contacts.

The names to be added are James Smith and Steve D and their numbers are +919898985400 and 898954045 respectively.

- *Make sure you do not enter any space before and after "=".*

The contact is added at a first free index, between 0001 to 0025 in the Personal Directory and a confirmation mail is sent to the sender, with the Subject: *SMS Server Personal Directory Configuration* and the message in the body: New entry is successfully added at index-XXXX, Name: XXXXX, Number: XXXXX. Where XXXXX= is the information received in the mail for configuration. A separate mail is sent for each contact that is added.

View details of existing contact

You can view the numbers saved against a Name or Group in the Personal Directory. Given below is the format of the mail sent to the SMS Server.

Given below is the format of the mail to be sent to the SMS Server, to get the details of the existing contacts.

To: smssever@domain.com
Subject: HDFC Customer Care? (this is the name/group)

Here,

The To field contains the Email ID of the SMS Server.

The Subject contains the Name/Group Name whose details are required by you.

The Group Name is HDFC Customer Care.

The server will send a return mail with the number(s) as given below:

HDFC Customer Care:

James: +919898985400

John: +919897894512

Steve: +91898954045

If multiple entries exist, the return mail will contain the details of all. For example, if the query is made for the name James, that is Subject: James?. If the system finds two entries (James D and James S) then reply email contains both entries.

James D: 9426712345

James S: 9426921345

Similarly, if you want the details of all the names/groups beginning with J, then return mail will contain all names starting with character "J" and each name will be displayed in a separate row, followed by their numbers.

James D: 9426712345

James S: 9426921345

John S :9996565123

If no match is found for the Name/Group Name, the system sends a reply mail with the Subject: *SMS Server Error Cause* and the message in the body: *X not found in Personal Directory*, where X is the actual name.

Deleting a Contact

To delete an entry from the Personal Directory, the mail to be sent to the SMS Server must be in the format as given below.

To: smssever@domain.com
Subject: HDFC Customer Care=
Here,
The To field contains the Email ID of the SMS Server.
The Subject contains the Name/Group Name that you want to delete.

In this case, there are three contacts +919898985400 (James), +919897894512 (John), +91898954045 (Steve) that will be deleted.

If the system is able to delete the entry, a reply mail with Subject: *SMS Server Personal Directory Configuration* and the message in the body: *X is deleted from Personal Directory*, where X is the particular name which is received for deletion of the contact/group name. In this case, the reply Email will be *HDFC Customer Care is deleted from Personal Directory*.

If the SMS Server received a delete request for a contact and the same is not configured in the Personal Directory, then a reply mail is sent to the sender, with the Subject: *SMS Server Error Cause* and the message in the body: *X not found in Personal Directory*. Where, X is the actual name.

Modify/Edit a Contact

You cannot edit any contact in the Personal Directory via Email.

To modify any contacts details, you must first delete the existing contact from the Personal Directory. Then you can add the same contact with new contact details.

Configuring Personal Directory using a Telephone

- Enter SE mode.

To program a telephone number in a personal directory, dial:

- **1902-Personal Directory-Location Code-Number**

Where,

Personal Directory is from 01 to 50.

Location Code is from 01 to 25.

Number is the telephone number, max. 16 digits. If the number has fewer than 16 digits, you must dial #* to terminate the command.

To clear a telephone number from a location in a personal directory, dial:

- **1902-Personal Directory-Location Code-#***

To program a name in the personal directory, dial:

- **1903-Personal Directory-Location Code-Name**

Where,

Personal Directory is from 01 to 50.

Location Code is from 01 to 25.

Name is a string of alphanumeric characters, max. 12 characters. If the name has fewer than 12 characters, you must dial #* to terminate the command.

To clear a name from a location in a personal directory, dial:

- **1903-Personal Directory-Location Code-#***

To program the TAC Index for personal directory, dial:

- **1904-Personal Directory-Location Code-TAC Index**

Where,

PM Group is from 01 to 50.

Location Code is from 01 to 25.

TAC Index is from 1 to 6.

By default, the TAC Index 1 is assigned to Personal Directory.

- To assign a Personal Directory to an extension, dial the following commands:

If the extension is an SLT, dial:

- **1905-1-SLT-Personal Directory** to apply personal directory on a single extension.
- **1905-2-SLT-SLT-Personal Directory** to apply the same personal directory on a range of extensions.
- **1905-*-Personal Directory** to apply the same personal directory on all extensions.

Where,

SLT is the Software Port Number of SLT from 001 to 512.

Personal Directory is from 01 to 50.

By default, 00 is the Personal Directory assigned to all SLTs.

To clear the personal directory assigned to the SLT, dial:

- **1905-1-SLT-00** to clear personal directory from a single SLT.
- **1905-2-SLT-SLT-00** to clear personal directory from a range of SLTs.
- **1905-*-00** to clear personal directory from all SLTs.

If the extension is a DKP, dial:

- **1906-1-DKP-Personal Directory** to assign personal directory to a single DKP.
- **1906-2-DKP-DKP-Personal Directory** to assign the same personal directory to a range of DKPs.
- **1906-*-Personal Directory** to assign the same personal directory to all DKPs.

Where,

DKP is the Software Port Number of the DKP from 001 to 128.

Personal Directory is from 01 to 50.

By default, 00 is the Personal Directory assigned to all DKPs.

To clear the personal directory assigned to the DKP, dial:

- **1906-1-DKP-00** to clear personal directory from a single DKP.
- **1906-2-DKP-DKP-00** to clear personal directory from a range of DKPs.
- **1906-*-00** to clear personal directory from all DKPs.

If the extension is an ISDN Terminal, dial:

- **1907-1-ISDN-Personal Directory** to assign personal directory to a single ISDN Terminal.
- **1907-2-ISDN-ISDN-Personal Directory** to assign the same personal directory to a range of ISDN Terminals.
- **1907-*-Personal Directory** to assign the same personal directory to all ISDN Terminals.

Where,

ISDN is the Software Port Number of the ISDN Terminal from 01 to 64.

Personal Directory is from 01 to 50.

By default, 00 is the Personal Directory assigned to all ISDN Terminals.

To clear the personal directory assigned to an ISDN Terminal, dial:

- **1907-1-ISDN-00** to clear personal directory of a single ISDN Terminal.
- **1907-2-ISDN-ISDN-00** to clear personal directory of a range of ISDN Terminals.
- **1907-*-00** to clear personal directory of all ISDN Terminals.

Where,

ISDN is the Software Port Number of the ISDN Terminal from 01 to 64.

Personal Directory is from 01 to 50.

By default, 00 is the Personal Directory assigned to all ISDN Terminals.

- Exit SE mode.

Configuring Global Directory using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Abbreviated Dialing**.
- Click **Global Directory** to open the page.

The screenshot shows the 'Abbreviated Dialing - Global Directory' configuration page. The table below represents the data shown in the interface:

Index	Number	Name	OG Trunk Bundle Group
100			01
101			01
102			01
103			01
104			01
105			01
106			01
107			01
108			01
109			01
110			01
111			01
112			01
113			01
114			01
115			01
116			01
117			01

Each page of has 100 entries. To go to the next 100 entries click the links above the table '200-299'

- Enter the **Number** you wish to store against a Memory Location Code. Enter the contact's **Name** against the number.

The length of the Number field is limited to 16 digits. The length of the Name field is limited to 18 alphanumeric characters. All ASCII characters except < > and " (double quote) are allowed. Ensure that the number and the name are programmed within this limit.

The Name can be configured upto 18 characters using Jeeves and CSV file only.

From the Extended Phones — SPARSH VP210 and SPARSH VP510, you will be able to view 18 characters Name configured from the Server as well as you will be able to add or edit Name of contact to a maximum of 18 characters.

From all other Extended Phones, you will be able to view 18 characters Name configured from the Server. But from these Phones you will be able to add or edit Name of contact to a maximum of 12 characters only.

- Change the **OG Trunk Bundle Group**, if required. Default: 01. See [“OG Trunk Bundle Group”](#).

While routing the Global Directory number, the system will use the OG TBG configured in the Station Advanced Feature Template assigned to the Extension that is dialing a Global Directory number. So, if you want the system to route Global Directory numbers using OG TBG you configured here, make sure you have selected **OG TBG configured in the Global Dir.** in the **Route Global Directory Calls using** parameter of the Station Advanced Feature Template.

- Click **Advance** to configure the **Email ID** and select the **Group** for the contact.
- Enter the **Email ID** of the contact you wish to store. The Email ID can be a maximum of 64 characters.
- You can assign the contact to a Group. Select the desired **Group** Type from the list. The system clubs together contacts assigned the same Group. Default: None. For details, see [“SMS/Email Group”](#).
- Click **Submit** at the bottom of the page to save your entries.

Applying Global Directory to Extensions

To apply the Global Directory to extensions,

- Make sure that the feature Global Directory (desired Part1/2/3) is enabled in the CoS of the extensions to which you are assigning the Global Directory.

If the entire directory is to be assigned to all extensions, you may simply enable Global Directory Part 1 Global Directory Part 2 and Part 3 in the default CoS group 01 in the default Station Basic Feature Template 01 assigned to the extensions.

However, if selected extensions are to be allowed Global Directory Part 1/2/ 3, follow these steps:

- Define a CoS group with Global Directory Part 1/Part 2/Part 3 enabled.
- Prepare a Station Basic Feature Template with this CoS group applicable in all the [“Time Zones”](#).
- Assign this template to the extensions to which Global Directory Part1/Part2 /Part 3 are to be allowed.

Refer the topics [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#) for further instructions.

- Decide which of the DKP Extension users are to be allowed ‘Global Directory Programming’ (of Global Directory Part 1) and allow this feature in their Class of Service.

By default, Global Directory Programming is disabled in the default CoS group 01 in the default Station Basic Feature Template 01 assigned to all extensions of the system. This means none of the extensions can program Global Directory.

If you want to allow Global Directory Programming to all DKP extension users, simply enable this feature in the CoS group of the Station Basic Feature Template assigned to them.

If you want to allow Global Directory Programming to only selected extensions, then follow these steps:

- Define a CoS group with Global Directory Programming enabled.
- Make sure this CoS also has Global Directory Part 1 enabled.
- Prepare a Station Basic Feature Template with this CoS group applicable in all the “Time Zones”.
- Assign this template to the DKP extensions to which Global Directory Programming is to be allowed.

Refer the topics “Class of Service (COS)” and “Station Basic Feature Template” for programming instructions.

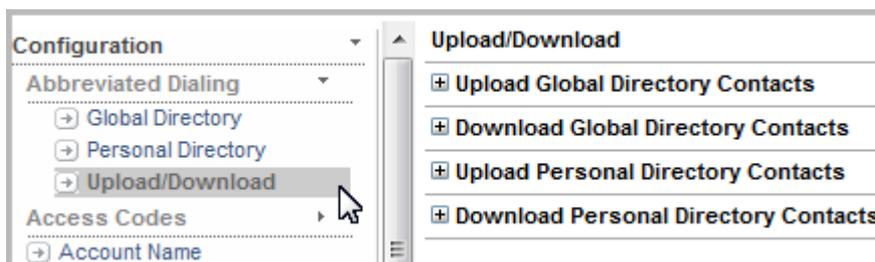

- *If Global Directory Part 1, 2 or 3 is assigned to an extension user, the system will not check for Toll Control.*
- *When you assign Global Directory Programming to a DKP extension user, the user can program any number in Global Directory Part 1, this includes numbers denied to the extension user in the Call Privilege defined in the Toll Control level of this extension user.*
- *Since the system does not check for Toll Control for numbers dialed out from Global Directory Part 1, there is a possibility of extension users programming numbers not allowed to them in their Toll Control level in the Global Directory Part 1, inadvertently or intentionally.*
- *Hence, the System Engineer is advised to exercise caution when allowing this feature to DKP extension users.*

- Click **Submit** at the bottom of the pages on which you make changes to save your settings.
- If you have finished configuration, you may log out of Jeeves. Or you may continue, as required.

Upload Global Directory CSV file

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Abbreviated Dialing**.
- Click **Upload/Download** to open the page.

- Click **Upload Global Directory Contacts** to expand.

- Select the **Clear all other indices of the Global Directory, which are not specified in the .csv file being uploaded** check box, to overwrite the existing contacts in the Global directory with the contacts of CSV file. Default: Disabled.
- Click the **Browse** button to **Select the .csv file to be uploaded** from the location on the local disk.
- Click the **Upload** button.
- All the contacts of the CSV file will be uploaded in the Global Directory. To view, click the Global Directory link.

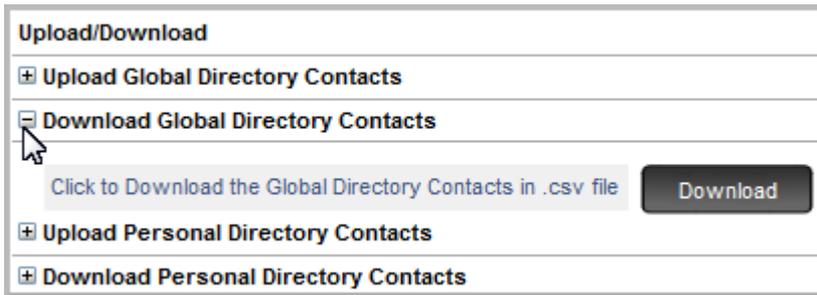

- *If all the Global Directories are selected for LDAP, then contacts will not be uploaded through .csv file.*
- *The contacts will be uploaded through .csv file only in the Global Directory that is not synchronized for LDAP.*

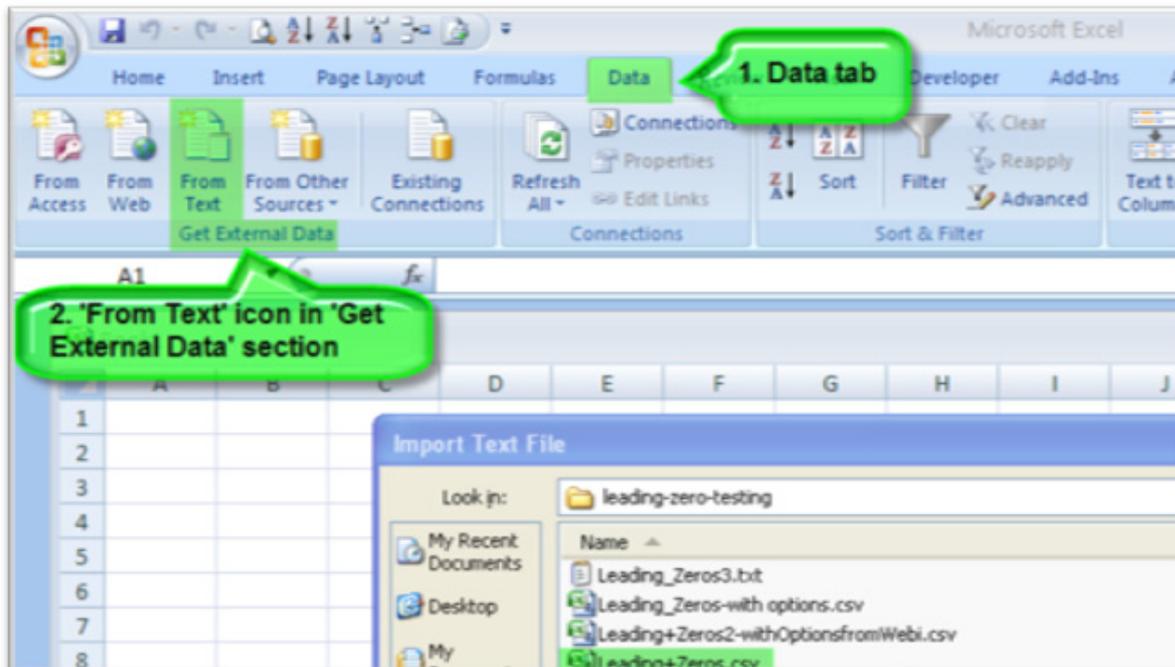

Download Global Directory CSV files

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Abbreviated Dialing**.
- Click **Upload/Download** to open the page.

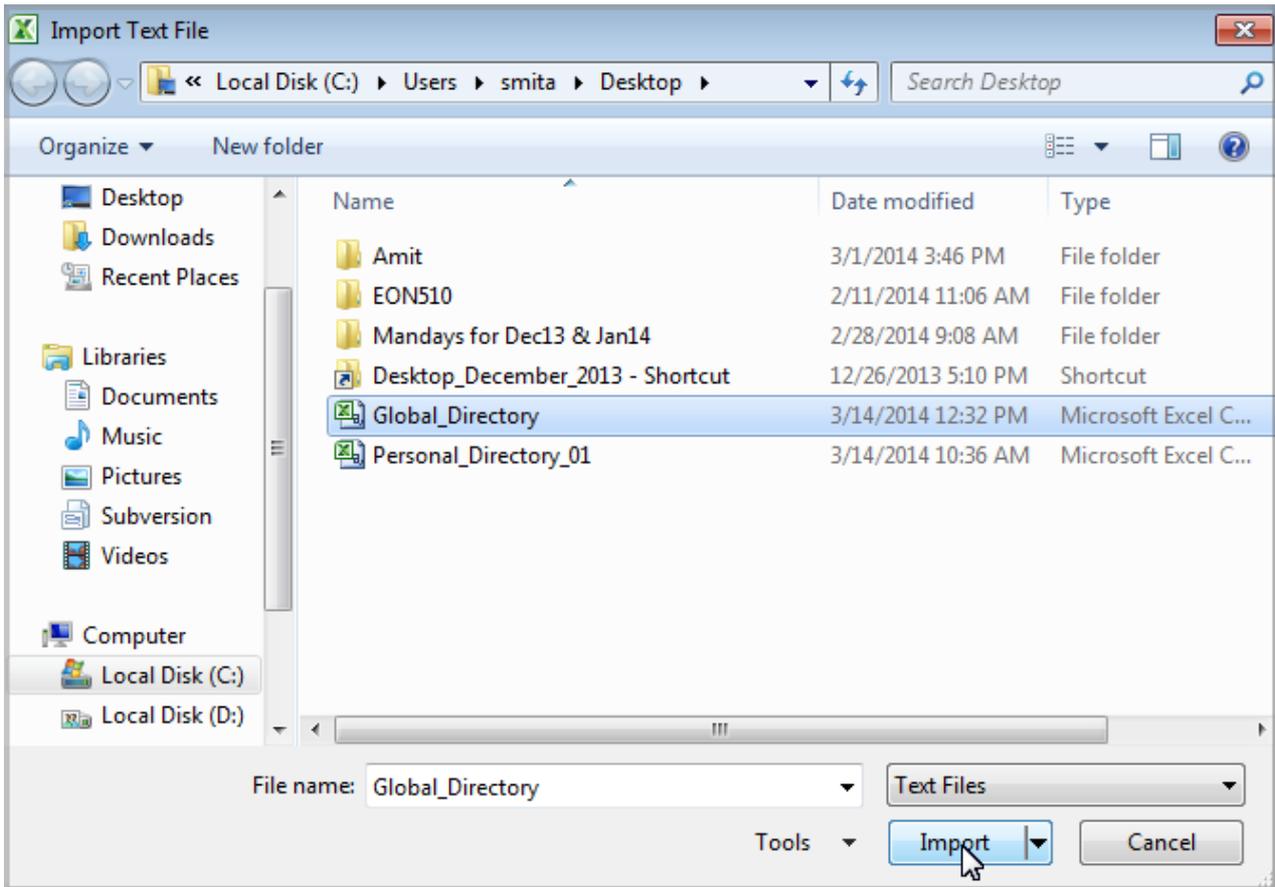

- Click **Download Global Directory Contacts** to expand.

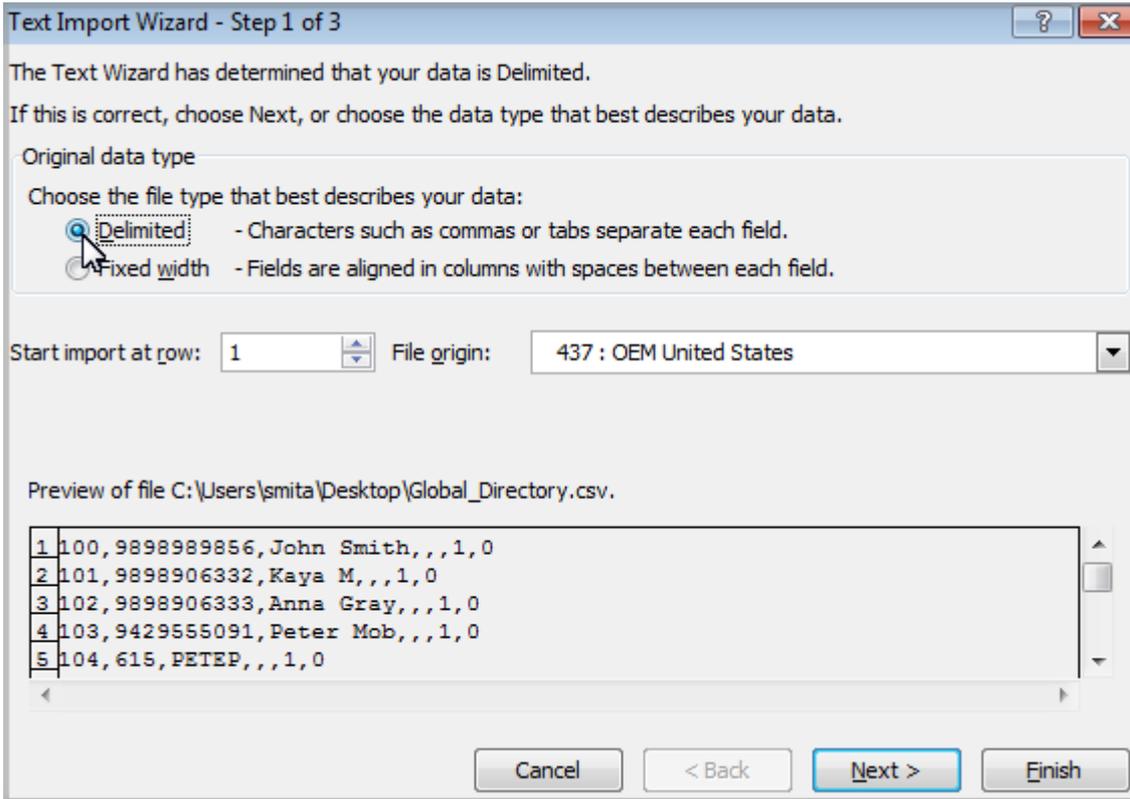

- Click the **Download** button.
- You will get a prompt with an option to open the **Opening Global_Directory.csv** file or save the file to a location. Save the file on the local disk.
- To Open the **Global_Directory.csv** file from the location on the local disk, make sure you follow the steps given below:
 - **DO NOT OPEN THE CSV FILE DIRECTLY WITH EXCEL!**
 - Open a **New** worksheet in Excel.
 - Open the **Data** tab and select **From text** button in the **Get External Data**.

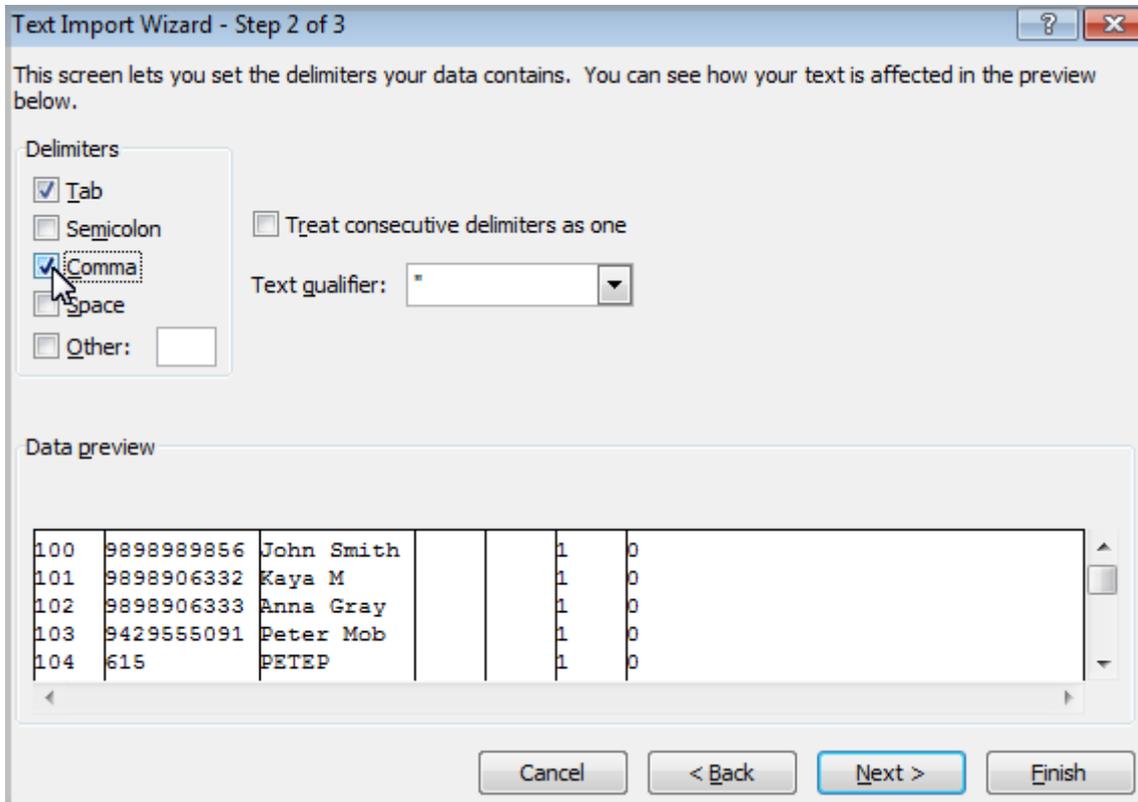

- Select your CSV file from the location on the local disk to import.

- In **Original data type** section, select **Delimited** radio button and click **Next**.

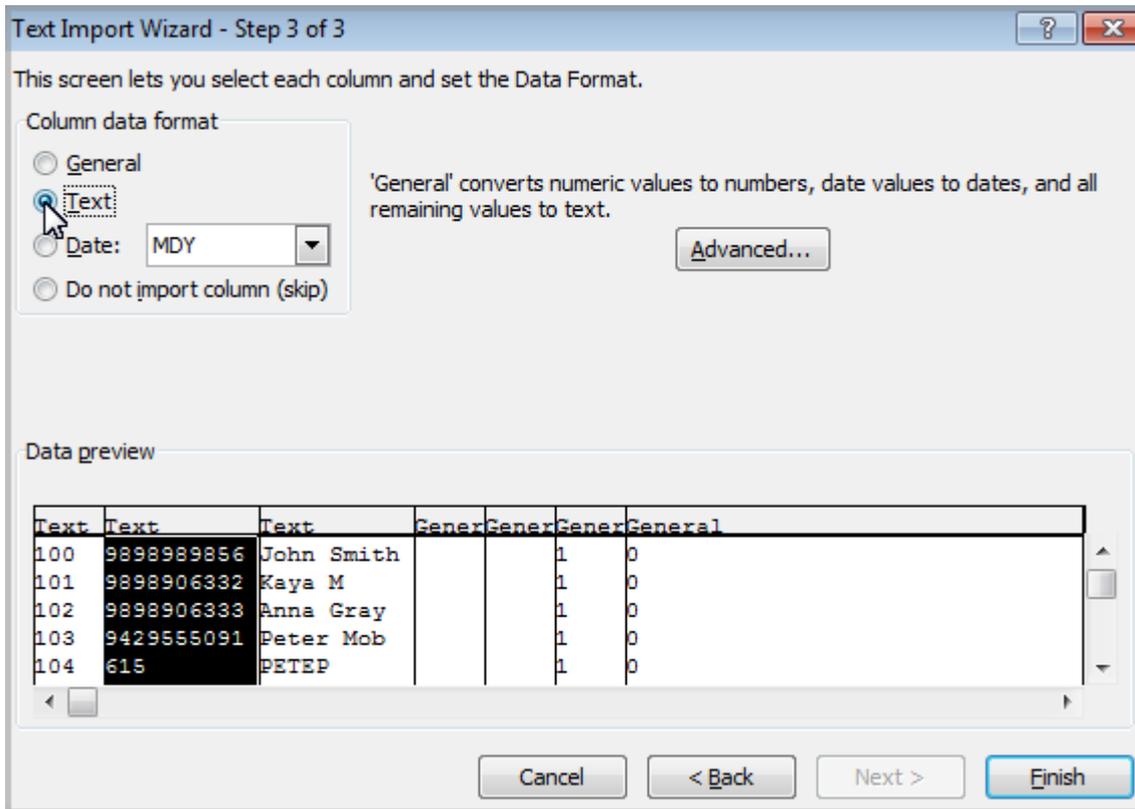

- In **Delimiters** select the **Comma** check box (column dividers will appear in preview) and click **Next**.

- Select the column with leading zeros and in **Column data format** select the **Text** radio button.

You will have to do this for each column where the data contains leading zeros.

- Click **Finish**.
- The leading zeros will still be there in the new worksheet with the imported data.

Configuring Global Directory using a Telephone

- Enter SE mode.

To program a telephone number in the global directory, dial:

- **1801-Location Code-Number**

Where,

Location Code is from 100 to 999.

Number is the telephone number, max. 16 digits. If the number has fewer than 16 digits, you must dial **#*** to terminate the command.

To clear a telephone number from a location in the global directory, dial:

- **1801-Location Code-#***

To program a name in global directory, dial:

- **1802-Location Code-Name**

Where,

Location Code is from 100 to 999.

Name is a string of alphanumeric characters, max. 12 characters. If the name has fewer than 12 characters, you must dial **#*** to terminate the command.

To clear a name from a location in the global directory, dial:

- **1802-Location Code-#***

To program the OGTBG for a contact in the global directory, dial:

- **1803-1-Location Code-OGTBG** to assign OGTBG to a single Location code.
- **1803-2-Location Code-Location Code-OGTBG** to assign OGTBG to a range of Location Codes.
- **1803-*-OGTBG** to assign OGTBG to all Location Codes.

Where,

Location Code is from 100 to 999.

OGTBG is from 01 to 32.

By default, the OGTBG assigned is 01.

To clear a location code in the global directory:

- **1800-1-Location Code**
- **1800-2-Location Code-Location Code**
- **1800-***

- Exit SE mode.

Refer the topics "[Class of Service \(COS\)](#)" and "[Station Basic Feature Template](#)" for instructions on how to use SE commands to

- enable a feature (Global Directory) in the CoS Group.
- assign the CoS group to a Station Basic Feature Template
- apply the template with the newly programmed CoS group to the extensions.

Personal Directory Configuration by Extension Users

Extension users can program their own Personal Directories using their extension phones. The personal directory may be programmed using DKP or SLT.

If you are using an SLT, you will not be able to program the Name of the contact in the directory.

For EON and Extended IP Phone Users

- Press DSS Key assigned to Personal Directory (if programmed).

OR

- Dial 1071.
- Enter Personal Memory Index (01 to 25)
- Enter Number of the contact (max. 16 digits).
- Press 'Enter' key.
- Enter Name of the contact (max. 12 characters).
- Press 'Enter' key.
- Enter Trunk Access Code.
- Press 'Enter' key.
- You get confirmation tone and the message on your phone's display.

For SLT Users

- Pick up handset.
- Dial 1071.
- Dial Personal Memory Index (01 to 25).
- Dial Number of the contact (max. 16 digits).
- Press #*.
- Dial Trunk Access Code.
- You get confirmation tone.
- Replace handset

Global Directory Configuration by Extension Users

Extension users can add, delete and edit contacts in Global Directory Part 1 using their extension phones, provided that:

- their phone is a digital key phone;
- Global Directory Part 1 is allowed to them in their Class of Service.
- Global Directory Programming is allowed to them in their Class of Service.

- *Extension users can only add, delete and edit names and numbers of contacts in Global Directory Part 1. However, they cannot program the Outgoing Trunk Bundle Group (OGTBG) for the contacts in the directory.*
- *If LDAP is enabled, then the contacts stored in the Global Directory synchronized with LDAP cannot be edited or deleted from the system.*
- *When an extension user programs Global Directory Part 1, the system will automatically assign the number and name to a free Memory Location. The system will use the OGTBG assigned to that Memory Location by the System Engineer to dial out the number added by the extension user.*
- *By default, OGTBG 01 is assigned to all Memory Location Codes in the Global Directory.*
- *To simplify configuration for both the System Engineer and the extension users, the System Engineer is recommended to assign the same OGTBG number uniformly to all Memory Location Codes, and enable Least Cost Routing on this OGTBG.*
- *If no OGTBG has been assigned to a Memory Location in the Global Directory (that is, the field is blank), and an extension user adds a contact to this Memory Location, the number will not be dialed out.*

To program Global Directory Part 1 from the Digital Key Phone or Extended IP Phone, follow these steps:

- Press Enter key to enter Phone Menu.
- Scroll to 'Contacts' and press Enter Key.
- You will get the following options:
 - Add
 - Edit
 - Delete

Adding a contact

To add a contact, select 'Add' and press Enter key.

- Enter your contact's name on the prompt: 'Name:'
A maximum of 12 characters are allowed.
- Press Enter key to save name.
- Enter your contact's number on the prompt: 'Number:'
A maximum of 16 digits are allowed.
- Press Enter key to save number.
- You will get the confirmation tone and the confirmatory message: "Stored at Index xxx".

Editing a contact

To edit a contact,

- Scroll to 'Contacts' in the phone menu and press Enter key.
- Select 'Edit' and press Enter key.
- You get the prompt: 'Name:'
- Enter the initial letters of the contact's name.
- The number of matching entries that will appear at a time on your phone's display will vary according to your phone's LCD display capacity.
- Scroll with the Up/Down navigation keys to reach the desired contact's name on the list.
- Press 'Enter' key to select the name.
- The system displays the name you selected.
- To delete a character, use the Back/Forward navigation key to place the cursor under the character you want to delete.
- Press the 'Cancel' key to delete the character you selected with the cursor.
- To enter a character, use the Back/Forward navigation key to place the cursor in the position you want to enter the character.
- Enter the desired character by pressing the relevant digit pad keys in quick succession.
- After you have finished editing the name/ number, press Enter key.
- The number of the contact whose name you edited will be displayed.
- Repeat the same steps as you did for editing the name.
- After you have finished editing the number, press Enter key.
- You will get the confirmation tone and the confirmatory message: "Stored at Index xxx".

Deleting a contact

To delete a contact,

- Scroll to 'Contacts' in the phone menu and press Enter key.
- Select 'Delete' and press Enter key.
- You get the prompt: 'Name'
- Enter the initial letters of the contact's name.
- The number of matching entries that will appear at a time on your phone's display will vary according to your phone's LCD display capacity.
- Scroll with the Up/Down navigation keys to reach the desired contact's name on the list.
- Press 'Enter' key to delete the name.
- You will get the confirmation tone and the confirmatory message: 'Deleted'.

How to use

Personal Abbreviated Dialing

For EON and Extended IP Phone Users

- Press DSS Key assigned 'Abbreviated Dialing' function (if programmed).
- OR
- Dial 8 (users world wide)
- OR
- Dial 6 (users in USA)
 - You get the message 'Give Index'
 - Enter Personal Directory Index number: 001 to 025²³⁴.
 - The desired number will be dialed out.

For SLT Users

- Pick up the handset.
 - Dial 8 (users world wide)
- OR
- Dial 6 (users in USA)
 - Dial Personal Directory Index number: 001 to 025²³⁵.
 - The desired number will be dialed out.

Global Abbreviated Dialing

For EON Users

- Press DSS Key assigned 'Abbreviated Dialing' function (if programmed).
- OR
- Dial 8 (users world wide)
- OR
- Dial 6 (users in USA)
 - You get the message 'Give Index'
 - Enter Global Directory Index number: 100 to 999²³⁶.
 - The desired number will be dialed out.

234. For ETERNITY LENX/MENX it is 0001 to 0025.

235. For ETERNITY LENX/MENX it is 0001 to 0025.

236. ETERNITY LENX/MENX stores up to 2900 numbers in the Global Directory; Part 1 - 0100 to 2399, Part 2 - 2400 to 2699 and Part 3 - 2700 to 2999.

For SLT Users

- Pick up the handset.
- Dial 8 (users world wide)

OR

- Dial 6 (users in USA)
- Dial Global Directory Index number: 100 to 999²³⁷.
- The desired number will be dialed out.

237. *ETERNITY LENX/MENX stores up to 2900 numbers in the Global Directory; Part 1 - 0100 to 2399, Part 2 - 2400 to 2699 and Part 3 - 2700 to 2999.*

Access Codes

What's this?

Access codes are short digit sequences dialed from an extension phone to instruct the System to perform a function such as:

- Calling an extension.
- Calling a group of extensions (“[Department Call](#)”).
- Grabbing a trunk line or any trunk line from a group of trunks (“[OG Trunk Bundle Group](#)”).
- Invoking a feature. Activating or deactivating a feature.

Accordingly Access Codes are classified into:

- **Station Codes:** Codes used for calling extensions. These codes are also commonly referred to extension numbers, phone numbers. For the purpose of this document, station codes are referred to as Flexible Numbers.

Default station codes: the factory-set default values for SLT extensions are from 2001 to 2512; for DKP extensions from 3001 to 3128.

- **Logical Group Codes:** codes used for calling a group of stations as in a Department group, a group of trunks as in Outgoing Trunk Bundle Group.

Default logical group codes: the factory-set codes for Department Numbers start from 3901, 3902.... Outgoing Trunk Bundle Groups from 61, 62, etc.

- **Feature Codes:** codes used for invoking a feature.

Default feature codes: there are different feature codes for every feature/function of the SARVAM UCS, e.g.: '2' for Auto Call Back, '5' for Raid, '13' for Call Forward, etc.

Access codes may consist of single digits or a sequence of a maximum of 6 digits.

You can change the default access codes to codes of your choice. For example: the default Operator code '9' can be changed to '0'; the default trunk access code for dialing Trunk Group1 can be changed from '61' to '5'.

How it works

Whenever an access code is dialed from an extension, the system matches each digit in the code with the access codes programmed within the system to determine the instruction, that is, whether it is an extension it must call, or a trunk line it must grab, a port it has to activate, etc. The system processes the instruction when a match is found.

For example:

- An extension user dials 131 to set Call Forward.

- When the first digit '1' is dialed, the system finds a match. As several default access codes begin with '1' the system waits for the next digit to be dialed.
- When the second digit '3' is dialed, the system finds a match for '13'.
- As '13' is common for all Call Forward options²³⁸, the system waits for the next digit to be dialed
- When the user dials the third digit '1', the system finds a match for '131'.
- If there is more than one access codes matching with '131', e.g. '1311', '1314', '1315' the system will wait for the next digit to be dialed.
- If no further digit is dialed on expiry of the Inter Digit Wait Timer, the system understands the instruction as 'Call Forward - Unconditional' and waits for the destination phone number to be dialed.

Access Codes are related to various phases of a call. When a call is processed by a System, it goes through a number of pre-defined phases.

Typically a call passes through the different phases as shown below:

Idle	Dial	Routing	Blocked	Placed	Matured 2-Way	Matured 3-Way	Denied
No activity.	Digits are pressed on the phone keypad/dialed from the rotary.	The system is processing the call. The call is neither placed nor blocked.	The dialed extension is busy.	The dialed extension is ringing.	Connected with the dialed extension.	Connected with two extensions.	No reply from dialed extension.
	Dial tone is played.	Beeps are played.	Busy tone is played.	Ring Back Tone is played.	Two-way speech.	Three-way speech.	Error Tone is played.

Different access codes are dialed at different call phases. Station Codes and Logical Group Codes are dialed in the 'Dial' phase.

As different features are invoked in each call phase, Feature Access Codes are dialed at different call phases. For example:

- Call Forward code is dialed at the 'Dial' phase'.
 - DND Override code is dialed at the 'Routing' phase'
 - Auto Call Back code is dialed at the 'Blocked' phase' as well as 'Placed' phase.
 - Three-party Conference code is dialed at the 'Matured 2 way' phase.
- 'Idle' phase is when no code is dialed. In the 'Denied Phase' no code is allowed to be dialed.

238. Call forwarding options: Unconditional, When Busy, When No Reply, When Busy or No Reply.

Each access code in a single call phase may be of different lengths, but must be unique. For example, the same access code cannot be used for two different features like Call Forward and Redial, since both these features are invoked in the 'Dial' phase.

However, the same access code can be used for features in different call phases. For example, '4' is the default feature access code for DND Override (Routing Phase), Call Pick-Up-Group (Dial Phase) and Barge-In (Blocked Phase).

Similarly, Station and Logical Group Codes too must be unique and should not match with any of the features invoked in the 'Dial' phase. Refer the topics [“Flexible Numbers”](#) and [“OG Trunk Bundle Group”](#) to know more.

How to configure

SARVAM UCS provides default Access Codes for stations, logical groups - department and trunk groups - and features.

It also provides country-specific default Access Codes which are applied automatically when you select the 'Region' to configure the system.

The default Access Codes for India are presented in the table below. The default Access Code tables also indicate the call phase in which each feature is invoked.

Feature	Feature Number	Access Code	Call Phases					
			Dial	Routing	Blocked	Placed	Matured 2-way	Matured 3-way
Enter SE Programming Mode	1	1#91	Y				Y

You can either use the default Access Codes or change them to suit your preferences.

Changing Feature Access Codes using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **Access Codes**.
- Click **Feature Access Code** to open the page.

The screenshot shows the 'Access Codes' configuration page in the Jeeves system. The left sidebar contains a navigation menu with 'Configuration' expanded and 'Access Codes' selected. The main content area displays two tables of feature access codes. The first table lists features like 'Enter SE Programming Mode' with access code '1#91'. The second table lists features like 'Invoke RCOC' with access code '**'. At the bottom, there are 'Submit' and 'Default' buttons.

- Change the Access Codes as per your preference. A maximum of 6 digits.
- Click **Submit** at the bottom of the page to save changes.
If you enter a code that is already assigned to a station or a feature, the system will not accept the duplicated code. The value will remain unchanged.

- To disable an access code, delete the existing code and leave the field blank.
- Click **Default** all to default all Access Codes.

To change Station Access Codes (for extensions), Department Groups, Trunks and Trunk Groups, and General Mailbox Access Code refer the topics [“Flexible Numbers”](#), [“Department Call”](#), [“OG Trunk Bundle Group”](#) and [“General Mailbox Settings”](#).

Changing Feature Access Codes using a Telephone

- Enter SE mode from an SLT/DKP.

To program the access code for a feature, dial:

- **3111-1-Feature Number-Access Code-#***

Where,

Feature Number is from 01 to 88.

Access Code is a string of maximum 6 digits

- E.g.: To change the prefix of SA command '1072' to '107' dial: **3111-1-60-107-#***

Where,

60 is Feature Number for SA command.

107 is the new Access Code for SA command.

If you try to assign a number string that is already used to access an extension or use a feature then the system will not accept the command and will play error tone.

To default access codes, dial:

- **3161-1-Feature Number** to default access codes for a single feature.
- **3161-2-Feature Number-Feature Number** to default access codes of a range of features.
- **3161-*** to default access codes of all features

Where,

Feature Number is from 01 to 88.

E.g.: To default the prefix of SA command '107' to '1072' dial: **3111-1-60**

A default trunk access codes table is given below:

OGTBG Index	Default Trunk Access Code
1	0
2	5
3	61
4	62
5	63
6	64

To assign access code for a trunk access index, dial:

- **3112-1-OGTBG Index-Access Code-#***

Where,

TAC Index is from 1 to 6.

Access Code is maximum 6 digits (Generally access code for trunk is of two digits).

To clear the access code for a trunk access index, dial:

- **3112-1-OGTBG Index-#***
- **3112-2-OGTBG Index-OGTBG Index-#***
- **3112-*-#***

To assign default access code for a TAC index, dial:

- **3162-1-OGTBG Index**
- **3162-2-OGTBG Index-OGTBG Index**
- **3162-***

To program the access code for a VMS Group, dial:

- **3114-1-VMS Group Index-Access Code-#***
- **3114-2-VMS Group Index-VMS Group Index-Access Code-#***
- **3114-*-Access Code-#***

Where,

VMS Group Index is 1.

Access Code is maximum of 6 digits. If it is less than 6 digits, terminate it with #*

By default, the Access Code of the VMS Group is 3931.

To default the access code for a VMS Group, dial:

- **3164-1-VMS Group Index**
- **3164-2-VMS Group Index-VMS Group Index**
- **3164-***

Where,

VMS Group Index is 1.

To clear the access code for a VMS Group, dial:

- **3114-1-VMS Group Index-#***
- **3114-2-VMS Group Index-#***
- **3114-*-#***

Where,

VMS Group Index is 1.

- Exit SE mode.

Account Codes

What's this?

Account Codes are very useful feature for organizations such as business consultants, law firms, advertising and media agencies, and the like that cater to several clients, interacting with third parties on behalf of their clients. Such organizations need to keep track of calls made to and on behalf of each client.

An 'Account Code' is a unique three-digit number that an organization can assign to each of its clients. Each Account Code may be given a name and programmed in the Account Name List.

Doing so, whenever calls are made to the client or to a third party on behalf of the client,

- The extension user dials the Account Code or Name assigned to the client.
- The Account Code may be dialed,
 - before dialing the external number.
 - Or
 - when in speech with the client/third party
- Details of these calls are recorded by the Account Code dialed in the Station Message Detail Recording Report (SMDR) for Outgoing Calls.
- The SMDR report can be printed using the Account Code as filter.

This way, the organization can know the details of calls made to and on behalf of each client.

- The SARVAM UCS supports as many as 999 Account Codes.

How it works

For example, an advertising media agency makes nearly 100 calls every day to and on behalf of its clients that includes 'Midas Business Solutions', 'Jet-Set Holidays', 'Bacchus Vineyard'.

- Assign a three-digit account code to Midas Business Solutions, for instance '001' and the name code 'Midas Biz' in the Account Name List.
- Assign a three-digit account code to Jet-Set Holidays, for instance '002' and the name code 'Jet' in the Account Name List.

Case 1: Applying same Account Code

- A, a person from advertising media agency makes a call to Midas Business Solutions and talks to the secretary B. During an ongoing conversation A dials the account code 001. In between, A needs to consult the manager C. Therefore, A presses the *Transfer* key to put B on **Consultation hold** and dials the number of C. Account code 001 will be applicable to the second call made to C also.

Case 2: Applying different Account Codes

- A, a person from advertising media agency makes a call to Midas Business Solutions and talks to the secretary B. During an ongoing conversation A dials the account code 001. In between, A needs to talk to another client, say Jet-Set Holidays D. Therefore, A pressed the *Call Hold* key to put B on **Exclusive/Global hold** and dials the number of D. While in speech with D, A dials account code 002. Here, Account Code 001 will be applicable to Midas Business Solutions and Account Code 002 will be applicable to Jet-Set Holidays.

Forced Account Code

The SARVAM UCS can be programmed to prompt extension users to dial the Account Code whenever they grab a trunk to dial out a number. Hence the feature name Forced Account Code.

To apply Forced Account Code, this feature must be enabled on the extensions and trunks from which calls using Account Codes are to be made. When Forced Account Code is enabled on an extension, and the extension user dials out a number or the Trunk Access Code to grab a trunk, the system will play an error tone. If the extension is a DKP, the system will flash a message on the phone's display that Account Code is required to make the outgoing call.

- *Account Codes are applicable for external calls only.*
- *To use Account Codes, this feature must be included in the Class of Service (CoS) group allowed to the extensions.*
- *If you want to use Account Names, you must program the Account Name List.*
- *When the Forced Account Code is enabled on an extension and trunk, the system will ask the user to enter the account code irrespective of the method of dialing: Global Abbreviated dialing, Personal abbreviated dialing, Least Cost Routing, or Selective Trunk Access.*
- *However, if Forced Account Code is enabled on the selected trunk, and the number is dialed using Selective Trunk Access, the system will dial out the number using Store and Forward dialing.*

In the case of Abbreviated Dialing or Direct Dialing, if the extension user fails to dial the Account Code, an error message will be displayed on the extension user's DKP.

How to configure

For Account Code to work, you must:

1. Enable Account Codes feature in the Class of Service (CoS) of the extensions to which this feature is to be allowed.
2. Prepare and program the Account Name List, if it is to be used.
3. If Forced Account Code is to be used, you must enable 'Forced Account Code' flag in
 - the ["Station Advanced Feature Template"](#) applied to the extensions from which calls using account codes are to be made.
 - the ["Trunk Feature Template"](#) applied on the trunks through which calls using account codes are to be made.

All the above feature parameters can be programmed using Jeeves or by dialing commands from a Telephone.

Preparing Account Name List

In consultation with the Users, you may prepare the Account Name list. You may do the following

- Draw a two-column table on a paper.
- Write Account Codes on one column. Account codes may be any three-digit number between 001 and 999.
- Write the Account Names, that is, names of the clients on the second column, against their respective Account Codes.
- The names must not exceed 12 characters. All ASCII characters except < > and " (double quote) are allowed. For example:

Account Code	Client Account Name
001	Midas Biz
002	Jet Set
:	
010	Bacchus

You need not follow a cardinal numbering sequence when assigning Account Codes.

You may assign any code to any client. For instance, you can assign code '111' to Midas Business Solutions, '222' to Jet-Set Holidays, '333' to Bacchus Vineyard.

Configuring Account Codes using Jeeves

After preparing the Account Name list,

- Log in as System Engineer.

- Under **Configuration**, click **Account Name**.

The screenshot shows a web-based configuration interface. On the left is a navigation menu with categories like 'Abbreviated Dialing', 'Access Codes', 'BRI Configuration', 'Call Cost Calculation', 'CO Configuration', 'CTI', 'DDI Routing', 'DKP Configuration', 'Emergency', and 'E&M Configuration'. The 'Account Name' option under 'Access Codes' is selected. The main area shows a table titled 'Account Name' with 52 rows and 6 columns. The columns are labeled 'Account Code' and 'Name', and are repeated twice. The table is currently empty. At the bottom of the main area are 'Submit' and 'Default' buttons. At the top of the main area, there are three input fields containing the numbers '001-333', '334-888', and '667-999'.

- Enter the Names of the clients against the account codes you have assigned to them. Refer the paper with the two-column table you created.
- Click **Submit** to save your settings.

Now, include the feature **Account Codes** in the **Class of Service** of the extensions.

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all extensions of the system. Template 01 has the feature Account Codes in the default CoS Group (Number 01). So, all extensions of the system can use this feature.

If Account Codes is to be allowed only to selected extensions, follow these steps:

1. Define a CoS group with 'Account Codes' enabled.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the ["Time Zones"](#).
3. Assign this new Template to the extensions to which Account Codes is to be allowed.

Refer the topics ["Class of Service \(COS\)"](#) and ["Station Basic Feature Template"](#) for detailed instructions.

If Forced Account Code is to be used, enable the 'Forced Account Code' flag in the ["Station Advanced Feature Template"](#) of the extensions and in the ["Trunk Feature Template"](#) assigned to the trunks.

When you enable 'Forced Account Code' in a template, this feature will be enabled on all DKP, SLT and SIP extensions that are assigned this template. If necessary, create a separate template with this feature and assign this template only to those extensions that are to be assigned this feature.

To enable **Forced Account Code** flag on Trunks,

- Go to the parameters page of the type of trunk you want to program. For example: **CO Parameters** page to program CO Trunk, **Mobile Parameters** page to program GSM Trunk, **SIP Parameters** page to program SIP Trunks etc.
- Click the **Trunk Feature Template** link in the column. The feature template page will open.

By default Trunk Feature Template 01 is assigned to all Trunk Types.

If you want to enable this feature on all trunks, enable it in Trunk Feature Template 01.

If you want to enable this feature only on select trunks, program a different Template number with this feature.

- Select the **Forced Account Code** check box in the template number assigned to the trunk.
- Click **Submit** to save your changes.
- Return to the trunk parameters page.
- Now change the Trunk Feature Template number of the trunk you want to program. This number should be the same as the template in which you have enabled the Forced Account Code check box.
- Click **Submit** to save changes.

Repeat the above steps to configure all other trunk types.

Configuring Account Codes using a Telephone

- Enter SE mode.

To create the Account List:

- Dial command **4851-1-Account Code-Account Name**
Where,
Account Code is 001 to 999.
Account Name is a string of 12 characters.

Terminate Account Name with #*, if it is less than 12 characters.

For example: to program account code '001' with the name 'Midas Biz', dial

4851-1-001-MIDAS BIZ-#*

Press the digit key '1' twice to give space between characters.

To enable Forced Account Code flag in Station Advanced Feature Template:

- Dial command **5602-1-Template Number-Feature Number-Flag Code**
Where,
Template Number is Station Advanced Feature Template from 01 to 50. Default: 01
Feature Number for Forced Account Code is 09.
Flag Code is

0 for Disable
1 for Enable

For example: To enable Forced Account Code Flag in Station Advanced Feature Template 02: Dial **5602-1-02-09-1**

To apply the Station Advanced Feature Template now programmed with the Forced Account Code on stations, refer the topic "[Customizing Station Advanced Feature Template using a Telephone](#)".

To enable Forced Account Code flag on a Trunk:

- Dial command **5802-1-Template Number-Feature Number-Flag Code**

Where,

Template Number is from 01 to 50.

Feature Number for Forced Account Code flag is 29.

Flag Code is

0 for Disable

1 for Enable

For example: To enable Forced Account Code Flag in Trunk Feature Template 01: Dial **5802-1-01-29-1**

To apply the Trunk Feature Template now programmed with the Forced Account Code on different types of trunks, refer the topic "[Customizing Trunk Feature Template using a Telephone](#)".

- Exit SE mode.

How to use

Account Codes can be dialed in two ways: by Number and by Names.

Account codes, that is, number and names, can be dialed:

- before making the call,
- during the call,
- when grabbing a trunk (if Forced Account Code flag is enabled).

Print and hand out copies of the Account Code List to everyone in the organization for reference while making calls.

Dialing Account Code by Number

For EON Users and Extended IP Phone Users

To enter Account Code Number before making the call:

- Press DSS Key assigned to 'Account Code by Number'.

OR

- Dial **1058**
- Enter Account Code
- Dial Trunk Access Code

- Dial the number of the client.

To enter Account Code Number during the call:

- Press 'Transfer' Key
- Press DSS Key assigned to Account Code by Number.

OR

- Dial **1058**
- Enter Account Code
- Speech will be resumed.

To enter Account Code Number when Forced Account Code Flag is enabled:

For EON Users and Extended IP Phone Users

- Press DSS Key assigned to Account Code by Number.

OR

- Dial **1058**
- Enter the Account Code Number.
- You get dial tone.
- Dial Trunk Access Code followed by the number of the client.

If you dial the Trunk Access Code to grab a trunk, without dialing the Forced Account Code, you will get an error tone. Go ON-hook and then go OFF-hook. Now follow the same steps in the sequence mentioned above.

For SLT Users

- Go OFF hook.
- Dial Account Code first.
- Dial Trunk Access Code followed by the number of the client.

If you dial the Trunk Access Code to grab a trunk, without dialing the Forced Account Code, you will get an error tone. Go ON-hook and then go OFF-hook. Now follow the steps in the sequence mentioned above.

Dialing Account Code by Name

Dialing Account Code by Names is possible only if your phone is a DKP / Extended IP Phone.

For EON Users and Extended IP Phone Users

To enter Account Code Name before making the call:

- Press DSS Key assigned to Account Code by Name.

OR

- Dial **1059**.

- Enter the initial letter of the client's name.
The Account Name List will be displayed on your DKP, alphabetically with the corresponding account codes.
- Scroll to select the desired client name and press Enter key.
- Dial Trunk Access Code.
- Dial the client's number.

To enter Account Code Name during the call:

- Press Hold key to put the called party on hold.
- Press DSS Key assigned to Account Code by Name.

OR

- Dial **1059**.
- Dial the initial letter of the client's name.
The Account Name List will be displayed on your phone, alphabetically with the corresponding account codes.
- Scroll to select the desired client name and press Enter key.
Speech will be resumed with the called party.

Dialed the wrong account code or name?

If you have dialed the wrong account code or name while in the middle of a call, you can correct it by pressing 'Hold' again and following the steps described above. The system will override the previously dialed account code or name.

Printing Call Reports of Clients

You can print the call details of your clients using their account codes as filter.

Refer the section [“Station Message Detail Recording-Report”](#), for more detailed instructions on printing reports using filters.

AC Impedance Test

What's this?

SARVAM UCS supports the AC Impedance Test for clear, audible and echo-free speech over the CO Trunks. This test helps you to set the most appropriate values for the CO Trunk parameters —AC Impedance, CO Termination and CO Line Type— to correct the line impedance mismatch between the AC Termination Impedance presented by the CO port of SARVAM UCS to the line and the CO Termination Impedance presented by the Central Office to the line.

Conducting AC Impedance Test

You can conduct an AC Impedance Test,

- by making an outgoing call
or
- on an ongoing incoming call.

To conduct the AC Impedance Test you will need,

- a telephone with a valid number. You are recommended to use -a mobile phone with Mute function.
- the CO Trunk which you want to test.

For the CO Trunk you want to test, make sure you select a CO Hardware Template number.

The DSS Key assigned to this CO Trunk will display status as busy to all the user, for the duration of the test.

Configuring Using Jeeves

You can conduct the test after you have set the relevant test parameters. To do this,

- Log in as System Engineer.

- Under **CO Configuration**, click **AC Impedance Test**.

To conduct an AC Impedance Test by making an outgoing call

- In **Enter Phone Number to which call should be made**, enter the phone number on which you want to make test call. The number can be a landline or a mobile number. We recommend you to use a mobile number for the test call.

If you are using a mobile phone number, be sure the handset of the configured number supports the Mute function.

- In **Make call using CO Port**, select the CO trunk using which you want to make the test call. This must be the same CO trunk for which AC Impedance is to be set.
- Select the **Test Mode**. You may select **Reliable (Recommended)** or **Accurate**.

The **Reliable Test** mode suggests the AC Impedance settings on the basis of most commonly used AC Impedances, CO Terminations and CO Line Types across the globe. The test using Reliable Test mode takes approximately 5 minutes to complete.

The **Accurate Test** mode suggests the AC Impedance settings on the basis of all the possible AC Impedances, CO Terminations and CO Line Types across the globe. The test using the Accurate Test mode takes 1 hour and 20 minutes to complete.

- Click the **Start Test** button. The system calls the phone number you configured. The message '*Setting up the Test...*' appears on your screen.

AC Impedance Test	
Enter Phone Number to which call should be made	02652630555
Make call using CO Port	001 ▼
Test mode	Reliable (Recommended) ▼
<input type="button" value="Help"/>	
Setting up the Test...	
<input type="button" value="Abort Test"/>	

While the test is being conducted, you will hear pulsating tone on all the ports of the same card. For ETERNITY PENX, you will hear this tone on all the CO ports of the system.

- Answer the test call from your mobile phone. You will hear the Music-on-Hold as per the type of Answer Supervision you have configured in the CO Hardware Template assigned to the CO trunk you are testing.

By default, the Answer Supervision selected in the template is Pseudo Answer and the Pseudo Answer Supervision Timer is set to 10 seconds. If you have not changed this default setting, you will hear Music-on-Hold after 10 seconds of answering the call.

- As the Music-on-Hold begins to play, Mute the microphone of your mobile phone.

If you are making the test call on a landline number, mute the call using the Mute key of the phone. If your phone does not have a Mute key, unplug the handset cable from the phone body. This is to prevent test signals from reflecting back into the mic of the handset.

- After 5 seconds of Music-on-Hold, you will hear the test signals being transmitted by the system for the duration of the test. The message *'Reliable' Test running successfully...* appears on your screen.

AC Impedance Test	
Enter Phone Number to which call should be made	02652630555
Make call using CO Port	001 ▼
Test mode	Reliable (Recommended) ▼
<input type="button" value="Help"/>	
<i>'Reliable' Test running successfully on CO-001...</i>	
<input type="button" value="Abort Test"/>	

- On completion of the test, the system will automatically disconnect the call. The message *'Test completed'* appears on your screen.

However, if you wish to abort the test midway, you may click the **Abort Test** button.

To conduct an AC Impedance Test on an ongoing incoming call

- Click the *Click Here* link on the AC Impedance Test page.

The screenshot shows the 'AC Impedance Test' configuration interface. It includes the following elements:

- AC Impedance Test** (Section Header)
- Form fields:
 - Enter Phone Number to which call should be made: 02652630555
 - Make call using CO Port: 001
 - Test mode: Reliable (Recommended)
- Buttons: Help, Start Test
- Text: Alternatively, you can perform the test on ongoing call on CO line.
- Link: [Click Here](#) to view list of ongoing calls. (A mouse cursor is pointing to this link.)
- Status: Test completed.
- Suggested Impedance Settings** (Section Header)
- Table of settings:

AC Impedance	600 Ω
CO Termination	600 Ω
CO Line Type	EIA-0
Return Loss	30.79dB
- Form field: Apply to CO Hardware Template (Double-click to select...)
- Buttons: Apply, Generate Test Report

- A new window opens. A list of ongoing calls will be displayed. Select a call on which you want to perform the test.

The screenshot shows a dialog box titled 'AC Impedance Test' with the following elements:

- AC Impedance Test** (Section Header)
- Form fields:
 - Select the Call: 3002 Speech CO-009
 - Test mode: Reliable (Recommended)
- Buttons: Cancel, Start Test

- Select the **Test Mode**. You may select **Reliable (Recommended)** or **Accurate**.

The **Reliable Test** mode suggests the AC Impedance settings on the basis of most commonly used AC Impedances, CO Terminations and CO Line Types across the globe. The test using Reliable Test mode takes approximately 5 minutes to complete.

- The **Accurate Test** mode suggests the AC Impedance settings on the basis of all the possible AC Impedances, CO Terminations and CO Line Types across the globe. The test using the Accurate Test mode takes 1 hour and 20 minutes to complete.
- Click the **Start Test** button. The message 'Setting up the Test....' appears on your screen.

While the test is being conducted, you will hear pulsating tone on all the ports of the same card.

- After 5 seconds the message 'Test running successfully...' appears on your screen.
- On completion of the test, the system will automatically disconnect the call. The message 'Test completed' appears on your screen.

However, if you wish to abort the test midway, you may click the **Abort Test** button.

Suggested Impedance Settings

- At the end of the test, the page displays the **Suggested Impedance Settings** for the AC Impedance, CO Termination, CO Line Type and Return Loss.
- You may now apply the suggested AC Impedance settings to the CO Trunk. To apply these settings, select the desired CO Trunks and click on the **Apply** button.

Suggested Impedance Settings

AC Impedance	600 Ω
CO Termination	600 Ω
CO Line Type	2000 ft 22AWG
Return Loss	23.26dB

Apply to CO Trunks

CO-1
CO-2
CO-3
CO-4
CO-5
CO-6

Apply

Generate Test Report

- Verify the settings by making a trial call from a DKP. There should be no echo and speech should be audible and clear.

If you still hear echo during the trial call, you may re-run the test using the **Accurate Test** mode.

- After you have determined the best matching AC Impedance, CO Termination, CO Line Type and Return Loss by running the tests, apply the same suggested settings on the CO Trunk you are testing. You may configure the same settings to all other CO Trunks, you have subscribed from the same CO exchange.

It is possible that the CO trunks subscribed from the same exchange differ in their AC Impedance settings, in such a case, you must run the test for each CO trunk separately and configure a different CO Hardware Template for each of these trunks.

- To generate the detailed test report, click the **Generate Test Report** button.

Suggested Impedance Settings

AC Impedance	600 Ω
CO Termination	600 Ω
CO Line Type	2000 ft 22AWG
Return Loss	23.26dB

Apply to CO Trunks CO-1 CO-2 CO-3 CO-4 CO-5 CO-6

Apply

Generate Test Report

The detailed test report appears in a new window. The **Suggested Impedance Setting** will appear in bold.

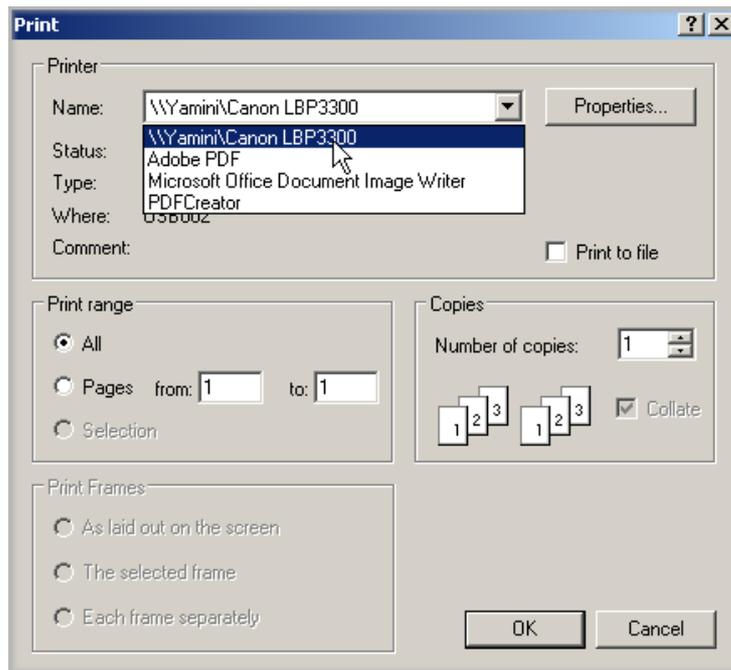

AC Impedance Test Detail Report

AC Impedance	CO Termination	CO Line Type	
600 Ω	None	2000 ft 22AWG	3.94d
600 Ω	150 Ω + 510 Ω + 47 nF	2000 ft 22AWG	16.65

270 Ω + (750 Ω 150 nF)	220 Ω + 120 Ω + 115 nF	2000 ft 24AWG	18.07

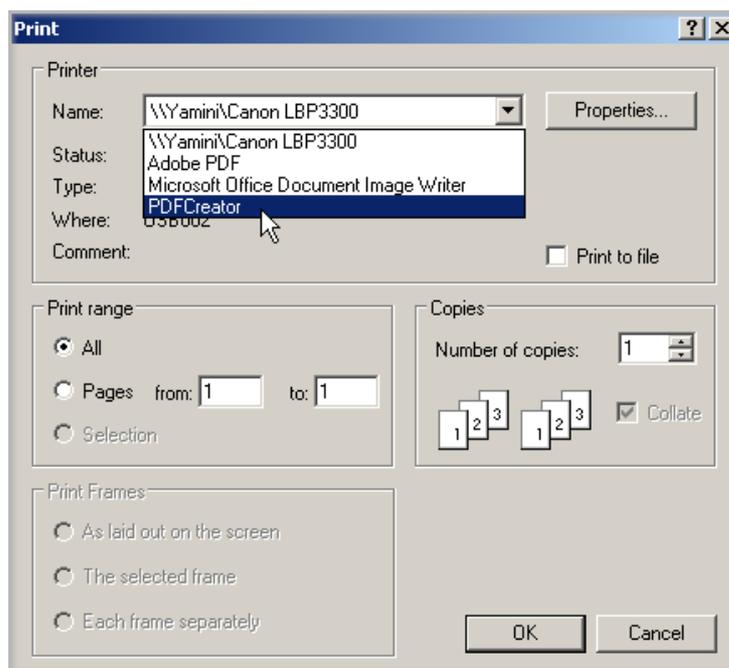

Print

- You may print the report by clicking the **Print** in the test report window.

- Select your Printer in the Printer options.

- You can also save the report in PDF format by selecting the PDF creator in your Printer options.

- Close the window to return to the AC Impedance Test page.
- Repeat the above steps to conduct further tests as per your requirement.

Configuring Using Telephone

- Enter SE mode from a DKP/SLT.

To run the AC Impedance Test using the Accurate Mode, dial:

- **3361-1-CO Port Number**

where,

CO Port Number is 001 to 128.

You can view the details of the test report on the port configured as the **Syslog Server IP Address: Port** on the System Debug page.

To view the report, dial:

- **3362**

Alarms

What's this?

Alarms are an efficient and user-friendly feature available to all extensions of the SARVAM UCS.

Alarms can be set and canceled

- by the Operator for extension users.
- by the extension users for themselves.

Alarms can be set as:

- *Once Only* - A one-time call, where the extension phone rings at the set time.
- *Daily* - A repeat call, where the extension phone rings at the set time everyday.

Alarms can be served as:

- *Personalized* - The Operator greets the extension user to serve the alarm request.
- *Automated* - The system serves the alarm request by playing a voice message or music.

How it works

Personalized Alarm

When the Alarm serving mechanism is configured as 'Personalized',

- The Operator phone rings first²³⁹, displaying the number of the extension to which the alarm is to be served.
- When the Operator answers this call, a call is placed on the extension on which the alarm is set.
- The extension rings for the duration of the Alarm Ring Timer.
- When the extension user answers the call, the Operator greets the extension user with the time and alarm message.
- This event is recorded in the Hotel-Motel Activity Log as 'Wake-up Alarm of <HH:MM> Answered on <phone number>'.
- If the extension user does not answer the call till the Alarm Ring Timer has elapsed, the Operator phone will display a text message notifying 'No Reply' from the extension. The Alarm is now considered as served.

²³⁹. The Operator phone rings for the duration of the Alarm Ring Timer. If the Operator does not answer the call, the system will make two more Alarm Attempts at an Alarm Attempt Interval of 5 minutes to call the Operator.

- This event is recorded in the Hotel-Motel Activity log as 'Wake-up Alarm of <HH:MM> No Reply on <Phone Number>'.
- If the extension is busy²⁴⁰, the Operator phone will display a text message notifying that the extension number is 'Busy'.
- The Operator can now choose to
 - inform the extension user about the alarm in person or send someone to do it.
 - try the busy extension again.
 - set "Auto Call Back (ACB)".

Automated Alarm

When the Alarm serving mechanism is configured as 'Automated',

- The extension phone rings at the set time till the end of the Alarm Ring Timer. If the extension phone is from the EON series, an Alarm message will appear on its display.
- When the extension user answers the call, s/he may be played music-on-hold, or a pre-recorded voice message or be connected to a routing group, depending upon the Alarm Notification Type programmed by the System Engineer.

The System Engineer may consult with the Enterprise to decide which of these options is to be programmed as the Alarm Notification Type.

- If the extension user does not answer the alarm call, the system makes two more attempts (in all, 3 attempts) at an interval of 5 minutes between each attempt, to call the extension. (Each attempt is recorded in the Hotel-Motel Activity log as 'Wake-up Alarm of <HH:MM> No Reply on <Phone Number>'.
- If all Alarm attempts go unanswered, the system places the call on the Operator phone. The Operator phone rings till the end of the Alarm Ring Timer. The Operator phone displays the extension number with the message 'No Reply'. The Alarm is now considered as served. (This event is recorded as "Alarm Notification to Front Desk for <Phone Number>").
- If the extension phone is busy the system will continue to make Alarm Attempts at the Alarm Interval programmed. When all Alarm Attempts go unanswered, the system will place a call on the Operator phone. The Operator phone will display the number of the extension phone with the message 'Busy'.

Snooze

The Snooze function can be added to Automated-Alarms to ensure that the extension user answers the call. Snooze is a system-wide feature; when set, this function will be added to all Automated Alarms.

When Snooze is activated,

- The extension phone rings for the Number of Alarm Attempts programmed, at set Alarm Attempt Intervals.
- The extension stops ringing, when the extension user answers the call and dials the Code '0' to acknowledge the Alarm. Please note that this Alarm Acknowledgement Code is non-programmable.

²⁴⁰. An improperly placed receiver may also be the cause for the busy tone on the extension phone. In that case, the system will notify the Operator Phone with the 'OFF-Hook Alert'. This event is recorded in the Hotel-Motel Activity Log as "Alarm not Served, <phone number> is Busy".

Consider you have set an alarm with snooze enabled and Number of Alarm Attempts set as three (configurable). If this alarm call is not acknowledged by the extension user at the first alarm attempt and due to some reason, the system restarts, then the pending two alarm attempts will not be served. However, this alarm will be displayed under the pending alarm list.

The system now considers this as a new alarm and will serve the same on the next day at the same time. Also, the number attempts made by the system will be as per value configured in the parameter **Number of Alarm Attempts**, provided it is not acknowledged by the extension user.

Alarm Status Report

The Operator can know the status of Alarms (details of Alarms that have not been served) from the WakeUp Alarms Reports from SA mode or by pressing the DSS key assigned to Wakeup Call Log.

The WakeUp Alarms Report is useful when Operators change shifts.

Using SA Mode

The Jeeves displays the status of Alarms set by Operator as well as extension users appears on this report, with details of time (hours and minutes), type (once only, daily), and serving mechanism (personalized, automated). The Alarm Report generated by the system can be printed or sent to a computer.

Using DSS Key

The DKP / Extended IP Phone users can also view the Wakeup Call Log Status on the phone LCD using the DSS key assigned to Wakeup Call Log. For instructions to assign a DSS Key to Wakeup Call Log, see [“Configuring Alarm Parameters using Jeeves”](#).

The Wakeup Call Log²⁴¹ is the log of:

- Unanswered Alarm Calls - This log will display both Alarms Calls that have not been answered as well as unacknowledged Alarm Calls.
- Pending Alarm Calls - This log will display Alarm Calls which have been set for a later time and/or date.
- Served Alarm Calls - This log will display Alarm Calls which have already been served.

You can check Alarms set (pending), served and unanswered for last 25 hours. Altogether maximum 500 entries will be displayed. Each Alarm Call will display the details of time (hours and minutes), date and type (once only, daily).

The LED of the DSS key assigned to Wakeup Call Log glows in Red to indicate Unanswered Alarm calls or it glows in Blue to indicate Pending Alarm calls.

If there are both, Unanswered and Pending Alarm calls, the LED of the DSS key will glow in Red. After you view the Unanswered Alarm Calls, the LED will glow in Blue to indicate Pending Alarm Calls. The LED will glow in Blue till all the Pending Alarm calls have been served. If any Daily Alarm has been set the LED of the DSS key will glow in Blue till the alarm is canceled.

²⁴¹. The logs will also display the Reminders.

To view the log from any DKP / Extended IP Phone user,

- Press the DSS Key assigned to Wakeup Call Log.
- The phone displays the logs — Unanswered Alarm Calls, Pending Alarm Calls, Served Alarm Calls.
- Select the desired log to view the details in the respective log.
- The acknowledged call is removed from the Alarms Log and is logged into the System Activity Log with the details of the extension that acknowledged the call.

- *SARVAM UCS can register as many as 960 Alarm requests set by the Operator and extension users.*
- *Multiple Alarms can be set for an extension by the Operator and/or by the extension user. For example, Daily Alarm at 09:00am is set for an extension. The extension user wants to change the alarm time to 08:30am for a day. The extension user/Operator can set another alarm, that is, a Once Only Alarm, at 08:30am without disturbing the daily alarm. Both the Alarms will ring at the set time.*
- *When multiple alarm requests have been set on an extension, if the Operator/extension user cancels an alarm set for an extension, the system cancels all alarms set for the extension. It is not possible to cancel any of these alarms selectively.*
- *It is not possible to modify an alarm request. Instead, the alarm request should be canceled and a new one should be made.*
- *The duration of Alarm Ring Timer, the Number of Alarm Attempts and the Alarm Attempt Interval are programmable.*
- *Alarms can be set for all extensions of the system, including the Operator phone also.*
- *All the Alarm events are logged in the "Hotel-Motel Activity Log".*
- *Alarm settings will be retained in the system during power down and system upgrades.*

How to configure

The following parameters play an important role in the functioning of the Alarm feature. These parameters carry default values. The default values have been selected keeping the larger user base in mind. However, these values can be changed by the System Engineer at the time of installation or afterwards as per users' requirements.

1. **Alarm Ring Timer** - The duration for which the system rings the extension to serve an Alarm call. By default, the Alarm Ring Timer is set to 45 seconds. This timer can be set between 001 to 255 seconds. This timer also signifies the duration for which the Operator phone rings to notify that an Alarm call has not been answered or the extension phone is busy.
2. **Number of Alarm Attempts** - Number of times the system attempts to place an Alarm call on the extension phone before notifying the Operator that the call is not answered or the phone is busy. By default, the Number of Alarm Attempts is set to '3'. The Number of Alarm Attempts can be set between 1 and 9.

3. **Alarm Attempt Interval** - The time period between each Alarm Call attempt. By default, the Alarm Attempt Interval is set to 5 minutes. The Alarm Attempt Interval can be set between 1 and 9.
4. **Use Alarm with Snooze** - Snooze is a functionality which forces the extension user to acknowledge the Alarm call. With snooze enabled, the system expects the user to answer the Alarm call by going OFF-Hook and dial Acknowledgement code '0'. With snooze disabled, the system considers the Alarm as answered when the extension user simply answers the alarm call by going OFF-Hook (dialing acknowledgement code is not mandatory). Users may choose whether or not to enable snooze. By default, snooze is disabled.
5. **Configurable Alarm Type** - When the Operator and extension user set an Alarm call request, the system gives them the choice of setting 'Once Only' or 'Daily' Alarm calls.

User experience however, shows that 'Once Only' Alarm call requests are more common than 'Daily' Alarm requests. So, the system allows you the flexibility of setting 'Once Only' as the default Alarm Type, by disabling the 'Configuring Alarm Type' flag.

When this flag is disabled the system will prompt the Operator/Extension user to enter the Time of the Alarm call and consider the Alarm Type as 'Once Only'.

By default, this flag is disabled.

6. **Configurable Alarm Category** - When the Operator sets an Alarm call for an extension, the system prompts the Operator to select an Alarm Type (Once Only or Daily) and to select the alarm serving mechanism - 'Automated or Personalized'.

If the Enterprise wishes to offer only 'Automated' Alarms to its extension users, the system allows the flexibility to set 'Automated' as the default Alarm call serving mechanism. This can be done by disabling the 'Configurable Alarm Category' flag.

When this flag is disabled, the system will consider the Alarm call serving mechanism as 'Automated' and will prompt the Operator only for the Time of the Alarm call.

By default, this flag is disabled.

- *When both flags 'Configurable Alarm Type' and 'Configurable Alarm Category' are disabled, the system will set and serve 'Once Only - Automated' alarms only.*
- *If the 'Configurable Alarm Type' flag is disabled, but the 'Configurable Alarm Category' flag is enabled, the system will set 'Once Only' alarm calls, but give the option of selecting 'Automated' or 'Personalized' as the serving mechanism.*
- *Similarly, if 'Configurable Alarm Type' is enabled, but the 'Configurable Alarm Category' flag is disabled, the system will allow both 'Once Only' and 'Daily' alarms to be set, but the serving mechanism will be 'Automated'.*

7. **Voice Guided Alarm Verification:** For Voice-guided Alarms, the VMS of the system allows you to enable/disable the Alarm Verification for alarms and reminders, allowing extension users who want to use alarms and reminders to confirm the Time set for an alarm and Date and time set as a reminder. By default, this flag is enabled.

The flags 'Configurable Alarm Type' and 'Configurable Alarm Category' are not applicable for Voice-guided Alarms. In the case of Voice-guided Alarms, the Operator/Extension user will be prompted to select the Alarm type and serving mechanism, each time, even when both aforementioned flags are disabled.

8. **Alarm Notification Type** - This is the means of notifying the extension user about the Alarm call. The extension user can be played Music-On-Hold, Live Music, Pre-recorded Voice Message, Weather information, Date and Time, etc. The system supports four types of Alarm Notifications:
- *Voice Message*: Selecting this option would play a recorded message recorded to the extension user when s/he answers the Alarm call.
 - *Music-On-Hold*: Selecting this option would play music-on-hold to the extension user when s/he answers the Alarm call.
 - *Routing Group*: Selecting this option would connect the extension user to the stations programmed in the Alarm Notification Group. The System Engineer may connect a device which can play customized alarm greetings with date, time, weather conditions, traffic conditions, a marketing message, etc. on the stations programmed in the Alarm Notification Group.

If Voice Mail Auto Attendant is selected as a Routing Group member, the system will place the call on the Voice Mail System.

- *Voice Mail*: Selecting this option would connect the extension user to the Voice mail System. Use this option only if you have the VMS module installed in the system.
9. **Macros** - This is a short code for simulating the Alarm call. The SLTs with special function keys send a fixed string to the system, when each function key is pressed. The system interprets this string and translates it into a string that can be understood by the system. For example, the SLT has a special function key for Alarm calls which sends the string '51' to the system. The system can be programmed to translate '51' into the feature access code for Alarm calls, '*161'.

All the above listed parameters can be programmed using Jeeves and a Telephone.

Configuring Alarm Parameters using Jeeves

- Log in as System Engineer.
- To configure Alarm parameters, go to ["System Parameters"](#).
- To view the Alarm Report Status on your phone LCD, you must assign a DSS Key to Wakeup Call Log. Refer the topic ["DSS Keys Programming"](#), ["DSS Key Settings"](#) in ["Configuring Matrix SPARSH VP330"](#), ["DSS Key Settings"](#) in ["Configuring Matrix SPARSH VP248"](#), ["DSS Key Settings"](#) in ["Configuring Matrix SPARSH VP310"](#) and ["DSS Key Settings"](#) in ["Configuring Matrix SPARSH VP510"](#) for instructions.
- To select Alarm Notification Type for extensions, under *Configuring Extensions*, see ["Station Advanced Feature Template"](#).
- If you select Voice Message as Alarm Notification type, ensure that you assign a voice module to 'Alarm' voice message application. Please refer topic ["Voice Message Applications"](#) for more details.
- If you select Music-On-Hold as Alarm Notification type, no further configuration is required.

- If you select Voice Mail as the Alarm Notification Type, make sure you have installed the Voice Mail module.
- If you have selected Routing Group as Alarm Notification Type, you must create a Routing Group and assign this Routing Group number in the Station Advanced Feature Template of the extensions. See [“Routing Group”](#) and [“Station Advanced Feature Template”](#) for instructions on applying the template to SLTs, DKPs, ISDN Terminals, Virtual Extensions.
- To program SLTs with special Alarm function key and to create macro for a DKP key, see [“Macros”](#).
- To use a customized alarm messaging device, see [“Configuring Customized Alarm Messaging Devices”](#)

Configuring the Alarm Parameters using a Telephone

- Enter SE mode from a DKP/SLT.

To configure Alarm Ring Timer, dial:

- **2201-Seconds**
Where,
Seconds is from 001 to 255. Default: 45 seconds.

To configure Number of Alarm Attempts, dial:

- **2202-Number of Alarm Attempts**
Where,
Number of Alarm Attempts is from 1 to 9. Default: 3.

To configure Alarm Attempt Interval, dial:

- **2203-Alarm Attempt Interval**
Where,
Alarm Attempt Interval is from 1 to 9 minutes. Default: 5 minutes.

To configure Snooze function, dial:

- **2204-Snooze**
Where,
Snooze is 0 or 1.
Select '0' to disable Snooze and '1' to enable snooze.

To disable/enable Configurable Alarm Type, dial:

- **2208-Flag**
Where,
Flag is 0 for Disable, 1 for Enable. Default: Enabled.

To disable/enable Configurable Alarm Category, dial:

- **2209-Flag**
Where,
Flag is 0 for Disable, 1 for Enable. Default: Enabled

To configure Alarm Notification Type, dial:

- **5602-1-Template Number-12-Alarm Notification Type**

Where,

Template Number is Station Advanced Feature Template from 01 to 50.

Default: 01.

Alarm Notification Type is:

1 for Music on Hold

2 for Voice Message (Voice Modules)

3 for Routing Group

4 for Voice Mail

For example: To program Routing Group as Notification Type in Station Advanced Feature Template

02: Dial **5602-1-02 -12-3**

To apply the Station Advanced Feature Template now programmed with the Alarm Notification Type to extension phones, refer the topic "[Customizing Station Advanced Feature Template using a Telephone](#)".

To program Macros, dial the following commands:

- Dial command **1810-Macro Index-Number String** to create a macro.

Where,

Macro Index is from 01 to 25 (as 25 macros can be created)

Number String is the feature access code for Alarm, in this case '*163'

Terminate the command with **#*** as the number string is less than 24 digits.

For example: to create a macro for Alarm on Index 2: dial **1810-02-*163-#***

- Dial command **1810-Macro Index-#*** to clear a macro.

- Dial command **3115-1-Macro Index-Access Code** to program Access code (that is, number sent to the system by the SLT)

Where,

Macro Index is from 01 to 25 Access Code is a string of 4-digits.

If the length of the Access code is less than 4-digits terminate the command with **#***

For example: To program access code '53' for the macro for Alarm dial: **3115-1-02-53-#***

- Dial command **3115-1-Macro Index** to clear the Access code for the macro.

- Exit SE mode.

Configuring Customized Alarm Messaging Devices

Alarm Messaging devices play real-time updated information like the date and time, greetings, weather information, Road highway status, specific event announcements, etc. when called upon. These devices should be connected to the system on its SLT ports.

If the User wants to connect customized alarm messaging devices to the SARVAM UCS, the SE should configure the system as instructed below:

- Connect the devices for customized alarm greetings to SLT ports only.
- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Routing Group** to open the page.

- Select the default Routing Group 31 used for Alarm Notification Group, or any other Routing Group number.

The screenshot shows the 'Routing Group' configuration interface. A table lists Routing Groups 25 through 32. Each row has a 'Rotation' checkbox (all checked), a 'Member Type' dropdown (all set to 'DKP'), a 'Port Number' (all '0001'), and a 'Ring Timer' (all '015'). A dropdown menu is open for the 'Member Type' of group 31, with 'SLT' selected. Below the table are buttons for 'Submit', 'Default', 'Default One', and 'Clear'.

- Select **SLT** as the **Member Type** and enter the **SLT Port Number** where the device is connected. It is possible to configure 32 members in a single routing group.

If only one device is connected, disable all other members from 02-32 by setting **Member Type** to **None**.

This is a close-up of the 'Routing Group' table. The 'Member Type' for group 31 is 'None' and is being selected by the mouse. The 'Member Type' for group 32 is 'DKP'. The 'Rotation' column shows checkboxes for all groups, all of which are checked.

- Click **Submit** at the bottom of the page to save changes.
- Open the **Station Advanced Feature Template** page. By default Template Number 01 is applied to all stations. The template has **Voice Message** as default notification type. It is recommended that you program another Template.
- Select **Routing Group** as the Alarm Notification Type in the template you have selected for configuration.

- Enter the number of the **Alarm Notification Routing Group** (default group: 31) in which you have programmed the device (SLT port).
- Click **Submit** at the bottom of the page to save changes.
- Apply the Advanced Feature Template now configured with Routing Group as Alarm Notification Type and the number of the Alarm Notification Routing Group to the stations.
- Refer the section “[Station Advanced Feature Template](#)” for instructions on applying this template to extension phones.

Viewing and Printing Alarm Reports

The Operator can view the status of Alarms that are yet to be served from the System Administrator mode and if required print them.

- Log in as System Administrator.
- Click the **Reports** link.
- Under **Reports**, click **Wakeup Alarm**.

Wakeup Alarm Report

Phone Number	Alarm	Cancel Alarm
2001	05:00 * +	<input type="checkbox"/>
2001	08:00	<input type="checkbox"/>

Daily Alarm is denoted by *.
Personalized Alarm is denoted by +.

Print Cancel Selected Alarms Close

- The unserved Alarm calls will appear on your screen.
- You can cancel any of the unserved Alarm calls by selecting the check-box and clicking the **Cancel Selected Alarms** button on this page.
- You can also print this page by clicking the **Print** button on this page.
- Click **Close** to exit the page.
- Click **Submit** to save changes.

How to use

Alarms can be set by the extension users by themselves. The extension users can also ask the Operator to set the alarm for them.

Alarms set/canceled by Operator

The Operator can set/cancel non-voice guided Alarms using EON, SLT and from System Administrator mode.

Operator using EON

Using DSS Key:

To set Alarm for the extension user,

- Press the key assigned the 'Remote Alarm' function.
- Enter the Extension Number.
- Enter Time in HH:MM
- Select 'Once Only' or 'Daily'.
- Press 'Enter' key.
- Select 'Personalized' or 'Automated'.
- Press 'Enter' key to set Alarm.
- You get a confirmation tone and a text message with the phone number for which the alarm is set.
- Go Idle or you get dial tone after 3 seconds.

To cancel Alarms,

- Press key assigned the 'Remote Alarm' function.
- Enter Extension Number.
- Select 'Cancel All'.
- Press 'Enter' Key.

Using Commands:

To set Alarm for the extension user,

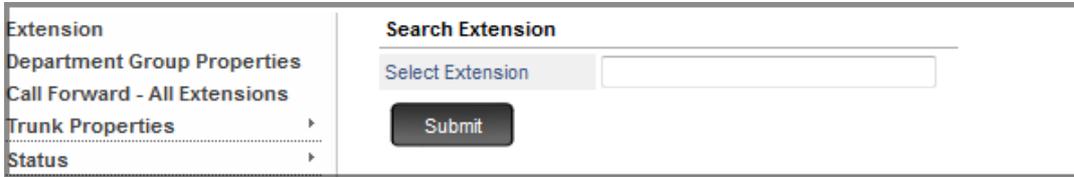

- Pick up the handset.
- Dial **1072-003**.
- Enter Extension number.
- Enter Time in HH:MM
- Dial 1 for Once Only or Dial 2 for Daily
- Dial 1 for Personalized or Dial 2 for Automated.
- Press 'Enter' key to set Alarm.
- You get a confirmation tone and a text message with the phone number for which the alarm is set.
- Replace handset or you get dial tone after 3 seconds.

To cancel Alarms,

- Pick up the handset.
- Dial **1072-003**.
- Enter Extension Number.
- Dial #.
- You get a confirmation tone and a text message with the phone number for which the alarm is canceled.
- Replace handset or you get dial tone after 3 seconds.

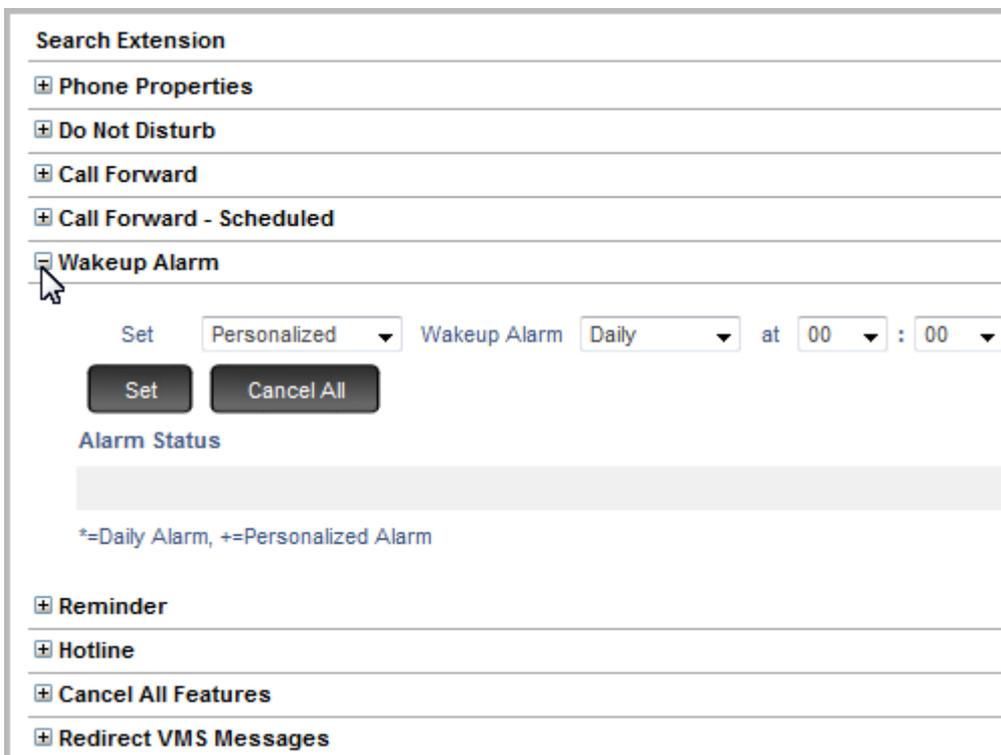

Using Jeeves:

- Log in as System Administrator.
- Click the **Extension**.

The screenshot shows a sidebar menu on the left with options: Extension, Department Group Properties, Call Forward - All Extensions, Trunk Properties, and Status. The main area is titled 'Search Extension' and contains a text input field labeled 'Select Extension' and a 'Submit' button.

- In **Select Extension**, enter the Number or the Name of the extension on which you want to set the alarm.
- The page of the Extension will open.

The screenshot shows the 'Search Extension' page with various configuration options. The 'Wakeup Alarm' section is expanded, showing a 'Set' dropdown menu with 'Personalized' selected, followed by 'Wakeup Alarm', a 'Daily' dropdown menu, and 'at 00 : 00'. Below this are 'Set' and 'Cancel All' buttons. An 'Alarm Status' section is also visible. At the bottom, there are links for 'Reminder', 'Hotline', 'Cancel All Features', and 'Redirect VMS Messages'. A legend indicates '*=Daily Alarm, +=Personalized Alarm'.

- Now set the desired type of alarm on this extension.
- Click **Submit** to save.
- Repeat the same to set alarm on another extension number.
- Click **Logout** to exit the System Administrator mode.

Alarms set/cancel by Extension Users

Extension Users using EON / Extended IP Phone

If the extension user has EON, alarms can be set using the DSS key as well as by dialing the command.

Using DSS Key:

To set Alarm,

- Press the key assigned the 'Alarm' function.
- Enter Time in HH:MM
- Select 'Once Only' or 'Daily'.
- Press 'Enter' key.
- You get a confirmatory text message and confirmation tone.
- Go Idle or you get dial tone after 3 seconds.

To cancel Alarms,

- Press the key assigned the 'Alarm' function.
OR
- Dial 161
- Select 'Cancel All'.
- Press 'Enter' Key.

Dialing Commands:

To set Alarm,

- Pick up the handset.
- Dial **161**.
- Enter Time in HH:MM (24-hours format)
- Dial 1 for Once Only or Dial 2 for Daily.
- Press 'Enter' key.
- You get a confirmatory text message and confirmation tone.
- Replace handset or you get dial tone after 3 seconds

To cancel Alarms,

- Pick up the handset.
- Dial **161**.
- Dial #.
- You get a confirmatory text message and confirmation tone.
- Replace handset or you get dial tone after 3 seconds.

Extension Users using SLT

To set Alarms,

- Pick up the handset.
- Dial **161**.
- Dial HH:MM
- Dial 1 for Once Only or Dial 2 for Daily.
- You get confirmation tone.
- Replace the handset on the cradle.

To cancel Alarms,

- Pick up the handset.
- Dial **161**.
- Dial #.
- You get confirmation tone.
- Replace the handset.

- *Extension users can set only automated alarms from their phones. For personalized alarms, they must request the Operator.*
- *If there are multiple alarms set, alarms cannot be canceled selectively. Only the Operator can cancel alarms selectively from SA mode.*
- *Alarms set on an extension will be served, even if DND is also set on the same extension.*

Printing Alarm Reports

When Scheduled Alarm Report is enabled and the time is set, the system will automatically print the report at the set time. The Operator can also print Alarm Status Report any time s/he using SA commands. The Operator can issue SA commands from EON or an SLT to print Alarm Status Reports.

For EON and Extended IP Phone Users

- Press the key assigned the 'Print Alarm Report' function (if programmed).

OR

- Dial **1072-913**.
- You get a confirmatory text message and a confirmation tone.
- Go idle.

For SLT Users

- Pick up the handset.
- Dial **1072-913**.
- You get confirmation tone.
- Replace the Handset on the cradle.

Wakeup/Alarm Report

AS ON 05-05-2016(Thu) AT 23:49

Room#	Phone#	Wakeup	D	P	Room#	Phone#	Wakeup	D	P
	3001	12:18				2017	14:12		
	3001	12:21				2017	12:14		

* indicates Daily Alarm and + indicates Personal Alarm

Page : 1

---End of Report---

Alternate Number Dialing

What's this?

Alternate Number Dialing allows you to dial different phone numbers in an attempt to reach a person whose line is busy.

Alternate Number Dialing is useful when the person or organization you are trying to reach has more than one number, where they may be reached. The system dials out different phone numbers of the same party, saving you time and effort of dialing each of these numbers manually.

How it works

This feature works as an extension of the features “[Last Number Redial](#)” and “[Auto Redial](#)”. It requires you to program Alternate Number Groups in the Global Directory first. With the alternate numbers programmed in the Global Directory, all you need to do is to use Last Number Redial or Auto Redial, every time you want the system to try Alternate Number Dialing.

For example: Midas Business Solutions has four telephone numbers: 2640459, 2631235, 2635589 and 2565590. To be able to use Alternate Number Dialing, you must first program all four numbers as Alternate Number Group in the Global Directory.

Now, when you dial one of these numbers, '2640459', and get a busy tone, you can either initiate Last Number Redial or set an Auto Redial request.

When you initiate Last Number Redial,

- The system will dial an alternative number for the dialed number.
- If the redialed number is busy, you can set Last Number Redial again.
- The system will dial a second alternative number.
- If the second alternative number is also busy, you can set Last Number Redial again.
- The system will dial a third alternative number.
- This process will be repeated each time you set Last Number Redial, until the call gets through.

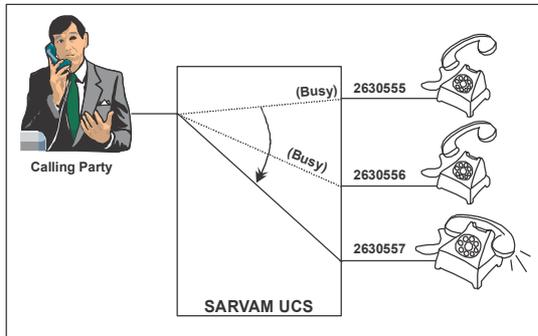

When you set an Auto Redial request on busy tone,

- The system will dial an alternative number.
- If the alternative number is busy, the system will redial another alternative number.
- The system will dial a different (alternative) number on each auto redial attempt²⁴², until the call gets through.

²⁴². The number of auto redial attempts depends on the Auto Redial Count programmed in the system. By default, the system will make 5 redial attempts if Auto Redial 'normal' is set. If Auto Redial 'Priority' is set, the system will make 20 redial attempts.

- (for the number of redial attempts programmed), until the call gets through.
- when any of the alternate numbers gets through, the system will give a ring on your extension.

This process is illustrated in the graphic below:

- *Alternate Number Dialing will work only on extensions that are allowed the features “Last Number Redial” in their “Class of Service (COS)”*
- *Also, Alternate Number Dialing will work only for those numbers that exist in the Global Directory assigned to each extension. The Global Directory is divided into three parts²⁴³, 100-799 (Part 1), 800-899 (Part 2), and 900-999 (Part 3). If an extension is assigned only Global Directory Part 2, Alternate Number Dialing will work only for those numbers grouped as Alternate Number Groups in Global Directory Part 2.*
- *Alternate Number Dialing will work also with “Abbreviated Dialing”. For example, an extension user dials the abbreviated code 8100, and the dialed out number is busy. When the extension user sets Redial or Auto Redial, the system will try the alternate numbers related to 8100.*

How to configure

For Alternate Number Dialing to work, the System Engineer must:

1. Make a List of Alternate Numbers.
2. Create Alternate Number Groups.
3. Program Alternate Number Groups in the Global Directory.
4. Enable the features 'Last Number Redial', 'Global Directory', in the Class of Service (CoS) group of the extensions to which Alternate Number Dialing facility is to be provided. If desired, 'Auto Redial', 'Auto Redial Priority' may also be enabled in the CoS of these extensions.

All of the above parameters can be programmed using Jeeves or dialing SE Commands from a telephone.

243. ETERNITY LENX/MENX stores up to 2900 numbers in the Global Directory; Part 1 - 100 to 2399, Part 2 - 2400 to 2699 and Part 3 - 2700 to 2999

- To create Alternate Number Groups, the alternate numbers must exist in the Global Directory. If any of the alternate numbers do not exist in the Global Directory, first program the numbers in the directory, before you begin creating Alternate Number Groups. Refer the topic “[Abbreviated Dialing](#)” for instructions on programming the Global Directory.
- As Alternate Number Dialing works only for the Alternate Number Groups in the Global Directory assigned to each extension, ensure that the relevant Global Directory with the Alternate Number Groups is allowed in the CoS of the extensions.

Preparing Alternate Number List

In consultation with the User, you may:

- Draw a two-column table on a paper.
- Write the name of the contact on one column and the Alternate Numbers for the contact on the other column.
- Make a list of the numbers which need to be grouped as alternate numbers. For example:

Name of the Contact	Alternate Numbers
Midas Business Solutions	2640459, 2631235, 2635589, 2565590
Jet Set Holidays	022281110001, 022281110002
Bacchus Vineyard	2640075, 2640076
GoodLife Inn	2788856, 2788896

You may include as many alternate numbers as required by the User.

Creating Alternate Number Groups

- Assign the alternate numbers of each of contacts to an 'Alternate Number Group'.
- Each group must be assigned a number between 000 to 255.
- Taking the above example further, the Alternate Number Groups on the list may be numbered as follows:

Name of the Contact	Alternate Numbers	Alternate Number Group (No.)
Midas Business Solutions	2640459, 2631235, 2635589, 2565590	001
Jet Set Holidays	022281110001, 022281110002	002
Bacchus Vineyard	2640075, 2640076	003
GoodLife Inn	2788856, 2788896	004

Programming Alternate Number Groups in Global Directory using Jeeves

Make sure that the numbers on the list are also programmed in the Global Directory. If any of these numbers do not exist in the Global directory already, program them in the Global Directory first. Refer the topic “[Abbreviated Dialing](#)” for instructions on programming the Global Directory.

To create Alternate Number Groups and program them in the Global Directory,

- Log in as System Engineer.
- Under **Configuration**, click **Abbreviated Dialing**.
- Click **Global Directory** to open the page.

The screenshot shows the 'Abbreviated Dialing - Global Directory' configuration page. The left sidebar contains a 'Configuration' menu with 'Abbreviated Dialing' expanded to 'Global Directory'. The main content area displays a table with the following columns: Index, Number, Name, and OG Trunk Bundle Group. The table contains 17 rows with indices 100 through 117. At the bottom of the page, there are three buttons: 'Submit', 'Default', and 'Advance'.

Index	Number	Name	OG Trunk Bundle Group
100			01
101			01
102			01
103			01
104			01
105			01
106			01
107			01
108			01
109			01
110			01
111			01
112			01
113			01
114			01
115			01
116			01
117			01

- Click the **Advance** button on the bottom of this page.

The screenshot shows the 'Abbreviated Dialing - Global Directory' configuration page after clicking the 'Advance' button. The left sidebar contains the same 'Configuration' menu. The main content area displays a table with the following columns: Index, Number, Name, Email Id, and SMS/Email Group Type. The table contains 8 rows with indices 100 through 108. At the bottom of the page, there are three buttons: 'Submit', 'Default', and 'Default One'.

Index	Number	Name	Email Id	SMS/Email Group Type
100				None
101				None
102				None
103				None
104				None
105				None
106				None
107				None
108				None

- Enter the number of the **Alternate Number Group** in the last column of the page.

For example, you have assigned Alternate Number Group '001' to all the numbers of the contact Midas Business Solutions, enter this number against each number belonging to this contact.

Similarly, enter Alternate Group number '004' against the numbers belonging to the 'GoodLife Inn' to which it is assigned.

Memory Location	Outgoing Trunk Bundle Group	Number	Name	Alternate Number Group
100	01	2640459	Midas Biz	001
101	01	2631235	Midas Biz	001
102	01	2635589	Midas Biz	001
103	01	2565590	Midas Biz	001
104	01	2788856	GoodLife Inn	004
105	01	022281110001	Jet Set	002
106	01	022281110002	Jet Set	002
107	01	033298765432	R. Mendez	000
108	01	2640075	Bacchus	003
109	01	2640076	Bacchus	003
:	:	:	:	:
129	01	2788896	GoodLife Inn	004

The numbers of the contacts may not necessarily appear alphabetically or in a sequence. It is possible that the numbers of the same contact may be programmed at different memory locations in the Global Directory.

100-199
200-299
300-399
400-499
500-599
600-699
700-799
800-899
900-999

Abbreviated Dialing - Global Directory

Index	Number	Name	Email Id	SMS/Email Group Type	OG Trunk Bundle Group	Alternative Number Group
125				None	01	000
126				None	01	000
127				None	01	000
128				None	01	000
129	2788896	GoodLife Inn		None	01	004
130				None	01	000
131				None	01	000
132				None	01	000
133				None	01	000

Submit
Default
Default One

In the above example, one number of the GoodLife Inn is programmed at memory location Index 104 and the other on Index 129. Since these two numbers are grouped and assigned the number alternate group

number '004', this number must be entered against the GoodLife Inn numbers at the respective memory location Index.

- After assigning Alternate Number Groups, click **Submit** at the bottom of the page to save changes.
- Enable the features **Last Number Redial** and **Global Directory**, in the Class of Service (CoS) group of the extensions to which Alternate Number Dialing facility is to be provided. If desired, **Auto Redial**, **Auto Redial Priority** may also be enabled in the CoS of these extensions.

By default Station Basic Feature Template Number 01 is assigned to all extensions of the system. The default CoS Group 01 in this template has 'Redial' enabled in the set of 'Basic Features', so all extensions of the system can use Last Number Redial.

However, the default CoS Group 01 has only Global Directory Part 1 enabled.

Recall that Alternate Number Dialing will work only for those numbers that exist in the Global Directory assigned to each extension. So, the Global Directory Part containing the Alternate Number Groups must be allowed to the extensions in their Class of Service. For example, if Alternate Number Groups are programmed in Global Directory Part 2, extensions must have Global Directory Part 2 in their Class of Service.

If all extensions are to be allowed the Alternate Number Dialing facility, simply enable the Global Directories containing Alternate Number groups in the default CoS group 01.

However, if Alternate Number Dialing is to be allowed to select extensions only, define a new CoS group and prepare a new Station Basic Feature Template with this CoS group and apply it to the desired extensions.

Refer the topics "[Class of Service \(COS\)](#)" and "[Station Basic Feature Template](#)" for detailed instructions.

The Station Basic Feature Template 01 does not have the features Auto Redial and Auto Redial Priority in the default CoS group 01. If these features are also to be allowed to the extensions, enable them in the CoS you prepare.

Programming Alternate Number Groups in Global Directory using a Telephone

- Enter SE mode from a DKP/SLT.

To assign Alternate Group Numbers, dial:

- **1804-1-Memory Location Code-Alternate Group Number**

Where,

Memory Location Code = 100 to 999. This is the Index number, where the number and name of the contact is programmed.

Alternate Group Number = 000 to 255.

For example: To assign the numbers of the GoodLife Inn to an Alternate Number Group, dial:

1804-1-104-004

The number '2788856' stored at Index 104 will be assigned to Alternate Number Group 004, which is the number assigned to GoodLife Inn.

Similarly, to program the second number dial: **1804-1-129-004**

The number '2788896' stored at Index 129 will be assigned to Alternate Number Group 004.

If you have a continuous sequence of numbers that need to be programmed in the same group, you may dial:

- **1804-2-Memory Location Code-Memory Location Code-Alternate Group Number**

Here you enter a sequence of Memory Location Codes, from 100 to 999, and the number of the Alternate Number Group.

For example: To assign the numbers of Midas Biz to an Alternate Number Group, dial: **1804-2-100-103-001**

The numbers stored at Index 100 to 103 will be assigned to Alternate Number Group 001, which is the number assigned to Midas Biz.

To clear the Alternate Number Groups, dial the following commands:

- **1804-1-Memory Location Code-000** to clear group of a single number.
- **1804-2-Memory Location Code-Memory Location Code-000** to clear group of a continuous sequence of numbers.
- **1804-*-000** to clear all Alternate Number Groups

For example: To clear the Alternate Number Group assigned to a number of GoodLife Inn, dial: **1804-1-104-000**

The Alternate Number Group assigned to the GoodLife Inn number '2788856' stored at Index 104 will be cleared.

For example: To clear the Alternate Number Group assigned to the sequence of numbers of Midas Biz, dial: **1804-2-100-103-000**

The Alternate Number Group assigned to the Midas Biz numbers stored in a continuous sequence starting from Index 100 to 103 will be cleared.

- Exit SE mode.

How to use

Confirm with your System Engineer that

- Alternate Number Groups are programmed in the Global Directory allowed to your extension.
- 'Basic Features' (these include Redial) are enabled in the Class of Service allowed to your extension.

Now, follow the instructions for using the feature [“Last Number Redial”](#).

Authority Codes

What's this?

Authority Code is a unique password-protected code with an associated Class of Service, Toll Control and Call Budget, which can be assigned to extension users. With Authority Codes, extension users of the system can make calls or access features from any other extension of the system as per the Class of Service, Toll Control and other features / facilities assigned to their code.

This feature is useful when you want a group to extension users to use a single extension, but at the same time you want to keep an account of the calls made by each user. If required, you can assign a call budget to each Authority code to control call cost.

To make outgoing calls or access features, extension users must 'Walk-In' from any extension port: DKP, SLT, SIP, ISDN Terminal, E&M (with Station as Orientation Type), and then dial their Authority Code and Password.

How it works

An 'Authority Code' is a unique three-digit number, protected by a four-digit password. The default Authority Password is **1111**. To be able to use an Authority Code, the password must be changed to another value. To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential.

The SARVAM UCS supports as many as 999 Authority Codes.

Each Authority Code has an associated Class of Service and Toll Control, which is configured in the Station Basic Feature Template assigned to the Code.

To make calls using an Authority Code,

User A is assigned 222 as Authority Code and is provided a unique 4-digit Authority Password.

To access features or make calls as per the assigned Authority Code 222, User A must do the following:

- Dial the feature code for Walk-In Class of Service (default 111) from any extension of the system.
- Dial the code for Walk-In by Authority followed by the Authority Code and then the Authority Password.

To make calls or access features according to the Authority Code dial 111, the feature code for 'Walk-In Class of Service' from any extension of the system.

- Select the option 'Walk in by Authority Code' or dial '2'.
- A dials the Authority Code assigned to him/her followed by the Password.

If the user enters a wrong password, to prevent any attempt to misuse the Authority Code, by default, the system allows the user only three attempts to re-enter the password. If the user fails to enter the correct password at the third attempt, the system will set the password to default, 1111. With the default password the user will not be able to use the Authority Code.

The number of attempts to re-enter can be configured by setting the parameter **Retry counts for Authority Code** password in the “[System Timers and Counts](#)”.

- User A can now make outgoing calls.
- If the Walk Out mode set for A is One Call A will automatically be logged out from the extension after one call.
- If the Walk Out mode set for A is Multiple Calls, A can make as many calls as desired, and remains 'walked-in' until the A dials the feature code to 'Walk-Out', or until another extension user walks into the same extension.
- If a call budget has been assigned to A's Authority Code, A will be able to make calls till the assigned amount is consumed.
- Details of the calls made by A are recorded by the Authority Code in the Station Message Detail Recording Report (SMDR) for Outgoing Calls.
- The SMDR report can be printed using the Authority Code as filter.

This way, the organization can know the details of calls made by each user as well as have control over the expenses

How to configure

For Authority Codes to work, you must:

- Configure the Authority Code Table.
- Assign a Station Basic Feature Template to the Authority Code, with the desired Class of Service, Toll Control and features/facilities.
- Enable the parameter *Store Outgoing Calls* in the Station Basic Feature Template assigned to the Authority Code, if you want details of outgoing calls made using Authority Codes.
- Assign a Station Advanced Feature Template to the Authority Code with the desired Walk-Out Mode
- Assign each user a Call Budget, if required.
- Change the Retry Counts for the Authority Code, if required.

Configuring Authority Code Table

- Make a list of users you want to assign Authority Codes to and their respective passwords.
- Log in as System Engineer.

- Under **Configuration**, click **Authority Code**.

Authority Code	Name	Authority Password	Station Basic Feature Template	Station Advance Feature Template
1		41	41
2		41	41
3		41	41
4		41	41
5		41	41
6		41	41
7		41	41
8		41	41
9		41	41
10		41	41

Against each **Authority Code**,

- Assign an **Authority Password**. The password can be a minimum of 4 digits and a maximum of upto 10 digits. Valid digits are 0 to 9, * and #. Default: 1111.

To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential.

- Enter the **Name** of the user. The name acts as an identifier. Default: Blank.
- By default, **Station Basic Feature Template** number 41 and **Station Advanced Feature Template** number 41 are assigned to all Authority codes.

If you want to change the calling permission, allow/deny features to users, you must customize the Class of Service, Toll Control and other features/facilities in the Station Basic Feature Template according to your requirement.

You may set the 'Walk-Out Mode' in as One Call or Multiple Calls in the Advanced Feature Template. Refer to "[Station Basic Feature Template](#)" and "[Station Advanced Feature Template](#)" for detailed instructions.

- Click **Submit** to save your settings.

You can assign/change the Name and Password from the SA mode also. To do this,

- Log in as System Administrator.

- Click **Authority Code**.

The screenshot shows a web interface for configuring Authority Codes. On the left is a navigation menu with 'Authority Code' highlighted. The main content area has a header with extension ranges (001-100, 101-200, etc.) and a table titled 'Authority Code'. The table has three columns: 'Authority Code', 'Name', and 'Authority Password'. The 'Authority Code' column lists numbers 1 to 19. The 'Name' column is empty. The 'Authority Password' column contains 10 dots for each row. At the bottom are 'Submit' and 'Default' buttons.

Authority Code	Name	Authority Password
1	
2	
3	
4	
5	
6	
7	
8	
9	
10	
11	
12	
13	
14	
15	
16	
17	
18	
19	

Against each **Authority Code**,

- Assign/change **Authority Password**. The password can be a minimum of 4 digits and a maximum of upto 10 digits. Valid digits are 0 to 9, * and #. Default: 1111.

To avoid unauthorized access, we recommend you to change the password regularly. Make sure it is strong and is kept confidential.

- Enter the **Name** of the user against the authority code you have assigned to them. The name acts as an identifier. Default: Blank.
- Click **Submit** to save your settings.

Assigning a Call Budget to Authority Codes

Call Budget is a cost control feature that allows you to keep a tab on the total cost of each user. With this each user can be allotted a 'budget' limit for outgoing calls, which is automatically reloaded at the start of every month.

To assign a Call Budget to the Authority Code,

- Log in as System Administrator.
- Under **Reports**, click **Call Budget**.
- Click the **Authority Code** tab.

Authority Code	Allot an Amount (₹)	Allotted Amount (₹)	Consumed Amount (₹)
1		9999.00	0.00
2		9999.00	0.00
3		9999.00	0.00
4		9999.00	0.00
5		9999.00	0.00
6		9999.00	0.00
7		9999.00	0.00
8		9999.00	0.00
9		9999.00	0.00
10		9999.00	0.00
11		9999.00	0.00
12		9999.00	0.00
13		9999.00	0.00
14		9999.00	0.00
15		9999.00	0.00
16		9999.00	0.00
17		9999.00	0.00
18		9999.00	0.00

For each Authority Code assigned to the user,

- In the **Allot an Amount** column, enter the amount you want to assign to the user as budget limit for outgoing calls. The amount you allot here will be displayed as Allotted Amount.

*If you are re-assigning a new amount before the previous balance is consumed, make sure you add the available balance to the new amount. Enter this amount in **Allot an Amount**.*

For example, you have allotted an amount of Rs.1000 and the consumed amount is Rs.600. The available balance is Rs.400. Now, if you want to assign a new amount of Rs.500. In Allot an Amount you must enter 900 (Available Balance + New = 400 + 500).

- The **Allotted Amount** column displays the amount allotted to the user for making outgoing calls.

- The **Consumed Amount** column displays the call budget amount consumed by the user.
- Click **Submit** to save.

Setting the Retry Counts for Authority Code

By default, the system allows three attempts to re-enter the Authority Code Password. If you want to increase or decrease the number of attempts, set the parameter **Retry Counts for Authority Code** to the desired value. For instructions, see [“System Timers and Counts”](#).

How to use

For EON Users and Extended IP Phone Users

To use Authority Code from any extension:

- Go OFF-Hook.
- Press DSS Key assigned to 'Walk-in COS'.
OR
- Dial **111**
- Select the 'Walk-in by Authority Code' option and press the Enter key.
- Dial the Authority Code, followed by the Password.
- You will hear the confirmation tone, followed by dial tone.
- Dial the desired number.

For SLT Users

- Go OFF-Hook.
- Dial **111**
- Press 2 to select 'Walk-in by Authority Code'
- Dial the Authority Code, followed by the Password.
- You will hear the Confirmation tone, followed by dial tone.
- Dial the desired number.

Printing Reports of Outgoing Calls made using Authority Codes

You can print call details of users who made outgoing calls using Authority Codes. For this, you will need to:

- enable **Store Outgoing Calls** in the Station Basic Feature Template of the extension user.
- set the **Calls made using Authority Code** filter in Outgoing Call Report.
- configure the **destination port** for SMDR-Outgoing Call Report.

Refer the section [“Station Message Detail Recording-Report”](#), for detailed instructions on printing reports using filters.

Apple Push Notification Service Support

What's this?

Apple Push Notification Service (commonly referred to as Apple Notification Service or APNs) is a platform notification service created by Apple Inc. that enables third party application developers to send notification data to their applications installed on Apple devices.

Previously, VoIP applications needed to maintain a persistent connection in order to receive calls. Keeping a connection open in the background, drains the battery as well as causes all kinds of problems when the application crashes or is terminated by users.

In iOS 8 Apple has introduced PushKit as part of their effort to improve battery life, performance and stability for VoIP applications such as Skype, WhatsApp, etc. PushKit offers high-priority push notification with a large payload. The VoIP application receives the notification in the background, sets up the connection and displays a local notification to the user.

SARVAM UCS supports PushKit for VARTA AMP100 Application only. Push Notifications will be sent for calls, new messages as well as for voicemail. Push Notifications will be sent to the MATRIX VARTA AMP100 Application only if it is in the background and when there is persistent internet connection. You will receive the Push Notifications even after the you exit the application, provided the check box *Calls and Messages after exit* is enabled in the VARTA AMP100 Application. For details refer to the VARTA AMP100 User Guide.

How it works

Pre-requisites for Push Notifications:

- Make sure that the server has a persistent internet connection and there is connectivity with the APNS Server. To check the connectivity, refer [“APNS Connectivity”](#).
- Make sure the Date and Time of the server is synchronized with the NTP Server.
- To receive IM and IM notifications make sure the application is registered at Location 1. For more details, refer [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

Let us see how the notifications will be sent by the server when MATRIX VARTA AMP100 application is registered with the server as a SIP Extension and it is in the background. There is an incoming call or message:

- You can check the status of the SIP Extension user. It will display Registered (as the device is in the background) and under the respective Contact 1, 2, 3 it will display the time remaining for the expiry of the VARTA Client Inactivity Timer. The default value of the VARTA Client Inactivity Timer is 10 days. To configure this timer, refer to [“System Timers and Counts”](#).
- The server will send a Push Notification to the MATRIX VARTA AMP100 application (client).
- The server will wait for 15 seconds after sending the Push Notification:
 - if the client registers with the server within this time, the call will be connected or the message will be delivered. The status of the SIP Extension will display Registered and under the respective Contact 1, 2, 3 it will display the SIP ID, IP Address and the Registration Expiry Timer.
 - if the client does not register with the server within this time, the call will be disconnected or the message will be rejected. The status of the SIP Extension will display Registered and under the

respective Contact 1, 2, 3 it will display the time remaining for the expiry of the VARTA Client Inactivity Timer.

- The server maintains a configurable timer, VARTA Client Inactivity Timer which is set as 10 days. Till the expiry of the timer the server will send Push Notifications to the application.
- If for this duration, the server does not receive any registration request from the application and the timer expires, the server will consider the application as unregistered and will stop all Push Notifications to the application. The status of the SIP Extension will display Not Registered and under the respective Contact 1, 2, 3 the details will be cleared. Calls and messages will be rejected.

The server will start sending notifications to the application in the background after the application is brought in the foreground once and a registration request is received by the server.

Feature Interactions when the Application is in the Background

Call Forward when not Registered:

If the application receives an incoming call from a QSIG caller, the Call Forward functionality will not be applicable.

To know more, see [“Call Forward-When Not Registered”](#).

Handover and Handoff:

VARTAAMP100 users will be able to use Handover but Handoff will not be possible. To know more, see [“Handover and Handoff”](#)

System Restart

After System Restart the VARTA Client Inactivity Timer will be reset.

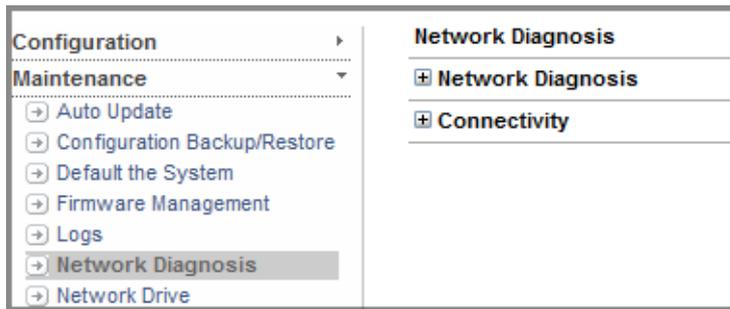

APNS Connectivity

A connectivity between the system and the APNS Server is required so that the Push notifications can be sent to the clients.

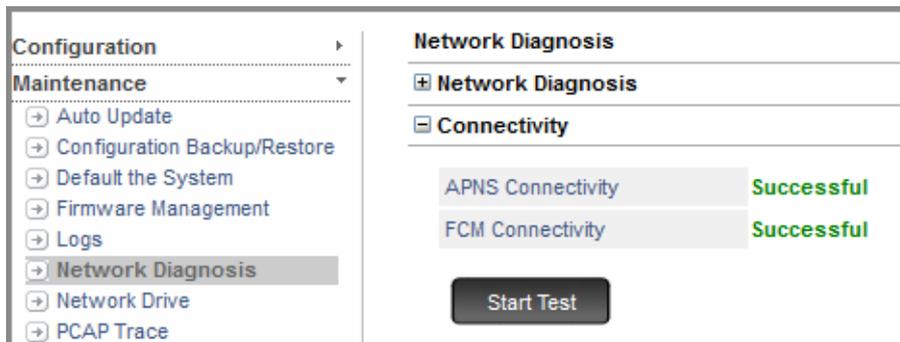

To check the APNS connectivity status,

- Log into Jeeves.
- Click the **Maintenance** link.

- Click the **Network Diagnosis** link

- Click **Connectivity** to expand.

- Click **Start Test**.
- In **Connectivity** the status is displayed as:
 - Successful - if the connectivity between the system and the APNS/FCM Server is established
 - Timeout - if there is no connectivity.

*If the **Connectivity** Test of either of the servers (APNS or FCM) with SARVAM UCS is not successful, then Push Notifications will not be sent to the Mobile Clients — MATRIX VARTA ADR100 / AMP100 application.*

Auto Attendant

What's this?

Auto Attendant allows external callers to reach an extension directly without the intervention of the Operator.

If Auto Attendant is enabled on a trunk, whenever an external call lands on that trunk, the *Built-In Auto Attendant* or the *Voice Mail Auto Attendant* (if VMS module is installed) of SARVAM UCS greets the caller and prompts the caller to dial the desired extension number. The call is then placed to the extension number dialed by the caller.

SARVAM UCS offers *Delayed Auto Attendant*, whereby incoming calls routed to the Operator or the Trunk Landing Group, can be answered by the Built-In Auto Attendant or the Voice Mail Auto Attendant, if none of the landing extensions answers the call within a certain time period.

Regular callers who know the extension numbers, can use the Auto Attendant to reach the desired extensions without Operator assistance. Thus, this reduces call traffic on the Operator extension, saves callers the time for call set-up and transfer. The Auto Attendant is particularly useful during non-working hours and holidays, and it helps project a professional image of the organization.

*Built-In Auto Attendant will not work, when the dialed extension has **Privacy from Built-In Auto Attendant** enabled in its Class of Service. So, if you want to prevent external callers from accessing certain extensions, you must enable **Privacy from Built-In Auto Attendant** in their Class of Service. To know more, see ["Privacy"](#).*

How it works

Auto Attendant can be configured on all trunk types, for the three time zones (working hours, break hours and non-working hours).

When configuring Auto Attendant on a trunk, you may choose to have calls answered by the Built-In Auto Attendant or the Voice Mail Auto Attendant.

Built-In Auto Attendant

When the Built-In Auto Attendant of SARVAM UCS is selected as the destination for incoming calls on a trunk, this is how it will work:

- A call lands on a Trunk.
- The system waits for the period of the *Built-In Auto Attendant Answer Wait Timer* (default: 05 seconds) to answer the call during this period. The caller gets Ring Back Tone from the CO.
- The system greets the caller with the pre-recorded Time-based Greetings. These are: *Built-In Auto Attendant— Morning Greetings/Afternoon Greeting/ Evening Greeting*. This is then followed by the *Built-In Auto Attendant-Welcome Greeting* for the current time zone (working hours, break hours, non-working hours). A Voice Module must be assigned for the Built-In Auto Attendant Time-based as well as the Welcome Greeting.
- The Built-In Auto Attendant Time-based and Welcome Greeting messages are played once.

If no voice module is assigned as Welcome Greeting, the system will play music-on-hold after answering the call. It will play music-on-hold until the end of the *Built-In Auto Attendant Music Timer* (default: 5 seconds).

- On the completion of the Welcome Greeting or music-on-hold at the end of the Built-In Auto Attendant Music Timer, the system plays the *Built-In Auto Attendant Dial Message* to prompt the caller to dial the desired extension number.

The Built-In Auto Attendant Dial Message is played once and the caller gets Beeps. The system waits for the *Built-In Auto Attendant Beeps Timer* (default: 10 seconds) to expire.

- If the caller does not dial any number before the *Built-In Auto Attendant Beeps Timer* expires, the system plays the *Built-In Auto Attendant Call Transfer to Operator* message and transfers the call to the landing destination as configured by you—Extensions or Operator.

The system waits for the duration of the *Built-In Auto Attendant Inactivity Timer* (default: 60 seconds) for the Operator to answer the call. If there is no answer at the end of this timer, the system releases the trunk.

*If the caller fails to dial digits, you can have the call disconnected instead of having it routed to the Operator. For this, you need to enable the **Disconnect Built-In Auto Attendant call, when caller does not dial any digit** flag in the System Parameters. When this flag is enabled, the system will play the *Built-In Auto Attendant No Dial Voice* message to the caller. If the caller fails to dial a digit within the *Built-In Auto Attendant Beeps Timer*, the system will disconnect the call.*

- If the caller dials the extension number, the system checks if the number is valid.

If the dialed digits are invalid, the system plays the *Wrong Dial* voice message to the caller. This message is played once. The system waits for the duration for the *Built-In Auto Attendant Error Tone Timer* (default: 5 seconds).

If the Wrong Dial Voice Message is not programmed, the system plays Error Tone to the caller for the duration of the Built-In Auto Attendant Error Tone Timer, followed by the *Built-In Auto Attendant Dial Prompt*.

- If the number dialed by the caller is valid, the system checks if the dialed extension is free.
- If the dialed extension is busy, the system plays the *Built-In Auto Attendant Busy Message* to the caller. The message is played once.
- If no *Built-In Auto Attendant Busy Message* is programmed, the caller will hear Busy Tone. The Busy Tone is played for duration of the *Built-In Auto Attendant Busy Tone Timer* (default: 15 seconds), followed by the *Built-In Auto Attendant Dial Prompt*.

*To have the call disconnected if the dialed extension is busy, you may enable the **Disconnect Built-In Auto Attendant Call, when dialed number is busy** flag in the System Parameters.*

- The dialed extension is free. The system calls the extension and plays *Built-In Auto Attendant Ring Back Tone Message* (if programmed) or Ring Back Tone to the caller. This message is played until the dialed extension is ringing.
- The system waits for the period of the Built-In Auto Attendant Ring Timer for the dialed extension to answer the call.

- When the dialed extension answers the call, the caller gets connected to the extension.

If the dialed extension does not answer before the expiry of the Built-In Auto Attendant Ring Timer, the system prompts the caller to dial again with the *Built-In Auto Attendant Dial Prompt* message to the caller.

- The system diverts the call to the Operator. When the call is transferred to the Operator, the system plays the *Built-In Auto Attendant Call Transfer to Operator* voice message (if programmed) or plays Ring Back Tone to the caller.

*If there is no reply from the dialed extension, you can have the call disconnected instead of having it routed to the Operator by enabling the **Disconnect Built-In Auto Attendant call, when dialed number is not responding** flag in the System Parameters.*

Voice Mail Auto Attendant

SARVAM UCS supports 64 simultaneous VMS calls²⁴⁴. These calls can be made by extension users to access their mailbox or incoming calls landing on a trunks that has Voice Mail Auto Attendant enabled.

If all channels are used by extension users, the external incoming calls on the Voice Mail Auto Attendant enabled trunks remain unanswered. To make sure that the incoming calls on the trunks are answered you can reserve channels of the VMS as per your requirement.

The extension users will not have access to the channels reserved for incoming calls on the trunks to access their mailbox.

If all the reserved channels are busy and there is an incoming call on the trunk, it will land on the unreserved channel if free.

To reserve a channel, see [“Configuring VMS General Parameters”](#).

When the Voice Mail Auto Attendant of SARVAM UCS is selected as the destination for incoming calls on a trunk, this is how it will work:

- A call lands on a Trunk.
- The Voice Mail System (VMS) answers the call.
- The VMS greets the caller with the Welcome message and the Greeting Message selected for the current time zone (working hours, break hours and non-working hours).
- If the system detects the day as a holiday, the VMS plays the Holiday Message. To know more, see [“Holiday Table”](#).
- The VMS plays prompts to the caller to process the call further.

Delayed Auto Attendant

You can use Delayed Auto Attendant to have incoming calls that are not answered by the landing destinations—the Operator and the Trunk Landing Group—within a certain time period, to be handled either by the Built-In or the Voice Mail Auto Attendant.

²⁴⁴. For the VMS calls, the number of channels that will be supported would be as per the license you purchase.

When you use Delayed Auto Attendant,

- as a call lands on a trunk, the system checks the incoming call routing configured for the current time zone for the trunk.
- on finding *Delayed Auto Attendant* enabled, the system rings on the destination extensions (Operator and Trunk Landing Group) for the duration of time defined for ringing the extensions (default: 10 seconds).
- if no reply is received from the extensions, the system routes the call to the auto attendant you selected, which may be the Built-In Auto Attendant or the Voice Mail Auto Attendant.
- the call is processed further by the auto attendant you selected.

How to configure

To use the **Built-In Auto Attendant** on trunks, do the following:

1. Make a list of the trunks by their port type (CO, Mobile, SIP, T1E1PRI, BRI) and port number on which you want to use the Built-In Auto Attendant.
2. In the [“Trunk Feature Template”](#) assigned to these trunks, enable Auto Attendant for the desired time zones by selecting **Built-In Auto Attendant**.
3. Set the Start Time for the Morning, Afternoon and Evening Greeting Messages. Refer [“Greeting Message Time”](#) in *System Parameters* for instructions.
4. Assign *Voice Modules* for Built-In Auto Attendant Messages. To play to callers pre-recorded voice messages as Built-In Auto Attendant greetings and to play voice prompts at each stage of the call, you need to assign Voice Modules for the following Built-In Auto Attendant Messages:
 - **Built-In Auto Attendant-Time-based Greetings (Morning, Afternoon and Evening Greetings):** These are played to the caller as soon as the call is answered by the **Built-In Auto Attendant**. Different messages can be recorded for Morning, Afternoon and Evening Hours. You can also set the time during which you want to play these greetings. For detailed instructions, see [“Greeting Message Time”](#) in *System Parameters*.
 - **Built-In Auto Attendant-Welcome Greeting:** Played to callers when answering the call. Different welcome greetings can be programmed for Working Hours, Break Hours and Non-working Hours. The Built-In Auto Attendant Welcome Greeting message is played once.
 - **Built-In Auto Attendant-Dial Prompt:** Played after the Welcome greeting message to prompt the caller to dial the desired extension number. This message is played once.
 - **Built-In Auto Attendant-Ring Back Tone:** Played after the caller has dialed the number and the system is ringing the dialed extension. This message is played continuously as the dialed extension rings.
 - **Built-In Auto Attendant-Wrong Dial message:** Played when the caller dials a wrong number or the number dialed by the caller does not match with any extension number of SARVAM UCS. This message is played once.
 - **Built-In Auto Attendant-Destination Busy:** Played when the dialed extension is busy. This message is played once.

- **Built-In Auto Attendant-Destination No Reply:** Played when the dialed extension does not respond. This message is played once.
- **Built-In Auto Attendant-No Dial:** Played when the caller has not dialed any number. This message is played once.
- **Built-In Auto Attendant-Call Transfer to Operator:** Played to the caller when the call is being transferred to the Operator. This message is played once.

The default Voice Module numbers assigned to Built-In Auto Attendant messages and the messages recorded on each module are:

Voice Module Number	Voice Message Application	Voice Message
02	Built-In Auto Attendant - Morning Greeting	Good Morning!
03	Built-In Auto Attendant - Afternoon Greeting	Good Afternoon!
04	Built-In Auto Attendant - Evening Greeting	Good Evening!
05	Built-In Auto Attendant - Welcome Greeting for Day Time (Working Hours)	Welcome!
06	Built-In Auto Attendant - Welcome Greeting for Night time (Non-working hours)	Welcome! I am sorry, we are closed.
07	Built-In Auto Attendant - Dial prompt	Please dial the desired number.
08	Built-In Auto Attendant - No Dial message	Sorry! You have not dialed any number.
09	Built-In Auto Attendant - Wrong Dial message	Sorry! The number is not valid.
10	Built-In Auto Attendant - Destination Busy message	The person you dialed is busy.
11	Built-In Auto Attendant - Destination Ringing message (Ring Back Tone)	The number you have dialed is ringing.
12	Built-In Auto Attendant - Destination No Reply message	The person you dialed is not responding.
13	Built-In Auto Attendant - Call Transfer to Operator message	Please hold, transferring your call to the Operator.

You may customize these Built-In Auto Attendant voice messages by recording messages of your choice and assigning them to the voice modules. For instructions on recording messages on the voice modules and assigning voice modules to different functions, see [“Voice Message Applications”](#).

If you do not use any of the above voice modules, the system will play the Call Progress Tone for each call state.

To use the **Voice Mail Auto Attendant** on trunks, do the following:

1. Make a list of the trunks by their port type (CO, Mobile, SIP, BRI, T1E1PRI) and port number on which you want to use the Voice Mail Auto Attendant.

2. In the [“Trunk Feature Template”](#) assigned to these trunks,
 - enable Auto Attendant by selecting **Voice Mail Auto Attendant** for the desired time zones.
 - select the desired **Voice Mail Auto Attendant (VMAA) Menu**.
3. Complete the VMS related configuration.
 - Configure Welcome and Greeting messages. You may either use the default, pre-recorded welcome messages of the VMS, or record the custom welcome messages that meet your requirements, in .WAV file format.
 - Configure the Voice Mail Auto Attendant (VMAA) Menu parameters.

For more information and instructions, see the [“Configuring Voice Mail System”](#).

To use **Delayed Auto Attendant** on trunks, do the following:

1. Make a list of the trunks by their port type and port number on which you want to enable Delayed Auto Attendant.
2. In the [“Trunk Feature Template”](#) assigned to these trunks,
 - set the **Auto Attendant Delayed Timer**.
 - if you want to use the *VMS Auto Attendant for Delayed Auto Attendant*, select **Voice Mail Auto Attendant** and complete the voice mail related configuration. For more information and instructions, see the [“Configuring Voice Mail System”](#).
 - if you want to use the *Built-In Auto Attendant for Delayed Auto Attendant*, select **Built-In Auto Attendant**, and assign the Voice Modules for Built-In Auto Attendant Messages, as described earlier.

If required, you may also change the default values of the following Built-In Auto Attendant related Timers and set them to the desired values.

- **Built-In Auto Attendant Inactivity Timer** (default: 60 seconds)
- **Built-In Auto Attendant Answer Wait Timer** (default: 5 seconds)
- **Built-In Auto Attendant Music Timer** (default: 5 seconds)
- **Built-In Auto Attendant Beeps Timer** (default: 10 seconds)
- **Built-In Auto Attendant Ring Timer** (default: 30 seconds)
- **Built-In Auto Attendant Busy Tone Timer** (default: 15 seconds)
- **Built-In Auto Attendant Error Tone Timer** (default: 5 seconds)

To know more about these timers and for configuration instructions, see [“System Timers and Counts”](#).

You may also configure the following Built-In Auto Attendant related flags, as required:

- **Disconnect Built-In Auto Attendant call, when dialed number is busy:** When this flag is enabled, if the dialed extension is found busy, the system will disconnect the call instead of routing it to the Operator. Default: disabled.

- **Disconnect Built-In Auto Attendant call, when dialed number is not responding:** When this flag is enabled, if there is no reply from the landing destination extensions, the system will disconnect the call instead of routing it to the Operator. Default: disabled.
- **Disconnect Built-In Auto Attendant call, when caller does not dial any digit:** When this flag is enabled, if the caller fails to dial a digit within the Built-In Auto Attendant Beeps Timer, the system will disconnect the call instead of routing it to the Operator. Default: disabled.

These flags may be used in Hotels that provide 'Limited Services' and do not want to receive unanswered/busy calls on the guest phones. For instructions on enabling or disabling these flags, see "[System Parameters](#)".

Auto Answer

What's this?

Auto Answer allows incoming calls to be answered without any manual interventions by the extension users.

This feature is particularly useful for Operators in high call traffic settings, as it saves them the effort of picking up the handset or pressing the speaker key repeatedly.

This feature works on digital key phones (DKP) as well as in Extended IP Phones.

How it works

With Auto Answer set on an extension DKP/Extended IP Phone, whenever a call lands on the DKP/Extended IP Phone extension,

- the extension rings for the duration of the Auto Answer Timer²⁴⁵. This timer is programmable, and by default it is set to 1 second.
- on the expiry of the Auto Answer Timer the system plays a beep²⁴⁶ to the user.
- the phone goes OFF-Hook to answer the call, without any intervention by the extension user such as picking up the handset or pressing the speaker or the headset key.
- If a headset is connected, and headset connectivity is enabled, the incoming speech audio will be diverted to the headset automatically.
- the extension user can talk to the caller.

Auto Answer works only if the phone is in idle state; the phone must not be busy with an active call or using a feature.

How to configure

For Auto Answer to work, you are required to do the following:

1. Enable Auto Answer in the DKP Parameters/Extended IP Phone Extensions.
2. Change Auto Answer Timer, if required. The range of this timer is 1 to 9 seconds. By default, the Auto Answer Timer is set to 1 second.
3. Enable Headset Connectivity, if headset is to be used for Auto Answer.

All of the above can be programmed by the System Engineer using Jeeves and a Telephone.

²⁴⁵. This timer defines the time in seconds that the phone should wait before going OFF-Hook to answer incoming calls.

²⁴⁶. Beep is not supported on IP Phones.

The extension users can also program the above parameters using the Phone Menu. See "How to use" Auto Answer later in this topic.

Programming Auto Answer using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **DKP Configuration**.
- Click **DKP Parameters** to open the page.
- If the DKPs are already installed and configured, identify the DKP you wish to provide Auto Answer feature by its Hardware Port/Slot Number, Access Code or Name.

The screenshot shows the 'DKP Parameters' configuration page. The left sidebar contains a navigation menu with 'DKP Parameters' selected. The main content area displays a table with the following data:

Port No.	DKP H/w Slot - Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template	Call Capacity
1	02 - 01	3001		01	01	02
2	02 - 02	3002		01	01	02
3	03 - 01	3003		01	01	02
4	03 - 02	3004		01	01	02
5	03 - 03	3005		01	01	02
6	03 - 04	3006		01	01	02
7	03 - 05	3007		01	01	02

Buttons at the bottom include: Submit, Default, Default One, Advance, Clear Access Code, Call Traffic.

- Click the **Advance** button.
- Go to the column **Auto Answer** of the DKP parameters using the horizontal scroll bar. Enable the flag by selecting the check box.

The screenshot shows the 'DKP Parameters' configuration page after clicking the 'Advance' button. The table now includes an 'Auto Answer' column with checkboxes. The 'Auto Answer' checkbox for Port 1 is checked.

Port No.	DTMF Transmit Level	Headset Connected?	Auto Answer	Auto Ans. Timer (sec)	LCD Back Light Level	Back Light Off Timer (sec)
1	2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	1	3	010
2	2	<input type="checkbox"/>	<input type="checkbox"/>	1	3	010
3	2	<input type="checkbox"/>	<input type="checkbox"/>	1	3	010
4	2	<input type="checkbox"/>	<input type="checkbox"/>	1	3	010
5	2	<input type="checkbox"/>	<input type="checkbox"/>	1	3	010
6	2	<input type="checkbox"/>	<input type="checkbox"/>	1	3	010
7	2	<input type="checkbox"/>	<input type="checkbox"/>	1	3	010

Buttons at the bottom include: Submit, Default, Default One, Clear Access Code, Call Traffic.

To cancel Auto Answer, disable the flag by selecting the check box.

- Now, go to the column **Auto Answer Timer**, and set the Timer as required. By default the Timer is set to 1 second.
- If Headset is to be used by the DKP, go to the column **Headset Connected?** and click the check box to enable the flag.
- Repeat the above steps to program Auto Answer parameters for each DKP that is to be provided this feature.
- Click **Submit** to save changes.
- Similarly configure these parameters for Extended IP Phones, see [“Configuring Matrix SPARSH VP248”](#) and [“Configuring Matrix SPARSH VP310”](#).

Programming Auto Answer using a Telephone

- Enter SE mode.

To set auto answer on DKP, dial:

- **1214-1-DKP-Auto Call Answer Mode** to set Auto Answer on a single DKP.
- **1214-2-DKP-DKP-Auto Call Answer Mode** to set Auto Answer on a range of DKPs.
- **1214-*-Auto Call Answer Mode** to set Auto Answer on all DKPs.

Where,

DKP is the Software port number of the DKP, from 001 to 128.

Auto Call Answer Mode is

0 for Manual mode

1 for Auto Answer mode.

To set Auto Answer Timer, dial:

- **1215-1-DKP-Auto Call Answer Timer** to set Timer for a single DKP.
- **1215-2-DKP-DKP-Auto Call Answer Timer** to set the same Timer for a range of DKPs.
- **1215-*-Auto Call Answer Timer** to set the same Timer for all DKPs.

Where,

DKP is the Software port number of the DKP, from 001 to 128.

Auto Call Answer Timer is from 1 to 9 seconds. Default: 1 second

To enable/disable Headset Connectivity flag, dial:

- **1213-1-DKP-Headset Connectivity Flag** to enable/disable the flag on a single DKP.
- **1213-2-DKP-DKP-Headset Connectivity Flag** to enable/disable the flag on a range of DKPs.
- **1213-*-Headset Connectivity Flag** to enable/disable the flag on all DKPs.

Where,

DKP is the Software port number of the DKP, from 001 to 128.

Headset Connectivity Flag is

0 for Disable

1 for Enable

- Exit SE mode.

Similarly to configure these parameters for Extended IP Phones using a telephone, see [“Configuring Matrix SPARSH VP248”](#), [“Configuring Matrix SPARSH VP310”](#), [“Configuring Matrix SPARSH VP510”](#), for SPARSH VP330 refer the SPARSH VP330 User Guide and for SPARSH VP210 refer the SPARSH VP210 (*Extended*) User Guide.

How to use

Extension users can set/cancel Auto Answer and enable Headset connectivity from their DKP/ Extended IP Phone or by navigating the Phone Menu.

To set Auto Answer:

- Press the DSS Key assigned to Auto Answer function²⁴⁷.

OR

- Press 'Enter' Key.
- Scroll down to select 'Phone Settings'; press Enter Key.
- Enter Your User Password (default: 1111).
- Scroll down to select 'Call Answer Type'; press Enter Key.
- You get the options:
 - Manual Call Answer
 - Auto Call Answer
- Scroll to select Auto Answer and press Enter key.
- Now select the Timer for Auto Answer from any of the options:
 - Answer After 1 sec (default)
 - Answer After 2 sec
 - :
 - Answer After 9 sec
- Press Enter Key.

To cancel Auto Answer:

- Repeat the above steps.
- Select 'Manual Answer' as the Call Answer Type.

It is recommended that Auto Answer Timer be set to at least 2 seconds.

To enable Headset Connectivity:

- Press the DSS Key assigned to Headset function²⁴⁸.

OR

- Press 'Enter' Key.
- Scroll down to select 'Phone Settings'; press Enter Key.
- Enter Your User Password (default: 1111).
- Scroll down to select 'Headset Connectivity'; press Enter Key.
- You get the options:
 - Headset Not Connected
 - Headset Connected
- Scroll to select 'Headset Connected' and press Enter key.

247. This function must have been programmed by the System Engineer on a DSS Key of the phone. Refer "[DSS Keys Programming](#)" for instructions.

248. This function must have been programmed by the System Engineer on a DSS Key of the phone. Refer "[DSS Keys Programming](#)" for instructions.

Auto Call Back (ACB)

What's this?

If the extension number you have dialed is busy or is not responding, you may use the Auto Call Back feature, instead of repeatedly dialing the number. Similarly, when you dial a code to access a trunk and the trunk is busy, you may set Auto Call Back. SARVAM UCS allows you to set a maximum of 300 Auto Call Backs.

How it works

When you set Auto Call Back,

- the SARVAM UCS will queue your call attempt.
- As soon as both extensions, yours and the remote extension, are available, the system will ring first on your extension for the duration of the Auto Call Back Ring Timer. This timer is set by default to 30 seconds and is programmable.
- When you go OFF-Hook, the system will ring on the remote extension (provided it is also available at that moment) for the duration of the Auto Call Back Ring Timer.
- When the remote extension user goes OFF-Hook, your call will get connected.

However, if the remote extension gets busy before the system can ring on it, the system will continue to try again.

Auto Call Back set for a busy trunk works the same way. As soon as the busy trunk port you are trying to access is available, the system will ring your extension. When you go OFF-Hook you will be connected to the trunk port.

- *Each extension of the SARVAM UCS can set only one Auto Call Back request at a time. If you set another Auto Call Back request, before the first one has been served, the system will override the first request and serve the second.*
- *The SARVAM UCS has the capacity to serve 300 Auto Call Back requests from its extensions at a time. The service duration for each request is 60 minutes. Requests that are not served within 60 minutes are automatically canceled by the system. Also, the system will not serve any more requests if all the 300 requests are pending. In such a case, the system will play an error tone, when an extension attempts to make a request.*

Auto Call Back request set by you will be cleared by the system if:

- it was successfully served, that is, your extension was connected to the remote extension or the trunk you were trying to reach.
- you do not answer the Auto Call Back ring, before the expiry of the Ring Timer, that is, within 30 seconds (default setting).
- the remote extension does not answer the Auto Call Back ring before the expiry of the Ring Timer.

- it has not been served within 60 minutes.

- *Auto Call Back works for internal calls and for accessing trunk ports only.*
- *Internal calls include calls between Systems that are networked using Q-SIG.*

How to configure

Auto Call Back is a Class-of-Service dependant feature. An extension user can set/cancel Auto Call Back only if it is enabled in the extension's Class of Service.

The only programming involved in this feature is enabling/disabling Auto Call Back in the Class of Service and changing the duration of the Auto Call Back Ring Timer, if required.

Both these can be programmed using Jeeves and a Telephone.

Programming Auto Call Back using Jeeves

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all extensions of SARVAM UCS. Template 01 has the features 'Auto Call Back Busy' and 'Auto Call Back No Reply' enabled in the default CoS group 01. So, all extensions of the SARVAM UCS can set/cancel Auto Call Back if the called number is busy or does not reply.

However, if Auto Call Back Busy/No Reply is to be denied to any of the extensions, follow these steps:

1. Define a CoS group with Auto Call Back Busy/No Reply disable.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the ["Time Zones"](#).
3. Assign this new Template to the selected extensions to which Auto Call Back is to be denied.

Refer the topics ["Class of Service \(COS\)"](#) and ["Station Basic Feature Template"](#) for instructions on how to enable/disable a feature in a CoS group, how to prepare a Station Basic Feature Template with a new CoS group and assign the new template to SLT, DKP, SIP and ISDN Terminal extensions using Jeeves.

If the User wants to increase or decrease the duration of the of the Auto Call Back ring on both extensions, that is, the extension requesting Auto Call Back and the destination extension, program the 'Auto Call Back Ring Timer', according to User preference.

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **System Timers and Counts** to open the page.

- Scroll to reach **Other Features**.

System Timers	
Other Features	
Auto Call Back Ring Timer (sec)	030
Interrupt Request Timer (sec)	045
Barge-In Timer (sec)	010
Trunk Reservation Timer (min)	010
Transfer while Ringing Timer (sec)	030
Transfer on Busy Timer (sec)	030
Trunk to Trunk Inactivity Timer (min)	002
Call Park Timer (min)	002
Call Park Release Timer (min)	003
LCS Timer (sec)	010
Message Wait Ring Count	010
Message Wait Ring Timer (sec)	030

- Set the **Auto Call Back Ring Timer (sec)** to the desired duration.
- Click **Submit** to save your settings.

Programming Auto Call Back using a Telephone

Refer the topics “[Class of Service \(COS\)](#)” and “[Station Basic Feature Template](#)” for instructions on how to enable/disable a feature in a CoS group, how to prepare a Station Basic Feature Template with a new CoS group and assign the new template to SLT and DKP extensions using SE commands.

- Enter SE mode from a DKP/SLT.

To program Auto Call Back when Busy/No Reply in a CoS group, dial:

- **1302-1-COS Group-Feature Number-Code**
Where,
CoS group is from 01 to 20
Feature Number for Auto Call Back when Busy is '04'
Feature Number for Auto Call Back when No Reply is '05'.
Code is
0 for Disable
1 for Enable.

For example: To enable Auto Call Back when Busy in CoS group 02, dial **1302-1-02-04-1**

To enable Auto Call Back when No Reply in CoS group 02, dial **1302-1-02-05-1**

To assign the CoS group with Auto Call Back Busy/No Reply to a Station Basic Feature Template, dial:

- **5502-1-Template Number-Feature Number-Code**
Where,
Template Number is from 01 to 50.
Feature Number is

03 for CoS group for Working Hours
04 for CoS group for Break Hours
05 for CoS group for Non-Working Hours
Code is CoS group number from 01 to 20.

For example: To apply CoS group 02 with Auto Call Back Busy and No Reply for each Time zone in Station Basic Feature Template 02, dial the following commands:

5502-1-02-03-02 for Working hours
5502-1-02-04-02 for Break hours
5502-1-02-05-02 for Non-working hours

- To apply the Station Basic Feature Template now programmed with Auto Call Back when Busy and No Reply, to the extensions, dial the following commands:

If extension is an SLT, dial:

- **5503-1-SLT-Template Number** to apply on a single SLT.
- **5503-2-SLT-SLT-Template Number** to apply on a range of SLTs.
- **5503-*-Template Number** to apply on all SLTs.

Where,

SLT is the Software port number of the SLT, from 001 to 512

Template Number is the number of the Station Basic Feature Template (01 to 50) you have programmed with the Auto Call Back feature.

If extension is a DKP, dial:

- **5504-1-DKP-Template Number** to apply to a single DKP.
- **5504-2-DKP-DKP-Template Number** to apply to a range of DKPs.
- **5504-*-Template Number** to apply to all DKPs

Where,

DKP is the Software port number of the DKP, from 001 to 128.

Template Number is from 01 to 50.

To program the Auto Call Back Ring Timer:

- Dial command **3801-Seconds**

Where,

Seconds = 001 to 255 seconds.

- Exit SE mode.

How to use

Extension users can set two types of Auto Call Back:

- Auto Call Back on Busy - when the extension/trunk they are trying is Busy.
- Auto Call Back on No Reply - when there is no reply from the extension they are trying.

Auto Call Back on Busy

For EON and Extended IP Phone Users

Using DSS Key:

To set Auto Call Back on Busy:

- Press the 'Call Back' Key on EON48 on Busy Tone or press the DSS Key assigned to Auto Call Back on EON310 on Busy Tone.
- You get confirmatory message "Auto Call Back Set" on the phone's display. The LED of the DSS Key will be turned on.
- Go idle or you get dial tone after 3 seconds.

To cancel Auto Call Back on Busy:

- Press the 'Call Back' Key on EON48 again or press the DSS Key assigned to Auto Call Back on EON310 again.
- You get confirmatory message "Auto Call Back Canceled" on the phone's display. The LED of the DSS Key will be turned off.
- Go idle or you get dial tone after 3 seconds.

Using Command:

To set Auto Call Back on Busy:

- Dial 2 on Busy Tone.
- You get confirmatory message "Auto Call Back Set" on the phone's display. The LED of the DSS Key assigned to Auto Call Back will be turned on.
- Go idle or you get dial tone after 3 seconds.

To cancel Auto Call Back on Busy:

- Dial 102.
- You get confirmatory message 'Auto Call Back Canceled' on the phone's display. The LED of the DSS key assigned to Auto Call Back will be turned off.
- Go idle or you get dial tone after 3 seconds.

For SLT Users

To set Auto Call Back on Busy:

- On Busy Tone.
- Dial 2.
- You get confirmatory tone
- Replace handset or you get dial tone after 3 seconds.

To cancel Auto Call Back:

- Pick up the handset.
- Dial 102.
- You get confirmatory tone.
- Replace handset or you get dial tone after 3 seconds.

Auto Call Back on No Reply

For EON and Extended IP Phone Users

Using DSS Key:

To set Auto Call Back on No Reply:

- Press the 'Call Back' Key / DSS Key assigned to Auto Call Back on Ring Back Tone.
- You get confirmatory message "Auto Call Back Set" on the phone's display. The LED of the DSS Key will be turned on.
- Go idle or you get dial tone after 3 seconds.

To cancel Auto Call Back on No Reply:

- Press the 'Call Back' Key / DSS Key assigned to Auto Call Back again.
- You get confirmatory message "Auto Call Back Canceled" on the phone's display. The LED of the DSS Key will be turned off.
- Go idle or you get dial tone after 3 seconds.

Using Command:

To set Auto Call Back on No Reply:

- Dial 2 on Ring Back Tone.
- You get confirmatory message "Auto Call Back Set" on the phone's display. The LED of the DSS Key assigned to Auto Call Back will be turned on.
- Go idle or you get dial tone after 3 seconds.

To cancel Auto Call Back:

- Dial 102.
- You get confirmatory message 'Auto Call Back Canceled' on the phone's display. The LED of the DSS key assigned to Auto Call Back will be turned off.
- Go idle or you get dial tone after 3 seconds.

For SLT Users

To set Auto Call Back on No Reply:

- On Ring Back Tone
- Dial 2.
- You get confirmatory tone
- Replace handset or you get dial tone after 3 seconds.

To cancel Auto Call Back on No Reply:

- Pick up the handset.
- Dial 102.
- You get confirmatory tone.
- Replace handset or you get dial tone after 3 seconds.

If you hear an error tone while setting an Auto Call Back request, it is likely that the system already has 300 pending requests and is unable to accept yours.

Auto Redial

What's this?

The Auto Redial feature retries a call automatically if the dialed number is busy. It repeatedly checks the busy line till it is free. When the called number is no longer busy, the extension of the caller rings.

Auto Redial saves time and the effort of repeatedly dialing the entire phone number over and over until the called party gets off the phone.

The Auto Redial feature is supported for external numbers only. Maximum 50 Auto Redials can be set by extension users.

How it works

When an extension user dials a number and gets a busy tone, s/he may set Auto Redial. When Auto Redial is set,

- SARVAM UCS checks for a free trunk to dial the number.
- SARVAM UCS will dial out the requested number and will wait until the 'Ring Back Tone Wait Timer'²⁴⁹ expires to sense the Ring Back Tone from the requested number. This timer is programmable and is set to 60 seconds as default.
- If the system does not detect Ring Back Tone for 60 seconds, it releases the trunk and tries again after some time. If the system detects a busy tone, it releases the trunk and redials the number automatically after some time. This process is repeated until the system detects the Ring Back Tone.
- When the SARVAM UCS detects the Ring Back Tone instead of the Busy Tone, it will ring on the extension that set Auto Redial. The extension will ring for the duration of the 'Redial Ring Timer'²⁵⁰. This timer is programmable and is set to 45 seconds as default.
- The extension must go OFF-Hook to get connected to the remote party.
- If the extension is in the middle of any activity such as dialing, ringing or speech, the SARVAM UCS will suspend Auto Redial until the extension becomes idle again. After which it dials the requested number again.

Two types of Auto Redial are supported by the SARVAM UCS - Auto Redial (normal) and Auto Redial 'Priority' - that differ from each other in terms of the number of redial attempts and the interval between attempts.

- **Auto Redial (normal):** The system is programmed by default to make 5 attempts to redial at an interval of 45 seconds (default) between each attempt. Both, the number of attempts as well as the duration of the interval can be changed match User preference, like decreasing the number of attempts to 3 and increasing the interval to 60 seconds.

249. Time for which SARVAM UCS waits to sense the RBT from the PSTN/CO Network after dialing the requested number. This timer is particularly relevant to CO ports. Valid range of the timer: 000 to 255 seconds. Default: 060 seconds.

250. Time for which the extension that has requested Auto Redial should ring. Valid range of the timer: 000 to 255 seconds. Default: 045 seconds.

- **Auto Redial 'Priority'**: the system makes a greater number of attempts to redial and the duration of the interval between each attempt is less. By default the system is programmed to make 20 redial attempts at intervals of 20 seconds. The number of attempts as well as duration of the interval are programmable; for instance, the number of attempts can be set to 30 and the interval to 15 seconds.

To change the number of redial attempts and the interval between them, the SE must Auto Redial Count and the Auto Redial Timer respectively. In addition to these, the system has three other related timers, which can be programmed to match User preference:

- Auto Redial Ring Back Tone (RBT) Wait Timer
- Auto Redial Ring Timer

An extension user can request Auto Redial for multiple numbers at a time from the same extension and more than one extension can attempt auto redial simultaneously.

- *The system uses the same OG Trunk Bundle Group you used. If you dialed the number on group code 60, the system grabs one of the free trunks from group code 60 for Auto Redial.*
- *If the number was dialed the first time using selective trunk access, the system will use the same trunk to execute Auto Redial.*
- *If the extension is programmed for 'Dynamic Lock', and you have set the 'Auto Redial', the system will not check the Toll control as per dynamic lock level.*

Auto Redial may not work well on Two-wire Trunk lines, as its functioning greatly depends on line condition.

How to configure

For Auto Redial to work, the System Engineer must:

1. Enable the features 'Auto Redial' and 'Auto Redial Priority' in the Class of Service (CoS) group of the extensions to which this feature is to be allowed.
2. Change the 'Auto Redial Normal/Priority Count' and the 'Auto Redial Normal/Priority Timer' to match User preference. This will change the number of redial attempts made by the system and the interval between them.
3. If required, also change other related Timers such as Auto Redial Dial Tone Wait Timer, Auto Redial Ring Back Tone (RBT) Wait Timer, Auto Redial Ring Timer.

All the above parameters can be programmed using Jeeves and by dialing SE commands from a telephone.

Programming Auto Redial using Jeeves

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all extensions of the system. The Station Basic Feature Template 01 does not have the feature Auto Redial and Auto Redial Priority in the default CoS group 01. Thus none of the extensions of the SARVAM UCS have this feature.

If the User wants to allow all extensions the Auto Redial and /or the Auto Redial Priority feature, the you can simply enable this feature in the default CoS group 01.

However, if Auto Redial/Auto Redial Priority is to be allowed on only select extensions, follow these steps:

1. Define a CoS group with Auto Redial/Auto Redial Priority enabled.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the “Time Zones”.
3. Assign this new Template to the extensions to which Auto Redial/Auto Redial Priority is to be allowed.

Refer the topics “Class of Service (COS)” and “Station Basic Feature Template” for detailed instructions.

To change Auto Redial Counts and Timers:

- Log in as System Engineer.
- Under **Configuration**, click **System Timers and Counts**.

Auto Redial	
Auto Redial - Ring Back Tone Wait Timer (sec)	060
Auto Redial - Ring Timer (sec)	045
Auto Redial - Normal Timer (sec)	045
Auto Redial - Normal Count	005
Auto Redial - Priority Timer (sec)	010
Auto Redial - Priority Count	020

Call Progress Tones	
Dial Tone Timer (sec)	007
Ring Back Tone Timer (sec)	045
Busy Tone Timer (sec)	007
Error Tone Timer (sec)	030
Feature Confirmation Tone Timer (sec)	007

- Below **Auto Redial**, change the Count and Timer of the type of Auto Redial - Normal or Priority - as per your requirement.
- You may change any of the related timers - Auto Redial Dial Tone Wait Timer, Auto Redial Ring Back Tone (RBT) Wait Timer, Auto Redial Ring Timer - as per your preferences on this page.
- Click **Submit** at the bottom of the page to save changes.

- *If the SARVAM UCS is installed in Australia, please ensure that:*
 - i. *The Timer for Auto Redial Normal as well as Priority must be set to more than 5 seconds.*
 - ii. *The Auto Redial Priority Count should be set to less than 15.*
- *Click Submit at the bottom of the page to save your setting.*

Programming Auto Redial using a Telephone

Refer the topics “[Class of Service \(COS\)](#)” and “[Station Basic Feature Template](#)” for instructions on how to use SE commands to:

- enable a feature (in this case Auto Redial and Auto Redial Priority) in the CoS group.
- assign the CoS group to a Station Basic Feature Template.
- apply the Template with the on DKP and SLT extensions, using SE commands.

To program the relevant Timers and count for Auto Redial:

- Enter SE mode from a DKP/SLT.

To set Auto Redial Normal - Timer:

- Dial command **1704-Seconds**
Where,
Seconds is from 000 to 255.

To set Auto Redial Normal - Count:

- Dial command **1705-Count**
Where,
Count is from 000 to 255.

To set Auto Redial - Priority:

- Dial command **1706-Seconds**
Where,
Seconds is from 000 to 255.

To set Auto Redial - Count:

- Dial command **1707-Count**
Where,
Count is from 000 to 255.

To change Auto Redial RBT Wait Timer:

- Dial command **1702-Seconds**
Where,
Seconds is from 000 to 255 seconds.

Do not set this timer to less than 2 seconds.

To change Redial Ring Timer:

- Dial command **1703-Seconds**
Where,
Seconds is from 000 to 255 seconds.

Do not set this timer to less than 2 seconds.

- Exit SE mode.

How to use

Auto Redial can be set/canceled from EON/Extended IP Phone as well as SLT.

For EON and Extended IP Phone Users

Using DSS Key

To set Auto Redial:

- When the external number you are trying is busy,
- Go ON-Hook on Busy Tone.
- Press the DSS Key assigned to 'Auto Redial' function.
- Go Idle.

To cancel Auto Redial:

- Press the DSS Key assigned to 'Auto Redial' function again.

Using Command:

To set Auto Redial:

- When the external number you are trying is busy,
- Go ON-Hook on Busy Tone.
- Dial 17.
- Go Idle or you get dial tone after 3 seconds.

To cancel Auto Redial:

- Pick up the handset.
- Dial 1070.
- Go Idle or you get dial tone after 3 seconds.

For SLT Users

To set Auto Redial

- When the external number you are trying is busy,
- Go ON-Hook on Busy Tone.
- Dial 17.
- Replace handset or you get dial tone after 3 seconds.

To cancel Auto Redial:

- Pick up the handset.
- Dial 1070.
- Replace handset or you get dial tone after 3 seconds.

Automatic Number Translation

What's this?

SARVAM UCS offers connectivity to different networks - PSTN, GSM, ISDN T1E1PRI, BRI, VoIP - each having a different numbering plan. For example, the GSM network requires area codes to be dialed also for local numbers, whereas the PSTN requires dialing of area codes for long distance calls.

When SARVAM UCS is connected with multiple networks, outgoing calls may be routed through any of these networks, depending on the routing pattern configured in the system. However, as extension users do not know through which telecom network their calls will be routed, they cannot be expected to dial numbers according to the numbering plan of the destination networks.

The Automatic Number Translation feature of SARVAM UCS takes care of this. It modifies/manipulates dialed numbers or part thereof to match with specific route numbering plan understood by the destination network (PSTN, GSM, VoIP). This includes adding or stripping off of country codes and area codes.

For example, when an extension user dials a local landline number, if Automatic Number Translation is so programmed, the SARVAM UCS will prefix the number with the appropriate country-area code before routing the call through the GSM network.

How it works

Automatic Number Translation makes use of the Automatic Number Translation (ANT) Table. The ANT Table consists of three columns:

- **Dialed Number:** This column contains the numbers you expect the users to dial.
- **Strip Digit:** This column contains the number of digit(s) to be stripped off by the system from the Dialed Number string before dialing it out.
- **Add Prefix:** This column contains the digit(s) which are to be added as prefix to the Dialed Number string by the system before dialing it out.

This table is applied on the desired trunk, through which outgoing calls are made.

Upto 8 different ANT tables can be configured and each table can accommodate upto 32 strings.

Here is an example of how this table is to be configured and used:

You want

- All 10-digit numbers to be dialed out after adding the prefix '1'.
- All 7-digit numbers, starting with 2 to be dialed out after adding the prefix '1315'.
- All numbers beginning with 91 to be stripped off the first 2 digits and '0' to be added as prefix.

When you do not want to specify any numeric digits in the numbers to be modified, use the character **X**. This character represents any numeric digit from 0 to 9. For example, a 10-digit number (having the numeric digits from 0 to 9) can be represented using this character as **XXXXXXXXXX**.

Thus, the entries you will need to make in the ANT table will be as follows:

Dialed Numbers	Strip Digit	Add Prefix
XXXXXXXXXX	0	1
2XXXXXX	0	1315
91	2	0

- The entry for 10-digit numbers to be dialed out after adding the prefix '1' will be as shown in the first row of this table. The 10-digit number is represented with the **X** character in the Dialed Numbers column. Since no digit is to be stripped off, '0' is entered in the Strip Digit column. As the prefix '1' is to be added, this number is entered in the Add Prefix column. The system will add 1 as prefix before dialing out numbers from 000000000 to 999999999.
- Similarly, the entry for 7-digit numbers starting with 2 to be dialed out after adding the prefix '1315' will be as shown in the second row of this table. The system will add 1315 as prefix before dialing out numbers from 2000000 to 2999999.
- The entry for all numbers beginning with 91 to be stripped off the first 2 digits and '0' to be added as prefix will be as shown in the third row of this table. When users dial numbers beginning with 91, the system will strip off the first two digits and add 0. For example, when a user dials the number 919925801882, the system will dial out 09925801882.

Automatic Number Translation also forms the basis of ["Multi-Stage Dialing"](#).

How to configure

To apply Automatic Number Translation on a trunk,

- Decide which of the trunks types are to be assigned the Automatic Number Translation (ANT) feature.
- Decide the number of ANT tables you need. You can program 8 different tables, with a maximum of 32 entries in each.
- Make the tables on a piece of paper by drawing three-column tables. In the first column of a the table, write the dialed numbers that need to be modified before being dialed out from the trunk. For each dialed number in the first column, enter the number of digits you want the system to strip off (if required) from this number in the second column. In the third column enter the number you want the system to add as prefix (if required) before dialing out the number.
- Configure the Automatic Number Translation Table in the system using the tables you prepared.
- Enable the Automatic Number Translation flag in the Outgoing Trunk Bundle (OGTB) of the trunk.
- Assign the Automatic Number Translation Table you configured to the OGTB of the trunk.

This can be done using Jeeves and a Telephone.

Configuring Automatic Number Translation using Jeeves

- Log in as System Engineer.
- Click **Configuration**.

Configuring the ANT Table

- Click **Automatic Number Translation**.

The screenshot shows the configuration page for Automatic Number Translation (ANT). On the left, a navigation menu lists various configuration options, with 'Automatic Number Translation' highlighted. The main content area displays a table titled 'Automatic Number Translation (ANT)' with tabs for 'Table-1' through 'Table-8'. The 'Table-1' tab is selected, showing a table with the following structure:

Index	ANT Table - 1		
	Dialed Number String	Strip Digits	Add Prefix
1		00	
2		00	
3		00	
4		00	
5		00	
6		00	
7		00	
8		00	
9		00	

Below the table, there are two buttons: 'Submit' and 'Default'.

- Choose any table number from 1 to 8.
- In the **Dialed Number** column of the table you chose, configure the numbers you expect the extension users to dial. The Dialed Numbers can be a maximum of 16 characters. Default: Blank.

When you want to specify number-length without specifying the numeric digits, use the character **X** to represent the digit. **X** represents any number from 0 to 9.

- In the **Strip Digit** column, enter the number of digits you want the system to strip off from the Dialed Number before the dialing out this number. The valid range is from 00 to 16. Default: 0.
- In the **Add Prefix** column, enter the number you want the system to add as prefix to the Dialed Number before the system dials out this number. The Prefix can be a maximum of 40 characters. Default: Blank.
- Click **Submit** to save your entries.

Enabling Automatic Number Translation on Trunks

- Under **Configuration**, click **Outgoing Trunk Bundle** to open the page.
- In the OG Trunk Bundle of the desired trunk, enable the **Automatic Number Translation (ANT) Apply** flag by selecting the check box.

16	None	0000	01	001	Cyclic	<input type="checkbox"/>	1
17	None	0000	01	001	Cyclic	<input type="checkbox"/>	1

Submit Default Default One

- In the **ANT Table No.** list, select the table number you configured for this trunk.
- Repeat the steps to apply the feature on another OGTB.
- Click **Submit** at the bottom of the page to save changes.

Configuring Automatic Number Translation using a Telephone

- Enter SE mode from a DKP/SLT.

The ANT Table can be configured using Jeeves only.

To enable Automatic Number Translation Flag on OGTB, dial:

- **6702-1-OG Trunk Bundle Number-Feature Number-Code** to enable the flag in a single trunk bundle.
- **6702-2-OG Trunk Bundle Number-OG Trunk Bundle Number-Feature Number-Code** to enable the flag in a range of trunk bundles.
- **6702-*-Feature Number-Code** to enable the flag in all trunk bundles.

Where,

OG Trunk Bundle Number is from 001 to 128.

Feature Number for Automatic Number Translation flag is '5'.

Code is:

0 for Disable

1 for Enable

Default: Disabled.

For example:

To enable Automatic Number Translation flag in OGTB number 1, dial: **6702-1-001-5-1**

To enable the same flag in OGTB numbers 1 to 8, dial: **6702-2-001-008-5-1**

To enable the same flag in all OGTBs, dial: **6702-*-5-1**

To assign an Automatic Number Translation Table, dial:

- **6702-1-OG Trunk Bundle Number-Feature Number-Code** to assign a Table to a single trunk bundle.
- **6702-2-OG Trunk Bundle Number-OG Trunk Bundle Number-Feature Number-Code** to assign the same Table to a range of trunk bundles.
- **6702-*-Feature Number-Code** to assign the same Table to all trunk bundles.

Where,

OG Trunk Bundle Number is from 001 to 128.

Feature Number for Automatic Number Table is '6'.

Code is ANT Table number from 1 to 8.

For example:

To assign ANT Table 3 to OGTB number 1, dial: **6702-1-001-6-3**

To assign ANT Table 3 to OGTB numbers 1 to 8, dial: **6702-2-001-008-6-3**

To assign ANT Table to all OGTBs, dial: **6702-*-6-3**

- Exit SE mode.

Barge-In

What's this?

Barge-In allows you to break into an on-going conversation between two extension users, between an extension user and an external caller as well.

Barge-In can be used by Operators to transfer Incoming calls to busy extensions. The Operator can put the caller on hold, barge into the busy extension to inform about the call, and then transfer the call.

Barge-In can be used by a Boss to interrupt the secretary's busy extension.

SARVAM UCS offers flexibility to allow/deny Barge-In feature to an extension user, that is, allow the extension user to barge into on-going conversations. It also provides the flexibility to prevent conversations of extension users from being barged in, referred to as Privacy against Barge-In.

How it works

- A, B and C are users of the system.
- A and B are talking to each other.
- C calls A.
- C gets busy tone.
- C dials Barge-In feature code.
- C gets Ring Back tone (RBT) and A gets beeps indicating a new call. If A is using EON, C's name and number appear on C's phone display.
- C gets RBT and A gets beeps for Barge-in timer. (By default, 10 seconds)
- During the beeps, A may press 'Flash' to answer the call.
- If A does not respond till the end of the Barge-In Timer (set to 10 seconds, by default), A gets connected to C. B is put on hold and is given hold-on music.

Feature Interactions

- **Call States:**
 - Barge-In works only if the dialed extension is busy. The dialed extension may be busy with another extension or trunk (external number).
 - Barge-In cannot be used when accessed trunk is busy.
 - Barge-In works only if the user about to be barged in is in a two-way normal speech with another user or external party. However, it will not work if the conversation is being recorded.

- It will not work if the busy signal is due to the user being OFF-Hook, or in the middle of dialing, or accessing a feature of the System.
- **“Call Toggle”**: Once A and C comes in speech with each other, A can toggle between B and C using Call Toggle feature.
- **Privacy against Barge-In**: If the feature 'Privacy against Barge-in is enabled for an extension, it cannot be barged into.
- **“Priority”**: No Interaction with Barge-In. If 'A' has lower priority than 'B' but has Barge-In enabled; A can barge in B.
- **“Do Not Disturb (DND)”**: Barge-In will not work if the called user has set DND. If 'A' has set DND. A is busy with C. B calls A. B cannot barge in A.
- **DND Override**: Barge-In will work if the calling user is allowed DND-Override. If 'A' has set DND. A is busy with C. B calls A. On busy signal, B dials the Barge-In code. Barge-In will be successful only if B has DND-Override enabled.
- **“Call Taping”**: Barge-In will not work when the two-way conversation between the users is being taped.

How to configure

The functioning of this feature is controlled by three parameters, 'Barge-In', 'Privacy against Barge-In' and 'Barge-In Timer'.

Barge-In and Privacy against Barge-In

First decide which of the extensions are to be allowed Barge-In and the extension that are to be protected against Barge-In.

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS. The Station Basic Feature Template 01 is assigned CoS group 01. The default CoS group 01 has both Barge-In and Privacy from Barge-In are disabled. So, none of the extensions of the SARVAM UCS can use these features.

If you want to allow Barge-In to the all extensions, simply enable Barge-In in the default CoS group 01.

However, if Barge-In is to be allowed on only selected extensions then follow these steps:

- Define a CoS group with Barge-In enabled.
- Prepare an extension Basic Feature Template with this CoS group applicable in all the **“Time Zones”**.
- Assign this new Template to the extensions to which Barge-In is to be allowed.

Repeat the above steps to allow 'Privacy from Barge-In' in the CoS of extensions that are to be exempted from Barge-In.

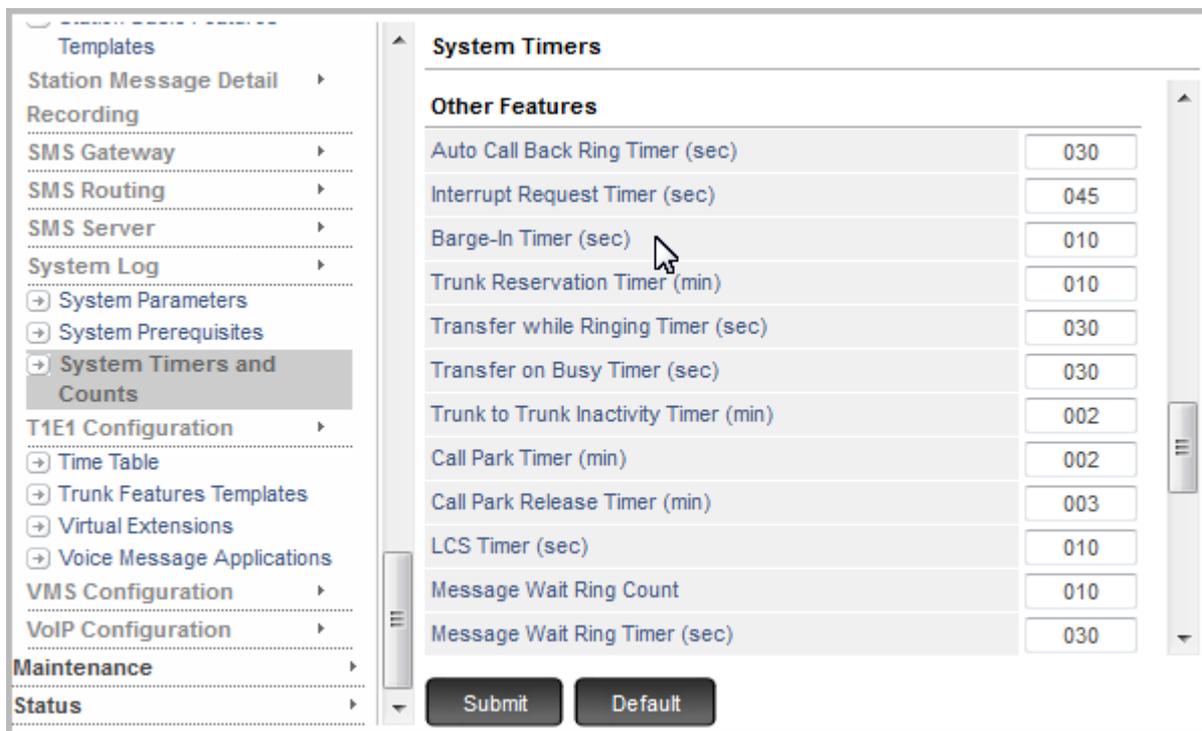

Refer the topics **“Class of Service (COS)”** and **“Station Basic Feature Template”** for detailed instructions on programming.

Barge-In Timer

Barge-In Timer is the time after which the caller gets connected to the called party. By default the Timer is set to 10 seconds.

Changing Barge-In Timer using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **System Timers and Counts** to open the page.
- Scroll to reach **Other Features**.
- Go to the parameter **Barge-In Timer (sec)**.

The screenshot shows the Jeeves configuration interface. On the left is a navigation menu with categories like Templates, Station Message Detail, Recording, SMS Gateway, SMS Routing, SMS Server, System Log, System Parameters, System Prerequisites, System Timers and Counts (highlighted), T1E1 Configuration, Time Table, Trunk Features Templates, Virtual Extensions, Voice Message Applications, VMS Configuration, VoIP Configuration, Maintenance, and Status. The main area is titled 'System Timers' and contains a section for 'Other Features'. This section is a table with two columns: the parameter name and its value. The 'Barge-In Timer (sec)' parameter is highlighted, and its value is 010. Other parameters include Auto Call Back Ring Timer (030), Interrupt Request Timer (045), Trunk Reservation Timer (010), Transfer while Ringing Timer (030), Transfer on Busy Timer (030), Trunk to Trunk Inactivity Timer (002), Call Park Timer (002), Call Park Release Timer (003), LCS Timer (010), Message Wait Ring Count (010), and Message Wait Ring Timer (030). At the bottom of the table are 'Submit' and 'Default' buttons.

Other Features	
Auto Call Back Ring Timer (sec)	030
Interrupt Request Timer (sec)	045
Barge-In Timer (sec)	010
Trunk Reservation Timer (min)	010
Transfer while Ringing Timer (sec)	030
Transfer on Busy Timer (sec)	030
Trunk to Trunk Inactivity Timer (min)	002
Call Park Timer (min)	002
Call Park Release Timer (min)	003
LCS Timer (sec)	010
Message Wait Ring Count	010
Message Wait Ring Timer (sec)	030

- Set the desired value for the Timer.
- Click **Submit** at the bottom of the page to save changes.
- Log out of Jeeves or continue, as required.

Changing Barge-In Timer using a Telephone

- Enter SE mode.
- Dial command **3803-Seconds**
Where,
Seconds is from 001 to 255 seconds. Default is 10 seconds.
- Exit SE mode.

How to use

For EON and Extended IP Phone Users

- Dial an extension.
- If the extension is busy, you get Busy Tone.
- Press DSS Key assigned to 'Barge-In' function.

OR

- Dial 4²⁵¹.
- You get Ring Back Tone.
- Wait for the system to connect you to the called extension.
- Talk.
- Replace the handset after the conversation has ended.

For SLT Users

- Dial an extension.
- If the extension is busy, you get Busy Tone.
- Dial 4.
- You get Ring Back Tone.
- Wait for the system to connect you to the called extension.
- Talk.
- Replace the handset after the conversation has ended.

251. This default feature access code can be changed to suit your preference. Refer the topic ["Access Codes"](#).

BCCH Selection

What's this?

BCCH Selection feature enables you to lock the Mobile Port of SARVAM UCS to a particular cell or channel or BTS (Base Transceiver Station) for various reasons such as:

- better network availability
- minimum call drop due to bad signal/ network failure, etc.

- *This feature is not applicable if CDMA Mobile Card is installed in your system.*
- *To use this feature, make sure GSM²⁵² or LTE is selected as the Preferred Network Mode of the Mobile Port. For instructions, see “[Mobile Port Parameters](#)” in “[Configuring Mobile Trunks](#)”.*

How it works

In the GSM network, each BTS is assigned one particular channel called as ARFCN (Absolute Radio Frequency Channel Number), which is transmitted by BTS in BCCH (Broadcast Control Channel).

Now, when SARVAM UCS is switched on, the Mobile Port gets registered with the network on a particular BTS which has the highest signal strength. However, the signal strength is not consistent. It keeps fluctuating, resulting in call drop or poor voice quality.

Therefore, to avoid this, SARVAM UCS enables you to lock the Mobile Port to a particular cell or channel manually after checking Signal Strength and Signal Quality of each cell.

How to configure

You can lock Mobile Port to a cell or a channel only through Jeeves.

- Log in as System Engineer.
- Under **Configuration**, click **Mobile Configuration**.

252. BCCH Selection will not be supported if Quectel UC20 is installed in your system.

- Click **BCCH Selection** to open the page.

- The page displays the following parameters:
 - **Mobile Port Number:** This is number of the Mobile port for which BCCH Selection status is displayed. You can choose a different Mobile Port number from the drop down list. The page will display the BCCH Selection related parameters for the selected mobile port.
 - **Mobile Port Status:** The current state of the Mobile Port is displayed in this field. Given below is the description of the various status indication messages that will appear in this field.

STATUS	DESCRIPTION
Disabled	Displayed when Mobile Port is disabled.
GSM Initialization	Displayed when GSM module is in initialization state, that is, before SIM detection.
SIM Absent	Displayed when SIM Card is not detected by the system.
SIM PIN wrong	Displayed when wrong SIM PIN is issued.
SIM PUK required	Displayed when SIM PUK is required.
Registering	Displayed when the Mobile Port is in registration process with the Network.
Idle	Displayed when the Mobile Port is registered with the Network and it is free.
Busy	Displayed when any active call is present on the Mobile Port.

- **BCCH Locking Status:** The current BCCH Locking status of the mobile port is displayed in this field. Given below is a description of the various BCCH Locking status indication messages that will appear in this field.

STATUS	DESCRIPTION
Trying to Lock	Displayed when user selects Manual BCCH Locking as 'No' from 'Yes' and module is in initialization process after system or module restart.
Trying to lock on BCCH xxxxx, BSIC / PCID xxx	Displayed when BCCH Locking is selected as Manual and the Mobile Port is in the registration process with the Network. xxxxx is the BCCH selected by the user for locking the cell.
Manually Locked on BCCH xxxxx, BSIC / PCID xxx	Displayed when BCCH Locking is selected as Manual and Mobile Port is successfully registered with the Network. xxxxx is the BCCH selected by the user for locking the cell.
Auto Locked on BCCH xxxxx	Displayed when BCCH Locking is selected as Auto and Mobile Port is successfully registered with the Network. xxxxx is the BCCH of the Main Cell. xxxxx is updated as per the changes in the Main Cell's BCCH.

BSIC is applicable for GSM, whereas PCID is applicable for LTE.

- **Main Cell- Bit Error Rate (%):** Bit Error Rate of the Main Cell is displayed in this field. Bit Error Rate (BER) is the percentage of received bits on a digital link that are in error relative to the number of bits received. Bit Error Rate is calculated from the received signal quality.
- **Manual BCCH Locking:** This parameter allows you to lock the Mobile Port to a particular cell of your preference. By default, manual BCCH locking is set to 'No'. When manual BCCH locking is set to 'No', Mobile Port gets locked to the cell as per the highest signal strength. Select 'Yes' if you want to lock the Mobile Port to the particular cell selected by you.

- *When you apply Manual cell lock with a Service Provider, make sure while changing the SIM, the SIM from the same service provider is inserted.*
- *During Manual BCCH locking if the SIM is not getting registered with the selected cell, you must select No as the Manual BCCH Locking option.*
- **Auto Refresh:** Click this button to refresh BCCH Selection page. All parameters on this page will be downloaded automatically after every 15 seconds. By default, Auto Refresh button is enabled.
- **Stop Auto Refresh:** By clicking this button, you can stop the system from automatically refreshing the BCCH Selection page every 15 seconds. When you stop Auto Refresh, you must click 'Refresh' at the bottom of this page to refresh the page whenever you want
- **Cells:** Indicates the cells with which the Mobile Port can be locked. You can decide to lock the Mobile Port with a particular cell after considering the following cell related parameters, which appear on the page:
 - **MCC-MNC:** In this field, MCC-MNC of a cell is displayed. Mobile Country Code (MCC) is a three digit number uniquely identifying a country and Mobile Network Code (MNC) is either a two or three digit number used to identify a given network from within a specific country.
 - **LAC (Location Area Code):** In this field, LAC (Location Area Code) is displayed. LAC uniquely identifies a location area within a GSM PLMN (Public Land Mobile Network). The maximum length of

LAC is 16 bits ranging from 0 to 65535. LAC is displayed in hexadecimal characters for SIMCOM-2G and Wavecom-2G engines which ranges from 0000 to FFFF. For SIMCOM-3G engine, LAC is displayed in decimal digits which ranges from 00000 to 65535.

- **Cell ID:** In this field, Cell ID is displayed. It is a 16-bit identifier that identifies the cell. Cell ID is displayed in hexadecimal characters for SIMCOM-2G and Wavecom-2G engines which ranges from 0000 to FFFF. For SIMCOM-3G engine, Cell ID is displayed in decimal digits which ranges from 00000 to 65535.
- **BSIC/PCID:** In this field, BSIC (Base Station Identification Code) is applicable for GSM whereas PCID (Physical Cell Identity) is applicable for LTE. BSIC/PCID allows a mobile extension to distinguish between different neighboring base stations. BSIC/PCID is a three-digit value ranging from 0 to 255.
- **BCCH (Broadcast Control Channel):** In this field, the BCCH value of the cell is displayed. BCCH defines the frequency channel number.
- **Receive Level:** In this field, the Receive Signal Strength level of the cell is displayed. It is the average Receive Signal Strength of the cell. Its value ranges from -110 dBm to -47 dBm.
- **Manual Cell Locking:** This radio button is for locking a Mobile Port to a selected cell manually.

Now, to lock a Mobile Port to a particular cell,

- Select the desired Mobile Port Number from the drop down list.
- Set the parameter **Manual BCCH Locking** to **Yes**.
- Go to the Cell to which you want to lock the Mobile Port you selected.
- Select the radio button **Manual Cell Locking** of that Cell.
- Click **Submit** at the bottom of the page.
- The BCCH Locking for the selected Mobile Port will appear on this page, if Auto Refresh is enabled.
- If you have stopped Auto Refresh, click 'Refresh' at the bottom of the page to refresh the page and view the current BCCH Locking settings of the selected Mobile port.
- You may now log out of Jeeves.

Example:

Consider the following example when using this feature:

Problem:

- SARVAM UCS is installed in roaming area, where more than one network is available, say A and B.
- Mobile Network Selection is set to 'Manual' mode and the first priority is programmed as network A and the second priority is programmed as network B.
- The Mobile Port gets registered with A network. After registration, the user locks the Mobile Port to one of the cells of A network.
- After registration, if the module or the system restarts or gets de-registered from the network, module starts registration process again.
- While re-registering, SARVAM UCS tries to lock the Mobile Port to the last selected cell of network A.
- If network A is unavailable then the Mobile Port will not get registered with the network.

Solution:

- In this situation, user should set Manual BCCH locking mode to 'No' to register Mobile Port with the suitable network automatically.
- Later, the user can set the Manual BCCH locking mode to 'Yes' and lock the Mobile Port to the desired cell after assessing the cell information.

Behind the System Application

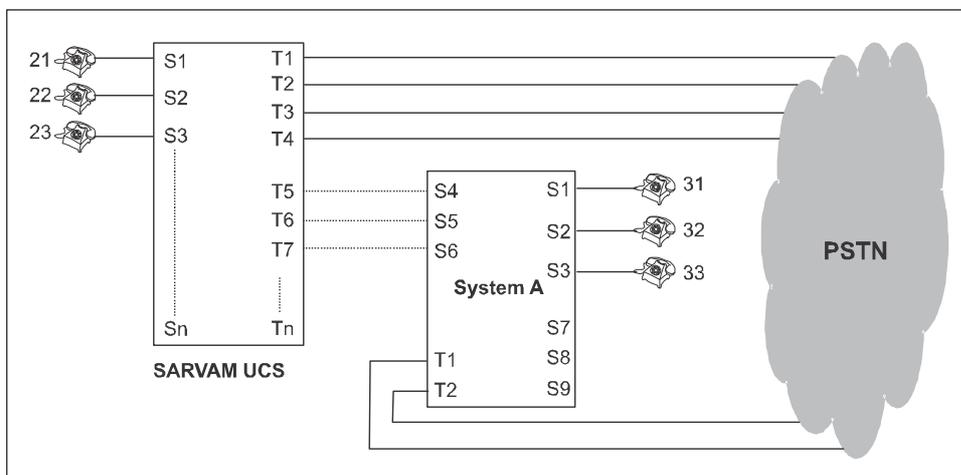

What's this?

It is common for small and medium Systems to be connected to larger System systems, where the trunks of the larger System are connected to the stations of the smaller system. This is usually done for the purpose of expanding the capacity of the large System already in use.

Such configurations are referred to as 'Behind the System Application'.

How it works

Consider the following illustration.

System-A is connected behind SARVAM UCS. In this 'Behind the System' configuration, the Trunk Lines T5, T6, T7 of SARVAM UCS are connected to the Stations (SLT) S4, S5, S6 of System-A.

However, Trunk lines T1 and T2 of System-A are connected directly to the PSTN.

In such application scenarios, implementing toll control restrictions for the trunks is a difficult task for SARVAM UCS.

For example: Extension number 21 of SARVAM UCS in the above illustration is not allowed the facility of long distance dialing. It has access to all the CO trunks.

When the user of Extension 21 wants to access T1, T2 or T3 (which are direct trunks from the PSTN to SARVAM UCS) the user dials '0' (Trunk Access Code programmed), gets PSTN dial tone. When the user dials the number, SARVAM UCS applies Toll Control.

When the user of Extension 21 tries to grab a trunk T5, T6 or T7 (which are connected to stations of System-A) by dialing Trunk Access Code, for example, '0', the user gets the dial tone of System A. This means, the user of Extension 21 must dial '0' again to grab PSTN dial tone of the T1/T2 connected to System-A.

But when the user dials '0' again, SARVAM UCS plays an Error Tone, because SARVAM UCS has applied Toll Control and since Extension 21 is not allowed long distance dialing, SARVAM UCS rejects dialing on trunk and plays error tone.

This would not have been a problem if Extension 21 were allowed long distance dialing. Since Extension 21 cannot be allowed long distance dialing, SARVAM UCS provides a solution for this in the form of a programmable Pre-PSTN Digit Count (PPDC) for each CO trunk.

The Pre-PSTN Digit Count defines the number of digits to be dialed to reach the PSTN. The system will apply Toll Control check for the extension only after the programmed PPDC.

PPDC is to be programmed only for trunks that are connected to another System, and not for Trunks connected directly to the PSTN. To take the above illustration further, PPDC must be programmed only for T5, T6, and T7.

PPDC count programmed should have the same number of digits as the Trunk Access Codes programmed for System-A. For example, if the Trunk Access Code is a single digit number, such as '0', the PPDC will be '1'. If Trunk Access Code is a two-digit number, such as 61, the PPDC will be '2'.

Since PPDC is not applicable on trunks directly connected to the PSTN, it must be programmed as '0' for T1, T2, T3, T4 of SARVAM UCS.

How to configure

The 'Pre-PSTN Digit Count' (PPDC) is to be programmed in the ["CO Hardware Template"](#) applied to the CO trunks of the System that are connected to station ports of the other System as well as to CO trunks that are directly connected to the PSTN.

- For CO Trunks that are directly connected to the PSTN, PPDC must be programmed as '0'.
- For CO Trunks that are connected to the stations of another System, PPDC must be programmed as per the number of digits in the Trunk Access Codes defined for the second System.

This can be done using Jeeves as well as from a Telephone.

The PPDC should be programmed only for 'Behind the System Applications'. For all normal applications, this count must be set to '0' for all the trunks. Otherwise, external number dialing may be hampered. Features like Least Cost Routing and Station Message Detail Recording will also be affected.

Configuring Pre-PSTN Digit Count (PPDC) using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **CO Configuration**.
- Click **CO Hardware Template** to open the page.

- Scroll with the horizontal scroll bar to reach the **PPDC** column of the template.

Template No.	On-Hook Speed (msec)	Off-Hook Speed (msec)	Current Limiting	Minimum Loop Current(mA)	Tip-Ring Voltage (Volts)	Ring Impedance	Ringer Threshold	PPDC
1	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	0
2	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	2
3	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	3
4	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	4
5	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	5
6	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	6
7	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	7
8	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	8
9	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	9
10	< 0.5	8	<input checked="" type="checkbox"/>	10	3.5	High	13.5 - 16.5	0

- By default CO Hardware Template Number 01 is assigned to all trunks. The default 'PPDC' in this template is '0'.
- For all trunks that are to be assigned PPDC '0' (that is, trunks connected directly to the PSTN), you may retain this template.
- For trunks that are to be assigned a PPDC count from 1 to 6 (that is, trunks connected to the stations of another System), prepare another CO Hardware Template by selecting another template number, for instance Template 02.
- From the drop down list, select the appropriate value. This would depend on the number of digits in the Trunk Access Code defined for the trunks in the other System. If the TAC is single digit, select '1'. If TAC is double or triple digit, select '2' or '3' as applicable as the PPDC.
- Click **Submit** at the bottom of the page to save your setting.
- Apply the CO Hardware Template to the CO ports. To do this,
 - Click **CO Parameters** to open the page.
 - Enter the number of the template you prepared (Template 02) in the field **CO Hardware Template** for each port you want to assign this template.
 - For Trunks to be assigned **PPDC** Count **0**, retain CO Hardware Template Number 01.
 - Click **Submit** at the bottom of the page to save your settings.
 - Log out or continue programming.

Configuring Pre-PSTN Digit Count (PPDC) using Telephone

- Enter SE mode from a DKP/SLT.

To program PPDC Count in CO Hardware Template:

- Dial command **5902-1-Template Number-08-Code**

Where,

Template Number is the CO Hardware Template, from 01 to 50. Default: 01

38 is the Feature Number for PPDC

Code is the PPDC Count, from 0 to 6.

For instance: To program PPDC

'1' in Template Number 02, dial: **5902-1-02-38-1**

'2' in Template Number 03, dial: **5902-1-03-38-2**

To assign the CO Hardware Template now programmed with the PPDC to trunks, dial:

- **5903-1-CO-Template Number** to apply the template on a single CO trunk port.
- **5903-2-CO-CO-Template Number** to apply the same template on a range of CO trunk ports.
- **5903-*-Template Number** to apply the same template on all CO trunk ports.

Where,

CO is the number of the Software port of CO Trunks, from 001 to 128.

Template Number is CO Hardware Template number programmed with the PPDC, from 01 to 50.

For instance: To apply Template Number 02 to CO 003 to 005, dial **5903-2-003-005-02**.

- Exit SE Mode.

Also, refer the topic [“CO Hardware Template”](#) to know more.

Building Intercom

What's this?

SARVAM UCS offers the Building Intercom solution by integrating Telecom and Security systems, for commercial and residential buildings, such as malls, shopping complexes, residential apartment blocks and gated-communities.

With the Building Intercom solution, you can also connect private networks, that is few Systems can be connected to each other using VoIP Network.

To use the Building Intercom solution you can either purchase the ILC cards or the SLT cards. For details, refer to ["Installing ETERNITY MENX"](#), ["Installing ETERNITY LENX"](#), ["Installing ETERNITY GENX"](#) and ["Installing ETERNITY PENX"](#).

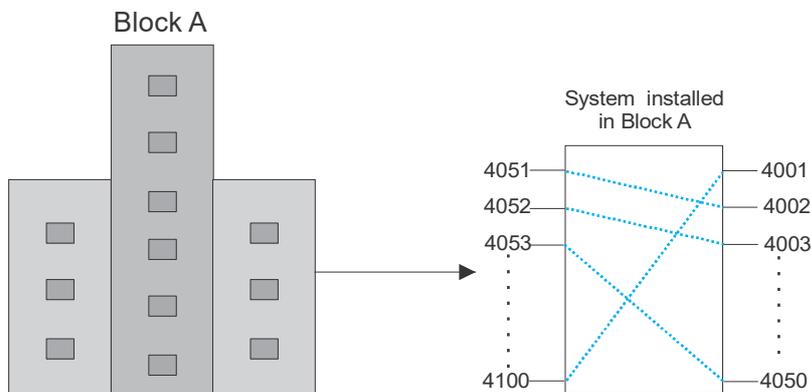

How to use

Building Intercom has two applications:

- Standalone Application
- Extended Application

Standalone Application²⁵³

In this case the system is installed at the site where internal communication is required between internal members in a same complex only.

Here Block A is a residential complex with 100 flats. SARVAM UCS with ILC Cards is installed for internal communication between the residents.

All the extensions 4001 to 4100 can communicate with each other.

Extended Application

Let us understand how to use the Building Intercom Application with the following illustration:

²⁵³. SARVAM SMB (PENX) does not support Standalone Application.

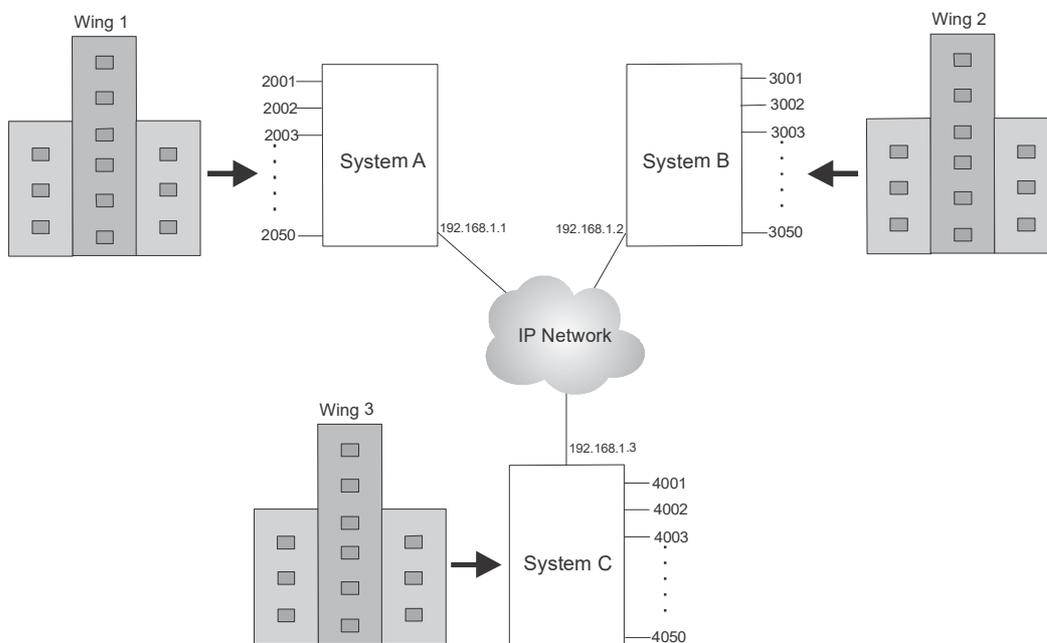

A residential society has three buildings. Each building has 50 flats. In each building a System (having Intercom Line Cards) is installed. The residents in the same building only, can communicate with each other. The residents of all the three buildings want to communication with each other.

To overcome this, you must install a Vocoder Module in each system. All the three buildings will be connected using the IP network as shown in the figure below.

For installing the Vocoder Module in:

- ETERNITY LENX, see [“Installing the VOCODER Module”](#).
- ETERNITY MENX, see [“Installing the VOCODER Module”](#).
- ETERNITY GENX, see [“Installing the VOCODER Module”](#).
- ETERNITY PENX, see [“Installing the VOCODER Module”](#).

In this case, System A, System B and System C will be connected to form a single group. The residents in Wing 1, 2 and 3 will be able to call each other using extension numbers.

Intercom calls can be made between Wing 1, 2 and 3 with suitable configurations of the System.

- **At each location**, you need to do the following configuration in the System:
 - Select a SIP trunk to be used for this application and enable it. For example, SIP Trunk 1.
 - Set the **SIP Trunk Mode** of this trunk to **Peer-to-Peer**.
 - In **Treat Incoming call as** select **Station**.
 - Keep the **SIP ID** field of this SIP trunk **blank**.

For detailed instruction, see [“Configuring SIP Extensions”](#).

- In **System-A**, to route the calls configure the following:
 - The CUG table

- The Peer-to-Peer table.

To configure the CUG table in System A,

- In the **Route Code** field of the CUG table, enter the Number that will be dialed to call the users of System B and C. In this case, 3 and 4 respectively. As the system uses the best match logic to match number strings in the CUG table, you may configure only the prefix of the number to be dialed, instead of configuring the complete number string.
- For the number you entered, in the **Dialed Digit Count** field, enter 4.
- Select the **OG Trunk Bundle Group**. Configure SIP Trunk 1 as the only member in this group. The calls will be routed through this SIP Trunk only.
- Configure the **Strip Digit Count** as 0 and clear the **Self Route** check box.

The CUG table you configure in System A would look like this:

Index	Route Code	OG Trunk Bundle Group	Strip Digit Count	Self Route	Dialed Digit Count
1	3	01	0		4
2	4	01	0		4

For detailed instructions, see [“Closed User Group \(CUG\)”](#).

- To configure the Peer-to-Peer table in System A,
 - In the **Number** field of the Peer-to-Peer table, enter the numbers of the extension users of System B and C. In this case, 3 and 4, respectively. As the system uses the best match logic to match number strings in the Peer-to-Peer table, you may configure only the prefix of the number to be dialed, instead of configuring the complete number string.
 - For the number 3001 enter the **Domain Address**, enter the Domain Name/IP Address of System B. In this case, 192.168.1.2 and for 4001 the Domain Address is 192.168.1.3
 - You can assign a **Name** to the numbers you have configured.
 - The SIP messages can be transported using UDP, TCP or TLS. Select the **Default Transport for Outgoing Message** as per your requirement for each index.

The Peer-to-Peer table you configure in System A would look like this:

Index	Number	Domain Address	Name	Default Transport for Outgoing Message
1	No Match Found			

Index	Number	Domain Address	Name	Default Transport for Outgoing Message
2	3	192.168.1.2	System B	TCP
3	4	192.168.1.3	System C	TCP

- When 2001 from System A dials 3001, the system compares it with the CUG table configured in System A. When a match is found in the CUG table, the system uses SIP Trunk 1 to route the call.
- SIP Trunk 1 is configured as a Peer-to-Peer trunk, hence the system will check the Peer-to-Peer table.
- As 3001 is configured in the Peer-to-Peer table, the system fetches Destination address and transports the SIP messages using the protocol selected as the Default Transport for Outgoing Message.
- The system places the call on System B, using SIP Trunk 1.
- When there is an incoming call on System B, the system checks the CUG table first and as 3001 is not programmed in the CUG table, it checks the flexible number of the extensions.
- As 3001 is found in the flexible number list, the call is routed to the extension 3001.

When 2001 dials 4001, the call will be routed as per the above logic.

Similarly you must configure the parameters in System B and C.

In certain cases different building may have the same extension numbers, in these cases you must configure the CUG Table with Exchange ID. For detailed information, see [“Closed User Group-With Exchange ID”](#).

Busy Lamp Field for Trunks

What is this?

On SIP extensions, SARVAM UCS supports the feature Busy Lamp Field (BLF) Subscription for Trunks, enabling SIP extension users to monitor the status of desired trunks.

Using BLF, SIP extension users can monitor the status of different Trunk types, namely CO, BRI, T1E1, Mobile and SIP. In the case of T1E1 and BRI Trunks, the state of calls on each channel can be monitored using BLF.

To provide SIP extension users this feature, you must enable this feature on their SIP phones and configure the trunk to be monitored on the BLF key of their SIP phones. The number of trunks that can be monitored will depend on the number of BLF keys supported on the SIP Phones.

With BLF subscription and BLF key configured, whenever, there is a change in the state of the monitored trunk, SARVAM UCS sends a NOTIFY message to the SIP Extension. The NOTIFY message contains the Call State. On receiving the NOTIFY message, the SIP Extension updates the LED indication of the BLF key on the SIP phone.

The SIP extensions will indicate the following calls states for the outgoing and incoming calls on the monitored trunks:

Outgoing Calls	
Call State	Description
Trying	When an outgoing call is made through the monitored trunk.
Confirmed	When the external party answers the call and speech is established with the extension user, that is, the call is matured.
Hold	When the call on the trunk has been put on hold by the extension.
Available/Idle	When the SIP EXTension user disconnects the call.

Incoming Calls	
Call State	Description
Early	When an indication is received from the Network that the external party is ringing.
Confirmed	When the incoming call is placed on the SIP Extension as the destination and speech is established with the extension user, that is, the call is matured.
Hold	When the call on the trunk has been put on hold by the SIP extension.
Available/Idle	When the SIP Extension user disconnects the call

SIP phones may differ in the BLF indication (LED color and cadence, text message display) they provide for the Call States. Refer to the manufacturer's documentation for BLF Indication supported on the SIP phones.

How it works

- An Standard SIP Phone is registered as a SIP Extension, with the extension number 3301.
- As the user of extension 3301 wants to monitor the trunk CO-001, BLF subscription is enabled on extension 3301 and CO-001 is assigned to the BLF key on the SIP phone.
- Extension 3301 makes an outgoing call to an external number 2630555. The BLF key will indicate the current call state of the CO-001 Trunk as “Trying” according to the LED indication supported by the SIP phone for this call state.

If the SIP phone supports text message display for call states, each call state will be displayed on the phone.

- When the external party answers the call, the call between the CO-001 and SIP Extension 3301 gets matured. The BLF key will indicate the current call state of the CO Trunk as “Confirmed” according to the LED indication supported by the SIP phone for this call state.
- When the SIP Extension 3301 disconnects the call, the SARVAM UCS will disconnect the call of external number and the BLF key will display the call state of the CO as “Terminated” according to the LED indication supported by the SIP phone for this call state.

Similarly, the BLF key configured on the SIP Extension 3301 will display the call states of the CO-001 trunk for incoming calls from external numbers.

Since multiple calls can be made through a single trunk, the BLF key will indicate the status of the first call detected by the system. When the first call is terminated, the status of the second call (if ongoing) will be indicated. Similarly the status of all subsequent calls will indicated after the previous call is terminated.

How to configure

To provide BLF to SIP extension users, you must do the following:

- Enable **Busy Lamp Field Subscription** on the SIP Extensions you want to provide this feature. For instructions, see [“Configuring SIP Extension using Jeeves”](#) under [“Configuring SIP Extensions”](#).
- Assign a BLF Key for the trunk to be monitored on the SIP Phones registered as extensions. For instructions refer to the manufacturer’s documentation (Installation Guide/User Guide) for the respective SIP Phones.
- To monitor the trunks, configure the BLF Key as per the table given below:

Trunk	User ID part in SUBSCRIBE	Remarks
CO	COxxx	Here, xxx should be a valid CO port number, that is, from 001 to 128.
BRI	BRIxxCHyy	Here, xx should be a valid BRI port number, that is, from 01 to 32 and the yy should be a valid channel no., that is, 01 and 02
T1E1	T1E1xxCHyy	Here, xx should be a valid T1E1 port number, that is, from 01 to 08 and the yy should be a valid channel number, that is, 01 to 30.

Trunk	User ID part in SUBSCRIBE	Remarks
Mobile	MOBxxx	Here, xxx should be a valid Mobile port number, that is, from 001 to 064.
SIP	SIPxx	Here, xx should be a valid SIP Trunk number, that is, from 01 to 32.
E&M	ENMxxx	Here, xxx should be a valid ENM port number, that is, from 001 to 128.

Call Back on Trunk Ports

What's this?

The feature Call Back on Trunk Ports is used to respond to missed calls from particular numbers on the different trunk ports of SARVAM UCS: SIP Trunks, T1E1PRI trunks, BRI trunks, Mobile trunks and CO Trunks.

When Call Back feature is enabled on a trunk port, and there is a missed call on that trunk port, the SARVAM UCS determines if the calling number is eligible for a call back or not. It calls back the same number or an alternative number programmed for that number, either from the port on which it was received or from a different port, depending on the programming. SARVAM UCS can be programmed to choose the most cost effective line to call back the missed call numbers.

Employees at remote locations can use this feature to have the SARVAM UCS installed in their office call them back, thereby saving on charges (for example, roaming charges on mobile calls), where applicable.

How it works

For this feature to work:

- Call Back must be enabled on the desired Trunk Ports.
- The CLI of those callers whom the system should call back must be programmed in the 'Call Back Incoming Number List'.
- The 'Call Back Timer' may be programmed. When the caller disconnects within the Call Back Timer, the Call Back will be applied for that number.
- You must define 'Call Back on', that is, you must select whether the number which must be called back should be the same CLI number which the call was received or an alternative number.
- The number on which call back is to be made must be programmed in the 'Call Back Outgoing Number List', if it is not the same CLI number or if it is an alternative number.
- You must select whether the call back should be made using the same trunk port on which the call was received or an Outgoing Trunk Bundle Group (OGTBG). If you select OGTBG, you must also program the OGTBG.
- You may enable Least Cost Routing (LCR) on the OGTB if you want the system to select the least cost trunk for calling back the missed call number. Program LCR accordingly.
- Select a 'Call Back Mode', that is, how the call should be routed when the call back is answered by the remote party; whether it should be routed through Built-In Auto Attendant, DISA or Operator.

Following is an example of a Call Back on a mobile port, when the above parameters are programmed.

- Caller A calls mobile port 01.
- The system checks if the Call Back flag is enabled on mobile port 01.
- The flag is enabled.

- The system matches the CLI of A with the Call Back Incoming Number List assigned to mobile port 01 to determine if the calling number is eligible for a call back.
- A match is found on Index 15 of the Call Back Incoming Number List.²⁵⁴
- The system waits for the period of the Call Back Timer (programmable, default: 10 seconds).
- A must disconnect before the expiry of the Call Back Timer so that the system can treat it as a Missed Call.
- If A disconnects within the Call Back Timer, the system applies Call Back for A's number.
- The system checks the 'Call Back on' parameter, whether it has to call back the same number or an alternative number.
- If an alternative number is programmed as 'Call Back on', the system checks the Outgoing Call Back Number List for the alternative number. As the CLI of A matches with the number on Index 15 of the Call Back *Incoming* Number List, the system checks Index 15 of the Call Back *Outgoing* Number List for the corresponding alternative number to this number.
- The system checks if the number is to be called from the same port or an OGTBG.
- If the same port is programmed, the system will make a call to the number using mobile port 01.
- If OGTBG is programmed, the system will check if Least Cost Routing is enabled in the OGTBG and make the call back accordingly.
- When A answers the call,
- The system checks the type of Call Back Mode enabled on mobile port 01 (the port on which the call back request was made).

Four scenarios are possible:

1. "Auto Attendant" is enabled as Call Back Mode on mobile port 01.
 - A gets dial tone of SARVAM UCS.
 - A can now use Built-In Auto Attendant feature.
2. 'Pin Authentication - Multiple Calls' or 'CLI Authentication - Multiple Calls' is enabled as Call Back Mode on mobile port 01.
 - A gets dial tone of SARVAM UCS.
 - A can now reach any station or trunk of SARVAM UCS from DISA Mode.
3. 'CLI Authentication - Single Call Answer Signaling' is enabled as Call Back Mode on mobile port 01.
 - A gets dial tone of another trunk of SARVAM UCS.

254. If the system does not find a match for the CLI of the caller in the Call Back Incoming Number List, the 'Call Back' feature will not be applicable and the call will be processed according to the normal incoming call logic.

- A can make calls from the trunk.
4. 'Operator' is enabled as Call Back Mode on mobile port 01.
- A gets Ring Back Tone.
 - The system lands the call on the Operator extension assigned to mobile port 01.

Read the topics [“Auto Attendant”](#), [“Direct Inward System Access \(DISA\)”](#) and [“Configuring 'Operator'”](#) to know more about the call respective call logic.

- *Since this feature is essentially for callers, they must be aware of its functioning to be able to use it, that is, disconnect the call within the Call Back Timer. If the caller does not disconnect within the Call Back Timer, the call will be processed according to the normal incoming call logic.*
- *SARVAM UCS supports only one call back request at a time, for one trunk port. The second incoming call on that trunk port will be processed by the system as per normal incoming call routing.*
- *For call back requests made from an OGTBG, if any of its trunks is busy, SARVAM UCS will support only the last call back request in the OGTBG. Previous requests will be processed as per the normal incoming call management logic.*

How to configure

For this feature to function, you must program the following parameters on each Trunk port type (CO, BRI, T1, E1, Mobile, SIP) on which you want to use this feature:

- **Enable Call Back:** This flag must be enabled on the desired trunk port on which you want to activate the Call Back on Trunk Port feature. By default, this flag is disabled on all trunk port types.
- **Call Back Timer:** This is the duration for which the system waits for the caller to disconnect the call after the system has found a matching number for the caller's CLI in the Call Back Incoming Number List.

When the caller disconnects within Call Back Timer, the system applies Call Back on the port. If the caller does not disconnect within the Call Back Timer, the incoming call management logic is applied for the call on the trunk port.

The range of this timer is from 01 to 99 seconds. By default, it is set to 10 seconds.

- **Call Back Incoming Number List:** This is the list of numbers that are eligible for Call Back. The system checks the CLI of the caller with this list to determine if the caller is eligible for a call back.

The system compares the number string programmed in the Call Back Incoming List with the number string received as CLI.

Number string programmed in the 'Call Back Incoming Number List' shall be compared with the actual received CLI.

The number string programmed in the Call Back Incoming Number List may be shorter than the number string received as CLI, but only if the programmed number string completely matches with the received CLI from the right towards left, the system will consider it as a complete match.

For example, if the programmed string is 263055 and the number string received in the CLI is 2652630555, the system will consider it a complete match. If the received CLI 912652630555, the system will consider this caller too as eligible for a call back. Thus any CLI received with 263055 as the last 7 digits will be considered as match found.

By default, 'Number List' 15 is assigned to all trunk port types as Call Back Incoming Number List. You may program this list for all port types, or you may program another Number List and assign it to the particular trunk port type.

Refer the topic "[Number Lists](#)" for instructions on how to configure the Number List.

- **Call Back on:** For each Trunk port type you have set the Call Back feature, you must define 'Call Back on', that is, you must select whether the number which must be called back should be the same number from which the call was received or a different number.

When missed call is eligible for call back (matches with Incoming Number list), the 'Call Back on' parameter determines the number on which the call back is to be made, that is, whether on the same number from which the missed call is received or on a different number.

In countries where CLI received on trunks can be dialed out without any modification, you may select 'CLI Number' as 'Call Back on' option.

In countries where CLI received on trunks can be dialed only after appropriate modification, you may select "Alternate Number" as the 'Call Back on' option. You may also select 'Alternate Number' as Call Back on when you want the call back to be made to a different number.

- **Call Back **Outgoing Number List:**** When the system finds a missed call eligible for a call back, it will make the call back on the basis of the Call Back on option you selected and the Outgoing Number List you programmed.

If you selected 'CLI Number' as "Call Back on" option, you do not need to program the corresponding outgoing number for the CLI received.

However, if the CLI received needs to be modified before being dialed out, then program the modified CLI in the Outgoing List as the corresponding outgoing number for the CLI received.

The modified CLI or the Alternate number should be programmed at the same index number as the index number at which the received CLI is programmed in the Call Back Incoming Number List. For example, for the received CLI number string programmed at Index 15 in the Call Back Incoming Number List, the corresponding modified CLI/Alternate number string should be programmed at the same Index, 15, in the Call Back Outgoing Number List.

When the CLI received matches with the number string programmed at Index 15 of the 'Call Back Incoming Number List', the call back will be made using the (modified/Alternate) number programmed at Index 15 of the 'Call Back Outgoing Number List'.

By default, 'Number List' 16 is assigned to all trunk port types as Call Back Outgoing Number List. You may program this list for all port types, or you may program another Number List and assign it to the particular trunk port type.

Refer the topic "[Number Lists](#)" for instructions on how to configure the Number List.

If you have selected 'Alternate Number' as 'Call Back on' option, but do not want to provide alternative numbers to call back particular callers (that is, CLI received), in such a case, program the CLI of these callers in the Incoming Number List but keep the corresponding index numbers in the Outgoing Number Lists blank.

- **Call Back from:** This parameter determines the trunk port to be used to make call back. The call back can be made using the same port or an Outgoing Trunk Bundle Group (OTGTBG). Select 'Same port' if you want the call back to be made using the same port on which the missed call was received. If you select OTGTBG, the call back will be made using the OTGTBG, which you have defined.
- **OGTB Group for Call Back:** If you selected OTGTBG for making the call back in the previous parameter, you must assign the OTGTBG that must be used in this parameter.

By default, OTGTBG 01 is selected for Call Back.

If you want the system to select the lowest cost trunk for making the call back, enable Least Cost Routing on the OTGTBG that you define here for Call Back.

- **Call Back Mode:** Select from the following options how a 'Call Back' call answered by the remote party should be routed:
 - **Built-In Auto Attendant:** The system will process the call as per the Built-In Auto Attendant call logic - give a dial tone to the remote party, who can now call any extension. Refer the feature description for "[Auto Attendant](#)".
 - **PIN Authentication-Multiple Calls:** The system will process the call as per DISA call logic - allow remote party to enter DISA mode with PIN-Authentication. On successful authentication (DISA Login) the user is allowed to make calls or use features as allowed to him/her.
 - **CLI Authentication-Multiple Calls:** The system will process the call as per DISA call logic, allowing the remote party to enter DISA mode with CLI Authentication-Multiple calls as authentication method and level of access.
 - **CLI Authentication-Single Call:** The system will process the call as per DISA call logic, allowing the remote party to enter DISA mode with CLI Authentication-Single call as authentication method and level of access. Refer the feature description for "[Direct Inward System Access \(DISA\)](#)".
 - **Operator:** When the remote party answers the Call Back call, the system will route the call to the Operator²⁵⁵.

By default, Operator is selected as the Call Back Mode.

All these parameters may be programmed using Jeeves or by dialing SE commands from a telephone.

To program Call Back on different port types, refer the relevant topics mentioned below:

- For Call Back on SIP Trunks, refer the topic "[Configuring SIP Trunks](#)".
- For Call Back on T1E1 Ports, refer the topic 'Call Back on T1E1 Trunk Ports', under "[Configuring E1 Trunks](#)" and "[Configuring T1 Trunks](#)".
- For Call Back on BRI Ports, refer the topic 'BRI Parameters' under "[Configuring BRI Trunks](#)".

255. 'Operator' is the station which is assigned to the Mobile port in the Trunk Feature Template. Refer "[Trunk Feature Template](#)" to know more.

- For Call Back on Mobile Ports, refer the topic [“Configuring Mobile Trunks”](#).
- For Call Back on CO Ports, refer the topic [“Configuring CO Trunks”](#).

Call Budget on Extension

What's this?

Call Budget is a cost control feature that allows you to keep a tab on the total cost of phone call made by extension users.

With this feature, each extension can be allotted a 'budget' limit for outgoing calls, which is automatically reloaded at the start of every month.

Long distance calls form a major part of the increased cost of telephone calls. Though excessive use or misuse of long distance dialing can be restricted using Toll Control, there may be extension users whose nature of work requires them to make long distance calls. Instead of denying them the facility, their telephone bill can be limited to a certain amount using Call Budget.

With a Call Budget allotted to the extension, the user is free to make calls as long as s/he does not cross the budget limit. Once the user exceeds the budget limit, the extension can be denied access to long distance dialing.

The extension user can be assigned a fresh budget, after which s/he can resume making long distance calls.

Call Budget can be enabled on all the extensions as well as on selected extensions. Each extension can be assigned a different amount depending on user requirement.

How it works

When an extension allotted Call Budget makes a call,

- The system checks the current call budget amount of the extension.
- If the consumed amount is within the budget limit allotted to the extension,
 - The system allows the extension to make the call as per the **"Toll Control Levels"** assigned to it.
 - After the call ends, the system calculates and adds the call amount to the extension's account. Thus it calculates and updates the total cost of calls made from the phone.
- If the consumed amount exceeds the budget limit allotted to the extension,
 - The system considers this as Call Budget exhausted.
 - The system allows the extension to make the call as per the Toll Control-Call Budget Consumed assigned to the extension.
 - After the call ends, the system calculates and adds the call amount to the extension's account.
- Until a new Call Budget is allocated to the extension user, the extension user can make calls only as per Toll Control assigned for the Call Budget Consumed state.
- Once a new Call Budget is allocated, the extension user can make calls as per the **"Toll Control"** assigned to the extension.

- If the budget exceeds anytime during the month, and if no fresh budget amount is allotted, the system allows calls to be made as per the Allowed and Denied List of Toll Control-Call Budget Consumed till the end of the month. From the 1st day of the following month, the system automatically reloads the budget amount. The extension can now make calls.
- The Call Budget allotted to extension is valid for one month. The system automatically reloads the budget at the start of every month.
- The budget amount can be changed or allotted afresh to extensions from the System Administrator (SA) mode, at any time. The Call Budget allotted by the SA will be reloaded in the following month.

- *Call Budget is not based on real time (online) call cost calculation. The SARVAM UCS calculates the call cost only after the call has ended.*
- *So, if the Call Budget allotted to an extension user gets exhausted in the middle of a call, the call will not get disconnected, though the budget exceeds. To prevent this from occurring, the System Engineer may program the “Call Duration Control (CDC)” feature.*
- *Call Budget is dependent on precise Call Cost Calculation. So, SMDR parameters and long distance codes must be programmed properly to prevent errors in calculation.*
- *This feature works independent of any Call Accounting Software (CAS) installed with the SARVAM UCS.*
- *The SARVAM UCS will calculate cost of phone calls made by extension phones even when no call budget is allocated²⁵⁶.*

How to configure

The working of this feature is controlled by three parameters: **Call Budget** flag, **Toll Control-Call Budget Consumed** and **Preset Call Budget Amount** (this parameter is applicable only for the Hotel Mode).

These parameters can be programmed using Jeeves and Telephone.

Call Budget flag and Toll Control-Call Budget Consumed

To enable Call Budget feature on an extension, the System Engineer must enable the Call Budget flag and define the Toll Control-Call Budget Consumed in the Station Basic Feature Template assigned to the extensions.

In the default Station Basic Feature Template 01 assigned to all extensions of the SARVAM UCS, the Call Budget flag is disabled and the Toll Control-Call Budget Consumed is set to 'No Calls'.

If Call Budget is to be allowed to all extensions, simply enable the flag in the default Station Basic Feature Template 01 and select the Toll Control for Call Budget Consumed state.

However, if Call Budget is to be allowed to selected extensions, then prepare a separate Station Basic Feature Template with the Call Budget flag enabled and the Toll Control-Call Budget Consumed set. Now, apply this template on extensions that are to be allowed this feature.

Refer the topic [“Station Basic Feature Template”](#) for detailed instructions for programming a feature in the template and assigning templates to extensions.

²⁵⁶. Based on the feature 'Call Cost Calculation'.

Preset Call Budget Amount²⁵⁷

The amount of '9999' is set as default Call Budget in the system. This value may be changed by the System Engineer according to the organization's practices. For example, if the organization wants to allocate a fixed amount of \$10 to all extension users, the Call Budget value can be set to '10'.

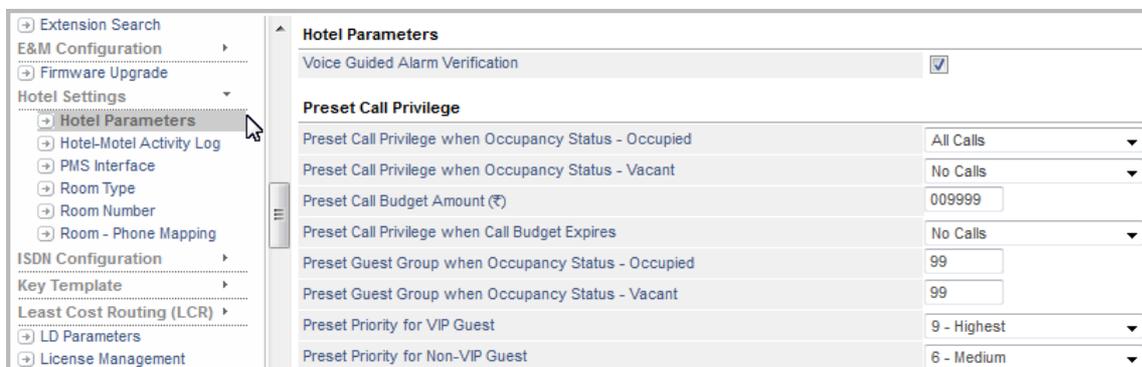

The new Call Budget set by the System Engineer will be considered as the Preset Call Budget amount. This amount will be allocated at the start of every month to all extensions having Call Budget feature in their Station Basic Feature Template.

Further, the System Administrator (SA) can override the Preset Call Budget amount set by the System Engineer, and allot call budgets on an extension-by-extension basis. For example: allotting higher amount to extensions of senior managers, Marketing, Sales, Exports departments, and lower amount to extensions that are less likely to make long distance calls frequently.

The amount may be greater or lesser than the default amount set by the System Engineer. The Call Budget amount allotted by the SA will be reloaded at the start of every month on the extension. For instructions refer 'How to Use' later in this section.

Changing the Preset Call Budget Amount using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Hotel Settings**.
- Click **Hotel Parameters**.
- Scroll to **Preset Call Privilege** and change the **Preset Call Budget Amount** to the required value.

Hotel Parameters	
Voice Guided Alarm Verification	<input checked="" type="checkbox"/>
Preset Call Privilege	
Preset Call Privilege when Occupancy Status - Occupied	All Calls
Preset Call Privilege when Occupancy Status - Vacant	No Calls
Preset Call Budget Amount (₹)	009999
Preset Call Privilege when Call Budget Expires	No Calls
Preset Guest Group when Occupancy Status - Occupied	99
Preset Guest Group when Occupancy Status - Vacant	99
Preset Priority for VIP Guest	9 - Highest
Preset Priority for Non-VIP Guest	6 - Medium

- Click **Submit** to save changes.

Changing Preset Call Budget Amount using a Telephone

- Enter SE mode from a DKP/SLT.
- Dial command **3710-Preset Call Budget Amount**
Where,
Preset Call Budget Amount is any amount of 6-digits.
If the amount is less than 6 digits, use leading zeros.
For example: To assign Call Budget = \$10, dial **3710-000010**
- Exit SE mode.

²⁵⁷. Applicable only for the Hotel Mode.

- Dial '00' to exit from an SLT
- Dial '00' and press '**Enter**' key to exit from a DKP.

- The amount programmed as Preset Call Budget is to be considered as the local currency.
- At the time of installation, when the SE selects the Region Code (country code) and defaults the system, the related Currency Code is applied.
- The currency symbol will not be displayed on the Operator's phone, on account of the limited number of characters that can be displayed.
- The local currency symbol will appear at the relevant places in the outgoing SMDR reports.

How to use

Call Budget amount can be allotted to extensions from the System Administrator mode, using Jeeves or by dialing SA commands from an extension phone.

Assigning Call Budget to Extensions using Jeeves

- Log into Jeeves as System Administrator.
- Click **Extension**.

- In **Select Extension**, enter the Number or the Name of the extension on which you want to set this feature
- Click **Submit**.
- The searched extension user details appear on your screen.

- Click **Phone Properties** to expand.

Phone Properties

Extension Number	2001	Phone Type	SLT Port-1
Extension Name	<input type="text"/>	Call Privilege	All Calls ▼
Hardware Slot-Port	<input type="text" value="02"/> - <input type="text" value="07"/>	Presence	Present ▼
Allot Call Budget (₹)	<input type="text"/>	Keypad	Unlock ▼
Call Budget Allotted/Used (₹)	9999/0.00	Mailbox	No ▼
Change User Password to	<input type="text"/>	Guest Group	99 ▼

- In **Allot Call Budget**, enter the amount you want to assign to the user as budget limit for outgoing calls.

To re-assigning a new amount before the previous balance is consumed, make sure you add the available balance to the new amount. Enter this amount in Allot a Call Budget.

For example, if you have allotted an amount is Rs.1000 and the consumed amount is Rs.600. The available balance is Rs.400. Now, if you want to assign a new amount of Rs.500. In Allot a Call Budget you must enter 900 (Balance + New = 400 + 500).

- The **Allotted Amount/Used** displays the amount allotted to the user as well as the call budget amount consumed by the user for making outgoing calls.
- Click **Submit** button to save.
- To allot call budget to another extension, follow the same instructions as above.

For EON and Extended IP Phone Users

To assign Call Budget to an Extension:

- Press DSS Key assigned to 'Set Call Budget for Remote Extension' function.

OR

- Dial **1072-004** (from SA mode).
- Enter Extension Number that is to be assigned a budget.
- Enter Call Budget Amount.
Use leading zero if amount is fewer than 6 digits.
- You get confirmatory message.
- Go idle.

To view Call Budget assigned to an Extension:

- Press DSS Key assigned to the 'Call Budget Extension' function.

OR

- Dial **1072-011** (from SA mode).

- Enter Extension Number
- Call Budget assigned to the extension appears on your phone display.

For SLT Users

- Lift the handset.
- Dial **1072-004** (from SA mode).
- Dial Extension Number.
- Dial Call Budget Amount.
Use leading zero if amount is less than 6 digits.
- You get confirmation tone.
- Replace handset.

Call Budget cannot be viewed on SLT.

Call Budget on Trunk

What's this?

Call Budget on Trunks is an expense control feature of SARVAM UCS that allows you to keep track of the cost of phone calls made from the different Trunk ports of SARVAM UCS.

With this feature, each trunk can be allotted a 'budget' limit for outgoing calls. This budget limit can be programmed to be reloaded manually each time it is exceeded or at a scheduled date, either daily or at a particular date of the month.

There are three types of Call Budget limit that can be set on the trunks:

- **Amount:** In this type of Call Budget, a fixed amount is assigned to the trunk. By default the amount of 999999 (to be considered in the local currency) is set as Call Budget Amount on trunks. With Amount-based Call Budget you can control the actual expense incurred on making calls from a trunk.
- **Minutes:** In this type of Call Budget, a fixed number of Minutes are assigned to the trunk. By default, 999999 minutes are assigned as Call Budget Minutes on trunks. This type of Call Budget is useful when the Service Provider offers 'Free' minutes. For example, the Service Provider allows the customer to make calls for the first 1000 minutes every month. This offer can be availed of by programming Minutes-based Call Budget on the trunk port.
- **Number of Calls:** In this type of Call Budget, you can define the maximum number of calls that can be made from a trunk. By default, the maximum number of Call Budget - Calls is set to 9999 calls on the trunks. This type of Call Budget is useful when the Service Provider offers a certain number of free calls or a certain number of free calls for a fixed period. For instance, the Service Provider offers 150 free calls per month.

With a Call Budget allotted to a trunk, the users can make calls from the trunk as long as the budget limit set for the trunk—Amount or Minutes or Maximum number of Calls—is not crossed. Once the budget limit exceeds calls will not be routed through this trunk.

The consumed Budget can be reset, after which the trunk becomes functional again and allows outgoing calls to be made. The consumed Call Budget can be reset manually, that is, anytime, as required/desired, or on a scheduled date either daily or on a particular date of the month.

By default, *Call Budget Type - Minutes* is enabled on all the trunk port types - SIP, T1E1PRI, BRI, Mobile, CO for *300 Minutes*. You can change the configurations as per your requirement, refer [“How to configure”](#) and [“Outgoing Call Routing”](#).

How it works

Call Budget can be enabled on trunk port types - SIP, T1E1PRI, BRI, Mobile, CO - all at once or on selected trunk port types from among them. Each trunk can be assigned a different Call Budget, depending on the requirement of the users.

When Call Budget is enabled on a trunk port, for each outgoing call,

- The system checks the type of Call Budget set on the trunk - Amount, Minutes or number of Calls.

- It checks the Call Budget consumed.

Call Budget- Amount

- When Amount-based Call Budget is selected, the Amount should be assigned to the trunk.
- At the end of each outgoing call made from the trunk, the system will calculate the cost of the call on the basis of the Pulse Rate Type programmed. The system will thus calculate the total amount consumed after the end of each call. Refer the topic [“Call Cost Calculation \(CCC\)”](#) to know more.

Call Budget - Minutes

- When Minutes-based Call Budget is set, the total minutes for which calls will be allowed from the trunk port must be defined.
- With the number of Minutes defined, at the end of each call, the system will calculate the duration of the call on the basis of the units programmed in the Pulse Rate. The system will calculate the consumed minute on the basis of the duration of the call. Refer the topic [“Call Cost Calculation \(CCC\)”](#) to know more.

Call Budget - Number of Calls

- When the Call Budget is based on 'Number of Calls', the maximum number of calls to be allowed from the trunk port is to be defined.
- With the number of calls programmed, the system will maintain a count for the number of matured outgoing calls made from that trunk port.
- Thus for each matured call, the Number of Calls-Count is incremented, irrespective of the actual duration of the matured call.

When the assigned 'cost' or 'minutes' or 'number of calls' assigned to trunk is exhausted, SARVAM UCS will:

- print 'system activity log'.
- bar or limit outgoing calls from such trunks.
- play an Error Tone to the extension users who attempt to access such trunks using Selective Trunk Access.
- However, incoming calls will remain unaffected, and will be allowed on these trunks.

The consumed Call Budget Amount/Minutes/Calls can be reset manually at any time from the System Administrator mode or the System Engineer mode or can be programmed to be automatically reset either daily or on a particular date of the month.

The current Call Budget Amount/Minutes/Calls limit can be changed from the System Administrator (SA) mode, at any time. If scheduled reset of consumed Call Budget is programmed, then the Call Budget allotted by the SA will be reloaded on the scheduled date.

Once a new Call Budget is allocated to the trunk, outgoing call facility is resumed on the trunk.

- *Call Budget on Trunks is not based on real time (online) call cost calculation. The SARVAM UCS calculates the call cost only after the call has ended.*
- *If the Call Budget allotted to a Trunk Port gets exhausted in the middle of a call, the call will not be disconnected, though the budget is exceeded.*

- Call Budget on Trunks is dependent on precise Call Cost Calculation. So, SMDR parameters and long distance codes must be programmed properly to prevent errors in calculation.
- This feature works independent of any Call Accounting Software (CAS) installed with the SARVAM UCS.
- The SARVAM UCS will calculate cost of phone calls made by the trunks even when no call budget is allocated²⁵⁸.

How to configure

Call Budget on Trunks is to be programmed in the Trunk Port Parameters of the trunk type on which you want to enable this feature. This can be done using Jeeves as well as a telephone

Programming Call Budget on Trunks using Jeeves

- Log in as System Engineer.
- **Call Budget** parameters must be programmed in the **Port Parameters** page of the trunk type you want to configure. For instance, to configure Call Budget on a CO Trunk,
- Under **Configuration**, click **CO Configuration** link.
- Click **CO Parameters** to open the page.

Port No.	H/w Slot - Port	Enable Port	Name	CO Hardware Template	Trunk Features Template
1	02 - 03	<input checked="" type="checkbox"/>		02	01
2	02 - 04	<input checked="" type="checkbox"/>		02	01
3	02 - 05	<input checked="" type="checkbox"/>		02	01
4	02 - 06	<input checked="" type="checkbox"/>		02	01
5	00 - 00	<input checked="" type="checkbox"/>		02	01
6	00 - 00	<input checked="" type="checkbox"/>		02	01
7	00 - 00	<input checked="" type="checkbox"/>		02	01

Buttons: Submit, Default, Default One, Advance, Call Traffic

258. Based on the feature 'Call Cost Calculation'.

- Click the **Advance** button and configure the following parameters:

Port No.	H/w Slot - Port	Enable Port	Name	CO Hardware Template	Trunk Features Template	Cost Factor
1	02 - 03	<input checked="" type="checkbox"/>		02	01	01
2	02 - 04	<input checked="" type="checkbox"/>		02	01	01
3	02 - 05	<input checked="" type="checkbox"/>		02	01	01
4	02 - 06	<input checked="" type="checkbox"/>		02	01	01
5	00 - 00	<input checked="" type="checkbox"/>		02	01	01
6	00 - 00	<input checked="" type="checkbox"/>		02	01	01
7	00 - 00	<input checked="" type="checkbox"/>		02	01	01
8	00 - 00	<input checked="" type="checkbox"/>		02	01	01

- **Call Budget:** By default, Call Budget is enabled on the trunk. If you wish to change the default configuration or disable it, configure the parameters as per your requirement:
 - **Type:** Select the type of Call Budget on Trunk, that is, Amount or Minutes or Calls to be applied on this CO trunk port. By default, Minutes is selected as the Call Budget type. To disable select Type as None.
 - **Amount:** If you selected 'Amount' as the Call Budget Type, enter the Budget Amount in this field. By default the Amount is set to 999999.
 - **Minutes:** If you selected 'Minutes' as the Call Budget Type, enter the number of Minutes in this field. By default the number of minutes is set as 000300.
 - **Calls:** If you selected 'Calls' as the Call Budget Type, enter the number of Calls in this field. By default the number of calls is set to 9999.
 - **Scheduled Reset:** Enable this flag if you want the Call Budget Amount/Minutes/Number of Calls to be reset on a particular date of every month.
 - **Scheduled (Date):** Select the date of the month (Daily or 1-31) on which you want the Call Budget Amount/Minutes/Number of Calls to be reset every month. You may select 'Daily' if your plan suggests so.
- Click **Submit** at the bottom of the page to save your settings.
- You may program the same Call Budget parameters as listed above for other trunk types:
 - Click **VoIP Configuration**, click **SIP Trunk Parameters** to program Call Budget on SIP trunks. Click the **Advance** button on this page to reach Call Budget parameters.
 - Click **Port Parameters** under **T1E1 Configuration** to program Call Budget on T1E1PRI trunks. Click the **Advance** button on this page to reach Call Budget parameters.

- Click **BRI Parameters** under **BRI Configuration** to program Call Budget on BRI trunks. Click the **Advance** button on this page to reach Call Budget parameters.
- Click **Mobile Port Parameters** under **Mobile Configuration** to program Call Budget on Mobile Ports. Click the **Advance** button on this page to reach Call Budget parameters.
- You may log out of Jeeves.

- *The consumed Call Budget on trunk can be reset from the System Engineer mode as well as the System Administrator mode manually at any time, referred to as Manual Reset.*
- *Manual Reset of Call Budget on Trunks by the System Engineer can be done either from Jeeves or using a Telephone.*

Manual Reset of Call Budget on Trunk using Jeeves

- You may perform manual reset of the consumed Call Budget on the above listed trunk types from the **Status** page of each of these trunk types.
- Click the **Status** page under **CO Configuration**. Select the **Reset Consumed Amount/Minutes/Calls** check box of the CO port for which you want to reset the consumed Call Budget.

CO Port No.	Port Name	Line Status	Call Budget Type	Allotted Amount (₹ /Minutes/Calls)
1		Up	None	0000
2		Up	None	0000
3		Up	None	0000
4		Up	None	0000
5		Down	None	0000
6		Down	None	0000
7		Down	None	0000
8		Down	None	0000
9		Down	None	0000

- Similarly, click **Status** page under **VoIP Configuration** and enable the parameter **Reset Consumed Amount/Minutes/Calls** to manually reset consumed Call Budget on the desired **SIP trunks**.
- Click **Status** page under **T1E1 Configuration** to enable the same parameter **Reset Consumed Amount/Minutes/Calls** of the T1E1 port for which you want to reset the consumed Call Budget.
- Click **Status** page under **BRI Configuration**, and enable the parameter **Reset Consumed Amount/Minutes/Calls** for the BRI port for which you want to reset the consumed Call Budget.
- Click **Status** page under **Mobile Configuration** to enable the same parameter **Reset Consumed Amount/Minutes/Calls** of the Mobile port for which you want to reset the consumed Call Budget.

Similarly, you can reset Call Budget on Trunks from the SA mode.

Programming Call Budget on Trunks using a Telephone

- Enter SE mode.

Call Budget on CO Trunks

To program Call Budget Type on CO, dial:

- **3301-1-CO-Budget Type** to select Call Budget Type for a single trunk port.
- **3301-2-CO-CO-Budget Type** to select the same Call Budget Type for a range of trunk ports.
- **3301-*-Budget Type** to select the same Call Budget Type for all trunk ports.

Where,

CO is the Software Port number of the CO port from 001 to 128.

Budget Type

0 for None

1 for Amount

2 for Minutes

3 for Number of Calls

By default, Budget Type is None.

To program Call Budget Amount on CO, dial:

- **3302-1-CO-Budget Amount** to program amount for a single trunk port.
- **3302-2-CO-CO-Budget Amount** to program the same amount for a range of trunk ports.
- **3302-*-Budget Amount** to program the same amount for all trunk ports.

Where,

CO is the Software Port number of the CO port from 001 to 128.

Budget Amount is of 6 digits max. Use leading zeros if amount to be programmed has fewer than 6 digits.

By default Budget Amount is 999999.

To program Call Budget Minutes on CO, dial:

- **3303-1-CO-Minutes** to program minutes for a single trunk port.
- **3303-2-CO-CO-Minutes** to program the same minutes for a range of trunk ports.
- **3303-*-Minutes** to program the same minutes for all trunk ports.

Where,

CO is the Software Port number of the CO port from 001 to 128.

'Minutes' is of 6 digits max. Use leading zeros if Minutes to be programmed has less than 6 digits.

By default, Minutes is 999999.

To program Call Budget - Number of Calls on CO, dial:

- **3309-1-CO-Number of calls** to program number of calls for a single trunk port.
- **3309-2-CO-CO-Number of calls** to program the same number of calls for a range of trunk ports.
- **3309-*-Number of calls** to program the same number of calls for all trunk ports.

Where,

CO is the Software Port number of the CO port from 001 to 128.

Number of Calls is of 4 digits from 0001 to 9999. Use leading zeros if number of calls to be programmed has fewer than 4 digits.

By default, Number of calls is 9999.

To program Call Budget Reset Mode for CO, dial:

- **3304-1-CO-Call Budget Reset Mode** to program reset mode for a single trunk port.
- **3304-2-CO-CO-Call Budget Reset Mode** to program the same reset mode for a range of trunk ports.
- **3304-*-Call Budget Reset Mode** to program the same reset mode for all trunk ports.

Where,
CO is the Software Port number of the CO port from 001 to 128.
Reset Mode is
1 for Scheduled reset
2 for Manual reset
By default, Call Budget Reset Mode is Scheduled.

To program the Date for Scheduled Reset mode, dial:

- **3305-1-CO-Date** to program date for a single trunk port.
- **3305-2-CO-CO-Date** to program the same date for a range of trunk ports.
- **3305-*-Date** to program the same date for all trunk ports

Where,
CO is the Software Port number of the CO port from 001 to 128.
Date is
01 to 31 for Scheduled date to reset every month.
00 for Scheduled reset Daily.
By default, Reset date is 1st. of every month.

Call Budget on Mobile Trunks

To program Call Budget Type on Mobile trunk port, dial:

- **8019-1-Mobile-Budget Type** to program budget type for a single trunk port.
- **8019-2-Mobile-Mobile-Budget Type** to program the same budget type for a range of trunk ports.
- **8019-*-Budget Type** to program the same budget type for all trunk ports.

Where,
Mobile is the number of the Mobile software port from 001 to 064.
Budget Type
0 for None
1 for Amount
2 for Minutes
3 for Number of Calls
By default, Budget Type is None.

To program Call Budget Amount on Mobile trunk port, dial:

- **8020-1-Mobile-Budget Amount** to program amount for a single trunk port.
- **8020-2-Mobile-Mobile-Budget Amount** to program the same amount for a range of trunk ports.
- **8020-*-Budget Amount** to program the same amount for all trunk ports.

Where,
Mobile is the number of the Mobile software port from 001 to 064.
Budget Amount is of max. 6 digits. Use leading zeros when programming an amount with fewer than 6 digits.
By default, Budget Amount is 999999.

To program Call Budget Minutes on Mobile trunk port, dial:

- **8021-1-Mobile-Minutes** to program minutes for a single trunk port.
- **8021-2-Mobile-Mobile-Minutes** to program the same minutes for a range of trunk ports.
- **8021-*-Minutes** to program the same minutes for all trunk ports.

Where,
Mobile is the number of the Mobile software port from 001 to 064.
Minutes is of max. 6 digits. Use leading zeros if Minutes to be programmed has fewer than 6 digits.
By default, Free Minutes is 999999.

To program Call Budget Number of Calls on Mobile trunk port, dial:

- **8033-1-Mobile-Number of calls** to program number of calls for a single trunk port.
- **8033-2-Mobile-Mobile-Number of calls** to program the same number of calls for a range of trunk ports.
- **8033-*- Number of calls** to program the same number of calls for all trunk ports.

Where,

Mobile is the number of the Mobile software port from 001 to 064.

Number of Calls is of 4 digits from 0001 to 9999. Use leading zeros if number of calls to be programmed has fewer than 4 digits.

By default, Number of calls is 9999.

To program Call Budget Reset Mode for Mobile trunk port, dial:

- **8022-1-Mobile-Call Budget Reset Mode** to program reset mode for a single trunk port.
- **8022-2-Mobile-Mobile-Call Budget Reset Mode** to program the same reset mode for a range of trunk ports.
- **8022-*-Call Budget Reset Mode** to program the same reset mode for all trunk ports.

Where,

Mobile is the number of the Mobile software port from 001 to 064.

1 for Scheduled reset

2 for Manual reset

By default, Call Budget Reset Mode is Scheduled.

To program the Date for Scheduled Reset mode for Mobile trunk port, dial:

- **8023-1-Mobile-Date** to program reset date for a single trunk port.
- **8023-2-Mobile-Mobile-Date** to program the same reset date for a range of trunk ports.
- **8023-*-Date** to program the same reset date for all trunk ports.

Where,

Mobile is the number of the Mobile software port from 001 to 064.

Date is

01 to 31 for Scheduled date to reset every month.

00 for Scheduled reset Daily.

By default, Reset date is 1st. of every month.

Call Budget on BRI Trunks

To program Call Budget Type on BRI, dial:

- **6214-1-BRI-Budget Type** to program budget type for a single trunk.
- **6214-2-BRI-BRI-Budget Type** to program the same budget type for a range of trunks.
- **6214-*-Budget Type** to program the same budget type for all trunks.

Where,

BRI is the number of the BRI software port from 01 to 32.

Budget Type

0 for None

1 for Amount

2 for Minutes

3 for Number of Calls

By default, Budget Type is None.

To program Call Budget Amount on BRI, dial

- **6215-1-BRI-Budget Amount** to program amount for a single trunk.
- **6215-2-BRI-BRI-Budget Amount** to program the same amount for a range of trunks.
- **6215-*-Budget Amount** to program the same amount for all trunks.

Where,

BRI is the number of the BRI software port from 01 to 32.

Budget Amount is of max. 6 digits. Use leading zeros when programming an amount with fewer than 6 digits.

By default, Budget Amount is 999999.

To program Call Budget Minutes on BRI, dial:

- **6216-1-BRI-Minutes** to program minutes for a single trunk.
- **6216-2-BRI-BRI-Minutes** to program the same minutes for a range of trunks.
- **6216-*-Minutes** to program the same minutes for all trunks.

Where,

BRI is the number of the BRI software port from 01 to 32.

Minutes is of max. 6 digits. Use leading zeros when programming an amount with fewer than 6 digits.

By default, Minutes is 999999.

To program Call Budget Number of Calls on BRI, dial:

- **6205-1-BRI-Number of calls** to program number of calls for a single trunk.
- **6205-2-BRI-BRI-Number of calls** to program the same number of calls for a range of trunks.
- **6205-*-Number of calls** to program the same number of calls for all trunks.

Where,

BRI is the number of the BRI software port from 01 to 32.

Number of Calls is of 4 digits from 0001 to 9999. Use leading zeros if number of calls to be programmed has fewer than 4 digits.

By default, Number of calls is 9999.

To program Call Budget Reset Mode for BRI, dial:

- **6217-1-BRI-Reset Mode** to program reset mode for a single trunk.
- **6217-2-BRI-BRI-Reset Mode** to program reset mode for a range of trunks.
- **6217-*-Reset Mode** to program reset mode for all trunks.

Where,

BRI is the number of the BRI software port from 01 to 32.

1 for Scheduled reset

2 for Manual reset

By default, Call Budget Reset Mode is Scheduled.

To program the Date for Scheduled Reset mode for BRI, dial:

- **6218-1-BRI-Date** to program date for a single trunk.
- **6218-2-BRI-BRI-Date** to program the same date for a range or trunks.
- **6218-*-Date** to program the same date for all trunks.

Where,

BRI is the number of the BRI software port from 01 to 32.

Date is

01 to 31 for Scheduled date to reset every month.

00 for Scheduled reset Daily.

By default, Reset date is 1st. of every month.

Call Budget on T1E1 Trunks

To program Call Budget Type on T1E1 Port, dial:

- **6122-1-T1E1-Budget Type** to program call budget type for a single trunk port.
- **6122-2-T1E1-T1E1-Budget Type** to program the same call budget type for a range of trunk ports.
- **6122-*-Budget Type** to program the same call budget type for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Budget Type is

0 for None

1 for Amount
2 for Minutes
3 for Number of Calls
By default, Budget Type is None.

To program Call Budget Amount on T1E1 Port, dial:

- **6123-1-T1E1-Budget Amount** to program call budget amount for a single trunk port.
- **6123-2-T1E1-T1E1-Budget Amount** to program the same amount for a range of trunk ports.
- **6123-*-Budget Amount** to program the same amount for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Budget Amount is of 6 digits max. Use leading zeros if amount to be programmed has fewer than 6 digits.

By default Budget Amount is 999999.

To program Call Budget Minutes on T1E1 Port:

- **6124-1-T1E1-Minutes** to program minutes for a single trunk port.
- **6124-2-T1E1-T1E1-Minutes** to program the same minutes for a range of trunk ports.
- **6124-*-Minutes** to program the same minutes for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Minutes is of 6 digits max. Use leading zeros if Minutes to be programmed has less than 6 digits.

By default, Minutes is 999999.

To program Call Budget Number of Calls on T1E1 Port, dial:

- **6125-1-T1E1-Number of calls** to program number of calls for a single trunk port.
- **6125-2-T1E1-T1E1-Number of calls** to program the same number of calls for a range of trunk ports.
- **6125-*-Number of calls** to program the same number of calls for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Number of Calls is of 4 digits from 0001 to 9999. Use leading zeros if number of calls to be programmed has fewer than 4 digits.

By default, Number of calls is 9999.

To program Call Budget Reset Mode for T1E1, dial:

- **6138-1-T1E1-Call Budget Reset Mode** to program reset mode for a single trunk port.
- **6138-2-T1E1-T1E1-Call Budget Reset Mode** to program the same reset mode for a range of trunk ports.
- **6138-*-Call Budget Reset Mode** to program the same reset mode for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

1 for Scheduled reset

2 for Manual reset

By default, Call Budget Reset Mode is Scheduled.

To program the Date for Scheduled Reset mode for T1E1, dial:

- **6139-1-T1E1-Date** to program date for a single trunk port.
- **6139-2-T1E1-T1E1-Date** to program the date for a range of trunk ports.
- **6139-*-Date** to program the date for all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

Date is

01 to 31 for Scheduled date to reset every month.

00 for Scheduled reset Daily.
By default, Reset date is 1st. of every month.

- Exit SE mode.

Resetting Consumed Call Budget on Trunks using a Telephone

- Enter SE mode.

To manually reset consumed Call Budget of CO trunks, dial:

- **3306-1-CO** to manually reset a single trunk port.
- **3306-2-CO-CO** to manually reset a range of trunk ports.
- **3306-*** to manually reset all trunk ports.

Where,

CO is the Software Port number of the CO port from 001 to 128.

To manually reset consumed Call Budget of Mobile trunks, dial:

- **8024-1-Mobile** to reset a single trunk port.
- **8024-2-Mobile-Mobile** to reset a range of trunk ports.
- **8024-*** to reset all trunk ports.

Where,

Mobile is the number of the Mobile software port from 001 to 064.

To manually reset consumed Call Budget of BRI trunks, dial:

- **6219-1-BRI** to reset a single trunk.
- **6219-2-BRI-BRI** to reset a range of trunks.
- **6219-*** to reset all trunks.

Where,

BRI is the number of the BRI software port from 01 to 32.

To manually reset consumed Call Budget of T1E1 trunks, dial:

- **6140-1-T1E1** to reset a single trunk port.
- **6140-2-T1E1-T1E1** to reset a range of trunk ports.
- **6140-*** to reset all trunk ports.

Where,

T1E1 is the number of the T1E1 software port from 01 to 08.

- Exit SE mode.

Call Chaining

What's this?

Call Chaining is when an external/internal call transferred by the Operator to another extension or external number is made to return to the Operator's extension after the conversation between the caller and the extension/external number to which it is transferred has ended.

Call Chaining is useful situations where the Operator intervention is required after the transferred call has ended. For instance:

- The caller needs to take an appointment or requires some information from the Operator after talking to the desired extension.
- A marketing executive who calls his supervisor to consult on a technical problem needs to be informed about his travel itinerary and ticket booking by the Operator. The Operator can transfer the call to the supervisor, and use Call Chaining to retrieve the call once the conversation has ended to give the information to the executive.

Call Chaining can be set for multiple calls.

Also refer ["Call Transfer"](#), ["Call Park"](#).

How it works

- A is an External Caller
- B is an extension.

- A calls a Trunk of SARVAM UCS.
- The Operator answers the call.
- The Operator sets Call Chaining and transfers the call to B.
- B disconnects the call with A, but A is still connected.
- The call comes back to the Operator, if the Operator is free.
- Now A is in speech with the Operator.

- If A disconnects the call with B, the call will be released. It will not return to the Operator.

- If the Operator is busy, A will be played music on hold for the duration of the Call Park Release Timer.
- If the Operator is busy and the Timer elapses, the call will be released.

Call Chaining can be performed when call is transferred from any extension to another extension or external number.

How to configure

The only programming involved in the functioning of this feature is assigning this feature to a DSS key which has LED and programming, if necessary, the Call Park Release Timer.

Refer the topic ["DSS Keys Programming"](#) and ["Call Park"](#) for instructions.

How to use

For EON & Extended IP Phone Users

- Go OFF-Hook to answer the incoming call.
- The caller requests for an extension/trunk.
- Press DSS Key assigned to Call Chaining.

OR

- Press the 'Transfer Key' and dial 1050.

You get confirmation tone and the message 'Party Chained' on your phone's display. If DSS Key is used, the LED of the key will glow.

- Dial the requested extension/external number.
- You get Ring Back Tone.
- The called party answers.
- Go ON Hook to transfer the call.
- When extension/trunk disconnects, your extension rings.
- Go OFF Hook. You get connected with the caller.
- Go Idle after the conversation ends, or you get dial tone after 3 seconds.

For SLT Users

- Answer the incoming call.
- The caller requests for an extension/trunk.
- Dial Flash-1050.
- Dial the requested extension/external number.
- You get Ring Back Tone.
- The called party answers.
- Go On-Hook to transfer call.
- When extension/trunk disconnects, your extension rings.
- Lift handset to answer. You get connected with the caller.
- Go Idle after the conversation ends.

Call Cost Calculation (CCC)

What's this?

SARVAM UCS can calculate the cost in amount for the external calls made by the extension users.

The call cost is calculated according to the tariffs offered by the Service Providers. Different types of tariffs are provided by different Service Providers. These may be:

- Time Based Tariffs, for example, free calling from 11.00 p.m. to 6.00 a.m.
- Unit Based Tariffs, for example, first 60 seconds at the rate of 50 paise and additional at the rate of 10 paise.
- Special Day Tariffs, for example, subsidized calls rates on August 15.
- Tariffs according to the Geographical Distances, for example, calling rates for UAE differ from calling rates to Canada.

Using the Call Cost Calculation feature, the system calculates the cost of the call according to the duration of the call interpreted in terms of units and the charge applicable for the duration as per the service provider.

How it works

For this feature to work,

- you must get the tariff details from the Service Providers and configure the same.
- determine the outgoing trunk for the calls according to the type of calls, namely, local calls, national calls or international calls.

SARVAM UCS will calculate the cost of the call as follows:

- When the call is made from a trunk, the system checks the **Call Cost Calculation Pulse Rate Option**, 1 to 4 assigned to the trunk, on the basis of the **Call Cost Calculation Time Schedule** configured for the outgoing call.

Each Call Cost Calculation Pulse Rate option contains a **Pulse Rate Type for the Pulse Rate**, which is assigned in the Area Code Table.

- The system matches the Number dialed by the extension user with the **Area Code Table** configured in the system. When the area code matches with an entry in the table, the system obtains the **Pulse rate type** configured for the Call Cost Calculation Pulse Rate option assigned to the trunk.
- This **Pulse Rate type** obtained from the **Area Code Table** is checked in the **Pulse Rate table** to obtain the corresponding **duration** and **cost** to be applied for the call duration. The Pulse Rate Table may be the **Normal Pulse Rate Table** or **Discounted Pulse Rate Table**, depending on the day of the call. The system uses the built-in RTC to determine the day.
- The **Pulse Rate Type** applied (duration and cost) is divided into two parts for each time zone:
 - First unit.
 - Additional units.

- Number of Units is derived from the pulse rate at the time of the call and duration of the call. System acquires the pulse rate type and call duration with the help of in-built RTC.

Total Units = First Unit + Additional Unit.

If the call duration is less than the pulse rate of the first unit then additional unit is zero.

Call Units = (Call duration in seconds)/(Pulse rate in seconds).

- If the duration of the call is less than or equal to one unit,

Cost of Call = Cost of First Unit + Service Charge as applied.

- If the duration of the call is more than one unit,

Cost of Call = [Cost of First Unit + (Number of Additional units x Cost for Additional units)] + Service Charge as applied.

- The system applies the rates as configured in the Normal Pulse Rate Table for all the days, except when it detects a day configured in the Discounted Pulse Rate Schedule. These are special days when special Tariffs are offered.

For the days configured in the Discounted Pulse Rate Schedule as special days, the system checks the the duration and cost of the First unit and the Additional units configured in the Discounted Pulse Rate Table.

SARVAM UCS uses the **Cost of the Call** for SMDR. This cost is deducted from the Call Budget (Amount), if allotted to the trunk and also from the Call Budget, if assigned to the extension users.

The logic for call cost calculation is explained with the help of an example:

- An Outgoing Call is made using trunk, CO-1.
- On CO-1, Call Cost Calculation is configured as follows:
 - Call Cost Calculation Pulse Rate option = 1
 - Call Cost Calculation Schedule
 - Time Zone 1 = Start Time: 00:00, End Time: 22:00
 - Time Zone 2 = Start Time: 22:01, End Time: 23:59
 - Assign Trunk Feature Template 1 to CO-1. Configuring the Call Cost Calculation parameters in the Trunk Feature Template as follows:

Template No.	Call Cost Calculation Pulse Rate Option	Call Cost Calculation Time Schedule											
		T1				T2				T3			
		Start Time		End Time		Start Time		End Time		Start Time		End Time	
		HH	MM	HH	MM	HH	MM	HH	MM	HH	MM	HH	MM
001	1	00	00	22	00	22	01	23	59				

- Area Code Table is configured as:

Index	Area Code	Name	Ignore Digit Count	Pulse Rate Type for Pulse Rate			
				Option - 1	Option - 2	Option - 3	Option - 4
001	26	Local		03	06	09	10
002	09	Mobile		05	03	07	08

- The Normal Pulse Rate Table is configured as:

Pulse Rate Type		Time Zone T1		Time Zone T2		Time Zone T3		Time Zone T4	
		First Unit	Add. Unit						
01	Duration (sec)	180	180	60	30	90	30	120	60
	Cost	002.00	002.00	002.00	002.00	002.00	002.00	002.00	002.00
02	Duration (sec)	300	300	300	300	300	300	300	300
	Cost	001.00	001.00	001.00	001.00	001.00	001.00	001.00	001.00
03	Durations)	30	30	30	30	30	30	30	30
	Cost	001.00	001.00	001.00	001.00	001.00	001.00	001.00	001.00
04	Duration (sec)	45	45	45	45	45	45	45	45
	Cost	001.00	001.00	001.00	001.00	001.00	001.00	001.00	001.00
05	Duration (sec)	180	180	180	180	180	180	180	180
	Cost	003.00	003.00	003.00	003.00	003.00	003.00	003.00	003.00
:	Durations)	:	:	:	:	:	:	:	:
	Cost	:	:	:	:	:	:	:	:
32	Duration (sec)								
	Cost								

- With this configuration, SARVAM UCS will calculate the call cost as follows:

- An Outgoing Call is made by an extension user, to the number '2630555' through the trunk, CO-1 at 20:10 hours. SARVAM UCS will check the Call Cost Calculation parameters assigned on the trunk and determine the Time Zone as per time of the call. The system will also check the corresponding Pulse Rate Option configured on the trunk.

In this example, Time Zone for CO-1 at 20:10 Hours would be Time Zone 1, and the Pulse Rate Option for CO-1 is '1'.

- SARVAM UCS will match the dialed number '2630555' in the Area Code table. A best match is found with the entry configured at index 001 in the Area Code Table.

As per the Area Code Table, the Pulse Rate Type '03' is programmed in 'Pulse Rate Option 1' for the matching entry (at Index 001).

(However, if CO-1 would have been assigned Pulse Rate Option '2', the Pulse Rate type '06' would have been selected as shown in Area Code Table)

- Finally, for Pulse Rate Type '03' SARVAM UCS will check the Normal Pulse Rate Table. SARVAM UCS will consider the Cost for the First Unit as 001.00 (As ` or \$ as per applicable currency) for the duration of 30 seconds and for the additional unit also, the cost will be considered as 001.00 for the duration of 30 seconds. This data will be used for calculating the total cost of call based on the total duration of the call.

Similarly, when there are Special Tariffs offered on certain days, the system will check the Discounted Pulse Rate Schedule and the Discounted Pulse Rate Table.

The days on which the special rates are to be applied must be configured in the Discounted Pulse Rate Schedule. The duration and cost of the First unit and the Additional units must be configured in the Discounted Pulse Rate Table according to the Time Zones.

How to configure

To be able to use Call Cost Calculation, you must do the following:

- Define the Unit and Service Charge on the basis of which call cost is to be calculated.
- Assign Call Cost Calculation Pulse Rate Option and the Call Cost Calculation Schedule on the trunks on which you want to apply this feature.
- Configure the Pulse Rate Types for the Pulse Rate Option you assign to the trunk.
- You may configure different Pulse Rate Types:
 - For Normal Days configure the pulse rate in the Normal Pulse Rate Table.
 - For Special days configure the pulse rate in the Discounted Rate Table. If you configure the Discounted Pulse Rate Table, you must also configure the Discounted Pulse Rate schedule.
- Configure the Area Code Table.

Configuring Call Cost Calculation using Jeeves

To configure call cost calculation parameters,

- Log in as System Engineer.
- Under **Configuration** click the **Call Cost Calculation** link.

Service Charge

By default, no Service Charge is applied on call cost by the system. Service Charge on call cost is generally applied in Hotels and other organization which charge users for the calls made by them.

If you want to apply Service Charge,

- Click **General Parameters** to open the page.

- In the **Service Charge Type** field, select the type of service charge you want to apply from the options:
 - **Fixed for a call:** A fixed amount is added as service charge to every call regardless of the cost of that call.

If you select this option, you must define the Amount to be added as service charge in the **Specify Service Charge** field.

- **per Unit:** service charge is added to each unit of the call. For example, if a call worth 10 units was made, the service charge will be applied on each of the 10 units, instead of the one time service charge as in the case of Fixed service charge.

If you select this option, you must define the amount to be added as service charge on each unit in the **Specify Service Charge** field.

- **Percentage of call cost:** A percentage of the cost of the call is added as a service charge for that call.

If you select this option, you must define the percentage in the **Specify Service Charge in %** field which appears.

- Click **Submit** to save changes.

Applying Call Cost Calculation on Trunks

- To assign **Call Cost Calculation Pulse Rate Option** and configure the **Call Cost Calculation Schedule** on the trunks, go to *Configuration*, and configure these in the “**Trunk Feature Template**” assigned to the different trunk port types. See “[Configuring CO Trunks](#)”, “[Configuring Mobile Trunks](#)”, “[Configuring BRI Trunks](#)”, “[Configuring E1 Trunks](#)”, “[Configuring T1 Trunks](#)”, “[Configuring Trunks](#)” and “[Configuring SIP Trunks](#)” under *Configuring SARVAM UCS* for instructions.

Configuring Pulse Rate Types

Generally service providers offer discounted call rates for special days. To take care of this, SARVAM UCS provides two types of Pulse Rate Tables: Normal and Discounted.

If your service providers do not offer any special rates, you may skip configuring the Discounted Pulse Rate table.

To configure the Normal Pulse Rate table,

- Click **Call Cost Calculation** under **Configuration**.

- Click the **Normal Pulse Rate Table** link.

Pulse Rate Type	Time Zone 1		Time Zone 2	
	1 st Unit	Additional Unit	1 st Unit	Additional Unit
1	Duration (sec)	180.00	180.00	180.00
	Cost (₹)	001.10	001.10	001.10
2	Duration (sec)	300.00	300.00	300.00
	Cost (₹)	001.10	001.10	001.10
3	Duration (sec)	090.00	090.00	090.00
	Cost (₹)	001.10	001.10	001.10
4	Duration (sec)	120.00	120.00	120.00
	Cost (₹)	001.10	001.10	001.10
5	Duration (sec)	030.00	030.00	030.00
	Cost (₹)	001.10	001.10	001.10
6	Duration (sec)	030.00	030.00	030.00

- Configure the **Pulse Rate Type** with rates for the **First Unit** and the **Additional Unit**.

Generally service providers offer different call rates for different types of calls, for example: local, national, international. You can configure different Pulse Rate Types for different types of calls. Thus, each Pulse Rate Type can have different rates for the First and the Additional unit.

The Pulse Rates offered by service providers may vary according to the time of the day. In such cases, you will need to configure the **Call Cost Calculation Schedule** for the trunk, by dividing the day into Time Zones, from 1 to 4, as required, to match the time of the pulse rates offered by your service provider. If you have configured Time Zones for the Call Cost Schedule on a trunk, you may define the different Pulse Rate Types for each Time Zone.

- Click **Submit** to save changes.

To configure the Discounted Pulse Rate table,

- Click the **Discounted Pulse Rate Table** link.

Call Cost Calculation (CCC) - Discounted Pulse Rate Table

Pulse Rate Type	Time Zone 1		Time Zone 2	
	1 st Unit	Additional Unit	1 st Unit	Additional Unit
1				
Duration (sec)	180.00	180.00	180.00	180.00
Cost (₹)	001.10	001.10	001.10	001.10
2				
Duration (sec)	300.00	300.00	300.00	300.00
Cost (₹)	001.10	001.10	001.10	001.10
3				
Duration (sec)	090.00	090.00	090.00	090.00
Cost (₹)	001.10	001.10	001.10	001.10
4				
Duration (sec)	120.00	120.00	120.00	120.00
Cost (₹)	001.10	001.10	001.10	001.10
5

- Click **Submit** to save.

Configuring Area Code Table

The pulse rate of a call depends on the destination number dialed. Generally, pulse rate varies according to the type of the call: Local, national, international. SARVAM UCS enables you to configure Pulse Rates according to Area codes.

To configure Pulse Rates for Area Codes,

- Click the **Area Code** link.

Index	Area Code	Name	Ignore Digit Count	Pulse Rate Type for Pulse Rate			
				Option - 1	Option - 2	Option - 3	Option - 4
1			0	01	01	01	01
2			0	01	01	01	01
3			0	01	01	01	01
4			0	01	01	01	01
5			0	01	01	01	01
6			0	01	01	01	01
7			0	01	01	01	01
8			0	01	01	01	01
9			0	01	01	01	01
10			0	01	01	01	01

- In the **Area Code** column, enter the number strings (prefix) of the Area Codes, country codes, local numbers. You can configure as many as 999 area codes in the table.
- You may enter a **Name** to tag each Area Code.
- Do not configure the Ignore Digit Count. This parameter is relevant only for Service Provider Based Least Cost Routing.
- Different service providers offer different pulse rates for the same type of calls. To take care of this, SARVAM UCS allows you to assign different Pulse Rate Options for each area code.
- For each area code, configure the Pulse Rate to be followed for the desired Pulse Rate Options in the **Pulse Rate Type for Pulse Rate (Option 1 to 4)** column.
- Click **Submit** to save changes.

For “[Default Area Code Table for the Region-USA](#)” at end of the chapter.

Configuring Call Cost using Telephone

Unit Charge

When call cost is to be calculated on the basis of 16 KHz metering pulses, user can select different unit charge for first unit and different unit charge for the additional units.

To program the unit charge for first unit when 16 KHz metering is used, dial:

- **2600-Unit Charge for First Unit**

Where,

Unit charge is the amount in XXX.XX format in any currency.

By default, unit charge for first unit is Rs.1.10.

To program the unit charge for additional units when 12/16 KHz metering is used, dial:

- **2601-Unit Charge for Additional Unit**

Where,

Unit charge is the amount in XXX.XX format in any currency.

By default, Unit charge for additional unit is Rs.1.10.

Example: To program unit charge for first unit to Rs. 1.50, dial **2600-0150**

To program unit charge for additional unit to US\$0.75, dial **2601-0075**

Service Charge

To select service charge type, dial:

- **2602-Service Charge Type**

Where,

Service Charge Type	Meaning
0	Fixed Service Charge
1	Unit wise Service Charge
2	Percentage wise Service Charge

By default, the service charge type is fixed.

To program the service charges for Fixed or Unit wise Service Charge, dial:

- **2603-Service Charge**

Where,

Service Charge is the amount in XXX.XX format in any currency.

By default, Service Charge is Rs.00.00.

Example: Let us program the service charge to Rs.2.00, dial **2603-0200**

Let us program the service charge to US\$1.75, dial **2603-0175**

To set the percentage, if the service charge is selected based on the percentage, dial:

- **2604-Percentage**

Where,

Percentage is from 000 to 100.

By default, percentage is 000.

Example: To set the percentage to 10% of the cost of each call, dial **2604-010**

Number of Units

- Number of Units is derived from the pulse rate at the time of the call and duration of the call. System acquires the pulse rate type and call duration with the help of in-built RTC.

Total Units = First Unit + Additional Unit.

- If the call duration is less than the pulse rate of the first unit then additional unit is zero.

Call Units = (Call duration in seconds)/(Pulse rate in seconds).

Assign parameters; 'CCC Pulse Rate Option' and program 'CCC Time Schedule' for the Trunk Feature Template which is assigned to the specific trunk used for OG calls.

- Assign 'CCC Pulse Rate Option' from 1 to 4.
- Program four 'CCC Time Schedule', T1, T2,T3 and T4. Program Start Time and End Time for each.
- Refer chapter “[Trunk Feature Template](#)” for more details.

Pulse Rate Types

Pulse rate can differ for normal and holidays. Maximum 32 entries can be made in the pulse rate type. Each pulse rate type can have different rate and different cost for first and additional unit. The table below displays the format of the pulse rate for normal day.

Pulse Rate Type		Time Zone 1		Time Zone 2		Time Zone 3		Time Zone 4	
		First Unit	Add. Unit						
01	Duration	180.00	180.00	180.00	180.00	180.00	180.00	180.00	180.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
02	Duration	:	:	:	:	:	:	:	:
	Cost	:	:	:	:	:	:	:	:
:	:	:	:	:	:	:	:	:	:
32	Duration	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10

To program duration of first unit for a pulse rate type on normal days, dial:

- **2607-Pulse Rate Type-Time Zone-Duration of First Unit**
Where,
Pulse Rate Type is from 01 to 32.
Time Zone is from 1 to 4.
Duration of First Unit is from 000.00 to 999.99.

To load default normal pulse rate type, dial:

- **2606**

To program duration of additional unit for a pulse rate type on normal days, dial:

- **2608-Pulse Rate Type-Time Zone-Duration of Additional Unit**
Where,
Pulse Rate Type is from 01 to 32.
Time Zone is from 1 to 4.

Duration of Additional Unit is from 000.00 to 999.99.

Pulse Rate Type		Time Zone 1		Time Zone 2		Time Zone 3		Time Zone 4	
		First Unit	Add. Unit						
01	Duration	180.00	180.00	180.00	180.00	180.00	180.00	180.00	180.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
02	Duration	300.00	300.00	300.00	300.00	300.00	300.00	300.00	300.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
03	Duration	90.00	90.00	90.00	90.00	90.00	90.00	90.00	90.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10

	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
06	Duration	30.00	30.00	30.00	30.00	30.00	30.00	30.00	30.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
07	Duration	16.00	16.00	16.00	16.00	16.00	16.00	16.00	16.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
08	Duration	3.30	3.30	3.30	3.30	3.30	3.30	3.30	3.30
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
09	Duration	2.10	2.10	2.10	2.10	2.10	2.10	2.10	2.10
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
10	Duration	1.70	1.70	1.70	1.70	1.70	1.70	1.70	1.70
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
11	Duration	2.10	2.10	2.10	2.10	2.10	2.10	2.10	2.10
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
12	Duration	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10
:	Duration	:	:	:	:	:	:	:	:
	Cost	:	:	:	:	:	:	:	:
32	Duration	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10

To program the cost of first unit of a pulse rate type for normal days, dial:

- **2609-Pulse Rate Type-Time Zone-Cost of First Unit**

Where,

Pulse Rate Type is from 01 to 32.

Time Zone is from 1 to 4.
 Cost of first Unit is from XXX.XX.

To program the cost of additional unit of a pulse rate type for normal days, dial:

- **2610-Pulse Rate Type-Time Zone-Cost of Additional Unit**

Where,

Pulse Rate Type is from 01 to 32.

Time Zone is from 1 to 4.

Cost of Additional Unit is from XXX.XX.

Discounted Pulse Rate Schedule

To load default Discounted Pulse Rate type:

- **2611**

CCC Pulse Rate Type		Time Zone 1		Time Zone 2		Time Zone 3		Time Zone 4	
		First Unit	Add. Unit						
01	Duration	180.00	180.00	180.00	180.00	180.00	180.00	180.00	180.00
	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10

	Cost	001.10	001.10	001.10	001.10	001.10	001.10	001.10	001.10

To program duration for a first unit of a pulse rate type on Special Days, dial:

- **2612-Pulse Rate Type-Time Zone-Duration of First Unit**
Where,
Pulse rate type is from 01 to 32.
Time Zone from 1 to 4.
Duration of First Unit is from 000.00 to 999.99.

To program duration for additional unit for a pulse rate type on Special Days, dial:

- **2613-Pulse Rate Type-Time Zone-Duration of Additional Unit**
Where,
Pulse rate type is from 01 to 32.
Time Zone from 1 to 4.
Duration of Additional Unit is from 000.00 to 999.99.

To program the cost of first unit of a pulse rate type for holidays, dial:

- **2614-Pulse Rate Type-Time Zone-Cost of First Unit**
Where,
Pulse Rate Type is from 01 to 32.
Time Zone is from 1 to 4.
Cost of First Unit is from XXX.XX.

To program the cost of additional unit of a pulse rate type for Special Days, dial:

- **2615-Pulse Rate Type-Time Zone-Cost of Additional Unit**
Where,
Pulse Rate Type is from 01 to 32.
Time Zone is from 1 to 4.
Cost of Additional Unit is from XXX.XX.

Area Code Table

To program an area code, dial:

- **2620-Area Code Index-Area Code-#***
Where,
Area Code Index is from 001 to 999.
Area Code is a number string of maximum of 4 digits.

To clear the area code for an index, dial:

- **2620-Area Code Index-#***

Example: Program area code 022 for Mumbai at area code index 001, dial **2620-001-022-#***

To program Pulse Rate Type for Pulse Rate Option of area code index, dial:

- **2621-Area Code Index-Pulse Rate Option-Pulse Rate Type**
Where,
Area Code Index is from 001 to 999.
Pulse Rate Option is from 1 to 4.
Pulse Rate Type is from 01 to 32.

To delete the complete Area Code Table, dial:

- **2622-Reverse SE Password**

Example: To delete the area code table, dial **2622-4321** (The SE password is assumed to be 1234).

There is no command to delete a single entry from the area code table. However, these can be cleared or overwritten.

To program ignore digit count when Service Provider based LCR is to be used, dial:

- **2623-Area Code Index-Ignore Digit Count**
Where,
Area Code Index is from 001 to 999. Refer [“Default Area Code Table for the Region-USA”](#) at end of the chapter.
Ignore Digit Count is from 0 to 9.
By default, Ignore digit is 0.
Please refer topic [“Configuring LCR”](#) for more details on Service Provider base LCR.

Special Days

To assign a Pulse Rate Table to any day of the week, dial:

- 2630-Day-Code
Where,

Index	1	2	3	4	5	6	7
Day	Sun	Mon	Tue	Wed	Thu	Fri	Sat

Code	Meaning
0	Normal Pulse Rate
1	Discounted Pulse Rate

Example: To program Discounted Pulse Rate for Tuesday, dial **2630-3-1**

To program a special date, dial:

- **2631-Special Date Index-Date-Month**
Where,
Special Date Index is from 1 to 5 (Five dates can be programmed).
Date is from 01 to 31.
Month is from 01 to 12.
By default, Special is shown below:

Special Date Index	Day
1	26-01
2	15-08

Special Date Index	Day
3	02-10
4	Blank
5	Blank

To clear a Special date index, dial:

- **2632-Special Date Index**

Example: To program 1st May as a Special Day, dial **2631-1-01-05**

To program Area code name, dial:

- **2633-Area Code Index-Name**

Where,

Area Code Index is from 001 to 999.

Name is character string is of maximum 12 characters.

Use following command to clear area code name, dial:

- **2633-Area Code Index-#***

Default Area Code Table for the Region-USA

Index	Area Code	Area Name	Pulse Rate Type	Ignore Digit Count
1	1201	NJ	2	0

Call Cost Display

What is this?

With Call Cost Display, you can view the cost of the last 10 external calls made from your extension. These external calls may have been made from Trunk Ports and on the Tie line network.

The system will display the dialed numbers and the call cost for each number that it has calculated on the LCD of EON / Extended IP Phone.

How to configure

For this feature to work, it must be enabled on the extension by the System Administrator (SA).

To enable 'Call Cost Display' for an extension:

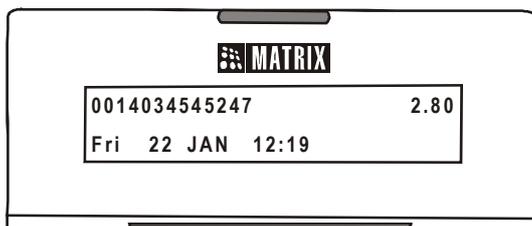

- Enter SA mode.
- Dial command **1072-181-Station-Flag**
Where,
Station is Number of the Extension
Flag is
0 for Disable
1 for Enable
By default Call Cost Display is enabled.
- Exit SA mode.

How to use

For EON and Extended IP Phone Users Only

- Press DSS Key assigned to Call Cost Display feature.
- OR
- Dial 1075.
 - Scroll with the up/down navigation keys to view the cost of the last 10 calls.
 - The display shows the last 10 dialed numbers and their corresponding call cost.

For example: If the call charge is for the dialed number 0014034545247 is \$2 and 80 cents' then the display will show:

- The display is retained till the extension remains OFF-Hook.
- Go Idle or you get dial tone after 3 seconds.

Call Duration Control (CDC)

What's this?

Call Duration Control (CDC) allows a maximum time limit to be set on internal and external (both incoming and outgoing) telephone calls. When the maximum call duration is reached, the calls are disconnected, after a warning tone indicating to the user that the calls in progress will be disconnected.

By limiting the duration of the conversations, CDC helps increase availability of trunks for making outgoing calls and for receiving incoming calls, which is important in high call traffic situations. Besides increasing trunk availability, CDC curbs unrelated and unproductive conversations.

By default this feature is enabled on the trunks and extensions, hence calls will be disconnected after the expiry of the timer. You can change the configurations as per your requirement, refer ["How to configure"](#) and ["Outgoing Call Routing"](#).

How it works

- A is an extension user. B is an external number.

External-Outgoing Calls

- A dials B's number.
- The system checks the CDC Table applied to A.
- SARVAM UCS will check whether the CDC is applicable on Extension of A as well as the Trunk used for making the outgoing call.

To check whether CDC is applicable on Extension A

- The system checks the **CDC Table** selected in the Station Advanced Feature Template assigned to A. In the Table,
 - It checks whether the check box, **Apply CDC for outgoing calls made from trunk**, is enabled.
 - It matches B's number with the entries on the **Apply CDC for calls matching with numbers** list and the **Do Not Apply CDC for calls matching with numbers** list in the CDC table.

To check whether CDC is applicable on the Trunk

- The system checks the **Call Duration Control - For OG Calls** check box in the Trunk Features Template assigned to the trunk.

The following results are possible:

- In the CDC Table, the **Apply CDC for outgoing calls made from trunk** check box is enabled and a match is found for the number in the **Apply CDC for calls matching with numbers** List. The **Call Duration Control - For OG Calls** check box is enabled in the Trunk Features Template assigned to the trunk. CDC is applied on the call.

- In the CDC Table, the **Apply CDC for outgoing calls made from trunk** check box is enabled and a match is found for the number in the **Apply CDC for calls matching with numbers** List. The **Call Duration Control - For OG Calls** check box is disabled in the Trunk Features Template assigned to the trunk. CDC is not applied on the call.
- In the CDC Table, the **Apply CDC for outgoing calls made from trunk** check box is enabled and a match is found in the **Do Not Apply CDC for calls matching with numbers** list. The **Call Duration Control - For OG Calls** check box is enabled in the Trunk Features Template assigned to the trunk. CDC is not applied on the call.
- In the CDC Table, the **Apply CDC for outgoing calls made from trunk** check box is enabled and a match is found in the **Do Not Apply CDC for calls matching with numbers** list. The **Call Duration Control - For OG Calls** check box is disabled in the Trunk Features Template assigned to the trunk. CDC is not applied on the call.
- In the CDC Table, the **Apply CDC for outgoing calls made from trunk** check box is enabled and a match is found in both the number lists. The system gives precedence to the Do Not Apply CDC for calls matching with numbers list. The **Call Duration Control - For OG Calls** check box is enabled in the Trunk Features Template assigned to the trunk. CDC is not applied on the call.
- In the CDC Table, the **Apply CDC for outgoing calls made from trunk** check box is enabled and a match is found in both the number lists. The system gives precedence to the Do Not Apply CDC for calls matching with numbers list. The **Call Duration Control - For OG Calls** check box is disabled in the Trunk Features Template assigned to the trunk. CDC is not applied on the call.
- When CDC is applied to the call, the CDC Timer starts as soon as B has answered the call. This timer is set to 160 seconds as default, but can be programmed to the desired time limit.
- At the end of the default/programmed time limit of the CDC Timer, the Beep Timer starts (5 seconds; non-programmable) then the CDC Goodbye Timer starts. This Goodbye timer provides a grace period of 20 seconds for the user to finish the call. This Timer is non-programmable.
- At the end of the Goodbye Timer, the call is disconnected, if the **Disconnect CDC after Time** check box is enabled.
- If this flag has not been programmed, the call will not be disconnected.
- Instead, the **CDC Timer** will be loaded again for the default/programmed duration. The user can know how long s/he has been talking.
- A is played Warning Beeps. B cannot hear the beeps. This continues until either party disconnects.

External-Incoming Calls

CDC works similarly for incoming calls.

- B calls A.
- The system checks whether the following conditions are fulfilled,
 - the **Apply CDC for incoming calls received from trunk** check box is enabled in the CDC Table assigned to A.

- the **Disconnect Call after CDC Timer** check box is enabled in the CDC Table assigned to A.
- a match is found for the B's number in the **Apply CDC for calls matching with numbers** List.
- the **Call Duration Control - For IC Calls** check box is enabled in the Trunk Features Template assigned to the trunk on which the call is received.

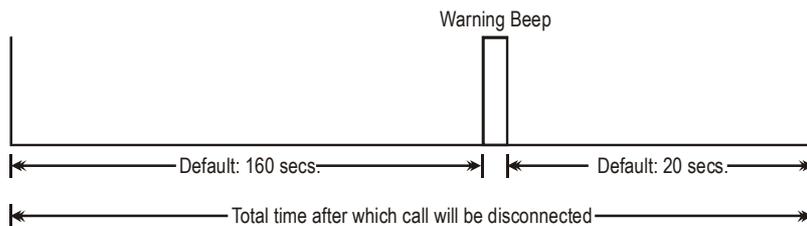

CDC is applied on the call.

- A will get beeps.

Internal Calls

A and B are extension users.

- A calls B.
- The system checks whether the check box, **Apply CDC to Internal Calls**, is enabled in the CDC Table.
- If the check box is enabled, CDC is applied on the call.
- Warning beeps are played to A, who made the call.

In this case the total time after which the call is disconnected will be 160 seconds (default CDC Timer) + 5 seconds (Beep Timer; non-programmable) + 20 seconds (Goodbye Timer; non-programmable).

Feature Interactions:

- **Call Transfer:** In case of transferred call, the CDC timer gets reset and starts again afresh on the transferred extension.
- **Conference, Conversation Recording and Call Taping:** CDC is treated as turned OFF.
- **Call Park and Call Hold (Exclusive and Global):** CDC is treated as turned ON.
- **Interrupt Request, Barge-In:** CDC is treated as turned ON.
- **Raid:** CDC is not applicable when you raid an extension as the conversation is converted into a 3 party conference.
- **Emergency Number Dialing:** Emergency calls are not affected by this feature, i.e. CDC will not be applied on the dialing of Emergency Numbers.

For Inter PINX or Intra PINX calls (QSIG Calls), the CDC will work only if it is enabled on the source port (calling extension) irrespective of whether CDC is enabled or disabled on the called extension.

How to configure

By default this feature is enabled on the Trunks and Extensions, that is:

- **Call Duration Control Table 1** is assigned to CDC for Trunks and Extensions.
- In the **Call Duration Control Table 1**, the check boxes **Call Duration Control For IC Calls**, **Call Duration Control For OG Calls**, **Apply CDC to Internal Calls** and **Disconnect Call after CDC Timer** all are enabled.
- In the **Call Duration Control Table 1**, **List Number 2** is assigned to **Apply CDC for calls matching with numbers**.
- The **CDC Timer** is set as 300 seconds.
- In the default **Trunk Feature Template 1** assigned to all the Trunks, the check boxes **Call Duration Control For IC Calls** and **Call Duration Control For OG Calls** are enabled.
- In the default **Station Advanced Feature Template 1** assigned to all the extensions, **CDC Table 1** is assigned.

If you wish to change the configurations, follow the steps as mentioned below:

- Configure Call Duration Control Table. You may configure up to 8 different Tables.
- Assign a CDC Table in the Station Advanced Feature Template of those extensions on which Call Duration Control is to be applied.
- Enable CDC for incoming and outgoing calls from the Trunks on which you want to apply this feature.

To program the Call Duration Control Table,

- decide the types of calls - Outgoing, Incoming and Internal - on which CDC is to be enabled.
- make a list of numbers on which CDC is to be applied, that is, the Apply CDC to Numbers List.
- Make a list of numbers on which CDC is not to be applied, the Do Not Apply CDC to Number List.

The Call Duration Control Table can be programmed using Jeeves and a Telephone.

Configuring CDC using Jeeves

CDC Table

- Log in as System Engineer.

- Under **Configuration**, click the **Call Duration Control** to open the page.

CDC Table No.	Apply CDC to Internal Calls	Apply CDC for incoming calls received from trunk	Apply CDC for outgoing calls made from trunk	Do Not Apply CDC for calls matching with numbers	Apply CDC for calls matching with numbers
1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	08	07
2	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	08	07
3	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	08	07
4	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	08	07
5	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	08	07
6	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	08	07

8	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	08	07

- The CDC Table will open. There are 8 CDC Tables. By default CDC Table No. 1 is assigned to all extensions of SARVAM UCS. If the same CDC is to be assigned to all extensions, program this table.

If different CDC is to be applied to different extensions, program separate CDC tables for these extensions.

- Now program the following parameters in the table you have selected:
 - **Apply CDC to Internal Calls:** By default, this check box is enabled, that is, CDC will be applied on internal calls. Clear the check box to disable.
 - **Apply CDC to Incoming Calls received from Trunk:** By default, this check box is enabled, that is, CDC will be applied to incoming external calls. Clear the check box to disable.
 - **Apply CDC to Outgoing Calls made from Trunks:** By default, this check box is enabled, that is, CDC will be applied to outgoing external calls. Clear the check box to disable.
 - **Do Not Apply CDC for calls matching with numbers:** This is the list of numbers on which CDC is not to be applied. By default, Number List 08 is assigned to this parameter. You must program this list with numbers which you want to be exempt from CDC.

To program the list, click **Do Not Apply CDC for calls matching with numbers**.

Call Duration Control				
CDC Table No.	Apply CDC to Internal Calls	Apply CDC for incoming calls received from trunk	Apply CDC for outgoing calls made from trunk	Do Not Apply CDC for calls matching with numbers
1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	08
2	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	08
3	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	08

6	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	08
7	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	08
8	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	08

Submit Default Default One

This will lead you to the "Number Lists" page. Click '001-250' of Number list 07-08.

01-02 03-04 05-06 07-08 09-10 11-12 13-14 15-16

001-250 251-500 501-750 751-999

Number List

Index	Number List 01	Number List 02
001		00
002		0
003		1
004		2
005		3
006		4
007		5
008		6
009		7
010		8
011		9

Submit Default Default One

By default, Number List 08 is assigned to this parameter. You can also program any other Number List you want. Enter the list of numbers on which CDC is not be applied (refer to the list you prepared).

Click **Submit** at the bottom of the page to save your list.

Return to the **Call Duration Control** page. If you have prepared a Number List other than the default 08, then enter the number of that list in the Do Not Apply CDC to Number List column.

- **Apply CDC for calls matching with numbers:** This is the list of numbers on which CDC is to be applied. By default, Number List 02 is assigned to this parameter. You must program this list with numbers on which you want CDC to be applied.

To program the list, click **Apply CDC for calls matching with numbers**. The 'Number Lists' page opens.

Click '001-250' of Number list 01-02. Follow the same steps as described above for programming the Do Not Apply CDC Number List.

- **CDC Timer:** This is the time for which the warning beeps are to be played before the system disconnects the call. The range of the timer is 0001 to 9999 seconds. By default this Timer is set to 300 seconds. Set the CDC Timer to the desired time limit.
- **Disconnect Call after CDC Timer:** By default, this check box enabled, that is calls will automatically disconnect on the expiry of the CDC Timer. Clear the check box to disable, that is, if you do not want calls to disconnect on expiry of the CDC Timer.
- Click **Submit** at the bottom of the page to save changes.
- Under **Configuration**, click **Station Advanced Feature Template**. Ensure that the **CDC Table** Number (in this case 01) you have programmed is assigned in the Template you want to apply to the extensions.

The screenshot displays the 'Station Advance Features Templates' configuration interface. At the top, there are tabs for number ranges: 01-10 (selected), 11-20, 21-30, 31-40, and 41-50. Below this is a table with the following structure:

Template No.	Internal Calls Storage	Walk Out Mode	CDC Table	Force Account Code
1	Made/Received by this Extension	One Call	1	<input type="checkbox"/>
2	Made/Received by this Extension	One Call	2	<input type="checkbox"/>
3	Made/Received by this Extension	One Call	3	<input type="checkbox"/>
4	Made/Received by this Extension	One Call	4	<input type="checkbox"/>
5	Made/Received by this Extension	One Call	5	<input type="checkbox"/>
6	Made/Received by this Extension	One Call	6	<input type="checkbox"/>
7	Made/Received by this Extension	One Call	7	<input type="checkbox"/>
8	Made/Received by this Extension	One Call	8	<input type="checkbox"/>

At the bottom of the table, there are three buttons: **Submit**, **Default**, and **Default One**. A left-hand navigation menu is visible, with 'Station Advance Features Templates' highlighted.

- Click **Submit** at the bottom of the page to save changes.
- To assign the Station Advanced Feature Template with the CDC Table on SLT, DKP and ISDN Terminal extensions, SIP Extensions go to the respective pages **SLT Parameters** under **SLT Configuration**, **DKP**

Parameters under **DKP Configuration** and **ISDN Terminal Parameters** under **ISDN Configuration** and **SIP Extensions Settings** under **VoIP Configuration**.

Refer "[Station Advanced Feature Template](#)" for instructions on customizing the templates and assigning them to extensions.

- If selected extensions are to be allowed CDC or if different CDC parameters are to be allowed to selected extensions (for example, 160 seconds duration timer for a few extensions, 360 duration timer for some other extensions), then follow these steps:
 - a. Define a new CDC table.
 - b. Program the different CDC parameters in this table, as required for the extensions.
 - c. Apply this CDC table on a separate Station Advanced Feature Template.
 - d. Apply the new Station Advanced Feature Template now programmed with a different CDC table on the selected extensions which are to be allowed this feature.

CDC on Trunk

- By default, CDC is enabled in the Trunk Feature Template assigned to the trunks. For instructions, see "[Configuring Trunks](#)".
- Log out of Jeeves or continue programming if required.

Configuring CDC using a Telephone

CDC Table

- Enter SE mode.

To enable CDC for Outgoing Calls in a CDC Table, dial:

- **4202-1-CDC Table-Code** to enable the flag in a single table.
- **4202-2-CDC Table-CDC Table-Code** to enable the flag in a range of tables.
- **4202-*-Code** to enable the flag in all tables.

Where,

CDC Table is from 1 to 8.

Code is

0 for Disable

1 for Enable.

To enable CDC flag for Incoming Calls in a CDC Table, dial:

- **4203-1-CDC Table-Code** to enable the flag in a single table.
- **4203-2-CDC Table-CDC Table-Code** to enable the flag in a range of tables.
- **4203-*-Code** to enable the flag in all tables.

Where,

CDC Table is from 1 to 8.

Code is

0 for Disable.

1 for Enable.

To enable CDC flag for Internal Call, dial:

- **4204-1-CDC Table-Code** to enable the flag in a single table.
- **4204-2-CDC Table-CDC Table-Code** to enable the flag in a range of tables.
- **4204-*-Code** to enable the flag in all tables.

Where,

CDC Table is from 1 to 8.

Code is

0 for Disable.

1 for Enable.

To assign a number list to Apply CDC to Number List, dial:

- **4205-1-CDC Table-Number List** to enable the flag in a single table.
- **4205-2-CDC Table-CDC Table-Number List** to enable the flag in a range of tables.
- **4205-*-Number List** to enable the flag in all tables.

Where,

CDC Table is from 1 to 8.

Number List is from 01 to 16.

Default Number List is 07.

To assign a number list to Do Not Apply CDC to Number List, dial:

- **4206-1-CDC Table- Number List** to assign Number List to a single table.
- **4206-2-CDC Table-CDC Table- Number List** to assign Number List to a range of tables.
- **4206-*-Number List** to assign Number List to all tables.

Where,

CDC Table is from 1 to 8.

Number List is from 01 to 16.

Default, Number List is 08.

You must also program the Number Lists (default: 07 and 08) before assigning them to a CDC table. Refer the topic 'Number Lists' for programming instructions.

To change CDC timer in a CDC table:

- **4207-1-CDC Table-CDC Timer** to set Timer value in a single table.
- **4207-2-CDC Table-CDC Table-CDC Timer** to set the same Timer value in a range of table
- **4207-*-CDC Timer** to set the same Timer value in all tables.

Where,

CDC Table is from 1 to 8.

CDC Timer range is from 0001 to 9999 seconds.

Default CDC Timer value is 160 seconds.

To enable the Disconnection Flag in a CDC table:

- **4208-1-CDC Table-Disconnection Flag** to enable the flag in a single table.
- **4208-2-CDC Table-CDC Table-Disconnection Flag** to enable the flag in a range of tables.
- **4208-*-Disconnection Flag** to enable the flag in all tables.

Where,

CDC Table is from 1 to 8.

Disconnection Flag is

0 for Disable.

1 for Enable.

To default a CDC table²⁵⁹ (see Table with Default Values):

259. Refer Call Duration Control Table (Default Values).

- **4201-1-CDC Table** to default a single table.
- **4201-2-CDC Table-CDC Table** to default a range of tables.
- **4201-*** to default all tables.

Where,

CDC Table is 1 to 8.

Example: Apply Call Duration Control on SLT 202 (connected at software port number 001) to disconnect all calls starting with '0' after 240 seconds, except calls starting with '022'.

Solution: Since only one SLT is to be programmed, it is recommended that you use a CDC table other than the default (CDC Table No. 1). So, select another CDC table to be assigned to SLT extension 202, for example CDC Table No. 5. Follow these steps:

1. First, program the Apply CDC to Number List and Do Not Apply CDC to Number List. For example, take Number List 04 as the Apply CDC to Number List and program the number '0' in this list. Take Number List 05 as the Do Not Apply CDC to Number List and program '022' in this list. Refer the topic "Number Lists" for programming instructions.
2. Enable CDC for Outgoing call in the table. If using SE Commands, dial **4202-1-5-1**.
3. Assign Number List 04 as allowed list and Number List 05 as denied list in table 5. If using SE commands dial **4205-1-5-04** to assign List 04 and dial **4206-1-5-05** to assign List 05.
4. Change the CDC timer to 240 seconds. If using SE Commands, dial **4207-1-5-240**.
5. Enable CDC disconnection Flag in CDC Table 5. If using SE Commands, dial **4208-1-5-1**.
6. Assign CDC Table 5 to SLT 202. To do this, change the CDC number in a Station Advanced Feature Template of SLT 202.
7. Program a different Station Advanced Feature Template for SLT 202. Ensure that all other features and parameters in the template are relevant for SLT 202.
8. Change the CDC Table number in the Template to 5.
9. Assign the Station Advanced Feature Template now programmed with CDC Table No. 5 to SLT 202. Refer the topic "[Station Advanced Feature Template](#)" for programming instructions.

Call Duration Display

What's this?

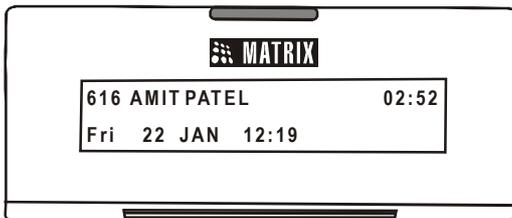

By invoking Call Duration Display, extension users can view the duration of the current call instantly.

The system displays the duration of the current call on the LCD display of the phone.

The current call may be incoming or outgoing, internal or external call.

How it works

- The user goes OFF-Hook
- Dials an external number.
- The remote party answers the call.
- The dialed external number with duration (5-digits in the format of MM:SS) is displayed on the LCD of the phone, when the call is answered.

Call Forward

What's this?

During a typical workday, it is common for people in an organization to move from one place to another. For instance, a manager might go on the production floor or remain in the conference room for a few hours; a field engineer may spend half of the day on site. So, they need to be able to attend their calls even when they are not present at their desks. The 'Call Forward' feature of SARVAM UCS ensures this.

Using this feature, calls landing on an extension can be forwarded to another extension, an external number, Voice Mail, or a Department Group. This way, extension users can ensure that callers can reach them and that they do not miss calls when they are not present at their extension.

You can also set Call Forward for all the extensions from the SA Mode. See [“Settings Call Forward for All Extensions using SA Jeeves”](#).

The Call Forward feature of SARVAM UCS offers the following forwarding options:

- **Unconditionally** - calls are forwarded to the destination phone number automatically without waiting for a response from the called party's phone.
- **If Busy** - calls are forwarded to the destination phone number only when the called party's phone is busy.
- **If No Reply** - calls are forwarded to the destination phone number only when the called party does not answer the phone. Each extension can set a different time after which the call should be forwarded, in case of no reply. The default time is 30 seconds for all extensions and can be changed by programming the Call Forward No-Reply Timer.
- **If Busy or No Reply** - calls are forwarded to the destination phone number when the called party's phone is either busy or does not reply.
- **Dual Ring²⁶⁰** - when calls are forwarded to another phone number. Both phones, that is, the source phone (whose calls are forwarded) as well as the destination phone (on which call is forwarded) will ring and the user can answer from either extension.

Dual Ring is useful to users who may have to be present frequently at two different places. As it is cumbersome to forward the calls from one extension to another and cancel it repeatedly, extensions users can set Dual Ring, so they can attend to their calls at either place they are present.

If you do not want to set/cancel Call Forward manually, you can set Preset Call Forward. Call will be forwarded automatically to the selected destination according to the type of Preset Call Forward set. You can set a different type of forward and destination for each time zone. To know more, see [“Preset Call Forward”](#).

260. This feature is not supported in Q-Signaling.

How it works

A has set Call Forward to extension B unconditionally.

- The system forwards all calls for A to B, without checking for Busy Tone and without waiting for the Call Forward No-Reply Timer to expire.

A has set Call Forward to external number on No-Reply.

- The system waits for the Call Forward No-Reply Timer to expire and forwards all external incoming calls to the external number.

A has set Call Forward to extension B on Busy.

- The system forwards the call for A to B on detecting Busy signal from A.

B belongs to a Department Group and has set Call Forward-If Busy to C within the Department Group.

- If the system detects Busy signal on B, it forwards the call for B to C in the Department Group.
- However, if the caller has called the Department Group instead of calling B directly, the call will land in the sequence on all Department group extensions. When it is B's turn, the call will not be forwarded to C, B will ring instead.

C belongs to a Department Group and has set Call Forward-No Reply to D within the Department Group.

- The system waits for the Call Forward No-Reply Timer to expire, and forwards the call for C to D in the Department Group.

D has set Call Forward to Voice Mail on Busy or No Reply.

- Whenever there is a call for D, if the system does not detect a busy signal from D, it waits for the Call Forward No-Reply timer to expire.
- The system forwards the call to the Voice Mail System.

E has set Call Forward Dual Ring on extension F.

- When there is a call for E, the system rings on both E and the destination F.
- E can answer the call at E or at F.

Call Forward set by member extensions in a routing group will be ignored by the system if, the Ignore call forward set by member extension, when call is routed on Routing/Dept. Group flag is enabled. See ["System Parameters"](#) for more information.

When an incoming call is routed to the Routing Group and if any member has set Call Forward to the Department Group, then only the first extension of that Department Group will ring.

Call Forward when set/canceled from the SA mode, will not depend on the assigned CoS.

Feature Interaction:

- **Do Not Disturb (DND):**

When DND or DND with Intercept Destination is set along with Call Forward-Unconditional on an extension, Call Forward is given priority.

If any other type of Call Forward and DND are set on an extension, DND is given priority. However, DND with Intercept Destination will not work.

If an extension has set both Call Forward and DND, then Feature Tone will be played to the extension user.

- *You can select the types of calls, that is, internal calls only, or trunk calls, or both, to be forwarded to external numbers. You can program the system to forward internal calls only, or trunk calls only or both trunk calls and internal calls, to the external number. For this, the parameter 'Allow External Call Forward for' must be programmed in the ["Station Advanced Feature Template"](#) of the extensions that are allowed Call Forward.*
- *The system supports only single-point Call Forward, which means, if the destination extension is also forwarded, the call will not follow the forwarding path. For example: Calls for extension A are set to be forwarded to extension B. Call Forward is also set on extension B with C as the destination number. Calls for A will land on B only and calls for B will land on C only.*
- *Only one Call Forward Type can be set from an extension. Every new Call Forward Type set overrides the previous one.*
- *When the calls are forwarded the extension user gets the feature tone on lifting the handset to indicate that Call Forward is set on his/her extension.*

How to configure

The functioning of this feature is controlled by three parameters: 'Class of Service' and 'Call Forward No-Reply Timer' and 'Allow External Call Forward for'.

Call Forward must be enabled in the Class of Service (COS) group of the extensions to which this feature is to be allowed.

When Call Forward No-Reply is set, if required the Call Forward No-Reply Timer needs to be programmed.

You may select the types of calls, that is, internal, external, both internal and external calls to be forwarded by programming the 'Allow External Call Forward for' parameter.

You can set Call Forward for All the Extensions from the SA mode only, see ["Settings Call Forward for All Extensions using SA Jeeves"](#).

Call Forward in Class of Service

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS. Template 01 is assigned COS group 01 in which Call Forward is enabled. So, all extensions of SARVAM UCS can use Call Forward.

If you want to deny Call Forward to certain extensions, follow these steps:

- a. Define a CoS group with Call Forward disabled.

- b. Prepare a Station Basic Feature Template with this CoS group applicable in all the ["Time Zones"](#).
- c. Assign this new Template to the extensions to which Call Forward is to be denied.

Refer the topics Class of Service and Station Basic Feature Template for programming instructions.

Call Forward No Reply Timer

When using Call Forward -No Reply, each extension can set a different Time after which the incoming call on the extension should get forwarded when there is no reply from the extension. For this, the Call Forward No-Reply Timer must be programmed. By default, this timer is set to 30 seconds.

The Call Forward No-Reply Timer is to be programmed in the ["Station Advanced Feature Template"](#) applied on the extensions which are allowed Call Forward in their COS.

If you want to set this timer to the same duration for all extensions, simply set the Call Forward No-Reply Timer in the default Station Advanced Feature Template 01 which is assigned to all extensions.

If you want to set different Timer duration for different extensions, then prepare separate Station Advanced Feature Templates with the desired Timer durations and assign different Templates (with different Timer durations) to the extensions as desired.

Allow External Call Forward for

The types of calls to be forwarded to the external number may be selected in the parameter *"Allow External Call Forward for"* in the ["Station Advanced Feature Template"](#) applied on the extensions which are allowed Call Forward.

You may select from 'Internal Calls', 'Trunk Calls' and 'Internal + Trunk Calls'. By default, only trunk calls are forwarded to external numbers in the default Station Advanced Feature Template 01 which is assigned to all extensions.

If you want to set different call types for different extensions, then prepare separate Station Advanced Feature Templates with the desired Call Types and assign these different Templates to the extensions as appropriate.

Refer the topic ["Station Advanced Feature Template"](#) for instructions on customizing the template and applying the template to extensions using Jeeves and from a Telephone.

Changing Call Forward No-Reply Timer using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Station Advanced Feature Template** to open the page.

- Select an Advanced Feature Template number. (by default Template 01 is assigned to all extensions)

Template No.	Caller ID Presentation while Transfer	Call Forward No Reply Timer (sec)	Preset Call Forward (WH)	
			Forward Type	Destination
1	Transferring Party	030	None	Voice Mail
2	Transferring Party	030	None	Voice Mail
3	Transferring Party	030	None	Voice Mail
4	Transferring Party	030	None	Voice Mail
5	Transferring Party	030	None	Voice Mail
6	Transferring Party	030	None	Voice Mail
7	Transferring Party	030	None	Voice Mail
8	Transferring Party	030	None	Voice Mail

- Go to the column **Call Forward No-Reply Timer (Sec.)**.
- Change to the desired value.
- Click **Submit** at the bottom of the page to save changes.
- Apply the Template now configured with the Call Forward No-Reply Timer to the extensions.

Changing Call Forward No-Reply Timer using a Telephone

- Enter SE mode from a DKP/SLT.
- Dial command **5602-1-Station Advanced Feature Template Number-02-Call Forward No-Reply Timer**
Where,
Station Advanced Feature Template is from 01 to 50. Default: 50.
Timer is from 001 to 255 seconds.
02 is the parameter number for "Call Forward No-Reply Timer" in the Template.

For example: To program Call Forward No-Reply Timer as '60' secs.' in Template number 02, dial **5602-1-02-02-060**

- Exit SE mode.

Refer the topic ["Station Advanced Feature Template"](#) for instructions on applying the template to extensions using Jeeves and from a Telephone.

When Call Forward No-Reply is set on a phone that is programmed in a Trunk Landing Group, the calls will be forwarded on expiry of 'Call Forward No-Reply Timer' programmed in the routing group for this member phone. Call Forward No-Reply Timer, programmed in Station Advanced Feature Template will not be applied in this case.

Settings Call Forward for All Extensions using SA Jeeves

- Log in to Jeeves as System Administrator.
- Click **Call Forward- All Extension**.

Call Forward For All Extensions

Forward Calls of all Extensions to Voice Mail Unconditionally

Forward Calls of all Extension, Unconditionally to Extension

Cancel Call Forward of all Extensions

Submit

- To set Call Forward of all Extensions to the Voice Mail, select **Forward Calls of all Extensions to Voice Mail**. Select the type of Call Forward—Unconditionally, When Busy, When No Reply, When Busy or No Reply you want to set.
- To set Call Forward of all Extensions to an Extension, select **Forward Calls of all Extensions to Extension** Configure the **Extension** Number to which the calls are to be forwarded. Select the type of Call Forward—Unconditionally, When Busy, When No Reply, When Busy or No Reply you want to set.
- To Cancel Call Forward, select **Cancel Call Forward of all Extensions**.
- Click **Submit** to save the option you select.

How to use

Call Forward can be set/canceled by extension users who are allowed this feature. It can be set/canceled by an extension user for another extension (refer "[Call Forward-Remote](#)" to know more).

For EON and Extended IP Phone Users

To set Call Forward,

- Press the 'Forward' key.
OR
- Dial 13.
- Scroll to select the desired Call Forward Type.
- Press 'Enter' key.
- Enter destination Phone Number/Voice Mail System/ Department Group Number.
- You get a confirmatory text message and confirmation tone.
- Go Idle or you get dial tone after 3 seconds.

To set Call Forward-Dual Ring,

- First, set the desired Call Forward type.
- Press the 'Forward' key.
OR
- Dial 13.
- Scroll to select Dual Ring.

- Press 'Enter' key.
- Select Dual Ring ON
- Press 'Enter' key.
- You get a confirmatory text message and confirmation tone.
- Go Idle or you get dial tone after 3 seconds.

- *If the call is to be forwarded to an extension, dial the extension number.*
- *If the call is to be forwarded to an external number, dial Trunk Access Code, then the external phone number and terminate the command with #*.*
 - *For users world wide, Trunk Access Code (TAC) for dialing external numbers are: 0, 5, 61, 62, 63, 64.*
 - *For users in USA, TAC for dialing external numbers are: 9, 5, 81, 82, 83, 84.*
- *If call is to be forwarded on voice mail, dial the Access Code for the Voice Mail System. The default Access Code is 3931. Verify with the System Engineer if the default VMS Access Code has been changed and use the new code to dial the VMS.*

To cancel Call Forward,

- Press 'Forward' Key again.
- OR
- Dial 13.
- Select 'Cancel'.
- You get a confirmatory text message and confirmation tone.
- Replace Handset on the cradle or you get dial tone after 3 seconds.

For SLT Users

To set Call Forward,

- Lift the handset.
- Dial 131 for Call Forward - All Calls
- Dial 132 for Call Forward - If Busy
- Dial 133 for Call Forward -If No Reply
- Dial 134 for Call Forward -If Busy or No Reply
- Dial destination Phone Number/Voice Mail System/Department Number.
- You get confirmation tone.
- Replace handset.

To set Call Forward-Dual Ring,

- Set the desired Call Forward type.
- Dial 136-1 for Call Forward -Dual Ring

To cancel Call Forward,

- Lift the handset.
- Dial 130.
- You get confirmation tone.
- Replace the handset.

To disable Dual Ring,

- Lift the handset.
- Dial 136.
- Dial 0.
- Replace Handset.

Call Forward-Remote

What's this?

An extension user can set Call Forward for another ('remote') extension from his/her own extension. Thus, Call Forward set for an extension from another extension is called 'Call Forward-Remote'.

This feature can be used by the Operator or the Receptionist to forward the calls for the Managers and other extension users to the destinations where they will be available.

This feature is also useful in Hotels, where the Front Desk can set Call Forward for guests. Refer the SARVAM UCS Hospitality System Manual to know how this feature can be used in hotels.

- *Call Forward-Remote is possible only from the System Administration (SA) mode.*
- *Call Forward-Remote is not supported by Q-Signaling (QSIG).*

How it works

This feature works in the same way as Call Forward. The only difference is that it is set by one extension user for another extension.

For example:

- A and B are extension users.
- A needs to forward calls for B's extension to another extension 'C' or an external number or a Voice Mail System or a Department Number.
- A dials the Call Forward-Remote feature code followed by B's extension number, the destination number where the calls for B should land.
- The system routes all incoming calls for B to the destination number.

How to configure

As Call Forward-Remote can be invoked only from the SA mode, either the feature 'SA Mode' or 'SA Extension' must be enabled in the Class of Service of extensions that are to be allowed this feature.

It can also be set from Jeeves by the SA.

The feature 'SA Mode' requires a password to be dialed. Users must be provided a password to use this feature from their extensions. The feature 'SA Extension' allows entry into SA mode, without a password.

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS. This Template is assigned CoS group 01 by default. The default CoS group 01 has both 'SA Mode' and SA Extension disabled.

You may decide which extensions should be allowed Call Forward-Remote feature. In general practice only very few extensions are allowed this feature.

So, to allow this feature to a few extensions only:

- a. Define a CoS group with either 'SA Mode' or 'SA Extension' enabled. Recall that the facility 'SA Mode' is password protected, so the extensions allowed access to this feature must also be provided an SA Password.
- b. Prepare a Station Basic Feature Template with this CoS group applicable in all the "Time Zones".
- c. Assign this new Template to the extensions to which Call Forward-Remote is to be allowed.

Refer the topics "Class of Service (COS)" and "Station Basic Feature Template" for detailed instructions and programming.

How to use

Settings Call Forward-Remote using SA Jeeves

- Log in to Jeeves as System Administrator.
- Click **Extension**.

- In **Select Extension**, enter the Number or the Name of the extension on which you want to set this feature.
- Click **Submit**.
- The searched extension users details appear on your screen.
- Click **Call Forward** to expand.

- Select the type of Call Forward you want to set for the extension:
 - To forward calls to voice mail, select **Forward Calls to Voice Mail** and the type of call forward. Default: Unconditionally.

- To forward calls of this extension to another extension, select **Forward Calls to Phone** and the type of call forward. Default: Unconditionally.

Enter the extension number to which calls must be forwarded.

- To forward calls of this extension to an external number, select **Forward Calls to External Number** and select the type of call forward. Default: Unconditionally.

Enter the external number to which calls must be forwarded.

- Click the **Call Forward** button to set Call Forward.

Call Forward

Forward Calls to Voice Mail Unconditionally

Forward Calls, Unconditionally to Phone

Forward Calls, Unconditionally to External Number using TAC 0

Cancel Call Forward **Call Forward is set** Apply Dual Ring **Dual Ring is Off**

The message “Call Forward is set” appears.

- Click the **Dual Ring** button to set Call-Forward Remote with Dual Ring.

The message “Dual ring is On” appears.

- To set Call Forward on another extension, follow the same instructions as above.
- You can also forward the calls of all extensions at one go to the same destination. To do this,
- Click **Call Forward-All Extensions**.

Call Forward For All Extensions

Forward Calls of all Extensions to Voice Mail Unconditionally

Forward Calls of all Extension, Unconditionally to Extension

Cancel Call Forward of all Extensions

Submit

- Select the **Forward Calls of all Extensions** and select the Call Forward type.
- In **to Extension**, enter the Call Forward destination number.
- Click **Submit** to save.
- To cancel, click **Cancel Call Forward of All extensions**.

- Click **Submit** to save.
- You may log out of Jeeves.

For EON and Extended IP Phone Users

To set Call Forward-Remote:

- Press the DSS Key assigned to 'Call Forward-Remote'.

OR

- Dial **1072-006**.
- Enter the Destination Phone Number.
- Scroll to select the desired Call Forward Type:
 - All Calls.
 - If Busy.
 - If No Reply.
 - If Busy or No Reply.
 - Dual Ring.
- Press 'Enter' key.
- Enter Destination Phone Number²⁶¹/Voice Mail System²⁶²/Department Group.
- You get a confirmation tone and a text message for the Call Forward type set.
- Go Idle or you get dial tone after 3 seconds.

To cancel Call Forward set for an extension:

- Press the DSS Key assigned to 'Call Forward-Remote'.

OR

- Dial **1072-006**.
- Enter Extension Number.
- Scroll to select 'Cancel'.
- Press 'Enter' key.
- You get a confirmation tone and text message for Call Forward canceled.
- Go Idle or you get dial tone after 3 seconds.

For SLT Users

To set Call Forward-Remote:

- Lift handset.
- Dial **1072-006**.
- Enter Extension Number.
 - Dial 1 for All Calls
 - Dial 2 for If Busy

261. If call is to be forwarded to an extension of the SARVAM UCS, dial the extension number. If call is to be forwarded on an external number, dial Trunk Access Code, then dial the external phone number and terminate the command with #*.

For users world wide, Trunk Access Code (TAC) for dialing external numbers are: 0, 5, 61, 62, 63, 64. For users in USA, TAC for dialing external numbers are: 9, 5, 81, 82, 83, 84.

262. If call is to be forwarded on voice mail, dial the Access Code for the Voice Mail System. The default Access Code is 3931.

- Dial 3 for If No Reply
- Dial 4 for If Busy or No Reply
- Dial 5 for Dual Ring
- Dial destination Phone Number/Voice Mail System.
- You get confirmation tone.
- Replace handset.

To cancel Call Forward Remote:

- Lift the handset.
- Dial **1072-006**.
- Dial the Extension Number.
- Dial 0.
- You get confirmation tone.
- Replace handset.

Call Forward-Scheduled

What's this?

Extension users may want their calls to be automatically forwarded to a desired destination number during working hours or non-working hours. To cite an example, a Support Technician spends working hours on the field and wants all incoming calls on his extension in the office to be forwarded to his cell phone during working hours. During non-working hours, he wants call calls to be forwarded to his voice mail.

Remembering to set and cancel Call Forward and changing the destination number for each Time Zone, that is, working hours, non-working hours, break hours, every day proves to be cumbersome for such extension users.

In addition to ["Call Forward"](#), SARVAM UCS supports 'Call Forward - Scheduled', which allows extension users to set call forward for desired Time Zones at one time, and the system automatically forwards the calls to the destination defined for each Time Zone.

How it works

Call Forward-Scheduled supports all the forwarding options as Call Forward: Unconditionally, If Busy, If No Reply, If Busy or No Reply, Dual Ring.

Any of these options can be set for the three Time Zones: working hours, break hours and non-working hours.

The destination for Call Forward-Scheduled can be an internal (extension) number or an external number.

Both 'Call Forward' and Call Forward-Scheduled can be set on the same extension. In this case, priority is given to 'Call Forward' over Call Forward-Scheduled.

The logic for forwarding calls to the destination number remains the same as described in the topic ["Call Forward"](#), illustrated in the following example.

- Extension user A sets Call Forward-Unconditionally to extension B for Non-working hours.
- When there is a call on extension A, the system first checks if there is any 'Call Forward' type (that is, Unconditional, Busy, No Reply, Busy/No Reply, Call Follow Me) set on extension A.
- If 'Call Forward' is set on extension A, the system will follow the logic described in 'How it works' under the topic 'Call Forward'.
- If no 'Call Forward' is set on extension A, the system will check if Call Forward-Scheduled is set on A.
- Since Call Forward-Scheduled is set on extension A, the system will compare the Time Zone for which the Call Forward is scheduled with the current Time Zone of extension A.
- If the current Time Zone of extension A is the same as the Time Zone set for Call Forward Scheduled, that is, non-working hours, the call will be forwarded to extension B as per the call forward type set.
- As the Call Forward Type set by A is Unconditional, the system will forward the call to B, without checking for the Busy Tone and without waiting for the Call Forward No-Reply Timer to expire.

- If the current Time Zone of extension A is not the same as Time Zone set for Call Forward-Scheduled, the call will not be forwarded. The system will consider that no call forward has been set.

- *Call Forward - Scheduled can be set simultaneously for more than one Time Zone from the same extension. For example, extension A can set Call Forward-Scheduled for working hours, then again set Call Forward-Scheduled for non-working hours, and again for break hours.*
- *A different Call Forward Type can be set for a different Time Zone. For example, extension A can set Call Forward -Unconditional for non-working hours, and Call Forward -Busy for working hours. Also, a different destination number can be set for forwarding calls in each Time Zone. For example, extension A can set Call Forward-Unconditional for non-working hours to a mobile number and set extension B as destination number for working hours.*
- *When more than one Call Forward type is set on the same extension for the same Time Zone, the latest Call Forward type set for the Time Zone will override the previous Call Forward type set for that Time Zone. For example, extension A sets Call Forward -Busy for working hours, then sets Call Forward Busy or No Reply for working hours, the latter will override the former. The system will consider the latest, that is, Busy or No Reply as the Call Forward type for forwarding calls during working hours.*
- *Call Forward-Scheduled can be cancelled individually for a desired Time Zone or all at once for all Time Zones.*
- *Call Forward-Scheduled can be set by extension users as well as for extension users from the System Administrator mode.*
- *It is also possible to select the types of calls, that is, internal calls only, or trunk calls, or both, to be forwarded to external numbers. You can program the system to forward internal calls only, or trunk calls only or both trunk calls and internal calls to the external number. For this, the parameter 'Allow External Call Forward for' must be programmed in the “Station Advanced Feature Template” of the extensions that want to use Call Forward-Scheduled.*
- *Call Forward-Scheduled when set/canceled from the SA mode, will not depend on the assigned CoS.*

How to configure

The programming of this feature involves the same parameters as in “[Call Forward](#)”.

'Call Forward' must be enabled in the Class of Service (CoS) group of the extensions to which this feature is to be allowed. Refer the topic “[Call Forward](#)”.

If Call Forward No-Reply is to be set, and if required, the Call Forward No-Reply Timer may be programmed in the “[Station Advanced Feature Template](#)” applied on the extensions which are to be allowed this feature. Refer the topic “[Call Forward](#)”.

The types of calls to be forwarded to the external number may be selected in the parameter "Allow External Call Forward for" in the “[Station Advanced Feature Template](#)” applied on the extensions which are allowed Call Forward-Scheduled. You may select from 'Internal Calls', 'Trunk Calls' and 'Internal + Trunk Calls'. By default, only trunk calls are forwarded to external numbers.

Extensions that are to be allowed to set Call Forward-Scheduled for other extensions must be allowed either the feature 'SA Mode' or 'SA Extension' in their COS. Refer the topic “[Call Forward-Remote](#)”.

How to use

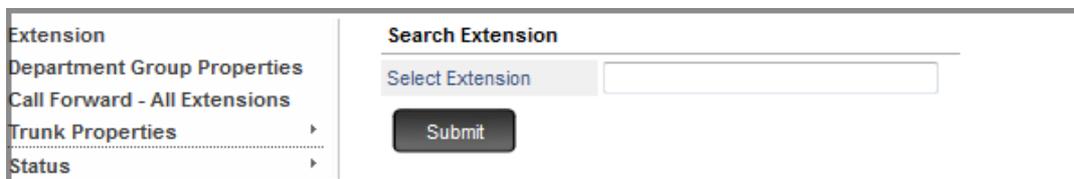

Call Forward-Scheduled can be set/canceled by users for their own extension, or for any other extension from the SA mode.

Setting Call Forward-Scheduled for Extension Users

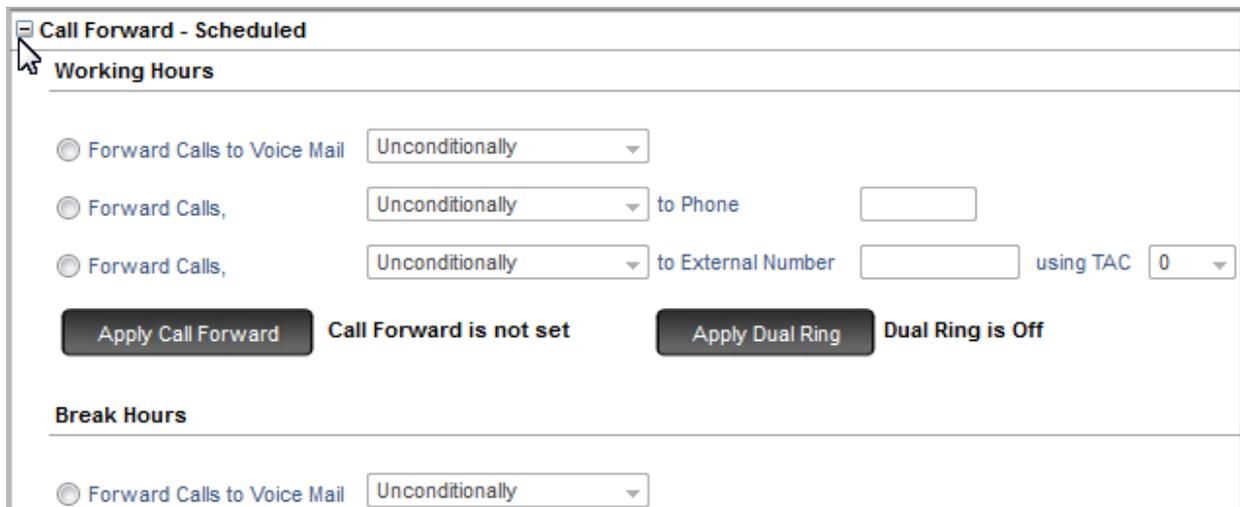

The Operator or any extension user having access to System Administrator mode can set or cancel Call Forward-Scheduled for other extension users using Jeeves or by dialing SA commands from a telephone.

Setting Call Forward-Scheduled using Jeeves

- Log in to Jeeves as System Administrator.
- Click **Extension**.

- In **Select Extension**, enter the Number or the Name of the extension on which you want to set this feature.
- Click **Submit**.
- The searched extension users details appear on your screen.
- Click **Call Forward - Scheduled** to expand.

- You can set **Call Forward - Scheduled** for Working Hours, Break Hours as well as for Non-working Hours

To set Call Forward for the extension for the Working Hours, under **Working Hours**, select the type of Call Forward:

- To forward calls to voice mail, select the radio button **Forward Calls to Voice Mail** and the type of call forward from the drop down list. Default: Unconditionally.

- To forward calls of this extension to another extension, select **Forward Calls to Phone** radio button and the type of call forward for this option from the drop down list. Default: Unconditionally.

Enter the extension number to which calls must be forwarded in the empty field provided for this option.

- To forward calls of this extension to an external number, select **Forward Calls to External Number** radio button, and select the type of call forward for this option from the drop down list. Default: Unconditionally.

Enter the external number to which calls must be forwarded in the empty field provided for this option.

- Click the **Apply Call Forward** button to set Call Forward -Scheduled.

The message "Call Forward is set" appears.

- Click the **Dual Ring** button to set Call Forward-Scheduled with Dual Ring.

The message "Dual ring is On" appears.

- To set call forward for Break Hours and Non-working Hours, follow the same instructions as above.
- To set Call Forward - Scheduled for another extension, follow the same instructions as above.

Setting Call Forward-Scheduled using a Telephone

- *The destination number for forwarding calls can be a maximum of 16 digits. Terminate the command with #* if destination number has fewer than 16 digits.*
- *If the destination number is an external number, enter the Trunk Access Code followed by the destination number.*

For EON and Extended IP Phone Users

Call Forward-Scheduled by Extension Users

To set Call Forward-Scheduled:

- Press DSS key assigned to Call Forward-Scheduled.
- OR
- Dial **1175**.
- Scroll to the desired Time Zone.
- Press Enter key to select Time Zone.
- Scroll to the desired Call Forward type for the selected Time Zone.
- Press Enter key to select Call Forward type.
- Enter Destination Number on prompt.
- You get confirmation tone and message showing extension to which Call Forward is set.

To cancel Call Forward-Scheduled for a Time Zone:

- Press DSS key assigned to Call Forward-Scheduled.
OR
- Dial **1175**.
- Scroll to the desired Time Zone.
- Press Enter key to select Time Zone.
- Scroll to select Cancel.
- Press Enter key.
- You get confirmation tone and message.

To cancel Call Forward-Scheduled in all Time Zones:

- Press DSS key assigned to Call Forward-Scheduled.
OR
- Dial **1175**.
- Scroll to 'Cancel Call Forward'.
- Press Enter key.
- You get confirmation tone and message.

Call Forward-Scheduled from SA mode

To set Call Forward-Scheduled:

- Press DSS key assigned to Call Forward-Scheduled - Remote.
OR
- Dial **1072-223**.
- Enter extension number (from which calls are to be forwarded)
- Scroll to the desired Time Zone.
- Press Enter key to select Time Zone.
- Scroll to the desired Call Forward type for the selected Time Zone.
- Press Enter key to select Call Forward type.
- Enter Destination Number on prompt.
- You get confirmation tone and message showing extension to which Call Forward is set.

To cancel Call Forward-Scheduled for a Time Zone:

- Press DSS key assigned to Call Forward-Scheduled - Remote.
OR
- Dial **1072-223**
- Enter extension number (for which it is to be canceled)
- Scroll to the desired Time Zone.
- Press Enter key to select Time Zone.
- Scroll to select Cancel.
- Press Enter key.
- You get confirmation tone and message.

To cancel Call Forward-Scheduled in all Time Zones:

- Press DSS key assigned to Call Forward-Scheduled - Remote.
OR
- Dial **1072-223**
- Enter extension number (for which it is to be canceled)
- Scroll to 'Cancel Call Forward'.
- Press Enter key.
- You get confirmation tone and message.

For SLT Users

Call Forward (CF)-Scheduled by Extension Users

To set/cancel CF-Scheduled for working hours:

- Lift handset.
- Dial **1175-1-1-Destination Number** for CF-Scheduled-Unconditional.
- Dial **1175-1-2-Destination Number** for CF-Scheduled -Busy.
- Dial **1175-1-3-Destination Number** for CF-Scheduled -No Reply.
- Dial **1175-1-4-Destination Number** for CF-Scheduled-Busy/No Reply.
- Dial **1175-1-5-1** for CF-Scheduled -Dual Ring.
- Dial **1175-1-5-0** to cancel CF-Scheduled -Dual Ring.
- Dial **1175-1-0** to cancel CF-Scheduled for Working Hours.
- Replace handset.

To set/cancel CF-Scheduled for break hours:

- Lift handset.
- Dial **1175-2-1-Destination Number** for CF-Scheduled -Unconditional.
- Dial **1175-2-2-Destination Number** for CF-Scheduled -Busy.
- Dial **1175-2-3-Destination Number** for CF-Scheduled -No Reply.
- Dial **1175-2-4-Destination Number** for CF-Scheduled -Busy/No Reply.
- Dial **1175-2-5-1** for CF-Scheduled -Dual Ring.
- Dial **1175-2-5-0** to cancel CF-Scheduled -Dual Ring.
- Dial **1175-2-0** to cancel CF-Scheduled for Break Hours.
- Replace handset.

To set/cancel CF-Scheduled for non-working hours:

- Lift handset.
- Dial **1175-3-1-Destination Number** for CF-Scheduled -Unconditional.
- Dial **1175-3-2-Destination Number** for CF-Scheduled -Busy.
- Dial **1175-3-3-Destination Number** for CF-Scheduled -No Reply.
- Dial **1175-3-4-Destination Number** for CF-Scheduled -Busy/No Reply.
- Dial **1175-3-5-1** for CF-Scheduled -Dual Ring.
- Dial **1175-3-5-0** to cancel CF-Scheduled -Dual Ring.
- Dial **1175-3-0** to cancel CF-Scheduled for Non-working Hours.
- Replace handset.

To cancel CF-Scheduled for all Time Zones:

- Lift handset.
- Dial **1175-0**.
- Replace handset.

Call Forward (CF)-Scheduled from SA mode

To set CF-Scheduled for working hours:

- Lift handset.
- Dial **1072-223-Extension number-1-1-Destination Number** for CF-Scheduled -Unconditional.
- Dial **1072-223-Extension number-1-2-Destination Number** for CF-Scheduled -Busy.
- Dial **1072-223-Extension number-1-3-Destination Number** for CF-Scheduled -No Reply.
- Dial **1072-223-Extension number-1-4-Destination Number** for CF-Scheduled -Busy/No Reply.
- Dial **1072-223-Extension number-1-5-1** for CF-Scheduled -Dual Ring.

- Dial **1072-223-Extension number-1-5-0** to cancel CF-Scheduled -Dual Ring.
- Dial **1072-223-Extension number-1-0** to cancel CF-Scheduled -for working hours.
- Replace handset.

To set Call Forward-Scheduled for break hours:

- Lift handset.
- Dial **1072-223-Extension number-2-1-Destination Number** for CF-Scheduled -Unconditional.
- Dial **1072-223-Extension number-2-2-Destination Number** for CF-Scheduled -Busy.
- Dial **1072-223-Extension number-2-3-Destination Number** for CF-Scheduled -No Reply.
- Dial **1072-223-Extension number-2-4-Destination Number** for CF-Scheduled -Busy/No Reply.
- Dial **1072-223-Extension number-2-5-1** for CF-Scheduled -Dual Ring.
- Dial **1072-223-Extension number-2-5-0** to cancel CF-Scheduled -Dual Ring.
- Dial **1072-223-Extension number-2-0** to cancel CF-Scheduled -for break hours.
- Replace handset.

To set Call Forward-Scheduled for non-working hours:

- Lift handset.
- Dial **1072-223-Extension number-3-1-Destination Number** for CF-Scheduled -Unconditional.
- Dial **1072-223-Extension number-3-2-Destination Number** for CF-Scheduled -Busy.
- Dial **1072-223-Extension number-3-3-Destination Number** for CF-Scheduled -No Reply.
- Dial **1072-223-Extension number-3-4-Destination Number** for CF-Scheduled -Busy/No Reply.
- Dial **1072-223-Extension number-3-5-1** for CF-Scheduled-Dual Ring.
- Dial **1072-223-Extension number-3-5-0** to cancel CF-Scheduled-Dual Ring.
- Dial **1072-223-Extension number-3-0** to cancel CF-Scheduled - for break hours.
- Replace handset.

To cancel Call Forward-Scheduled for all Time Zones:

- Lift handset.
- Dial **1072-223-Extension Number-0**
- Replace handset.

Call Forward-When Not Registered

What's this?

SIP Phones connected as extensions may fail to register with SARVAM UCS when the network link is down or when there is power failure. Using the Call Forward-When Not Registered feature, the extension users can have their calls forwarded even when their extension phone is not registered with SARVAM UCS.

The destination for 'Call Forward-When Not Registered' can be an internal number, an external number or the Voice Mail.

It is also possible to select the types of calls—internal calls only, or trunk calls, or both—to be forwarded to external numbers.

Call Forward-When Not Registered can be set/canceled by,

- the System Administrator mode.
- SIP phone users from their phones.

Call Forward- When Not Registered can also be set for each Time Zone—Working Hours, Break Hours, Non-working Hours, by setting *Call Forward-When Not Registered - Scheduled*.

Call Forward - When Not Registered-Scheduled can be set for more than one Time Zone at a time on the same SIP phone. It can be canceled individually for a desired Time Zone, or all at once for all Time Zones. A different destination number can be set for forwarding calls in each Time Zone. For example, the destination number for non-working hours can be a mobile number and the destination number for working hours can be another extension number.

When the VARTA AMP100 / ADR100 application is in background, and is a member in a Routing Group or Department Group, then Call Forward functionality will not be achieved.

Feature Interaction:

- If 'Call Forward-Unconditional' and 'Call Forward-When Not Registered', have been set on the same SIP phone. 'Call Forward-Unconditional' will have priority over 'Call Forward-When Not Registered'.
- If 'Call Forward-Scheduled-Unconditional' and 'Call Forward-When Not Registered-Scheduled', have been set on the same SIP phone. 'Call Forward - Scheduled - Unconditional' will have priority over 'Call Forward-When Not Registered-Scheduled'.

How to configure

The Call Forward-When Not Registered feature does not require any specific programming except:

- ensuring that 'Call Forward' in the "[Class of Service \(COS\)](#)" group in the "[Station Basic Feature Template Parameters](#)" applied to the SIP phones.
- if required, selecting the types of calls to be forwarded to the external number. By default, only trunk calls are forwarded to external numbers. If you want to select a different type of call, configure the parameter "Allow External Call Forward for" in the *Station Advanced Feature Template* applied to the SIP phones. Refer the sub-topic "[Station Advanced Feature Template](#)", under *Configuring Extensions*.

- If you want to allow Call Forward-When Not Registered to be set only by the System Administrator (SA) for the extension users, the System Engineer (SE) must disable 'Call Forward' feature in the Class of Service (CoS) group in the Station Basic Feature Template applied to the SIP phones.

If you disable 'Call Forward' in the CoS of a SIP phone, the user will not be able to set any other type of Call Forward.

Setting Call Forward-When Not Registered

Call Forward-When Not Registered can be set from

- the SA mode from Jeeves.
- the SIP phones connected as extensions.

Call Forward-When Not Registered set by SA

- Log in to Jeeves as System Administrator.
- Click **Extension**.

- In **Select Extension**, enter the Number or the Name of the extension on which you want to set this feature
- Click **Submit**.
- The searched extension user details appear on your screen.
- Click **Call Forward When Not Registered**.

- Select the destination for forwarding calls when the SIP Extension fails to register from the following:
 - **Forward Calls to Voice Mail**.
 - **Forward Calls to Extension Number**. If you select this option, you must enter the desired Extension Number in the corresponding box.

- **Forward Calls to External Number.** If you select this option, you must enter the desired external number in the corresponding box. Also, assign a trunk to route the call by selecting the Trunk Access Code from the **using TAC** list.
- Click the **Apply Call Forward** button. The message “Call Forward is set” appears.
- To set time-zone based Call Forward - When Not Registered, click **Call Forward When Not Registered-Scheduled** to expand.

Call Forward When Not Registered - Scheduled

Working Hours

Forward Calls to Voice Mail
 Forward Calls to Extension Number
 Forward Call to External Number using TAC

Apply Call Forward **Call Forward is not set**

Break Hours

Forward Calls to Voice Mail
 Forward Calls to Extension Number
 Forward Call to External Number using TAC

- To set Call Forward When Not Registered for working hours, under **Working Hours**, select the desired destination from the following options:
 - **Forward Calls to Voice Mail.**
 - **Forward Calls to Extension Number.** If you select this option, you must enter the desired Extension Number in the corresponding box.
 - **Forward Calls to External Number.** If you select this option, you must enter the desired number in the corresponding box, and assign a trunk to route the call by selecting the Trunk Access Code in the **using TAC** list.
- Click the **Apply Call Forward** button. The message “Call Forward is set” appears.
- To set call forward for Break Hours and Non-working Hours, follow the same instructions as above.
- To set Call Forward When Not Registered - Scheduled for another extension, follow the same instructions as above.

Call Forward-When Not Registered set/canceled by SIP Phone Users

SIP extension users can set/cancel Call Forward-When Not Registered from their SIP phones. The SIP phone may be a Matrix Extended IP Phone or any Standard SIP phone.

Using Matrix Extended IP Phone

- Lift handset.
- Press DSS key assigned to Call Forward-When Not Registered (if programmed).
OR
- Dial ***13**.
- Scroll to the desired option.

To set Call Forward - When Not Registered regardless of time-zone,

- Select 'Always' and press 'Enter' key.
- Select 'Set' and press 'Enter' key.

To set Call Forward When Not Registered - Scheduled,

- Select 'Working Hours'/'Break Hours'/'Non-Working Hours', and press 'Enter' key.
- Select 'Set' and press 'Enter' key.

- On the prompt, 'Forward to Number', enter the Destination Number—Extension Number/External Number/
Voice Mail System.

- *The destination number for forwarding calls can be a maximum of 16 digits. Terminate the command with #* if destination number has fewer than 16 digits.*
- *If the you want to route the calls to the Voice Mail, enter the VMS Access Code as the destination number.*
- *If the destination number is an external number, enter the Trunk Access Code followed by the destination number and #*.*
- You get confirmation tone and message.

To cancel Call Forward - When Not Registered,

- Lift handset.
- Press DSS key assigned to Call Forward-When Not Registered (if programmed).
OR
- Dial ***13**.
- Select 'Always' and press 'Enter' key.
- Select 'Cancel' and press 'Enter' key.

To cancel Call Forward When Not Registered - Scheduled for each Time Zone,

- Lift handset.
- Press DSS key assigned to Call Forward-When Not Registered (if programmed).
OR
- Dial ***13**.
- Select the desired time-zone 'Working Hours'/'Break Hours'/'Non-Working Hours', and press 'Enter' key.
- Select 'Cancel' and press 'Enter' key.

To cancel All Call Forward When Not Registered,

- Press DSS key assigned to Call Forward-When Not Registered (if programmed).
OR
- Dial ***13**.
- Select 'Cancel Call Forward' and press 'Enter' key.

Using Standard IP Phone

- Lift handset.

To set Call Forward - When Not Registered regardless of time-zone,

- Dial ***13-1-1-Destination Number**

- The destination number for forwarding calls can be a maximum of 16 digits. Terminate the command with #* if destination number has fewer than 16 digits.
- If the you want to route the calls to the Voice Mail, enter the VMS Access Code as the destination number.
- If the destination number is an external number, enter the Trunk Access Code followed by the destination number and #*.

To set Call Forward - When Not Registered - Scheduled,

- Dial ***13-2-1-Destination Number** for working hours.
- Dial ***13-3-1-Destination Number** for break hours.
- Dial ***13-4-1-Destination Number** for non-working hours.
- Replace handset.

To cancel Call Forward - When Not Registered,

- Lift handset.
- Dial ***13-1-0**.

To cancel Call Forward When Not Registered - Scheduled,

- Dial ***13-2-0** for working hours
- Dial ***13-3-0** for break hours.
- Dial ***13-4-0** for non-working hours.
- Replace handset.

To cancel All Call Forward-When Not Registered,

- Lift handset.
- Dial ***13-0**.
- Replace handset.

Call Hold

What's this?

Call Hold enables you to put an on-going conversation (with an internal or external number) on hold. SARVAM UCS offers three types of Call Hold:

- **Exclusive Hold:** An on-going conversation is put on hold from a DKP/Extended IP Phone and is retrieved from the same DKP/Extended IP Phone that put it on hold.
- **Global Hold:** An on-going conversation is put on hold from a DKP/Extended IP Phone and is retrieved from any DKP/Extended IP Phone connected to SARVAM UCS.
- **Consultation Hold:** An on-going conversation is put on hold in order to perform any further activity, such as Call Transfer, Conference, Call Toggle.

Exclusive Hold and Global Hold are supported on SIP and DKP extensions.

Consultation Hold is supported on the SIP, DKP and SLT extensions.

SARVAM UCS supports interoperability with the Polycom IP Phones. When any extension of SARVAM UCS puts a SIP Extension on hold (Exclusive, Global or Consultation Hold), SARVAM UCS will send Re-Invite message to the SIP Extension put on hold.

Call Hold is supported using RFC 2543 as well as RFC 3264. You can select the required RFC as the Call Hold Method, as per your requirement. For details, refer "[SIP Hardware Template Parameters](#)".

How it works

Exclusive Hold using the Hold Feature Key

When a call is put on Exclusive Hold,

- SARVAM UCS starts the *Exclusive Hold Retrieval Timer* (programmable; default: 2 minutes).
- The call remains on hold for the duration of this timer.
- The extension user can retrieve the call within this timer.
- If the call is not retrieved before the expiry of this timer, it will return back to the DKP/Extended IP Phone that has put the call on hold. The DKP/Extended IP Phone rings and the user may answer the call.
- The returned call is disconnected, if the DKP/Extended IP Phone is not in the idle state, or if the call is not answered by the DKP/Extended IP Phone user.

A call placed on Exclusive Hold can be retrieved in the following ways:

- Pressing the Hold key again (when the DKP/Extended IP Phone is idle).

- Pressing the Call Appearance key of the call put on hold (when the DKP/Extended IP Phone is busy).
- Pressing DSS key assigned to the Trunk/extension you put on hold.
- Answering the call, when it returns at the end of the Exclusive Hold Retrieval Timer.

To be able to place calls on Exclusive Hold, you must select **Exclusive Hold** as the **Default Call Hold Type** in the System Parameters. See [“System Parameters”](#) for instructions.

If multiple calls have been put on Exclusive Hold and you press the Hold key, then the last call that was put on hold will be retrieved.

Exclusive Hold using DSS Key

DKP and/or Extended IP Phone users can configure upto 8 DSS keys for Exclusive Hold, namely Exclusive Hold1 to 8. Using DSS key assigned to Exclusive Hold calls can be put on Exclusive Hold only. The functioning of the DSS key does not depend on the Default Call Hold Type you select.

For instructions to assign a DSS Key to Exclusive Hold, see [“DSS Keys Programming”](#).

When a call is put on Exclusive Hold using DSS key assigned to Exclusive Hold 1,

- SARVAM UCS starts the *Exclusive Hold Retrieval Timer* (programmable; default: 2 minutes).
- The call remains on hold for the duration of this timer.
- The extension user can retrieve the call within this timer.
- If the call is not retrieved before the expiry of this timer, it will return back to the DKP/Extended IP Phone that has put the call on hold. The DKP/Extended IP Phone rings and the user may answer the call. The LCD displays the message ‘Held X Recall’, where X is the hold position number.
- The returned call is disconnected, if the DKP/Extended IP Phone is not in idle state, or if the call is not answered by DKP/Extended IP Phone user.

A call placed on Exclusive Hold can be retrieved in the following ways:

- Pressing the DSS key (when the DKP/Extended IP Phone is idle).
- Pressing the Call Appearance key of the call put on hold (when the DKP/Extended IP Phone is busy).
- Pressing DSS key assigned to the Trunk/extension you put on hold.
- Answering the call, when it returns at the end of the Exclusive Hold Retrieval Timer.

Global Hold

When a call is placed on Global Hold,

- The call remains connected in the system. The call remains on hold for the duration of the *Global Hold Retrieval Timer* (programmable; default: 60 seconds).

- Any DKP/Extended IP Phone connected to the SARVAM UCS can pick up the call put on Global hold by:
 - Pressing DSS key assigned to the Trunk put on Global Hold.
 - Pressing the DSS key assigned to the extension put on Global Hold.
- If this call is not retrieved before the expiry of the Global Hold Retrieval Timer, the call is returned to the DKP/Extended IP Phone which put it on hold. The DKP/Extended IP Phone rings and the user may answer the call.
- The returned call is disconnected, if the DKP/Extended IP Phone is not in idle state, or if the call is not answered by DKP/Extended IP Phone.

To be able to place calls on Global Hold, you must select 'Global Hold' as the Default Call Hold Type in the System Parameters of SARVAM UCS. The DKP/Extended IP Phone (which picks up the call) must have a DSS Key to access the Trunk or the Extension which is put on hold. See ["System Parameters"](#) for instructions.

SARVAM UCS provides the flexibility to use Exclusive Hold and Global Hold at the same time. You can put calls on Exclusive Hold even when Global Hold is enabled in the system using the Hold Feature key only.

SARVAM UCS does not support Global Hold on SIP Trunks.

You must first retrieve the call that is put on Exclusive or Global Hold, if it is to be transferred or included in a Conference.

Consultation Hold

During an on-going conversation, any SLT, DKP or Extended IP Phone can place a call on Consultation Hold to perform any of the following:

- ["Call Transfer"](#)
- ["Call Toggle"](#)
- ["Conference-3 Party"](#), ["Conference-Multiparty"](#), ["Conference Dial-In"](#)
- ["Call Park"](#)
- ["Mute"](#)
- ["Call Chaining"](#)
- ["Conversation Recording"](#)
- ["Flashing on Trunks \(Continued Dialing\)"](#)
- ["Priority Calls in E&M MFCR2 Signaling"](#)

The call is released from the held state once the operation has been performed or canceled.

For instructions on using the above mentioned features, refer *How to Use* of the respective feature.

How to configure

For *Exclusive and Global Hold*, you must configure the following parameters:

- **Class of Service:** Call Hold must be enabled in the Class of Service (CoS) of the DKPs/Extended IP Phones you want to allow this feature.

In the default Station Basic Feature Template 01 assigned to all extensions of SARVAM UCS, Call Hold is included in the 'Basic Features' assigned to all Class of Service groups, including the default CoS group 01. So, all extensions of SARVAM UCS can use this feature.

Refer the topics [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#) to know more.

- **Call Hold Type:** Enable the desired option, that is, Exclusive Hold or Global Hold in the [“System Parameters”](#).
- **Send Re-INVITE over SIP Trunk on Hold:** When an external call over a SIP Trunk is put on hold by any extension, and you want SARVAM UCS to send Re-INVITE message over SIP Trunk to the remote end, you must enable this flag on the SIP Trunk. See [“Configuring SIP Trunks”](#) to know more.
- **DSS Keys:** Program DSS Keys for Trunks and Stations on the DKPs which are allowed to retrieve calls on Global Hold. Program the DSS Keys for Exclusive Hold, if required. Refer the topic [“DSS Keys Programming”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP330”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP248”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP310”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP210”](#) and [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP510”](#) for instructions.
- **Global Hold Retrieval Timer:** Change the default setting of this timer to the desired duration, if required.
- **Exclusive Hold Retrieval Timer:** Change the default setting of this timer to the desired duration, if required.

For instructions to change the Timers, see [“System Timers and Counts”](#).

For *Consultation Hold* to work, Call Hold must be enabled in the [“Class of Service \(COS\)”](#) of the SLTs, DKPs/ Extended IP Phones you want to allow this feature.

How to use

Exclusive Hold

For EON and Extended IP Phone Users Only

To put a call on Exclusive Hold, when Exclusive Hold is selected as the Default Call Hold Type:

- You are in speech with a Trunk/with an extension.
- Press 'Hold' Key.
- Go idle.
- Call with Trunk/extension is put on 'Exclusive Hold'.

To retrieve the call:

- Press 'Hold' Key again.
- Press Call Appearance key of your DKP/Extended IP Phone
- Press DSS Key of the Trunk/extension you put on hold from your DKP/Extended IP Phone.

To put a call on Exclusive Hold, when Global Hold is enabled:

- You are in speech with a Trunk/with an extension.
- Press 'Hold' Key twice in quick succession within 2 seconds.
- Go idle.
- Call with Trunk/extension is put on 'Exclusive Hold'.

To retrieve the call:

- Press 'Hold' Key again.
- Press Call Appearance key of your DKP/Extended IP Phone
- Press DSS Key of the Trunk/extension you put on hold from your DKP/Extended IP Phone.

To put a call on Exclusive Hold using DSS key assigned to Exclusive Hold:

- You are in speech with on a Trunk/with an extension.
- Press DSS key assigned to Exclusive Hold.
- Go idle.
- Call with Trunk/extension is put on 'Exclusive Hold'.

To retrieve the call put on hold using DSS key:

- Press DSS Key again.
- Press Call Appearance key of your DKP/Extended IP Phone
- Press DSS Key of the Trunk/extension you put on hold from your DKP/Extended IP Phone.

Using DSS key assigned to Exclusive Hold calls can be put on Exclusive Hold only. The functioning of the DSS key does not depend on the Default Call Hold Type you select in the System Parameters.

Global Hold

For EON and Extended IP Phone Users Only

To put a call on Global Hold, when Global Hold is selected as the Default Call Hold Type:

- You are in speech with a Trunk/with an extension.
- Press 'Hold' Key.
- Go idle.
- Call with Trunk/extension is put on 'Global Hold'.

To retrieve a call on Global Hold:

- From any DKP/Extended IP Phone, press the DSS Key of the Trunk/extension put on Global Hold.

To put a call on Global Hold, when Exclusive Hold is enabled:

- You are in speech with a Trunk/with an extension.
- Press 'Hold' Key twice in quick succession within 2 seconds.
- Go idle.
- Call with Trunk/extension is put on 'Global Hold'.

To retrieve a call on Global Hold:

- From any DKP/Extended IP Phone,
- Press the DSS Key of the Trunk/extension put on Global hold.

Consultation Hold

For EON and Extended IP Phone Users

To put a call on Consultation Hold:

- Press the DSS Key assigned to the feature (if configured).
OR
- Press Transfer key.

For SLT Users

To put a call on Consultation Hold:

- Press Flash.
OR
- Tap the Hook switch of your phone.

Call Park

What is this?

Call Park allows you to place a call on Hold, so it can be retrieved from the same or another extension of the system.

A call is 'parked' when the extension user temporarily places the call into a location in the system called 'Orbit'. The user can attend to other calls. The parked call can be retrieved on completion of the current call by dialing the Orbit number.

Call Parking is useful in offices housed in different parts of a building or multi-storied offices. It is useful in situations like:

- the person who picked up the call is not the desired called party or the desired party is at an unknown location. The person who picked up the call can then either go to find the desired called party or call other numbers to find him/her. When found, the desired called party can pick up the call from the same or any extension by dialing the Orbit number.
- the person who picked up the call may have to go to another part of the office to look up a file or consult a colleague. The person can park the call and continue the conversation from the other part of the office.
- the person who picked up the call is an Operator. The Operator needs to handle many calls on a daily basis. It becomes difficult to know the available free orbit or to remember the orbit number after parking the call. In such cases, the Operator can assign a separate DSS key for each General Orbit. The availability of the orbit will be indicated by the LED of the assigned DSS key. Thus, the Operator can now easily park or retrieve the call by pressing the DSS key.

The SARVAM UCS offers two types of Call Park facility:

- **Call Park-General Orbit:** The calls can be parked either manually or automatically in the General Orbit. The calls parked in the General Orbit can be retrieved from any extension including your own extension. General Orbit number can vary from 2 to 9.
- **Manual Call Park:** The extension user can park calls in any of the 8 General Orbits, which are like fictional extensions located in the system. The calls parked in the General Orbit can be picked up from any extension by dialing the General Orbit Number. At a time, only one call can be parked in each General Orbit.

The extension user can assign a separate DSS key for each General Orbit, this will help the user to know the status of the Orbit - available, occupied. During an ongoing call, the user can park the call by pressing the DSS key of the available orbit depending on the LED indication. When the call is parked in the orbit, the LED blinks in blue and when it is free, the LED is off.

- **Auto Call Park:** To park the call automatically in the free General Orbit, SARVAM supports General Call Park - Auto. When the DSS key assigned to General Call Park - Auto is pressed, the system searches for a free General Orbit (2 to 9) and automatically parks the call in the free orbit. The Orbit number is then displayed on the phone's LCD. At a time, only one call can be parked in each General Orbit.

- **Call Park-Personal Orbit:** Each telephone instrument (EON/SLT/IP Phone) connected as extension has one Personal Orbit. Calls parked in personal orbit can be picked up only from where the call is parked. So, no other person can pick up this call. Multiple calls can be parked in the Personal Orbit at a time.

Extension users can park the call either in the General Orbit or the Personal Orbit by dialing an Orbit Number from 1 to 9, where:

- 1 is the Personal Orbit Number.
- 2 to 9 are General Orbit Numbers.

After parking a call, the extension user can continue to make and answer other calls and use other system features.

- *For Standard SIP phones, SARVAM UCS supports Call Park and Retrieve using REFER Message. For a list of IP phones on which this feature has been tested, see [“SARVAM UCS Features tested on IP Phones of different Brands”](#) in the Appendix.*
- *General Call Park - Auto feature is not supported on SLT and Standard SIP Phones.*

How it works

A and B are extension users. C, D and E are callers.

Parking Calls in General Orbit

- C calls B.
- A picks up the call.
- As B is not present at his extension, A parks the call in General Orbit Number 2 by dialing the Access Code or by pressing the DSS key of the free General Orbit.
- C is played music on-hold.
- A tries to find B (by either calling several numbers or by going in person or sending someone).
- The parked call remains in orbit for the duration of the Call Park Timer, which is set to 2 minutes by default.
- A finds B.
- B retrieves the call from another extension by dialing the feature access code for retrieving Call Park and Orbit number 2.
- If A cannot locate B or if B cannot attend the call, A can also retrieve the call from his extension.

However,

- If neither A nor B retrieves the parked call within the Call Park Timer, the system will hunt for the extension that parked the call (A) on the expiry of the Call Park Timer.
- Meanwhile, if A is busy, the system again keeps the call parked in orbit number 2 for the period of the Call Park Timer. This process continues for the duration of the Call Park Release Timer, which is set to 3 minutes by default.
- If A is free, the system will ring on A's phone. A gets connected to C again.
- If A does not retrieve the parked call till the end of the Call Park Release Timer, C gets disconnected.

Automatically Parking Calls in General Orbit

- C calls B.
- A picks up the call.
- As B is not present at his extension, A presses the DSS key assigned to General Call Park - Auto.

OR

Press the Transfer key and dial access code for Call Park+0.

- System internally checks for the available free General Orbit and parks the held call there.
- Once the call is parked automatically in the free orbit, a confirmation message appears on the LCD of A's phone 'Call Parked in Orbit X' (where value of X varies from 2 to 9).
- C is played music on-hold.
- A tries to find B (by either calling several numbers or by going in person or sending someone).
- The parked call remains in orbit for the duration of the Call Park Timer, which is set to 2 minutes by default.
- A finds B.
- B retrieves the call from another extension by dialing the feature access code for retrieving Call Park and Orbit number X.
- If A cannot locate B or if B cannot attend the call, A can also retrieve the call from his extension.
- If the parked call is not retrieved before the expiry of the Call Park Release Timer, C gets disconnected.

Parking Calls in Personal Orbit

Parking calls in the Personal Orbit works the same way as in General Orbit. The only difference is that A can park multiple calls by dialing the Personal Orbit Number. But calls can be retrieved from A's phone only.

When there are multiple calls to be retrieved from the Personal Orbit, they are retrieved one by one, without following any particular sequence like FIFO or LIFO.

To be able to use 'Call Park', this feature must be enabled in the COS of the requesting extension. However, for retrieving parked calls, the system does not check COS. So any extension can retrieve parked calls.

How to configure

To provide this feature to extensions,

- Enable the Call Park in the “[Class of Service \(COS\)](#)” of the “[Station Basic Feature Template](#)” of the extensions. By default, this feature is enabled in the CoS of all extension types for all the time zones.
- Assign a DSS key for 'General Call Park - Auto'.
OR
Assign a separate DSS key for each General Orbit (2-9).

For instructions refer to “[DSS Keys Programming](#)”.

- If required, you may change the duration of the Call Park Timer and the Call Park Release timer. See “[System Timers and Counts](#)” for instructions.

How to use

For EON and Extended IP Phone Users

To park a call:

- You are in speech with extension/external caller.
- Press DSS Key assigned to 'Call Park'.
OR
Press Transfer Key and dial 115.
- Enter Orbit Number (1-9)
(Personal Orbit:1; General: 2-9).

To park a call manually in the available General Orbit (indicated through LED):

- You are in speech with extension/external caller.
- Press DSS Key assigned to the specific General Orbit (2-9).
Call is parked.

To park a call automatically in the General Orbit:

- You are in speech with extension/external caller.
- Press DSS Key/CSF Key²⁶³ assigned to 'General Call Park - Auto²⁶⁴'.
OR
Press Transfer Key and dial 115-0.
- The system checks for the available free General Orbit (2-9) and automatically parks the held call in it.
The General Orbit number is displayed on the phone's LCD.

To retrieve a parked call from your phone, when your phone is in idle state:

- Press DSS Key assigned to 'Call Park - Retrieve'.
OR
Dial 116
- Enter Orbit Number where you parked the call (1-9)
(Personal Orbit:1; General: 2-9).
- You are in speech with the extension/external caller.

To retrieve a parked call from your phone, when you are in speech with someone:

- Press Transfer Key.
- Press DSS Key assigned to 'Call Park - Retrieve'.
OR
Dial 116
- Enter Orbit Number where you parked the call (1-9)
(Personal Orbit:1; General: 2-9).

For SLT Users

To park a call:

²⁶³. This key is applicable only for EON 510 AND SPARSH VP510.

²⁶⁴. This feature is not applicable for SPARSH VP330 and SPARSH VP210.

- You are in speech with extension/external caller.
- Dial-Flash-115-Orbit Number
(Personal Orbit:1; General: 2-9).
- Call is parked.

To retrieve a parked call from your phone, when your phone is in idle state:

- Lift the handset.
- Dial 116-Orbit Number
(Personal Orbit:1; General: 2-9).
- You are in speech with the extension/external caller.

To retrieve a parked call from your phone, when you are in speech with someone:

- Dial Flash -116-Orbit Number
(Personal Orbit:1; General: 2-9).
- You are in speech with the extension/external caller.

Call Logs

What's this?

SARVAM UCS stores the details of 20 each, of the following types of calls:

- **Missed calls:** incoming calls that were not answered by extension users.
- **Answered calls:** incoming calls answered by extension users.
- **Dialed calls:** calls made by extension users.

The call history of each of the above types of calls is stored by Name, Number, and Date-Time of the Call.

If there is no name in the CLI of the above types of calls, the system stores and displays the Number and the Date-Time. In case there is no number in the CLI, the system will display the Port number on/from which the call was received/made.

The Call Logs contain details of both internal as well as external calls made or received by the extension users.

The Call Logs feature is supported on EON and Extended IP Phones.

Using call logs you can:

- **view call history:** you can see the calls you missed, answered or dialed.
- **make calls:** you can call any number that you have missed, answered, or dialed.
- **edit the numbers:** you can change or modify the number in the call log. This is useful when the CLI received and stored in the call log is not in the same format that is to be used to make calls.
- **save the numbers:** you can store the external numbers in your call logs in the "Personal Directory" and use them for "[Personal Abbreviated Dialing](#)".

The maximum number of calls that can be stored under each Call Log type is 20. The logs will be cleared automatically using the First-In, First-Out method, that is, the latest call detail will replace the record of the oldest call detail.

Given the limited Call Log capacity, the system also allows you to choose if you want internal calls to be displayed or not in the Missed, Answered and Dialed Call Logs. And accordingly it will store internal calls in the logs.

The system stores each Missed, Answered and Dialed call individually even if the same number is received multiple times.

How to configure

This feature does not require any specific programming, except:

- Selecting whether internal calls should be logged in the Missed, Answered and Dialed Call Logs. This can be done on the 'System Parameters' page of Jeeves or by using a Telephone.
- Programming of a DSS key for the Call Logs feature. For instructions please refer the topic "[Configuring DKP Extensions](#)", "[DSS Keys Programming](#)", "[DSS Key Settings](#)" in "[Configuring Matrix SPARSH VP330](#)", "[DSS Key Settings](#)" in "[Configuring Matrix SPARSH VP248](#)", "[DSS Key Settings](#)" in "[Configuring Matrix](#)".

SPARSH VP310”, “DSS Key Settings” in “Configuring Matrix SPARSH VP210” and “DSS Key Settings” in “Configuring Matrix SPARSH VP510” for instructions.

Programming Internal Call Logging using Jeeves

- Login as System Engineer.
- Under **Configuration**, click the **System Parameters** to open the page.

System Parameters	
Customer Name	
Customer Profile	Hotel
Onsite configuration	<input type="checkbox"/>
Station Name Pattern	Title-Space-Name
Default Call Hold Type	Exclusive Hold
Store Internal Calls in Missed Call Log	<input checked="" type="checkbox"/>
Store Internal Calls in Dialed Call Log	<input checked="" type="checkbox"/>
Store Internal Calls in Answered Call Log	<input checked="" type="checkbox"/>
Store Internal Calls in Redial Call Log	<input type="checkbox"/>
MoH Source when Station kept on Hold	Internal (VM-01)
MoH Source when Trunk kept on Hold	Internal (VM-01)
Play MOH to Queued Internal Calls on DKP/SIP Extension	<input type="checkbox"/>
Give Off-hook Alert to Operator	<input type="checkbox"/>
Day/Night Mode	Operate System as per Timetable assignment
Emergency Dialing Reporting	<input checked="" type="checkbox"/>
Replace '+' from CLI	<input type="checkbox"/>
Replace 'x' from CLI with the number string	

- You may enable any or all of the following flags by selecting the respective check box:
 - Store Internal Calls in Missed Call Log
 - Store Internal Calls in Answered Call Log
 - Store Internal Calls in Dialed Call Log
 - Store Internal Calls in Redial Call Log
- Click **Submit** at the bottom of the page to save your settings.
- Log out of Jeeves or continue, as required.

Programming Internal Call Logging using a Telephone

- Enter SE mode.

To enable/disable Log Internal Calls in Missed Calls, dial:

- **5361-Code**

Where,

Code is

0 for Disable (Do not store internal calls in "Missed Calls" log)

1 for Enable (Store internal calls in "Missed Calls" log)

By default, Internal Call Logs in Missed Calls is enabled.

To enable/disable Log Internal Calls in Answered Calls, dial:

- **5362-Code**

Where,

Code is

0 for Disable (Do not store internal calls in "Answered" log)

1 for Enable (Store internal calls in "Answered Calls" log)
By default, Internal Call Logs in Answered Calls is enabled.

To enable/disable Log Internal Calls in Dialed Calls, dial:

- **5363-Code**

Where,

Code is

0 for Disable (Do not store internal calls in "Dialed Calls" log)

1 for Enable (Store internal calls in "Dialed Calls" log)

By default, Internal Call Logs in Dialed Calls is enabled.

- Exit SE mode.

How to use

The Call Logs feature allows you to view calls and edit numbers, make calls to any number logged, and store numbers.

For EON & Extended IP Phone Users

Viewing Call Logs

There are two ways to view call logs:

- From the Phone Menu
- Using the Feature Key assigned to Call Logs.

If you are using a DSS Key for the Call Logs feature, whenever there is a missed call, the LED of the DSS key will glow. If you press the Call Logs key, the system will display the last missed call details.

To view Call Logs from Phone Menu:

- Press Enter key when the phone is idle.
- Place your cursor on Call Logs option, press Enter key.
- Scroll with the Up/Down Navigation Key to reach the desired Call Log: Missed, Answered, Dialed.
- Press Enter key to select the desired Call Log.
- The phone will display the call log details.
- To view another call log, scroll with the Back Navigation key to return to the previous option.
- You may exit the Phone Menu by going ON-Hook or pressing the Cancel key.

- *If there is no name in the CLI, the Call Log will only display the number.*
- *If you press the 'Enter' key, the system will dial out the number you just viewed.*

To view Call Logs using DSS Key:

- Press DSS Key programmed for Call Logs, when the phone is idle.
- Scroll to select the desired Call Log: Missed, Answered, Dialed.
- The phone will display the call log details.
- To view another call log, scroll with the Back Navigation key to return to the previous option.
- You may exit the Phone Menu by going ON-Hook or pressing the Cancel key.

OR

- Press the DSS Key assigned the Call Logs feature, when it glows.
- The Phone will display the Call Logs: Missed, Answered, Dialed.
- Press Enter key to select the Missed Call Log.
- The phone will display the call log details.
- To view another call log, scroll with the Back Navigation key to return to the previous option.
- You may exit the Phone Menu by going ON-Hook or pressing the Cancel key.
- The LED of the Call Logs DSS key will be turned off once you have viewed the missed call.

Editing Numbers in Call Logs

- Go to Call Logs from the Phone Menu or by pressing Call Logs DSS Key. (see instructions given above).
- Scroll with the Up/Down Navigation Key to reach the desired Call Log: Missed, Answered, Dialed.
- Press Enter key to select the desired Call Log.
- The phone will display the call log details.
- Scroll with the Up/Down Navigation Key to reach the desired number.
- To edit the number, move the cursor with the Forward (>) navigation key.
- Place the cursor under the digit you want to delete.
- Press 'Cancel' key to delete a digit.
- To insert a digit, place the cursor where you want to insert the digit, and enter the digit using the dial pad. The digit will be inserted in the number string accordingly.
- Repeat the same to delete/insert another digit.
- After editing the number, you may store it in the Personal Directory or dial the edited number by pressing the Enter key.

The original number (you now changed) will remain unaffected in the Log. However, if you make a call to the new number (you changed), it will be logged in the "Dialed" call log and the Last Number Redial list.

Making calls using Call Logs

- Go to Call Logs from the Phone Menu or by pressing Call Logs DSS Key.
- Scroll with the Up/Down Navigation Key to reach the desired Call Log: Missed, Answered, Dialed.
- Press Enter key to select the desired Call Log.
- The phone will display the call log details.
- Scroll with the Up/Down Navigation Key to reach the desired number.
- Press Enter key.
- The system will dial out the selected number using the Outgoing Trunks assigned for dialing '0'.
- The dialed number will be logged in the "Dialed" call log and the Last Number Redial List.

Storing numbers of Call Logs in the Personal Memory of the Phone

To store any external call record (trunk call) from Received, Missed and Dialed call logs to Personal Directory,

- Go to Call Logs from the Phone Menu or by pressing Call Logs DSS Key.
- Scroll with the Up/Down Navigation Key to reach the desired Call Log: Missed, Answered, Dialed.
- Press Enter key to select the desired Call Log.
- The phone will display the call log details.
- Scroll with the Up/Down Navigation Key to reach the desired number.
- Edit the number (following instructions given above), if required.
- Press 'v' (Down Navigation key).
- You will get the prompt: "Enter Name"²⁶⁵.
- Enter the name of the contact.
- Press Enter key.

²⁶⁵. Only if there is a free Memory Index in the Personal Directory.

- You will get the confirmation message: "Stored at Memory: <XXX>".

- *When you store the number in the Personal Directory, the system will automatically assign Trunk Access Code "0".*
- *If all 25 Location Index Numbers of the Personal Directory are already programmed, the message "Memory Full" will appear on your phone's display and you will get an Error Tone. Refer the topic ["Abbreviated Dialing"](#) to know more.*

Call Pick Up

What's this?

Call Pick-Up allows extension users to answer calls ringing on other extensions from their own extension; without physically going to the ringing extensions.

Extension users can 'pick-up' both internal and trunk calls ringing on other extensions.

As extension users can answer calls of their colleagues or co-workers without physically going to their extensions, this feature ensures that all incoming calls are answered.

Call Pick-Up Notification will be displayed if you have SPARSH VP510. Make sure you have enabled the **Call Pick-up Notification (Only for SPARSH VP510)** in ["Configuring Matrix SPARSH VP510"](#). For details also refer to the EON510_SPARSH VP510 V2 User Guide.

SARVAM UCS offers two types of Call Pick-Up:

- **Call Pick Up-Group** - extensions are assigned to Pick-Up Groups. Any extension in a Pick-Up Group can answer calls ringing on other extensions within the same group only.
- **Call Pick-Up Selective** - calls ringing on any extension of the system can be answered.

On SIP extensions, SARVAM UCS supports Call Pickup-Selective and Call Pickup-Group using Temporary Subscription. For a list of IP phones on which this feature has been tested, see ["SARVAM UCS Features tested on IP Phones of different Brands"](#) in the Appendix.

SARVAM UCS will send only first 3 ringing call's information in NOTIFY message to the SIP Extension, which has requested Group Call Pickup. This feature has been supported in SIP Phones of CISCO and POLYCOM.

SIP Extension which has subscribed for BLF of DKP / SIP Extension of SARVAM UCS, the SARVAM UCS will send information for the call present in the first call loop only.

How it works

Call Pick-Up Group

- Extensions must be assigned to Call Pick-Up Groups. The extensions in a Call Pick-Up group may be SLT, DKP and ISDN Terminal.
- As many as 99 such groups may be formed.
- Each group is assigned a number 01 to 99
- For example, extensions 2007, 2008, 2009, 2010, 2011, 2012, 2013 are assigned to Pick-Up Group number 03.
- When an extension in this group rings, any extension in the group can pick up the call by dialing the feature access code for "Call Pick-Up Group" (default: 4).

- The ringing extension should be in the same Pick-Up Group.

Call Pick-Up Selective

- Extensions need not be in Call Pick-Up Groups.
- Whenever an extension in the system rings, the call can be picked up by any extension of the system by dialing the feature access code and the number of ringing extension.

When more than one extension in a Pick-Up Group is ringing, you can choose which one to answer first, using Call Pick-Up Selective.

Feature Interactions:

- **Call States:** Call Pick-Up will fail if the ringing extension goes into idle state just when you are dialing the pick-up access code.
- **Auto Call Back:** Call Pick-Up will fail if the call ringing on the extension is an Auto Call Back request.
- **Alarms:** Call Pick-Up will fail if the call ringing on the extension is an Alarm Call.

How to configure

For this feature to function, **Call Pick-Up** should be enabled in the **Class of Service** of extension that are to be allowed this feature.

Call Pick-Up Groups

On a sheet of paper, list the extensions that are to be grouped into a Call Pick-Up Group. Make as many Call Pick-Up Groups as required. Assign each group a number.

Call Pick-Up Group Number	SLT Extensions	DKP Extensions	ISDN Terminals
01	2002, 2003, 2006, 2014	3003, 3004, 3005,	3201, 3201, 3203
02		3019, 3020, 3021, 3022, 3023, 3024	
03	2007, 2008, 2009, 2010. 2011, 2012, 2013		3205, 3206
:			
99			

The numbering of Call Pick-Up Groups must start from 01 and end at 99.

Do not assign '00' as Call Pick-Up Group. '00' is the command to de-assign from a Call Pick-Up Group.

To program these groups, you may use Jeeves or issuing SE commands from a telephone.

Assigning Extensions to Call Pick-Up Groups using Jeeves

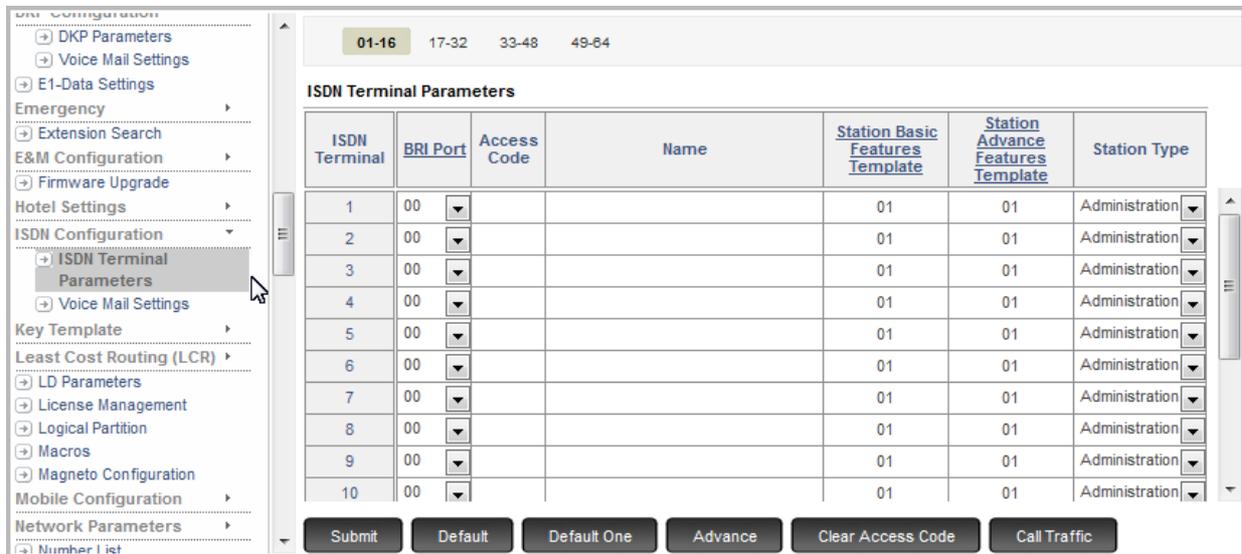

- Log in as System Engineer.
- Under **Configuration**, click **SLT Configuration**.
- Click **SLT Parameters** to open the page.

Port No.	H/w Slot - Port	Access Code	Name	Station Basic Features Template	Station Advance Features Template	SLT Hardware Template	Call Pickup Group	COSEC Door Group	Station Type
1	00 - 00	2001		45	50	02	01	00	Guest
2	00 - 00	2002		45	50	02	01	00	Guest
3	00 - 00	2003		45	50	02	01	00	Guest
4	00 - 00	2004		45	50	02	01	00	Guest
5	00 - 00	2005		45	50	02	01	00	Guest
6	00 - 00	2006		45	50	02	01	00	Guest
7	00 - 00	2007		45	50	02	01	00	Guest
8	00 - 00	2008		45	50	02	01	00	Guest
9	00 - 00	2009		45	50	02	01	00	Guest
10	00 - 00	2010		45	50	02	01	00	Guest
11	00 - 00	2011		45	50	02	01	00	Guest
12	00 - 00	2012		45	50	02	01	00	Guest
13	00 - 00	2013		45	50	02	01	00	Guest
14	00 - 00	2014		45	50	02	01	00	Guest
15	00 - 00	2015		45	50	02	01	00	Guest
16	00 - 00	2016		45	50	02	01	00	Guest

- In the column **Call Pick-up Group**, assign the group number for SLT extensions. Refer to the sheet of paper you prepared.
- Click **Submit** at the bottom of the page to save changes.
- Under **Configuration**, click **DKP Configuration**.
- Click **DKP Parameters** to open the page.

Port No.	Station Advance Features Template	Call Capacity	Call Waiting Tone	Key Map	Call Pickup Group	COSEC Door Group
1	01	02	Beep Once	Personalized	01	00
2	01	02	Beep Once	Personalized	01	00
3	01	02	Beep Once	Personalized	01	00
4	01	02	Beep Once	Personalized	01	00
5	01	02	Beep Once	Personalized	01	00
6	01	02	Beep Once	Personalized	01	00
7	01	02	Beep Once	Personalized	01	00
8	01	02	Beep Once	Personalized	01	00

- Assign **Call Pick-Up Group** number to DKP extensions. Refer to the sheet of paper you prepared.
- Click **Submit** at the bottom of the page to save changes.
- Under **Configuration**, click **ISDN Terminal Parameters** to open the page.
- Click the **Advance** button on the bottom of the page.

- Assign **Call Pick-Up Group** numbers to ISDN Terminals. Refer to the sheet of paper you prepared.
- Click **Submit** at the bottom of the page to save changes.

Assigning Extensions to Call Pick-Up Groups using a Telephone

- Enter SE mode from DKP/SLT.

To assign SLT extension to a group, dial:

- **3901-1-SLT-Call Pick-Up Group** to assign a single SLT to a group.
- **3901-2-SLT-SLT-Call Pick-Up Group** to assign a range of SLTs to the same group.
- **3901-*-Call Pick-Up Group** to assign all SLTs to the same group.

Where,

SLT is the Software Port of the SLT, from 001 to 240.

Call Pick-Up Group is from 00 to 99.

By default, Call Pickup Group for SLTs is 99.

To remove SLT extension from a group, dial:

- **3901-1-SLT-00** to remove a single SLT extension.
- **3901-2-SLT-SLT-00** to remove a range of SLT extensions.
- **3901-*** to remove all SLT extensions from a group.

To assign DKP extension to a group, dial:

- **3902-1-DKP-Call Pick-Up Group** to assign a single DKP to a group.
- **3902-2-DKP-DKP-Call Pick-Up Group** to assign a range of DKPs to the same group.
- **3902-*-Call Pick-Up Group** to assign all DKPs to the same group.

Where,

DKP is the Software Port of the DKP, from 001 to 96.

Call Pick-Up Group is from 00 to 99.
By default, Call Pickup Group for DKPs is 99.

To remove DKP extension from a group, dial:

- **3902-1-DKP-00** to remove a single DKP extension.
- **3902-2-DKP-DKP-00** to remove a range of DKP extensions.
- **3902-*** to remove all DKP extensions from a group.

To assign an ISDN Terminal to a group, dial:

- **3903-1-ISDN Terminal-Call Pick-Up Group** to assign a single ISDN Terminal to a group.
- **3903-2-ISDN Terminal-ISDN Terminal-Call Pick-Up Group** to assign a range of ISDN Terminals to the same group.
- **3903-*-Call Pick-Up Group** to assign all ISDN Terminals to the same group.

Where,

ISDN is the Software Port of the ISDN Terminal, from 01 to 64.

Call Pickup Group is from 00 to 99.

By default, Call Pickup Group for ISDN Terminals is 99.

To remove an ISDN Terminal from a group, dial:

- **3903-1-ISDN Terminal-00** to remove a single terminal.
- **3903-2-ISDN Terminal-ISDN Terminal-00** to remove a range of terminals.
- **3903-*** to remove all terminals.

- Exit SE mode.

Call Pick-Up in Class of Service

Decide which extensions are to be assigned to Call Pick-Up groups. Ensure that the feature Call Pick-Up is enabled in the Class of Service (COS) of these extensions.

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS. The Station Basic Feature Template 01 is assigned COS group 01 which has Call Pick-Up feature enabled. Thus, all the extensions of the system can use Call Pick-Up by default.

If you want to deny Call Pick-up feature to all extensions, you can simply disable Call Pick-Up in the default CoS group 01.

However, if Call Pick-Up is to be denied on only selected extensions then:

1. Define a CoS group with Call Pick-Up disabled.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the ["Time Zones"](#).
3. Assign this new Template to the extensions to which Call Pick-Up is to be denied.

Refer the topics ["Class of Service \(COS\)"](#) and ["Station Basic Feature Template"](#) for detailed instructions and programming.

How to use

For EON and Extended IP Phone Users

To pick up a ringing extension in your Group:

- Press DSS Key assigned to Call Pick-Up Group.

OR

- Dial 4.
- Talk.
- Go idle.

To pick up any one of several ringing extensions ringing or the extension that is not in your group:

- Press DSS Key assigned to Call Pick-Up Selective.

OR

- Dial 12.
- Dial number of the Extension you want to pick up.
- Talk.
- Go idle.

For SLT Users

To pick up a ringing extension in your Group:

- Lift the handset.
- Dial 4.
- Talk.
- Replace handset.

To pick up any one of several ringing extensions ringing or the extension that is not in your group:

- Lift the handset.
- Dial 12.
- Dial number of the Extension you want to pick up.
- Talk.
- Replace handset.

Call Progress Tones

What's this?

Call Progress Tones (CPT) are audible tones sent from switching systems such as PSTN or PBX to calling parties to show the status of phone calls, like dial tone, error tone, ringing error in number dialed, ringing called party, busy line, etc.

Each CPT has a distinctive tone frequency and cadence assigned to it, for which some standards have been established by the International Telecommunication Union (ITU).

On the basis of specific frequency, modulating frequency and cadence, the CPTs generated by SARVAM UCS are categorized as:

CPT	Event	Sound	Duration	Timer
Dial Tone 1	Played on lifting the handset.	Tooooooooooooo	Played for 7 seconds. After which Error Tone starts	Dial Tone Timer
Dial Tone 2	Played on lifting the handset, when 'Store and Forward Dialing ^a ' is done.	Tooooooooooooo	Played for 7 seconds. After which Error Tone starts	Dial Tone Timer
Ring Back Tone	Played when the internal number you have dialed is free.	Turroo... Turroo	Played for 45 seconds	Ring Back Tone Timer
Busy Tone (Engaged Tone)	High pitch beeps with equal ON and OFF periods, played when the dialed extension is busy. Busy tone continues for 7 seconds. This Busy Tone Timer is programmable.	Tooooooo..... Tooooooo	Played for 7 seconds.	Busy Tone Timer
Error Tone (Congestion/ Refusal Tone as per ITU)	Fast beeps, played on a wrong operation being performed or a feature invoked without access.	Too...Too...Too ...Too	Played for 30 seconds	Error Tone Timer
Internal Call Waiting Tone (Intrusion Tone as per ITU)	Short beep followed by longer OFF duration repeated every second; played to the busy extension when another extension attempts Interrupt Request/ Barge-In	Beep..... Beep	Played for duration of the Interrupt Request Timer or the Barge-In Timer.	Interrupt Request Timer, Barge-In Timer

CPT	Event	Sound	Duration	Timer
External Call Waiting Tone (Call Waiting Tone as per ITU)	Two ticks followed by a longer OFF time of approx. 3 seconds; played to a busy extension when there is a new incoming Trunk call.	Beep...Beep...Beep... Beep	Played for the duration of the Transfer-On Busy Timer.	Transfer-On Busy Timer.
Confirmation Tone (Acceptance Tone as per ITU)	Continuous, fast beeps, played to confirm successful use of features.	Beep... Beep... Beep	Played for 7 seconds.	Confirmation Tone Timer
Feature Tone	Short beep followed by a longer off duration repeated every second; played when dialing feature access codes	Beep..... Beep	Played until user goes ON-Hook or dials a feature code.	
Programming Tone	Short beep followed by a longer off duration repeated every second; played to prompt entering of fresh commands during programming.	Beep..... Beep	Played until user goes ON-Hook or dials a command.	
Programming Confirmation Tone	Continuous, fast beeps; played to indicate that system has received a valid command and is processing it.	Beep... Beep... Beep	Played for 3 seconds.	Programming Confirmation Timer
Programming Error Tone	Fast beeps, played on a wrong programming command being dialed.	Too...Too...Too ...Too	Played for 3 seconds.	Programming Error Tone Timer

- a. In Store and Forward dialing, the digits are first stored in a memory location and then these are dialed on the trunk. For example: When Least Cost Routing (LCR) is enabled, the system will store the dialed digits first, check the trunk through which the call is to be routed and then dials the number on the appropriate trunk.

Tone standards vary with the country of application. For example, as per ITU standard, the Dial Tone for India consists of 400Hz modulated by 25Hz, whereas it is 350+440Hz, without modulation, for USA/Canada. Further, many countries use different frequencies and cadences for the same tone. For example, in the US, five different frequency and cadence are used for Dial Tone.

SARVAM UCS offers the flexibility of setting the Call Progress Tone Generation (CPTG) type to match the country-specific CPT standards established by ITU.

India being the default 'Region' for SARVAM UCS, the CPTG for India is set as default in the system.

How it works

At the time of installation, when you select the **Region** (according to the geographical location of the site where the SARVAM UCS is installed), SARVAM UCS sets the country-specific CPTG type defined for the selected Region. To see default CPTG types applicable for each region, see “[CPTG Region Codes](#)”.

For countries that use different frequencies and cadences for the same tone, e.g. USA, only one frequency/cadence among the group is considered. See “[Default CPTG Type](#)” at the end of this topic.

How to configure

Programming of Call Progress Tones involves configuration of three parameters: CPTG Type (Region), CPT related Timers, and Dial Tone Type.

The country-specific CPTG type is set automatically by the system when the 'Region' is selected. However, if required, the System Engineer can change the CPTG type set by the system.

Programming CPTG Parameters using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Regional Settings**.
- Click **Call Progress Tones** to open the page.

The screenshot shows the Jeeves configuration interface. On the left, a sidebar titled 'Regional Settings' contains a list of menu items: Region Selection, Local Numbers, Regional Numbers, National Numbers, International Numbers, Limited Numbers 1, Limited Numbers 2, Limited Numbers 3, Call Progress Tones (highlighted with a mouse cursor), and Holiday Table. The main content area is titled 'Call Progress Tones' and contains two dropdown menus: 'Call Progress Tone Type' set to 'Region 1' and 'Dial Tone Type' set to 'Type 1'. Below these are two buttons: 'Submit' and 'Default'.

- To set the **Call Progress Tone Type**, select the desired **Region** from the list.
- Select the desired **Dial Tone Type** from Type 1 or Type 2.
- Click **Submit** to save changes.

To change CPT-related Timers

- Under **Configuration**, click **System Timers and Counts** to open the page.

- Go to **Call Progress Tones**.

System Timers	
Auto Redial	
Auto Redial - Ring Back Tone Wait Timer (sec)	060
Auto Redial - Ring Timer (sec)	045
Auto Redial - Normal Timer (sec)	045
Auto Redial - Normal Count	005
Auto Redial - Priority Timer (sec)	010
Auto Redial - Priority Count	020
Call Progress Tones

Built-In Auto Attendant	
Built-In Auto Attendant Inactivity Timer (sec)	060
Built-In Auto Attendant Answer Wait Timer (sec)	005
Built-In Auto Attendant Music Timer (sec)	005

- Change the values of the CPT-related Timers as desired.
- Click **Submit** to save changes.

Programming CPTG Parameters using a Telephone

- Enter SE mode from a DKP/SLT.

To select the Region, dial:

- **3501-Region Code**
For Region Code, see [“CPTG Region Codes”](#).

To select the Dial Tone Type, dial:

- **5307-Flag**
Where,
Flag is
1 for Dial Tone 1
2 for Dial Tone 2

To change CPT-related Timers, dial:

- **3502-Seconds** to program the Dial Tone Timer.
Where,

Seconds is from 002 to 255.

Default: 007 seconds

- **3503-Seconds** to program the Ring Back Tone Timer.
Where,
Seconds is from 001 to 255 seconds.
Default: 045 seconds.
 - **3504-Seconds** to program the Busy Tone Timer.
Where,
Seconds is from 001 to 255 seconds.
Default: 007 seconds.
 - **3505-Seconds** to program the Error Tone Timer.
Where,
Seconds is from 001 to 255 seconds.
Default: 030 seconds.
 - **3506-Seconds** to program the Feature Confirmation Tone Timer.
Where,
Seconds is from 001 to 255 seconds.
Default: 007 seconds.
 - **3509-Seconds** to program the Programming Confirmation Tone Timer.
Where,
Seconds is from 001 to 255 seconds.
Default: 003 seconds.
 - **3508-Seconds** to program the Programming Error Tone Timer.
Where,
Seconds is from 001 to 255 seconds.
Default: 003 seconds.
 - **3542-Seconds** to change Tone Demo Timer²⁶⁶.
Where,
Seconds is from 001 to 255.
- Exit SE mode.

For SE commands to change Interrupt Request Timer and the Barge-In Timer, Transfer-On Busy Timer, refer the relevant topics: [“Interrupt Request \(IR\)”](#), [“Barge-In”](#) and [“Call Transfer”](#).

How to use

It is important that users of SARVAM UCS also get acquainted with the different Call Progress Tones played by the system, so that they understand the meaning of the terms used for various tones. Therefore, SARVAM UCS makes it possible for users to listen to the various Call Progress Tones.

²⁶⁶. Time for which the system demonstrates the tone/ring to the user.

Demonstration of Tones

It is possible to demonstrate Call Progress Tones to users by dialing the SE commands from EON or an SLT.

By default, the system will play each tone as demonstration for 30 seconds. The duration of demonstration can be changed by setting the 'Tone Demo Timer' to match user preference (see "Changing CPT-related Timers using a Telephone" above).

To demonstrate call progress tones:

- Enter SE mode from a DKP/SLT.
- Dial command **3541-Code**.
Where,
Code is
01 Dial Tone 1
02 Dial Tone 2
03 Ring Back Tone
04 Busy Tone
05 Error Tone
06 Confirmation Tone
07 Feature Tone
08 Routing Tone
09 Programming Tone
10 Intrusion Tone (ICWT)
11 External Call Waiting Tone (CCWT)
- Exit SE mode.

Stuttered Dial Tone

Frequency: Same as Dial Tone 1 (Region wise)

Cadence: 400 ms On - 100 ms Off, 400 ms On - 100 ms Off (same for all Regions)

The meaning of frequency notation is as follows:

- **f1*f2:** f1 is modulated by f2.
- **f1+f2:** The juxtaposition of two frequencies f1 and f2 without modulation.

Call Restriction based on IP Address

What's this?

When the CPU Card of SARVAM UCS is connected to a public IP network, it may be necessary to allow traffic from particular IP address only.

With the feature 'Call Restriction based on IP Address', SARVAM UCS makes it possible to entertain requests on its LAN/WAN Ports from predefined IP Addresses only.

How it works

For this feature to work,

- the *Trusted IP Address/es* table must be configured for each SIP Trunk.
- with this table configured, incoming call traffic from all IP Addresses, other than those programmed in the Trusted IP Address/es table, will be blocked.

All incoming traffic on the SIP Trunk will be rejected if the Trusted IP Address/es Table of that SIP Trunk is blank.

How to configure

For each SIP Trunk, make a list of IP Addresses:Port from which you want to allow traffic. If you want to allow incoming calls from all ports for a particular IP Address, configure only the IP Address.

You are allowed to configure a maximum of 10 IP Addresses.

Programming IP Address Based Call Traffic Restriction using Jeeves

- Login to Jeeves as System Engineer.
- Under **Configuration**, click **VoIP Configuration**.

- Click **SIP Trunk Parameters**.

SIP Trunk Parameters

SIP Trunk No.	Enable SIP Trunk	Name	SIP ID	SIP Trunk Mode
1	<input type="checkbox"/>			Proxy
2	<input type="checkbox"/>			Proxy
3	<input type="checkbox"/>			Proxy
4	<input type="checkbox"/>			Proxy
5	<input type="checkbox"/>			Proxy
6	<input type="checkbox"/>			Proxy
7	<input type="checkbox"/>			Proxy
8	<input type="checkbox"/>			Proxy

Buttons: Submit, Default, Default One, Advance

- Scroll to the **Trusted IP Address/es** parameter.
- Click **IP Address Table**.

SIP Trunk Parameters

SIP Trunk No.	Outbound Proxy			Trusted IP Address/es	SIP Hardware Template
	Enable	Server Address	Server Port		
1	<input type="checkbox"/>		05060	IP Address Table	01
2	<input type="checkbox"/>		05060	IP Address Table	01
3	<input type="checkbox"/>		05060	IP Address Table	01
4	<input type="checkbox"/>		05060	IP Address Table	01
5	<input type="checkbox"/>		05060	IP Address Table	01
6	<input type="checkbox"/>		05060	IP Address Table	01
7	<input type="checkbox"/>		05060	IP Address Table	01
8	<input type="checkbox"/>		05060	IP Address Table	01

Buttons: Submit, Default, Default One, Advance

Trusted IP Address

Index	IP Address:Port
1	
2	
3	
4	
5	
6	
7	
8	
9	
10	

Note: While Programming IPV6 address as Trusted IP address use "[]" square bracket.

Submit Default

The first entry in the table will display the *Proxy/Registrar Server Address:Port* or *Outbound Proxy Address: Port* as configured for the ["Configuring SIP Trunks"](#). For the Index numbers 1 to 10,

- Enter the **IP Address** and the corresponding **Port** from which you want to allow incoming calls.

Do not configure the port, if you want to allow incoming calls from all the ports for a particular IP Address.

- Click **Submit** to save your entries.

Call Taping

What's this?

Call Taping allows extension users to record the telephone conversations they have with other extensions or external numbers, without the opposite party coming to know about it.

Feature is useful for keeping records of important conversations. For this feature to work, make sure the VMS Module is installed.

Call Taping can be done for:

- Incoming and outgoing external calls.
- Incoming and outgoing internal calls.

SARVAM UCS supports taping of 20 calls²⁶⁷ simultaneously in a 3-Party Conference. Calls can be taped either in the extension user's personal mailbox or a common mailbox assigned to this feature. The taped calls are stored along with the call details, that is, the time and date of the call, the calling number and the called number. If calls are taped in a common mailbox, only the extension users having access to the common mailbox can retrieve and listen to the recorded conversations.

To be able to record external incoming and outgoing calls,

- a list of phone numbers (both incoming and outgoing) must have been programmed in **Number List-Incoming Calls** and **Number List- Outgoing Calls** respectively, in the Station Advanced Feature Template.
- **Call Taping** must be enabled in the Trunk Feature Template assigned to the trunk used for making/receiving external calls.

Incoming calls without Calling Line Identification (CLI) can also be taped. For this, the check box **Tape calls coming without CLI** must be enabled in the Station Advanced Feature Template assigned to the extensions.

To be able to record internal calls, the **Call Taping for Internal Calls** check box must be enabled must be enabled in the Station Advanced Feature Template assigned to the extension.

- *Use this feature in accordance with the local privacy laws.*
- *Matrix Comsec is not responsible for any mis-/abuse of this feature by users.*

How it works

A and B are extensions. Both have Call Taping parameters configured in the Station Advanced Feature Template assigned to them. Also, the trunks assigned to both the extensions for making outgoing calls have Call Taping enabled.

C and D are external parties.

E is the mailbox extension where the taped calls are recorded.

²⁶⁷. ETERNITY PENX supports 16 calls simultaneously in a 3-Party Conference.

A calls C

- The system matches the dialed number with the numbers in the **Number List - Outgoing Calls**. The system finds a match.
- When speech is established, the system starts recording the conversation between A and C automatically in E's mailbox.
- Call Taping Beeps will be played to A and C, if **Play Beep when Raid/Call Taping/Conversation Recording starts** is enabled in the System Parameters.

D calls B

- The system matches the incoming number with the numbers in the **Number List-Incoming Calls**.
- On finding a match, when speech is established, system records the speech between D and B in E's mailbox.
- Call Taping Beeps will be played to D and B only if **Play Beep when Raid/Call Taping/Conversation Recording starts** is enabled in the System Parameters.

- *If an incoming call does not have any CLI, the system checks the check box **Tape calls coming without CLI** under the Call Taping in Station Advanced Feature Template assigned to the extension.*
- *If the check box is enabled, all calls without CLI are taped.*

A calls B

- The system checks if the **Call Taping for Internal Calls** is enabled under the Call Taping in Station Advanced Feature Template assigned to A.
- If the check box is enabled, the system records the speech between A and B in E's mailbox.
- Call Taping Beeps will be played to A and B only if **Play Beep when Raid/Call Taping/Conversation Recording starts** is enabled in the System Parameters.
- If the check box is disabled, the speech between A and B will not be recorded.
- The same is done when B calls A. The speech will be recorded in E's mailbox.

To listen to the conversation, A and B must have access to the mailbox of E.

During Call Taping, if the user puts the call on Consultation Hold and access the feature — Call Transfer/ Conference/ Call Park/ Call Toggle, then in this case, the conversation after the call is put on consultation hold will not be taped. However, the system will start tapping this call again once it is transferred to the respective user.

For example, consider F and G are in a two-party speech, and during the ongoing conversation, F wants to speak to H. So, when G puts the call of F on consultation hold and speaks with H, the conversation between G and H will not be taped. Call taping will be resumed again, after the call is transferred to H, that is, the conversation between F and H will be taped.

You can save the taped conversation either in Personal Mailbox or in a Common Mailbox. If you select Personal Mailbox, the taped conversations will be saved in each extension user's Personal Mailbox.

In you select Common Mailbox, you can save the taped conversation either in a single file or in individual files as per your requirement.

If the call is not transferred successfully and returns back to the transferor, then in this case, the system will save the taped conversation in two separate files.

Feature Interaction:

- **Conversation Recording:** If Call Taping and “Conversation Recording” both are enabled for an extension, then priority is given to Call Taping.

How to configure

The functioning of this feature requires the following parameters to be programmed:

- **Save Call Taping Files in:** Specify the location to save Call Taping files. You can select **Common Mailbox** or **Personal Mailbox**.
- **Common Mailbox for Call Taping (Enter Extension Number):** You must program the extension number of the user in whose mailbox the calls are to be taped.
- **Save Call Taping Files as:** If you select common mailbox, select the type of file you want the system to generate for saving the tapped conversation. You may select — *Individual File before and after call transfer* or *Single File before and after call transfer* as per your requirement.
- **Call Taping on Trunks:** Call Taping must be enabled in the Trunk Feature Template assigned to the Trunks. Make sure these trunks are used by extension users for making/receiving external calls.
- **Tape calls coming without CLI check box:** This check box must be enabled if you want calls without CLI to be taped.
- **Number Lists for Incoming and Outgoing Calls:** The Call Taping Number List-Incoming Calls and Call Taping Number List-Outgoing Calls are to be programmed in the Station Advanced Feature Template assigned to the extension users so that the system can match the phone numbers of the incoming and outgoing calls and initiate the recording of the speech.

On a sheet of paper, prepare the Call Taping List Incoming and Call Taping List Outgoing.

You can add as many as 999 numbers to each list. Each entry on these Lists is stored in a serial order against a 'Location Number'. So, draw three columns and enter the numbers against a location number from 01 to 999.

Location	Number List-Incoming Calls	Number List-Outgoing Calls
001		
002		
:		
:		
999		

Use this table to program the Number lists. By default Number List 09 is assigned for numbers of incoming calls, and Number List 10 is assigned to numbers of outgoing calls.

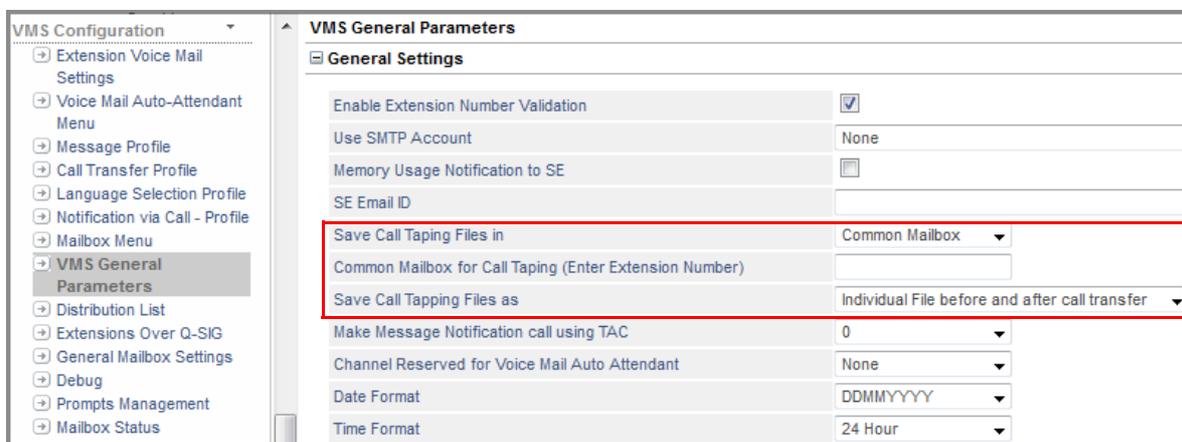

- **Call Taping for Internal Calls check box:** This check box is to be enabled in the Station Advanced Feature Template applied on those extensions that are to be allowed Call Taping of internal calls, that is, calls made or received by them to or from other extensions.
- **Play Beep when Raid/Call Taping/Conversation Recording starts:** This check box is to be enabled if Call Taping Beeps are to be played to the two parties in speech. Enable Call Taping Beeps only when you want indication of speech recording to the two parties in speech. By default, this check box is enabled.

Configuring Call Taping Parameters using Jeeves

- Log in as System Engineer.
- Under **Configuration**.

For Call Taping Mailbox,

- Click **VMS General Parameters** to open the page.

VMS General Parameters	
General Settings	
Enable Extension Number Validation	<input checked="" type="checkbox"/>
Use SMTP Account	None
Memory Usage Notification to SE	<input type="checkbox"/>
SE Email ID	
Save Call Taping Files in	Common Mailbox
Common Mailbox for Call Taping (Enter Extension Number)	
Save Call Taping Files as	Individual File before and after call transfer
Make Message Notification call using TAC	0
Channel Reserved for Voice Mail Auto Attendant	None
Date Format	DDMMYYYY
Time Format	24 Hour

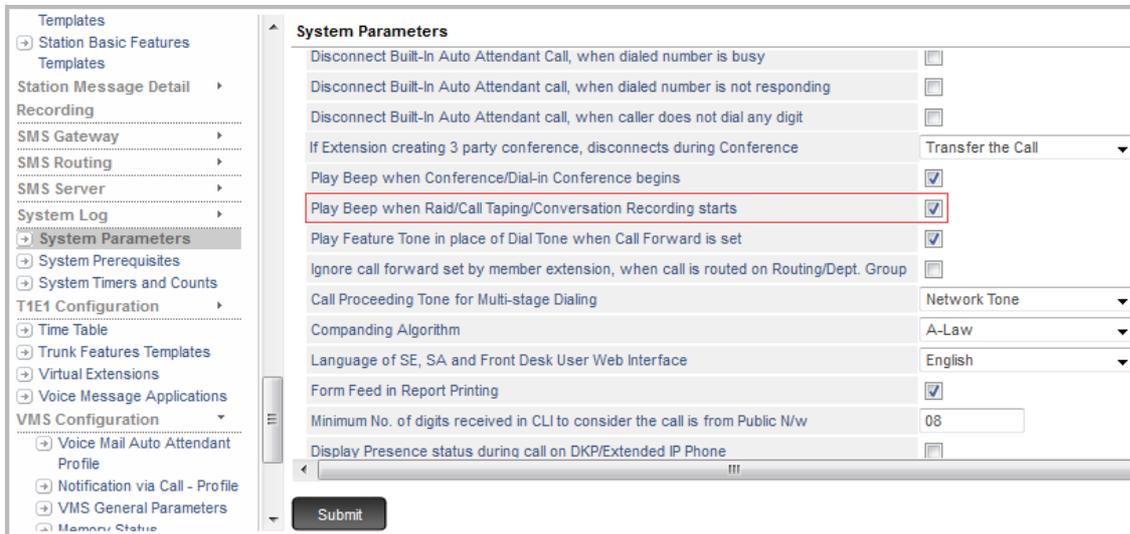

- Under **General Settings**,
- Specify the location where you want to **Save Call Taping Files in**. You can save the Call Taping files either in the Common Mailbox or in your Personal Mailbox. By default, Call Taping files are saved in the Common Mailbox.
- If you choose to save Call Taping files in the Common Mailbox,
 - enter the access code of any SLT, DKP, SIP Extension, Department Group or General Mailbox, whose mailbox you want to assign for Call Taping in **Common Mailbox for Call Taping (Enter Extension Number)**.
 - select the type of file you want the system to generate for saving the tapped conversation in **Save Call Taping Files as**. You may select — *Individual File before and after call transfer* or *Single File before and after call transfer* as per your requirement.

If you select *Individual File before and after call transfer*, the system will generate two separate files for saving the tapped conversation, that is, one file containing the conversation tapped before the call is transferred and another file containing the conversation tapped after the call is transferred. However, if you select *Single File before and after call transfer*, the system will generate one single file for saving the conversation tapped before and after the call is transferred.

- Click **Submit** to save changes.

To enable/disable Call Taping Beeps,

- On the same **System Parameters** page, go to **Play Beep when Call Taping/Conversation Recording Starts** and enable/disable beeps by selecting/clearing the check box.

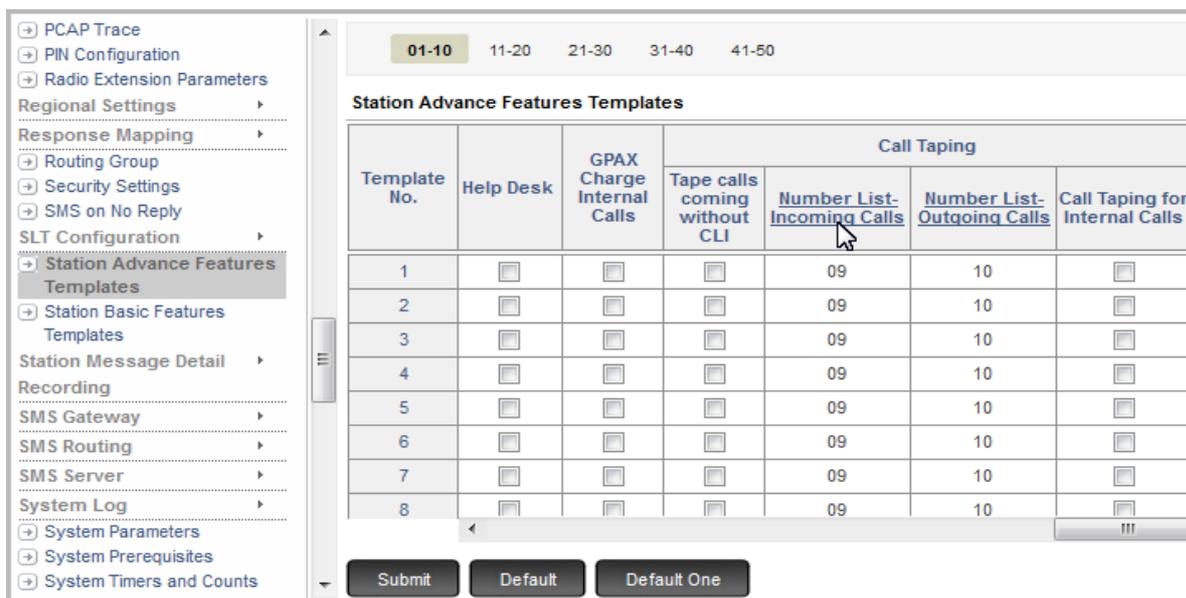

- Click **Submit** at the bottom of the page to save changes.

To enable **Call Taping on Trunks**,

- Select the Call Taping check box in the Trunk Feature Template assigned to the Trunks. For detailed instructions, see [“Configuring Trunks”](#).

To configure the Call Taping parameters and Number Lists,

- Click **Station Advanced Feature Template** to open the page.

By default, Station Advanced Feature Template 01 is assigned to all extensions of the SARVAM UCS. If you want to assign Call Taping facility to all extensions, then program the Call Taping related parameters and Number Lists, in Template 01.

However, if only selected extensions are to be assigned this feature, then:

1. Prepare a separate Station Advanced Feature Template.
 2. Set the Call Taping Parameters in this template.
 3. Apply this new template to desired extensions that are to be allowed this feature.
- Scroll with the horizontal bar to reach the **Call Taping** column of the Template Number assigned to the extensions.
 - If you want calls without CLI to be taped, select the **Tape calls coming without CLI** check box.
 - To program the list of numbers of incoming calls, click the link **Number List- Incoming Calls**.

The Number List page will open.

The screenshot shows the 'Network Parameters' configuration page. On the left is a navigation menu with 'Number List' selected. The main area displays a grid of number ranges: 01-02, 03-04, 05-06, 07-08, 09-10, 11-12, 13-14, 15-16, and 001-250, 251-500, 501-750, 751-999. Below this is a 'Number List' table with columns for Index, Number List 01, and Number List 02. The table contains rows for indices 001 through 010. At the bottom are 'Submit', 'Default', and 'Default One' buttons.

Index	Number List 01	Number List 02
001		00
002		0
003		1
004		2
005		3
006		4
007		5
008		6
009		7
010		8

- Click the default number list **9-10** link assigned to Call Taping, then click the **001-255** link of the default.

The Number Lists 9 and 10 will open.

- *If the same incoming and outgoing numbers are to be programmed for all extensions, you may simply program the default Number lists 09 and 10.*
- *If different incoming and outgoing numbers are to be programmed for different extensions, then prepare different number lists.*

- Enter the List of Incoming Numbers that the system should match in List No. 09.
- Enter the List of Outgoing Numbers that the system should match in List No. 10.
You can program as many as 999 numbers in each list. Each entry on these Lists is stored in a serial order against a 'Location Index, starting from 001-999'. There are 250 Location Index on each page on your screen. To go to the next set of Location Index, for instance, 251-500, click the link under 09-10.
- Click **Submit** at the bottom of the page to save your number lists.
- Follow the same steps to program a different Call Taping number list. But ensure that the different List number you programmed is entered in the Station Advanced Feature Template applied to the extensions.
- If you want calls between extensions to be taped, click the **Call Taping for Internal Calls** check box.
- Click **Submit** at the bottom of the page to save changes to the template.
- Now, apply the programmed template to the desired extensions to which you want to provide the Call Taping facility. Refer the topic "[Station Advanced Feature Template](#)" for programming instructions.

Programming the Station Software Port using a Telephone

- Enter SE mode from a DKP/SLT.

To enable/disable Call Taping Beeps, dial:

- **5332-Code**
Where,
Code is
0 for Disable
1 for Enable

To program a number in a List:

- **4302-List Number-Location Index-Number-#***
Where,
List Number is from 01 to 16. In this case, 09 for Incoming Number List and 10 for Outgoing Number List.
Location Index is from 001 to 999.
Number is a number string of maximum 16 digit long terminated with #*.
The digits used are as given in Table below for digits: 0-9, #, *, A, B, C, D, F, P, +.

Special Digit	Code
Flash (F)	#2
Pause (P)	#3
A	#4
B	#5
C	#6
D	#7
+	#8
Dot (.)	#9

Special Digit	Code
#	##
*	**

To clear a number from a Location Index:

- **4302-List Number-Location Index-#***

Where,

List Number is from 01 to 16. In this case, 09 for Incoming Number List and 10 for Outgoing Number List.

Location Index is from 001 to 999, where the number you want to clear is stored.

To program Number List - Incoming in Station Advanced Feature Template:

- **5602-1-Template Number-Feature Number-Code**

Where,

Template Number is from 01 to 50.

Feature Number is

18 for Number List-Incoming.

19 for Number List-Outgoing.

Code is the Number List from 01 to 16.

In this case, 09 for Incoming Number List and 10 for Outgoing Number List.

To enable Call Taping Internal Flag in a Station Advanced Feature Template, dial:

- **5602-1-Template Number-Feature Number-Code**

Where,

Template Number is from 01 to 50.

Feature Number for Call Taping Internal Flag is 20.

Code is

0 for Disable

1 for Enable

To enable Tape calls coming without CLI Flag in a Station Advanced Feature Template, dial:

- **5602-1-Template Number-Feature Number-Code**

Where,

Template Number is from 01 to 50.

Feature Number for Tape calls without CLI is 17.

Code is

0 for Disable

1 for Enable

- Exit SE mode.

For SE commands for applying the programmed template to DKP and SLT extensions, refer the topic [“Customizing Station Advanced Feature Template using a Telephone”](#).

Also refer the topic [“Number Lists”](#) to know more.

How to use

This feature works automatically on the extensions which have the Call Taping parameters configured.

Call Taping conversations can be recorded either in a common mailbox or in the extension user’s personal mailbox.

- If calls are taped in a common mailbox, only the extension users having access to the common mailbox can retrieve and listen to the recorded conversations.
- If calls are taped in a personal mailbox, the extension user can listen to the recorded conversation by accessing their personal mailbox.

Accessing Personal Mailbox

If you are an EON/Extended IP Phone user

- Press 'Voice Mail' Key.
OR
- Dial **3931-Your Mailbox Password**²⁶⁸
- Follow Voice Mail Prompts to listen to new messages.

If you are an SLT user

- Lift the handset.
- Dial **3931-Your Mailbox Password**
- Follow Voice Mail Prompts to listen to new messages.
- Replace handset.

²⁶⁸. Only if the mailbox is password protected, you will be prompted to enter the password.

Call Toggle

What's this?

Call Toggle allows you to have two simultaneous telephone conversations, talking to two persons alternately.

Call Toggle is also referred to as Hold-Consult or Call Splitting,

You can toggle between:

- Two internal calls (that is, two extensions).
- An internal Call and an External Call (extension and trunk).
- Two external calls (two trunks).

How it works

- A, B, and C are extensions.
- D and E are trunks.

Toggling between two internal calls

- A is in speech with B and C is on Consultation Hold.
- To talk with C, A dials Flash-1. Speech with C.
- To talk with B, A dials Flash-1. Speech with B.
- A can toggle back to C by dialing Flash-1.

Toggling between internal call and external call

- A is in speech with B and D (external call) is on Consultation Hold.
- To talk with D, A dials Flash-1. Speech with D.
- To talk with B, A dials Flash-1. Speech with B.
- A can toggle back to D by dialing Flash-1.

Toggling between two external calls

- A is in speech with D and E is on Consultation Hold.
- To talk with E, A dials Flash-1. Speech with E.
- To talk with D, A dials Flash-1. Speech with D.

- A can toggle back to E by dialing Flash-1.

- *The party put on Consultation Hold during Call Toggle cannot hear the conversation between the other two parties.*
- *You can also toggle between an incoming internal/external call (indicated by call waiting tone) and an internal/external call you are currently in speech with.*
- *You can also answer an incoming 'Interrupt Request' call and toggle between the interrupting extension and the extension you were in speech with.*
- *You can convert a Call Toggle into a three-party conference by dialing Flash-*3.*
- *You can transfer the call you are currently in speech with to another extension.*
- *You can park the call you are currently in speech with.*

How to configure

Call Toggle is a Class of Service (CoS) dependant feature.

In the default Station Basic Feature Template 01 assigned to all extensions of SARVAM UCS, Call Toggle is included in the 'Basic Features' assigned to all CoS groups, including the default CoS group 01. So, all extensions of SARVAM UCS can use this feature.

As Call Toggle is a part of the set of 'Basic Features', you cannot disable this feature selectively in the COS of extensions, without disabling the entire set of features.

No specific programming is required for this feature, except for programming a DSS key for Call Toggle, if required. Refer the topic [“DSS Keys Programming”](#) for instructions.

How to use

For EON and Extended IP Phone Users

Call Toggle between two internal calls:

- Speech with Extension 1.
- Extension 2 on Consultation Hold.
- To talk with Extension 2, press DSS key assigned to Call Toggle.
- Speech with extension 2.
- Press DSS key assigned to Call Toggle again.
- Speech with Extension 1.

Call Toggle between an Internal Call and an External Call:

- Speech with extension.
- External party on Consultation Hold.
- To talk with the external party, press DSS key assigned to Call Toggle.
- Speech with external party.
- Press DSS key assigned to Call Toggle again.
- Speech with Extension.

Call Toggle between two External Calls:

- Speech with external party 1.
- External party 2 on Consultation Hold.
- Press DSS Key assigned to Call Toggle.
- Speech with External party 2.
- Press DSS key assigned to Call Toggle again.
- Speech with External party 1.

For SLT Users

Call Toggle between two internal calls:

- Speech with extension 1.
- Extension 2 on Consultation Hold.
- To talk with extension 2, dial Flash-1.
- Speech with extension 2.
- Dial Flash-1 again.
- Speech with extension 1.

Call Toggle between an Internal Call and an External Call:

- Speech with extension.
- External party on Consultation Hold.
- To talk with external party, dial Flash-1.
- Speech with external party.
- Dial Flash-1 again.
- Speech with extension.

Call Toggle between two External Calls:

- Speech with external party 1.
- External party 2 on trunk 2 on Consultation Hold.
- To talk with external party 2, dial Flash-1.
- Speech with external party 2.
- Dial Flash-1 again.
- Speech with external party 1.

Call Traffic

What is this?

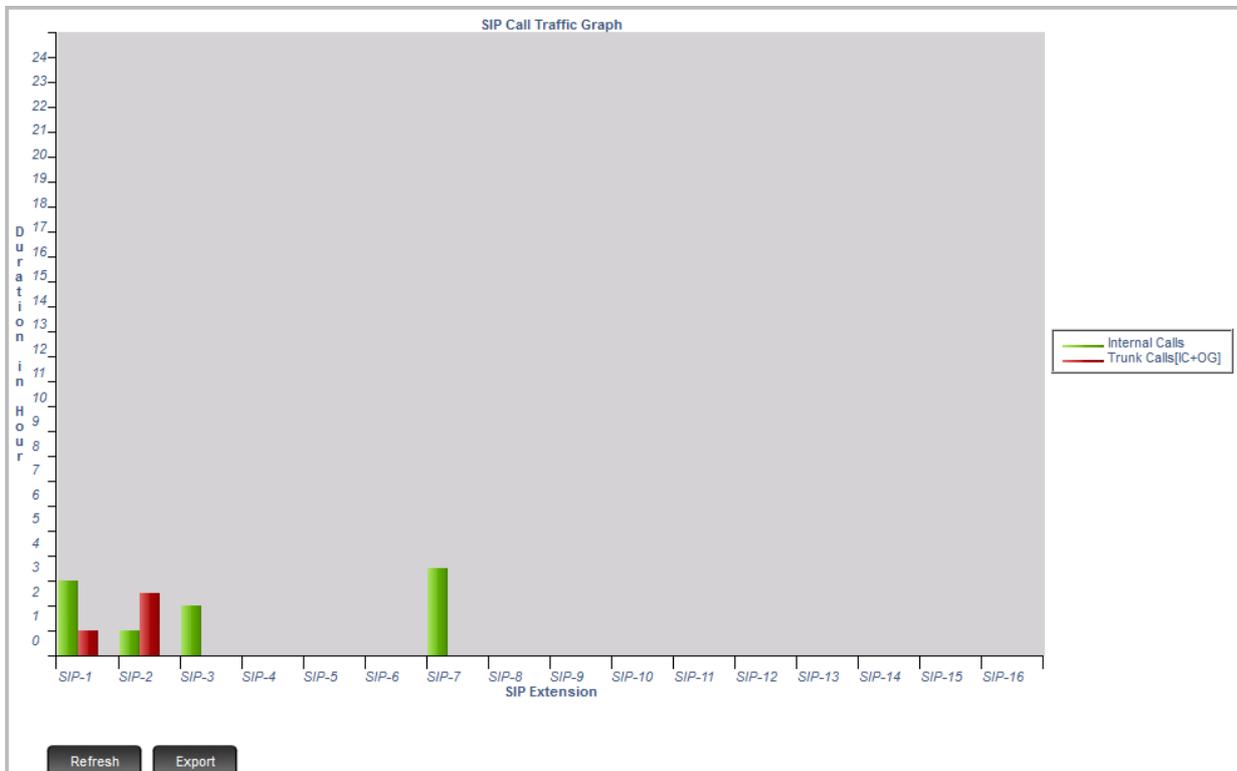

Call traffic measurement feature of SARVAM UCS gives a graphical representation of the time duration for which extensions and trunk ports remained Off-hook. The data is represented in a bar graph format for the SLT, DKP, Magneto, ISDN Terminals, CO, E&M, T1E1 and Mobile ports as well as SIP Extensions.

In the graph, the duration is shown in Hours along the Y-axis while the extension(s)/ trunk(s) port names are shown along the X-axis. The following call traffic measurement data (for each Extension and Trunk port separately) is displayed:

- Time for which each extension remained in speech for making/receiving Internal calls.
- Time for which each extension remained in speech for making/receiving Trunk calls (Incoming + Outgoing).
- Time for which each trunk port remained in speech for Incoming calls.
- Time for which each trunk port remained in speech for Outgoing calls.

This time is measured in terms of the number of hours, and the traffic is measured for last 24 hours.

You can view this traffic information in graphical format on the Jeeves; see the illustration below for Call Traffic information generated for SIP extension.

The two-color bars distinguish Internal calls (green) and Trunk calls (red)

You can also export this information in a database readable format like Microsoft Excel. The call traffic information files can be saved on a local disk.

How to use

To view Call Traffic in graphical format, you need to log into the Jeeves as System Engineer.

Go to the configuration page of the desired trunk or extension port for which you want to view Call Traffic data.

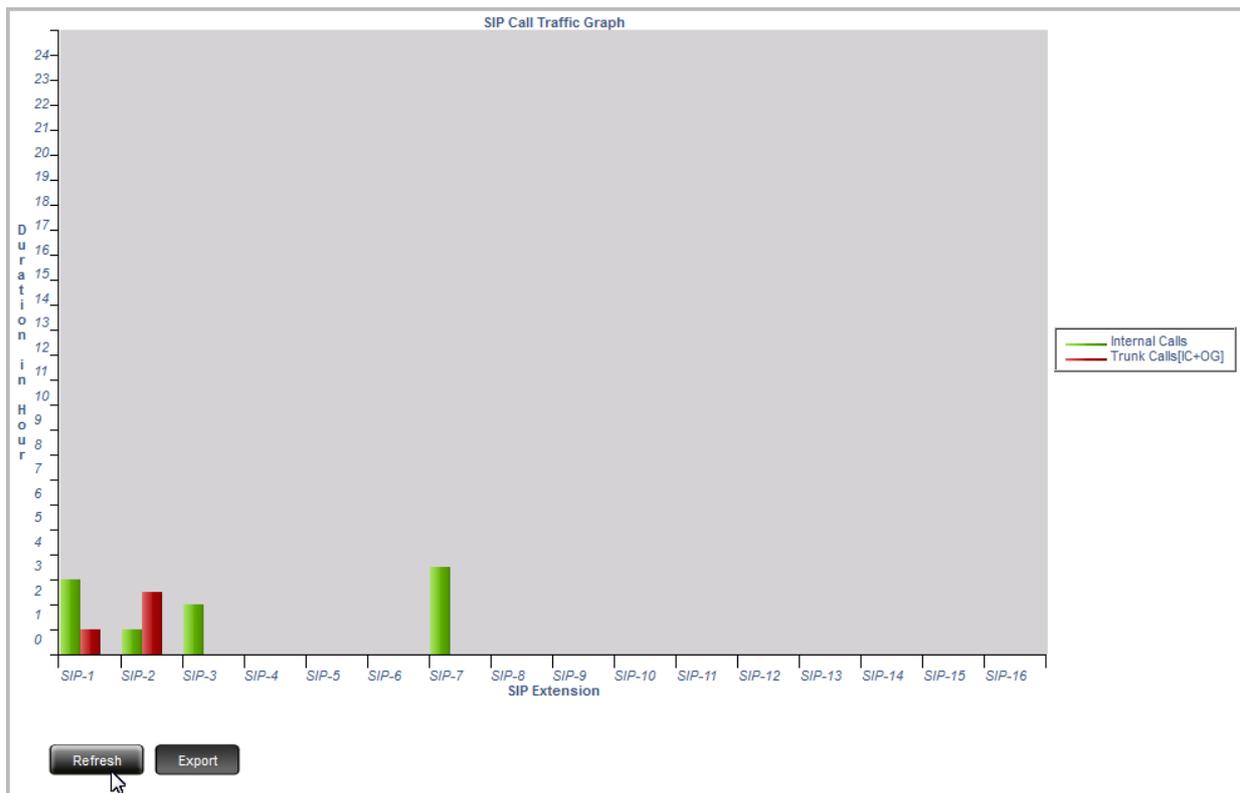

On the page, click the **Call Traffic** button.

The call traffic will be generated as a graph.

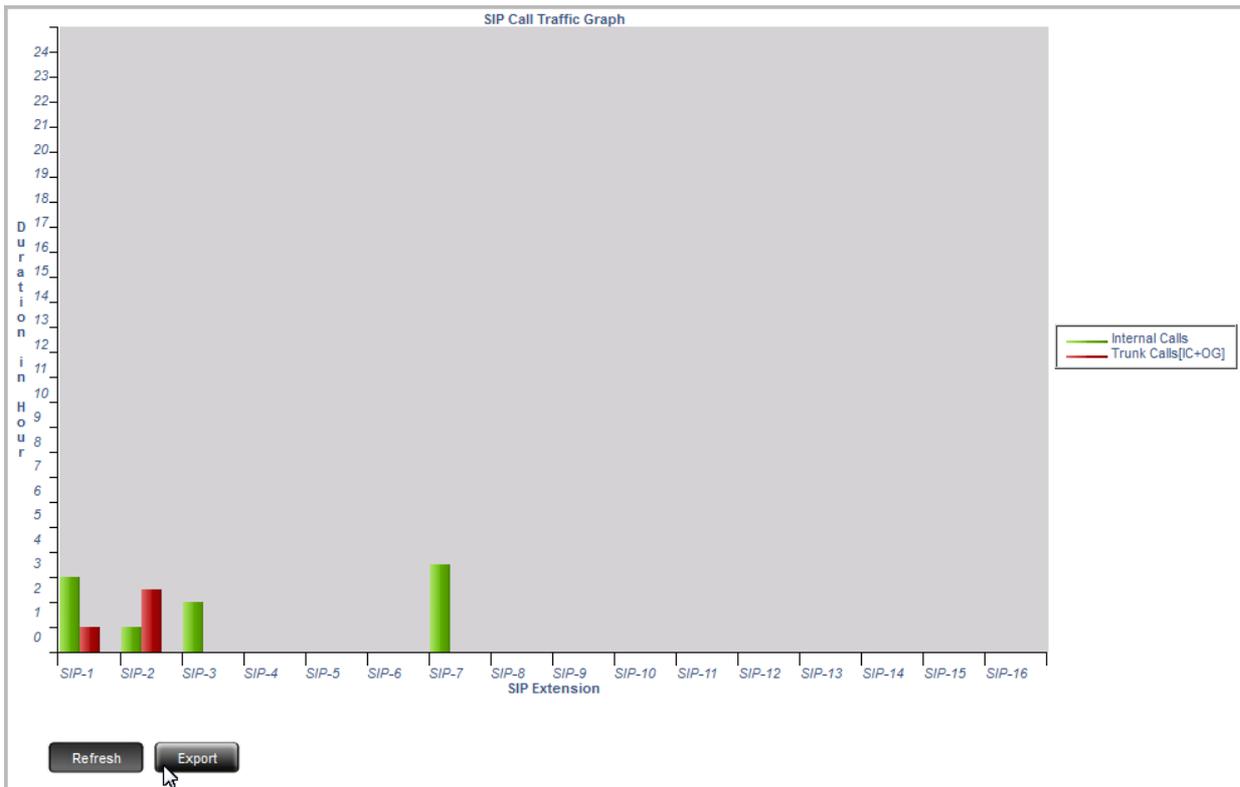

If there is no call traffic usage data is available for the extension/ trunk you are currently viewing, the page will not show any bars.

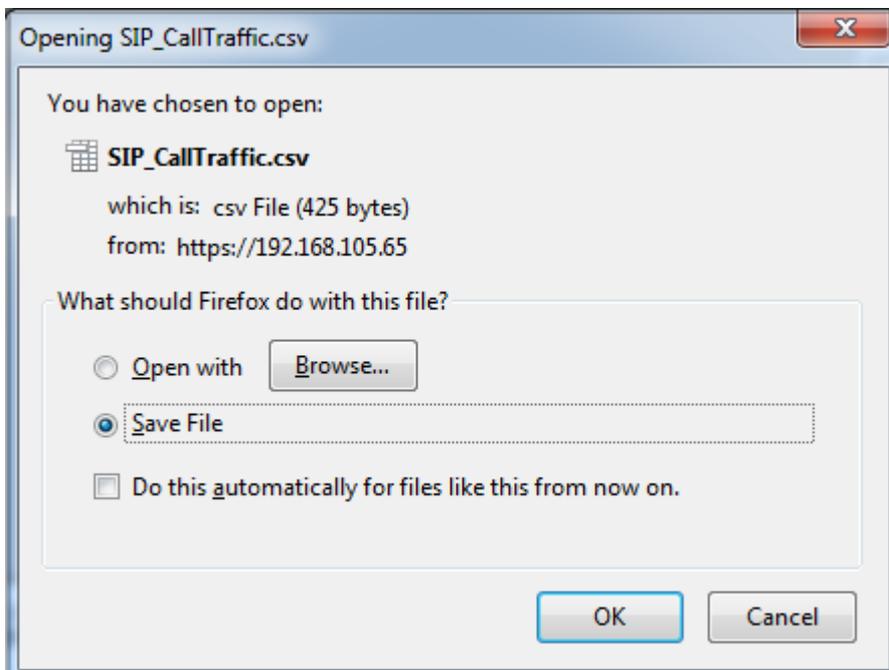

Click the **Refresh** button to get the latest 24hrs call traffic statistics. The application filters the SMDR records for last 24hrs and graph is generated accordingly.

- Click the **Export** button to export the data you are currently viewing.

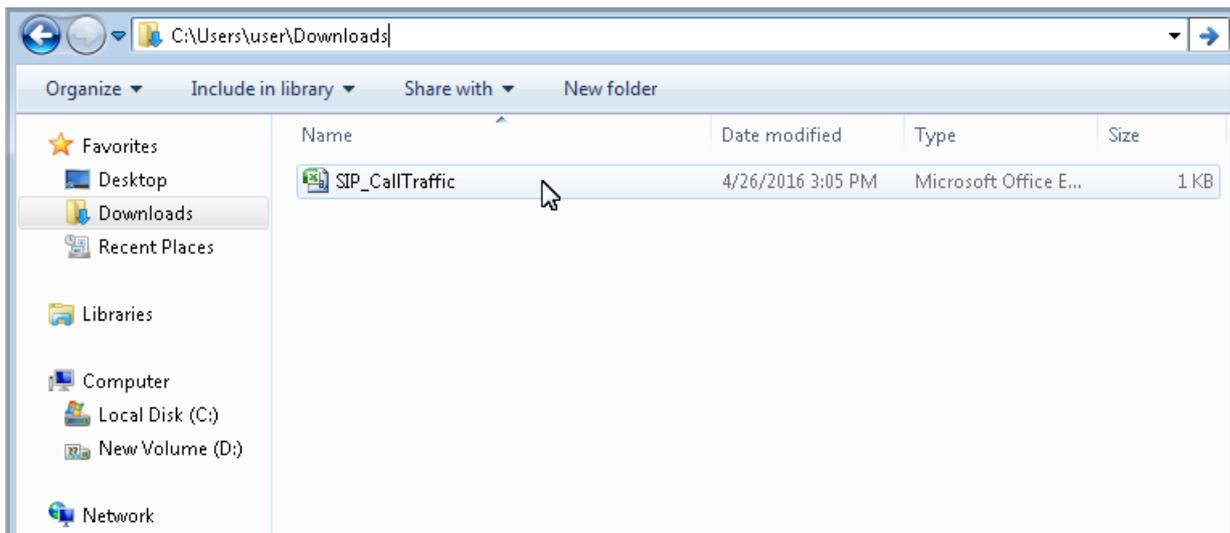

- The **Opening SIP_CallTraffic.csv** window will open.

You can choose whether to open this file or save it in .xls format as per your requirement.

- Save the file on the local disk.

- If you open this file in MS Excel then it may look as shown in the following image.

A screenshot of the Microsoft Excel application window titled 'SIP_CallTraffic - Microsoft Excel'. The ribbon shows the 'Home' tab with various formatting options. The spreadsheet data is as follows:

	A	B	C	D	E	F	G	H	I
1	14:40:33	26/4/2016	SIP Call Traffic Graph						
2	Extension Internal C Trunk Calls[I+C+OG] (Hrs.)								
3	SIP Extn-1	3	1						
4	SIP Extn-2	1	2.5						
5	SIP Extn-3	2	0						
6	SIP Extn-4	0	0						
7	SIP Extn-5	0	0						
8	SIP Extn-6	0	0						
9	SIP Extn-7	3.5	0						
10	SIP Extn-8	0	0						
11	SIP Extn-9	0	0						
12	SIP Extn-1	0	0						
13	SIP Extn-1	0	0						
14	SIP Extn-1	0	0						
15	SIP Extn-1	0	0						
16	SIP Extn-1	0	0						
17	SIP Extn-1	0	0						
18	SIP Extn-1	0	0						

 *The file contains the date and time when the call traffic data is calculated and the names of the extensions/trunks for which it is calculated.*

- You can save this file on your local disk from Excel window also.
- After you are done, you may log out of Jeeves.

Call Transfer

What is this?

Call Transfer enables you to relocate an existing call from an extension or trunk to another extension or to an external number. Calls can be transferred after notifying the other extension/external number about the impending transfer or can be transferred directly without notification.

The types of Call Transfer SARVAM UCS offers are:

- **Call Transfer - Screened:** The Operator puts the caller on Consultation Hold, dials the desired party's extension, and informs the desired party of the impending transfer. If the desired party chooses to accept the call, the call is transferred over to them.
- **Call Transfer - While Ringing:** The Operator puts the caller on Consultation Hold, dials the desired party's number and transfers the call when the desired party's extension starts ringing.

This feature is used when there are several other calls to be attended and the Operator cannot wait for the desired party to answer.

- **Call Transfer - On Busy:** The Operator puts the caller on Consultation Hold, dials the desired party's number and transfers the call even when the desired party is busy in speech with another person. The busy extension gets intrusion tone and can choose to answer the intruding (transferred) call.
- **Call Transfer - Trunk-to-Trunk:** An external call is transferred on to another trunk line. The Operator puts the external caller on Consultation Hold, dials the desired party's external number, and transfers the call after or without notifying the desired party of the impending transfer.

Trunk-to-Trunk call transfer may be used to transfer incoming calls for out-of-office extension users to their cell phones, or to connect personnel at remote or distant locations. For instance: an out-of-office executive who does not have long distance dialing permission can call the office and request the operator to connect him to the desired party on a trunk line.

- **Blind Transfer to VMS:** The Operator puts the caller on Consultation Hold, dials the feature access code for Blind Transfer to VMS, dials the desired party's number, and transfers the call. The call is transferred to the mailbox assigned to the desired party. The caller may leave a message in the mailbox.

- *Call Transfer is not exclusively an Operator feature, though it is used mostly by Operators. Calls can be transferred by any extension to another extension or external number, if "Basic Features" (this will allow you to access all types of Call Transfer except Trunk-to-Trunk Transfer) are allowed in Class of Service of the transferring extension.*
- *To access Trunk-to-Trunk Transfer make sure Trunk-to-Trunk Transfer feature is enabled in the Class of Service of the transferring extension.*
- *SARVAM UCS enables SIP extensions to resume a transferred call before it has been answered by the transfer target (which may be an extension or an external number). For a list of IP phones on which this feature has been tested, see ["SARVAM UCS Features tested on IP Phones of different Brands"](#) in the Appendix.*

- SARVAM UCS allows Semi-attended Transfer and Transfer on Conference Hangup on SIP Trunks. For a list of IP phones on which this feature has been tested, see [“SARVAM UCS Features tested on IP Phones of different Brands”](#) in the Appendix.

How it works

A and B are extension users.

C is an external caller.

D is an external number.

Call Transfer from Trunk/Extension to Extension

Three scenarios are possible:

1. Screened Transfer:

- C calls a Trunk of SARVAM UCS.
- The Operator answers the call.
- Operator puts C on Consultation Hold.
- Operator dials B's extension.
- When B answers the call, the Operator informs B about the call.
- If B accepts the call, the Operator transfers the call to B.
- Now, B and C are in speech.

- *If B does not accept the call, Operator may dial Flash to retrieve the call and speak to C.*
- *The Operator can also abort call transfer while B's phone is ringing by dialing Flash. The Operator gets connected to C.*

2. Transfer While Ringing:

- C calls a Trunk of SARVAM UCS.
- The Operator answers the call.
- The Operator puts C on Consultation Hold and dials B's extension.
- The Operator transfers the call when B's phone starts ringing.
- If B answers the call, B gets connected to C.
- If B does not answer the call at the end of the Transfer-While Ringing Timer (programmable; default: 30 seconds), the call is returned to the Operator. C gets Ring Back Tone.
- The Operator answers the call and is in speech with C.
- However, if the Operator is busy at the time of call return, the system waits for the Operator to become free. When the Operator is free, C gets Ring Back Tone.
- The Operator answers the call and is in speech with C.

3. Transfer On Busy:

- C calls a Trunk of SARVAM UCS.
- The Operator answers the call.
- The Operator puts C on Consultation Hold and dials B's extension.
- The Operator gets busy tone from B's extension. B is busy with A.
- The Operator transfers the call to B on Busy tone.
- B gets intrusion beeps. The beeps are played for the duration of the Transfer on Busy Timer (programmable; default: 30 seconds)
- B may dial Flash to answer the call. A is put on hold.
- B is now connected to C.

- If B does not answer the intrusion beeps at the end of the Transfer on Busy Timer, the call is returned to the Operator. C gets ring back tone.
- If the Operator too is busy at the time of call return, C gets busy tone.

Call Transfer - Trunk to Trunk

- C calls a Trunk of the SARVAM UCS.
- The Operator answers the call.
- B is out of office, but is available at external number D.
- The Operator puts C on Consultation Hold.
- The Operator dials trunk access code and calls the external number D.
- The Operator may:
Wait for D to answer the call, transfer the call if D accepts the call. (screened transfer)

OR

Transfer the call as soon as D's phone starts ringing. (transfer while ringing)

- C and D are now in speech for the duration of the Trunk-to-Trunk Inactivity Timer²⁶⁹.
- A warning tone is given at the end of the Trunk-to-Trunk Inactivity timer (programmable; default: 2 minutes). On expiry of this timer, the call is disconnected.
- To extend the call, either C or D must dial any digit in tone (DTMF), except '##'.

Dialing '##' to extend the call will result in Call Disconnection.

In the case of Trunk-to-Trunk transfer, both parties in speech on trunk lines must be informed that their call would be disconnected at the end of the Trunk-to-Trunk Inactivity Timer and that they must dial any digit, except '##' to extend the call.

Call Transfer - Blind Transfer to VMS

- C calls a Trunk of SARVAM UCS. C wants to talk to A.
- The Operator attends the call.
- The Operator puts C on Consultation Hold.
- The Operator dials Feature Access Code for Blind Transfer to VMS and A's extension number.
- The system hunts for the mailbox assigned to A's extension.
- When the mailbox is found, the Operator gets confirmation tone. C gets connected to A's mailbox.
- C gets voice prompts. C may follow the prompts to leave a message.

- If A does not have a mailbox assigned, the Operator will get an error tone while transferring the call.
- The Operator may retrieve C's call by pressing Transfer Key/Flash /Call Appearance key.

Feature Interactions:

²⁶⁹. The process of Trunk-to-Trunk transfer takes place outside of the System. So, the System will not know which of the two trunks have gone ON-Hook. Hence the call is automatically disconnected when the Trunk-to-Trunk Inactivity Timer expires.

- **CLIP and Caller ID Presentation while Transfer:** SARVAM UCS provides the flexibility to display either the extension number that is transferring the call or the held party's number, that is, the number of the party that is about to be transferred. Refer [“Calling Line Identification and Presentation \(CLIP\)”](#).
- **Privacy:** Call Transfer-On Busy will not work if the busy extension has Call Privacy from intrusion Tone in its Class of Service.
- **DND:** Call Transfer will not work if the destination extension has set DND.
- **Call Hold:** You must retrieve a held call, to Transfer it.

How to configure

To be able to use Call Transfer, this feature must be enabled in the Class of Service group of the extensions to be allowed this feature. The default values of the related Timers may be changed, if required.

To be able to use Blind Transfer to VMS, the extensions must be assigned a mailbox. For instructions, refer to [“Configuring Voice Mail System”](#) .

Call Transfer in Class of Service

In the default Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS, the default CoS group 01 in this template has Call Transfer included in the 'Basic Features'. So, all extensions of SARVAM UCS can use this feature.

You cannot disable 'Call Transfer' selectively without disabling the entire set of 'Basic Features'.

Refer the topics [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#) to know more.

Call Transfer Related Timers

- **Transfer While Ringing Timer:** This timer is related to Call Transfer - While Ringing. It is the time for which the system rings the extension. By default it is set to 30 seconds. At the end of the timer the call is returned to the transferring extension.
- **Transfer on Busy Timer:** This timer is related to Call-Transfer on Busy. It is the time for which the system waits for the busy extension to respond to the intrusion tone. By default the timer is set to 30 seconds. At the end of the timer the call is returned to the transferring extension.
- **Trunk to Trunk Inactivity Timer:** This is the time duration after which the system disconnects the call transferred from one trunk line to another. By default it is set to 2 minutes. At the end of the timer the call is disconnected, if either party does not dial digits to extend the call. This Timer is relevant for CO to CO and CO to E&M calls only.

Changing Call Transfer Related Timers using Jeeves

- Log in as System Engineer.

- Under **Configuration**, click **System Timers and Counts** to open the page.

System Timers	
Other Features	
Auto Call Back Ring Timer (sec)	030
Interrupt Request Timer (sec)	045
Barge-In Timer (sec)	010
Trunk Reservation Timer (min)	010
Transfer while Ringing Timer (sec)	030
Transfer on Busy Timer (sec)	030
Trunk to Trunk Inactivity Timer (min)	002
Call Park Timer (min)	002
Call Park Release Timer (min)	003
LCS Timer (sec)	010
Message Wait Ring Count	010
Message Wait Ring Timer (sec)	030
Message Wait Ring Interval Timer (min)	030

- Scroll to reach **Other Features** and change the values as required for Call Transfer related timers.
- Click **Submit** at the bottom of the page to save changes.
- Log out of Jeeves or continue with programming tasks, as required.

Changing Call Transfer Related Timers using a Telephone

- Enter SE mode.

To program Transfer While Ringing Timer:

- Dial command **3806-Seconds**
Where,
Seconds is from 001 to 255 seconds.
Default: 030

To program Transfer on Busy Timer:

- Dial command **3807-Seconds**
Where,
Seconds is from 001 to 255 seconds.
Default: 030

To program the Trunk-to-Trunk Inactivity Timer:

- Dial command **3808-Minutes**
Where,
Seconds is from 001 to 255 minutes.
Default: 2 minutes

- Exit SE mode.

How to use

For EON and Extended IP Phone Users

Extension to Extension:

- Speech with extension.
- Press DSS Key assigned to desired party extension.
- Go ON-Hook or press 'Transfer' Key.

OR

- Speech with extension.
- Press 'Transfer' Key. You get feature tone.
- Dial desired party's extension number.
- Go ON-Hook or press 'Transfer' Key.

Extension to Trunk:

- Speech with extension.
- Press DSS Key assigned to Trunk.
- Dial External Number (transfer target)
- Go ON-Hook or press 'Transfer' Key.

OR

- Speech with extension.
- Press 'Transfer' Key. You get feature tone.
- Dial-Trunk Access Code²⁷⁰ - External Number.
- Go ON-Hook or press 'Transfer' Key.

Trunk to Extension Transfer:

- Speech with Trunk.
- Press DSS Key assigned to desired party extension.
- Go ON-Hook or press 'Transfer' Key.

OR

- Speech with Trunk
- Press 'Transfer' Key and dial desired party's extension number
- Go ON-Hook or press 'Transfer' Key.

Trunk to Trunk Transfer:

- Speech with Trunk.
- Press DSS Key assigned to Trunk.
- Dial External Number.
- Speech with External Number.
- Go ON-Hook or press 'Transfer' Key.

270. Trunk Access Code: users worldwide may dial a code from 0, 5, 61, 62, 63, and 64. Users in USA may dial a code from 0, 9, 81, 82, 83, and 84.

OR

- Speech with Trunk.
- Press 'Transfer' Key and dial Trunk Access Code²⁷¹-External Number.
- Speech with the External Number.
- Go ON-Hook or press 'Transfer' Key.

Blind Transfer to VMS:

- Speech with extension.
- Press DSS Key assigned to Blind Transfer to VMS.
- Dial desired party's extension number.
- Go ON-Hook or press 'Transfer' Key.

OR

- Speech with extension.
- Press Transfer key.
- Dial 1078.
- Dial desired party's extension number.
- Go ON-Hook or press 'Transfer' Key.

For SLT Users

Extension to Extension Transfer:

- Speech with extension.
- Press Flash.
- Dial desired party's extension number.
- Replace handset.

Extension to External Number:

- Speech with extension.
- Press Flash.
- Dial Trunk Access Code.
- Dial External Number.
- Replace handset.

External Number to Extension Transfer:

- Speech with External Number.
- Press Flash.
- Dial desired party's extension number.
- Replace handset.

Trunk to Trunk Transfer:

- Speech with External Number 1.
- Dial Flash.
- Dial Trunk Access Code

271. Trunk Access Code: users worldwide may dial a code from 0, 5, 61, 62, 63, and 64. Users in USA may dial a code from 0, 9, 81, 82, 83, and 84.

- Dial External Number 2.
- Speech with the External Number 2.
- Replace Handset.

Blind Transfer to VMS

- Speech with Trunk/Extension.
- Press Flash.
- Dial 1078.
- Dial desired party's extension number.
- Replace handset.

Calling Line Identification and Presentation (CLIP)

What's this?

The SARVAM UCS provides the facility of detecting the caller's number and presenting it on the display of the called extension phone. This feature is called Calling Line Identification and Presentation (CLIP).

The calling number can be presented on ISDN Terminals, EON and also on SLTs that support CLI protocols.

The signaling protocols for CLI supported by SARVAM UCS are: DTMF, FSK V.23, and FSK-Bellcore.

These protocols are supported on trunks as well as extensions. Any type of trunk line and supporting DTMF or FSK signaling can be interfaced with the SARVAM UCS.

Similarly, any type of telephone instrument supporting DTMF or FSK signaling protocol can be connected to the SLT port.

How it works

When CLIP is enabled on a trunk,

- SARVAM UCS senses the digits/codes sent by PSTN.
- It sends this information to the landing extension/Operator along with the ringing signal.
- In case of, Internal calls the calling extension's name and number both are presented to the called extension.
- In the case of External calls, only the number will be displayed on the landing/Operator extension.
- When the landing extension/Operator transfers the incoming call to an extension, putting the external caller on hold, the system sends this information to the extension to which the call is transferred.
- During the transfer, the number of the landing extension/Operator will be displayed on the transfer destination extension.
- On successful call transfer, the caller's number will be displayed on the transfer destination extension.

In the case of Call Transfer, the system also provides the option of displaying to the destination extension either the number of the party that is put on hold to be transferred, that is, the Held Party OR the number of the Transferring Party, while the call transfer is taking place. This feature is called Caller ID Presentation while Transfer.

It is also possible to remove and replace the '+' character received as CLI on telephones that do not support CLIP starting with this character.

For example, the GSM network sends the calling party number with '+' as the prefix. If the telephone connected as extension does not support this, it will not present the CLI of the caller. To overcome this, SARVAM UCS provides you the option of replacing '+' with an appropriate number string which these telephones can display.

Feature Interactions:

- **CLIR:** CLIP and Caller ID Presentation while Transfer will work only if CLIR is not enabled on the extension that has transferred the call. Refer the topic "[Calling Line Identification Restriction \(CLIR\)](#)".
- **Q-Sig:** When two Systems - System A and System B are networked using Q-Sig, and an extension of one System, for instance, System A transfers a call to an extension of System B by putting the caller on hold, the CLI presented on the extension of System B will be according to the type of Caller ID Presentation while Transfer set on the transferring extension of System A.

How to configure

The functioning of this feature is controlled by two parameters: **CLIP Type** and **Caller ID Presentation while Transfer**.

If you want to replace '+' characters received as CLI on telephones that do not support CLI prefixed with this character, you must program the relevant flag and the desired number string in the 'System Parameters'.

All these parameters can be programmed using Jeeves and a Telephone.

CLIP Type

If SLTs supporting CLI are connected to the SARVAM UCS, the System Engineer must select a signaling protocol for CLI in the SLT Hardware Template applied on the SLT extensions. By default SLT Hardware Template 01 is assigned to all SLT extensions. The default CLIP Type in Template 01 is 'DTMF'.

There is no need to select a CLIP Type in the default Hardware Template 01, if all the SLTs support DTMF protocol.

If all SLTs support a different CLIP Type say FSK-Bellcore, you may simply select this CLIP Type in the default Hardware Template applied on all SLT extensions.

However, if certain SLTs support a particular CLIP type and some support a different CLIP type, then create separate SLT Hardware Templates with different CLIP types and apply them to the appropriate SLTs.

For example, you may select SLT Hardware Template 02 with FSK V.23 and SLT Hardware Template 03 with FSK Bellcore, and Template 04 with DTMF as the CLIP Type and apply each template to the SLTs as per the CLIP Type they support.

Selecting CLIP Type using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **SLT Configuration**.

- Click **SLT Hardware Templates** to open the page.

Template No.	CLIP Type	Digit Pad Count	Ring Type	SLT Gain Settings Template
1	DTMF	0	Trapezoidal	1
2	DTMF	0	Trapezoidal	1
3	DTMF	0	Trapezoidal	1
4	None DTMF FSK-V.23 FSK-Bellcore	0	Trapezoidal	1
5	DTMF	0	Trapezoidal	1
6	DTMF	0	Trapezoidal	1
7	DTMF	0	Trapezoidal	1
8	DTMF	0	Trapezoidal	1

- Select the **CLIP Type** supported by the SLT.
- Click **Submit** at the bottom of the page to save changes.

Selecting CLIP Type using Telephone

- Enter SE mode from a DKP/SLT.
- Dial command **5702-1-Template Number-Parameter Number-Code**
Where,
Template Number is SLT Hardware Template Number from 01 to 50
Parameter Number is 01 for CLIP Type.
Code is:
0 for None
1 for DTMF
2 for FSK-V23
3 for FSK Bellcore
For instance: To select FSK-V23 in SLT Hardware Number 01, dial 5702-1-01-01-2
- Exit SE mode.

Caller ID Presentation while Transfer

The Caller ID Presentation while Transfer gives you the choice of displaying to the destination extension, the CLI of either the party put on hold to be transferred, that is, the Held Party or the Transferring Party, that is, the party transferring the call, during a call transfer.

This feature is to be programmed in the Station Advanced Feature Template applied on the extension.

In the Station Advanced Feature Template 01 assigned to all extensions by default, Caller ID of the Held Party is selected.

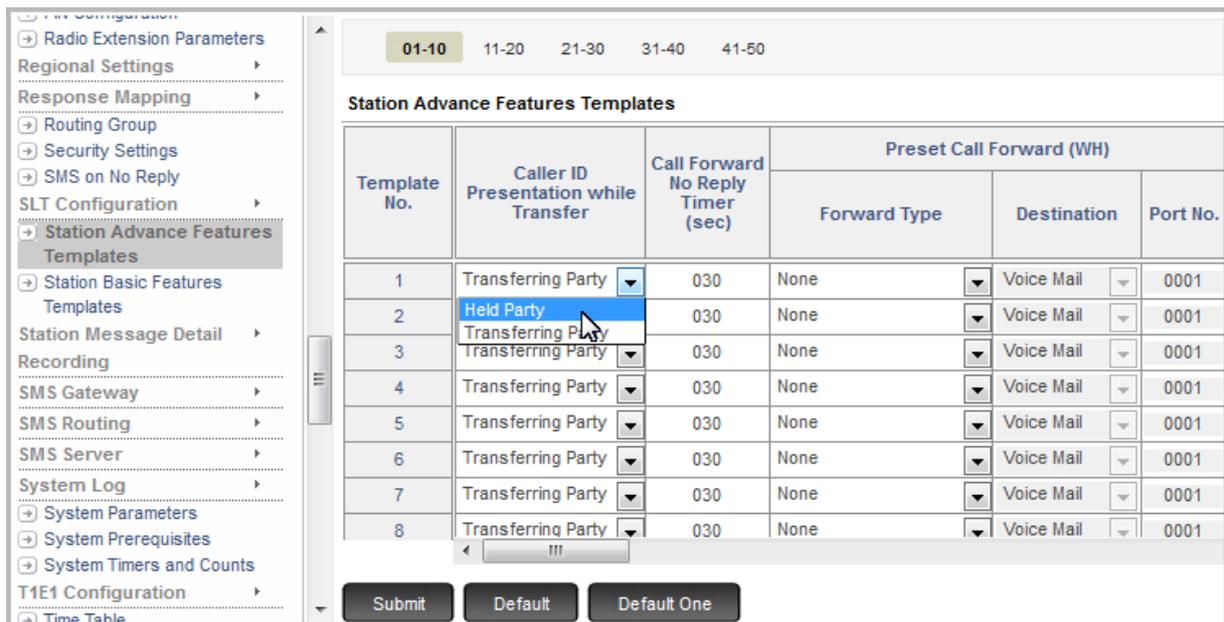

But if you want to show the Caller ID of the Transferring party, select this option in the default Station Advanced Feature Template 01.

If all certain extensions are to be provided Caller ID of the Held Party and others the Caller ID of the Transferring Party,

1. Create separate Station Advanced Feature Templates.
2. Select 'Held Party' or 'Transferring Party' as desired in each Template.
3. Apply this Template on the extensions.

Configuring Caller ID Presentation while Transfer using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Station Advanced Feature Templates** to open the page.
- In **Caller ID Presentation while Transfer** field, select the desired option: **Held Party** or **Transferring Party**.

- Click **Submit** at the bottom of the page to save your setting.
- Log out of Jeeves or continue programming.

Configuring Caller ID Presentation while Transfer using a Telephone

- Enter SE mode from a DKP/SLT.
- Dial command **5602-1-Template Number-Feature Number-Code**
Where,
Template Number is Station Advanced Feature Template Number from 01 to 50

Parameter Number is 01 for Caller ID Presentation while Transfer.

Code is:

1 for Transferring Party

2 for Held Party

For instance: To select Transferring Party in Template Number 02, dial 5602-1-02-01-1

- Exit SE mode

Refer the topic [“Station Advanced Feature Template”](#) for instructions assigning Templates to extensions.

Replacing '+' in CLI

To replace '+' characters received as CLI on telephones that do not support CLI prefixed with this character, you must program the flag 'Replace '+' from CLI?' and the desired number string that should replace this character.

Configuring Replace '+' in received CLI using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **System Parameters** to open the page.

Parameter	Value
Replace '+' from CLI	<input checked="" type="checkbox"/>
Replace '+' from CLI with the number string	
Disconnect Built-In Auto Attendant Call, when dialed number is busy	<input type="checkbox"/>
Disconnect Built-In Auto Attendant call, when dialed number is not responding	<input type="checkbox"/>
Disconnect Built-In Auto Attendant call, when caller does not dial any digit	<input type="checkbox"/>
If Extension creating 3 party conference, disconnects during Conference	Transfer the Call
Play Beep when Conference/Dial-in Conference begins	<input checked="" type="checkbox"/>
Play Beep when Raid/Call Taping/Conversation Recording starts	<input checked="" type="checkbox"/>
Play Feature Tone in place of Dial Tone when Call Forward is set	<input checked="" type="checkbox"/>
Ignore call forward set by member extension, when call is routed on Routing/Dept. Group	<input type="checkbox"/>
Call Proceeding Tone for Multi-stage Dialing	Network Tone
Companding Algorithm	A-Law
Language of SE, SA and Front Desk User Web Interface	English

- Enable the **Replace '+' from CLI** flag by selecting the check box.
- Enter the desired number string in the field **Replace '+' from CLI with the number string**.
- Click **Submit** at the bottom of the page to save your setting.
- Log out of Jeeves or continue programming.

Configuring Replace '+' using Telephone

- Enter SE mode from a DKP/SLT.

To replace '+', dial:

- **5334-Code**

Where,
Code is
0 for Disable (no modification in CLI)
1 for Enable (replace '+' in CLI with the substitute number string programmed)
Default: 0

To program Replacement string, dial:

- **5335-*Replacement String*-#***

Where,

Replacement string is any string with digits from 0 to 9. A maximum of 6 digits are permitted. Terminate the command with #* if the replacement string is fewer than 6 digits.

To remove the replacement string, dial:

- **5335-#***

- Exit SE mode.

Calling Line Identification Restriction (CLIR)

This feature is not applicable if CDMA Mobile Card is installed in your system.

What's this?

The SARVAM UCS allows extension users to suppress their identity, that is, extension number and name, when they call other extensions. This feature is called Calling Line Identification Restriction (CLIR).

Extensions that have 'CLIR Override' facility can view the CLI of those that have suppressed it with CLIR.

This is a feature of the system and not the PSTN. It is applicable for internal calls only.

This feature will work only on the Matrix Extended IP Phone, VARTA UC Clients, proprietary digital key phone EON and SLTs that support Caller Line Identification (CLI).

How it works

- Extension A has CLIR enabled.
- Extension B does not have CLIR Override enabled.
- Extension C has CLIR Override enabled.
- When A calls B, B cannot view the extension name and number of A.
- When A calls C, C can view A's extension name and number.

Now,

- Extension D calls extension E.
- A picks up the call.
- D will be able to view A's name and extension only if it has CLIR Override enabled and is a digital key phone, EON.

Feature Interactions:

- **CLIP and Caller ID Presentation while Transfer:** Both these features will not work if CLIR is enabled.

How to configure

CLIR and **CLIR Override** are Class-of-Service-dependent features. Extensions that are to be allowed these features, must have them enabled in their **Class of Service (CoS)** group.

Decide which extensions should be allowed CLIR and which should be allowed CLIR Override.

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS. Template 01 is assigned CoS group 01 in which both CLIR and CLIR Override are disabled. Thus, none of the extensions of the SARVAM UCS can suppress their CLI or force any other extension to display its CLI.

If you want to enable both features on all extensions, simply enable CLIR and CLIR Override in the default CoS group 01.

If you want to allow CLIR to all extensions, but not allow CLIR Override to any extension, simply enable CLIR in the default CoS group 01.

If you want to allow CLIR and/or CLIR Override to selected extensions, only, then follow these steps:

1. Define a new CoS group with CLIR/CLIR Override enabled.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the “Time Zones”.
3. Assign this new Template to the extensions to which CLIR/CLIR Override is to be allowed.

Refer the topics “Class of Service (COS)” and “Station Basic Feature Template” for detailed instructions and programming.

How to use

For EON and Extended IP Phone Users

To enable CLIR

- Press DSS Key assigned to CLIR²⁷².
OR
- Dial 1031 to enable CLIR.
- You get confirmatory tone and message on the phone's display.
- Go idle or you get dial tone after 3 seconds.

To disable CLIR:

- Press DSS Key assigned to CLIR again²⁷³.
OR
- Dial 1030.
- You get confirmatory tone and message on the phone's display.
- Go idle or you get dial tone after 3 seconds.

For SLT Users

To enable CLIR:

- Lift handset.
- Dial 103-1.
- You get confirmation tone.
- Replace handset.

To disable CLIR:

- Lift handset.
- Dial 103-0.
- You get confirmation tone.

272. System Engineer is recommended to assign a DSS Key with LED to this feature. When the assigned DSS key is pressed, it will glow red indicating that CLIR is enabled.

273. If a DSS key with LED has been assigned, when you press the key again, the LED will be turned off indicating CLIR is now canceled.

- Replace handset.

Cancel All Station Features

What's this?

For each feature of the SARVAM UCS that extension users have set/enabled on their extension, the system provides access code for cancellation of the feature.

Extension users can also cancel *all* features set on their extension by dialing a feature access code. These set of features can also be canceled for any extension user from the SA Jeeves.

When an extension user dials the '*Cancel All Station Features*' access code, the following features, if set, are canceled from the extension:

- Auto Answer
- Auto Call Back
- Call Forward
- Do Not Disturb
- Hot Line
- Trunk Reservation
- Walk-In Class of Service

How to use

The extension users can cancel *all* features set on their extension from their own extension or these can be canceled from SA Jeeves for any extension user.

Cancel All Features by Extension Users

For EON and Extended IP Phone Users

- Press DSS Key assigned to 'Cancel All Features' (if programmed).

OR

- Dial 1051.
- You get confirmation tone and confirmatory message on your phone display.
- Go idle or wait for dial tone.

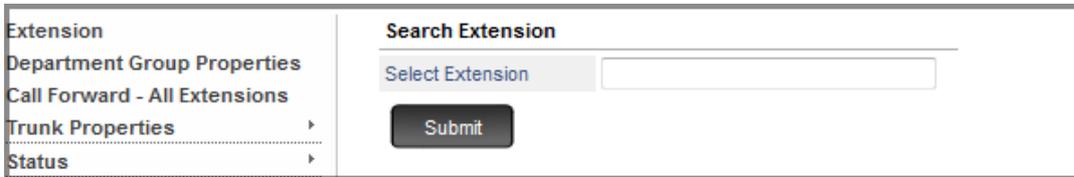

For SLT Users

- Lift handset.
- Dial 1051.
- You get confirmation tone.
- Replace the handset.

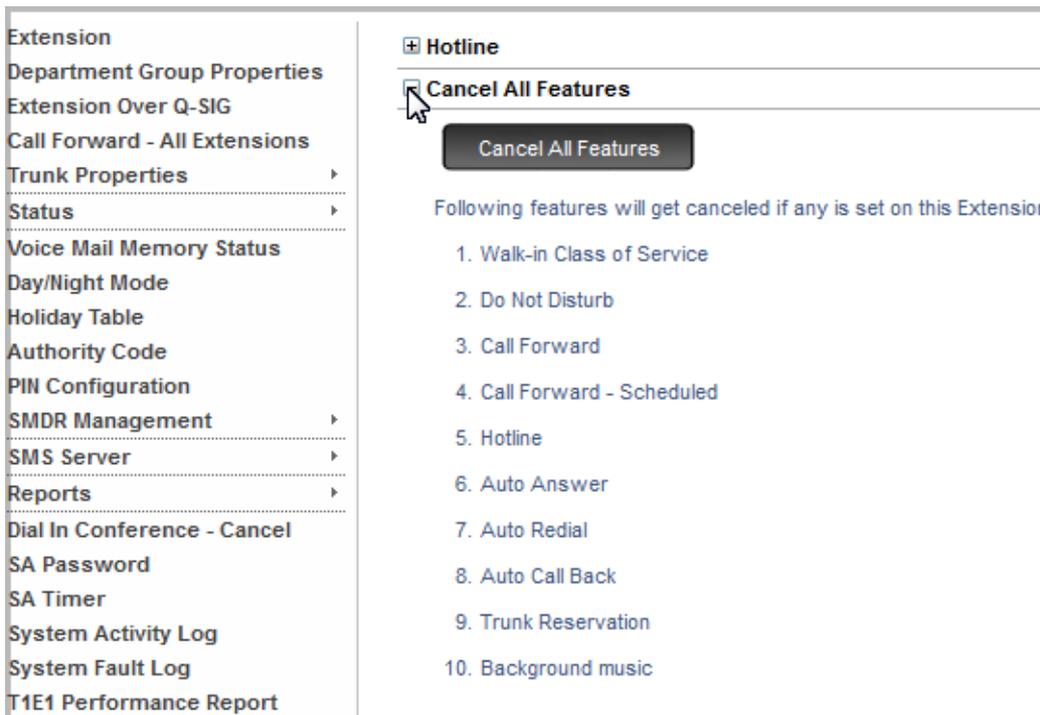

Cancel All Features for Extension Users

The Operator or any extension user having access to System Administrator mode can cancel all features for extension users using Jeeves.

- Log in to Jeeves as System Administrator.
- Click **Extension**.

- **Select Extension:** Enter the Extension Number or the Extension Name of the extension you want to search.
- Click **Submit**.
- The searched extension users details appear on your screen.
- Click **Cancel All Features** to expand.

- Click the **Cancel All Features** button. The following features will get canceled if any is set on this extension user:
 - Walk-in Class of Service
 - Do Not Disturb
 - Call Forward
 - Call Forward - Scheduled
 - Hotline

- Auto Answer
- Auto Redial
- Auto Call Back
- Trunk Reservation
- Background music²⁷⁴

274. *ETERNITY PENX does not support Background Music.*

Class of Service (COS)

What's this?

Class of Service (CoS) defines the permission an extension will have on a System. It defines the set features of the system that the extension is to be allowed access to.

Feature requirements vary among users and with time. Certain groups of extension users may have a need for voice mail, while another group may need the ability to forward calls to a cell phone, and still others may have no need to make calls outside the office.

Similarly, certain features that are required during working hours may not be required during break or non-working hours.

SARVAM UCS offers the flexibility to allow or deny extension users access to features of the System, on the basis of their requirement and according to time of the day. For users, access to various features from their extensions is their CoS.

How it works

The list of all features allowed to an extension is referred to as 'CoS group'. There are 20 CoS groups numbered from 01 to 20.

In each CoS group there are 60 features, which are identified by 2-digit numbers, from 01 to 60. These are referred to as the 'CoS Feature Numbers'.

Each extension port of the System has an associated CoS group that indicates which features of the System the port is allowed to access.

The CoS group of an extension port is defined in the ["Station Basic Feature Template"](#) applied to that extension port. It is defined for each "Time Zone", namely, working hours, break hours, and non-working hours, in the Template.

A feature can be allowed or denied to an extension by enabling or disabling it in the CoS group of the Station Basic Feature Template applied to that extension.

The same CoS group uniformly to all extensions ports for all Time Zones. Doing so, all extensions can access the same set of features in all time zones. For example: CoS group 03 is assigned to all extensions for Working, Break and Non-Working hours.

A different CoS group for each Time Zone can be assigned to all extension ports. Doing so, all extensions can access only those features allowed for the particular Time Zone.

For example: All extensions are assigned CoS group 03 for Working, CoS group 04 for Break hours and CoS group 05 for Non-Working Hours.

Different CoS groups can be assigned to different extension ports, for all or for different Time Zones. Doing so, each extension can access a different set of features in each Time Zone.

For example: extensions 3001 to 3010 are allowed CoS group 03 for all Time Zones, while extensions 3011 to 3015 are assigned CoS group 03 during Working Hours, and for the Non-Working and Break Hours, they are assigned CoS group 04 and 05 respectively.

The following features can be set/cancelled on extensions from the SA mode, regardless of whether these features are allowed or denied in the CoS assigned to the extensions:

- Call Forward
- DND
- Dynamic Lock and Timer
- Hotline

Basic Features

A set of features including Internal Call, Call Hold, Call Toggle, Call Transfer, Department Call, Operator Access, Redial, and Call Mute defined as Basic Features and allowed in all CoS groups.

It is not possible to enable or disable selectively any of the features included in "Basic Features".

How to configure

The table below presents the CoS groups from 01 to 20 with the list of 01 to 60 features supported on the extensions.

Default CoS Groups

Feature Number	Feature Name	Class of Service Group																			
		01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20
01	Account Code	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
02	SA Mode																				
03	SA Extension																				
04	Auto Call Back-Busy	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
05	Auto Call Back-No Reply	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
06	Auto Redial																				
07	Auto Redial Priority																				
08	Barge-In																				
09	Call Forward	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
10	Call Park	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
11	Call Pickup	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
12	Change Room Clean Status																				
13	Global Directory Programming																				
14	CLIR

a. Basic Features includes: Internal Call, Call Hold, Call Toggle, Call Transfer, Department Call, Operator Access, Redial, Mute.

- CoS group number 01 is assigned for all Time Zones in the default Station Basic Feature Template 01 assigned to all extensions of the SARVAM UCS.
- CoS group number 19 and 20 are assigned when the Hospitality Application of SARVAM UCS is used. When this application is being used in CoS group number 20, the SA Mode will be enabled. See SARVAM UCS Hospitality System Manual.

Creating CoS Groups

- Take a pen and a paper pad.
- Prepare a list of extensions.

- Read the list of features supported on the extensions (see above Table 'Default CoS Groups for Features').
- Against each extension name on the list, write the features needed for each Time Zone. You will notice that the features needed by many extensions are identical.
- List the common features to be allowed to and features to be denied to all extensions. Assign a CoS Group Number to this list.
- Are there any other features, in addition to those on the common list, which you want to allow to selected extensions?
- If yes, extend the common list you prepared by adding the features to be allowed to selected extensions. Assign a CoS Group Number to this extended list.
- You can prepare different CoS Groups for different Time Zones and assign a number to each group.
- For example, you may end up creating five different CoS groups. The First group may contain none of the features. The Second group may contain the most common features like Call Forward, Call Transfer, Internal Dialing, etc. The Third group may contain more advanced features, and the Fourth group may contain even more advanced features. The Fifth group may contain all the features.
- When you are finished preparing the CoS groups you need, program the CoS groups using Jeeves or by issuing SE commands from a Telephone (DKP or SLT). See below for instructions.
- Now, the CoS groups to be assigned to extensions must be programmed in the Station Basic Feature Template applied to the extensions. This can be done using Jeeves or by issuing SE commands from a Telephone (DKP or SLT). See below for instructions.

Enabling a feature in a CoS Group using Jeeves

- Log in as System Engineer.
- Under **Configuration**, Click the link **Class of Service (CoS)**.

Feature Name	Class of Service												
	1	2	3	4	5	6	7	8	9	10	11	12	13
Account Code	<input checked="" type="checkbox"/>												
ACB-Busy	<input checked="" type="checkbox"/>												
ACB-No Reply	<input checked="" type="checkbox"/>												
Auto Redial	<input type="checkbox"/>												
Auto Redial Priority	<input type="checkbox"/>												
Background Music	<input checked="" type="checkbox"/>												
Basic Features	<input checked="" type="checkbox"/>												
Barge-In (BI)	<input type="checkbox"/>												
Call Forward	<input checked="" type="checkbox"/>												
Call Park	<input checked="" type="checkbox"/>												
Call Pickup	<input checked="" type="checkbox"/>												

* Basic Features includes: Internal Call, Call Hold, Call Toggle, Call Transfer, Dept. Call, Operator Access, Redial

Submit Default Default One

- The default CoS groups from 01 to 20 appear. The check boxes selected under each CoS group column indicate that the feature is enabled in that CoS group. The default CoS groups meet the requirements of most extension users. Check the default CoS groups whether the features you want to allow are enabled and features you want to deny are disabled.
- To enable a feature in a CoS group, select corresponding check box in the CoS group. To disable a feature simply clear the check box. For example: to enable DND-Override in CoS group 01, select the check box against DND-Override in CoS group 01. To disable clear the check box again.
- Click 'Submit' to save changes.

Enabling a feature in a CoS Group using a Telephone

- Enter SE mode from a DKP/SLT.

To enable a feature in a CoS group, dial:

- **1302-1-CoS Group-Feature Number-Code** to enable a feature in a single CoS group.
- **1302-2-CoS Group-CoS Group-Feature Number-Code** to enable the same feature in a range of CoS groups.
- **1302-*Feature Number-Code** to enable the same feature in all CoS groups.

Where,

CoS Group from 01 to 20.

Feature Number from 01 to 60. Refer the Table "Default CoS Groups" for Feature Numbers.

Code is

1 for Enable

0 for Disable

To default a CoS group, dial:

- **1301-1-CoS Group** to default a single CoS group.
- **1301-2-CoS Group-CoS Group** to default a range of CoS groups.
- **1301-*** to default all CoS groups.

Where,

CoS Group is from 01 to 20.

- Exit SE mode.

Assigning a CoS group in a Station Basic Feature Template using Jeeves

- Log in as System Engineer, if not already logged in.
- Under **Configuration**, click **Station Basic Feature Template**.

Template No.	Time Table	Operator	Class Of Service			Call Budget	Toll Control Level-0 (WH)
			WH	BH	NH		
1	1	1	01	01	01	<input type="checkbox"/>	All Calls
2	1	1	01	01	01	<input type="checkbox"/>	All Calls
3	1	1	01	01	01	<input type="checkbox"/>	All Calls
4	1	1	01	01	01	<input type="checkbox"/>	All Calls
5	1	1	01	01	01	<input type="checkbox"/>	All Calls
6	1	1	01	01	01	<input type="checkbox"/>	All Calls
7	1	1	01	01	01	<input type="checkbox"/>	All Calls
8	1	1	01	01	01	<input type="checkbox"/>	All Calls
9	1	1	01	01	01	<input type="checkbox"/>	All Calls
10	1	1	01	01	01	<input type="checkbox"/>	All Calls

- The default CoS group assigned to each time zone, that is, working hour (WH), non-working hour (NH) and break hour (BH), appears under Class of Service in each Template.
- To assign a CoS group to a Station Basic Feature Template, enter the CoS group number for each time zone under Class of Service.
- Click **Submit** to save changes.

By default, Station Basic Feature Template 01 is applied on all extensions and CoS group 01 is the assigned by default to this template in all time zones.

If all extensions to be allowed the same set of features during working hours, break hours, non-working hours, enter the same CoS group number in all time zones in the Template Number applied to all extensions. For example: to assign CoS group 04 to all time zones in Template Number 01; enter 04 under WH, NH and BH.

Station Basic Features Templates							
Template No.	Time Table	Operator	Class Of Service			Call Budget	
			WH	BH	NH		
1	1	1	04	04	04	<input type="checkbox"/>	
2	1	1	02	02	02	<input type="checkbox"/>	
3	1	1	01	01	01	<input type="checkbox"/>	
4	1	1	01	01	01	<input type="checkbox"/>	
5	1	1	01	01	01	<input type="checkbox"/>	
6	1	1	01	01	01	<input type="checkbox"/>	
7	1	1	01	01	01	<input type="checkbox"/>	
8	1	1	01	01	01	<input type="checkbox"/>	
9	1	1	01	01	01	<input type="checkbox"/>	
10	1	1	01	01	01	<input type="checkbox"/>	

If all extensions are to be allowed a different set of features in each Time Zone, enter the CoS group for each Time Zone. For example: to assign CoS group 03 in working hours, 04 in Break Hours and 05 in Non-Working hours in Template 01, enter 03, 04, 05 under WH, BH and NH respectively.

Station Basic Features Templates							
Template No.	Time Table	Operator	Class Of Service			Call Budget	
			WH	BH	NH		
1	1	1	03	04	05	<input type="checkbox"/>	
2	1	1	02	02	02	<input type="checkbox"/>	
3	1	1	01	01	01	<input type="checkbox"/>	
4	1	1	01	01	01	<input type="checkbox"/>	
5	1	1	01	01	01	<input type="checkbox"/>	
6	1	1	01	01	01	<input type="checkbox"/>	
7	1	1	01	01	01	<input type="checkbox"/>	
8	1	1	01	01	01	<input type="checkbox"/>	
9	1	1	01	01	01	<input type="checkbox"/>	
10	1	1	01	01	01	<input type="checkbox"/>	

- If a set of features is to be allowed to select extensions only, assign the CoS group with these features enabled to a separate Station Basic Feature Template. Apply this template to the select extensions which are to be allowed this CoS.

For example: To assign all features to extensions, create a CoS group with all features enabled, CoS group 07. Select a different Station Basic Feature Template, for example 05. Enter CoS Group 07 in all Time Zones in Template 05. Apply Template 05 to the software ports of the extensions that are to be assigned all features.

Template No.	Time Table	Operator	Class Of Service			Call Budget
			WH	BH	NH	
1	1	1	03	04	05	<input type="checkbox"/>
2	1	1	02	02	02	<input type="checkbox"/>
3	1	1	01	01	01	<input type="checkbox"/>
4	1	1	01	01	01	<input type="checkbox"/>
5	1	1	07	07	07	<input type="checkbox"/>
6	1	1	01	01	01	<input type="checkbox"/>
7	1	1	01	01	01	<input type="checkbox"/>
8	1	1	01	01	01	<input type="checkbox"/>
9	1	1	01	01	01	<input type="checkbox"/>
10	1	1	01	01	01	<input type="checkbox"/>

Submit Default Default One

- Remember to click **Submit** to save the changes you make on every page.

Assigning CoS group to Station Basic Feature Template using a Telephone

- Enter SE mode from a DKP/SLT.

To assign CoS group to a template, dial:

- **5502-1-Template Number-Feature Number-Code**

Where,

Template Number is Station Basic Feature Template Number, from 01 to 50.

Feature Number is

03 for CoS group for Working Hours

04 for CoS group for Break Hours

05 for CoS group for Non-Working Hours

Code is CoS group number from 01 to 20.

For Example: To program CoS group 04 in Station Basic Feature Template Number 06 for all Time Zones, dial:

- **5502-1-06-03-04** to program CoS group 04 for Working Hours.
- **5502-1-06-04-04** to program CoS group 04 for Break Hours.
- **5502-1-06-05-04** to program CoS group 04 for Non-Working Hours.

Similarly, to program CoS Group 03 in working hours, 04 in Break Hours and 05 in Non-Working hours, dial:

- **5502-1-06-03-03** to program CoS group 03 for Working Hours.
 - **5502-1-06-04-04** to program CoS group 04 for Break Hours.
 - **5502-1-06-05-05** to program CoS group 05 for Non-Working Hours.
-
- Exit SE mode.

After you have programmed the CoS group in the Station Basic Feature Template, you must assign this template to the stations. Refer the topic "[Station Basic Feature Template](#)" for instructions on applying templates on SLT, DKP, ISDN Terminal and SIP extensions.

Finally, test the CoS programmed for each extension by invoking the features from each extension.

CLI Based Routing

What is this?

SARVAM UCS offers the facility to detect the calling party's number and name. This is known as Calling Line Identification.

On the basis of CLI, it is possible to land calls from a particular telephone number on a particular extension or group of extensions. This is known as CLI Based Routing.

How it works

A, B, C are extensions. D and E are external callers.

Calls made by D are to be landed on A.

Calls made by E are to be landed on B and C.

The CLI of D and E and their corresponding landing destinations should be entered in the CLI Based Routing Table.

CLI Based Routing should be enabled on the desired trunks for each Time Zone (working hours, break hours and non-working hours).

The system can match the incoming call CLI with the numbers configured in the CLI table in two ways, that is, Match from last digit of CLI or Match from first digit of CLI.

- If you select Match from last digit of CLI, this is how the call will be routed:
 - D calls on a trunk of SARVAM UCS.
 - The system checks if CLI Based Routing is enabled on the trunk for the current time zone.
 - If CLI Based Routing is enabled on the trunk, the system checks the numbers stored in the CLI Based Routing table.
 - D's number is found in the CLI Based Routing Table.
 - The system checks the destination number stored against D's CLI.
 - A's number is found as the destination extension.
 - The system lands the call on A.
- If you select Match from first digit of CLI, this is how the call will be routed:
 - D calls on a trunk of SARVAM UCS.
 - The system checks if CLI Based Routing is enabled on the trunk for the current time zone.
 - Then the system checks if the parameter **Replace '+' from CLI**, is enabled.
 - If enabled, the system will replace + sign received in the incoming CLI with the number string configured in the **Replace '+' from CLI with the number string**. To know more, see ["System Parameters"](#).
 - Now the system checks if **Incoming CLI Modification** is enabled.
 - If enabled the system modifies the incoming number according to the parameters configured in the Incoming CLI Modification. To know more, see ["Incoming CLI Modification"](#) in ["System Parameters"](#).
 - The system matches the modified number string with the numbers stored in the CLI Based Routing table.
 - D's number is found in the CLI Based Routing Table.
 - The system checks the destination number stored against D's CLI.
 - A's number is found as the destination extension.
 - The system lands the call on A.

If D's number does not exist in the CLI Based Routing Table, the call will be routed according to the incoming call management logic.

How to configure

For this feature to work, you must do the following:

- enter the numbers of the calling parties and the numbers of the corresponding destination extensions in the CLI Based Routing Table. You can store up to 2000 numbers in the CLI Routing Table.
- enable CLI Based Routing on the desired trunks according to time zones in their [“Trunk Feature Template”](#).

Creating CLI Routing Table

To apply this feature,

- On a sheet of paper, create a 5-column table, as illustrated below. Each calling party number in the CLI table is stored a location index in the system. Enter the telephone numbers and names of the calling parties and the corresponding landing destinations, that is, the Port Type and Port Number. The Port Type may be SLT, DKP, ISDN Terminal, SIP Extension, a Routing Group or Virtual Extension or a Voice Mail Auto Attendant.
- The 'Name' field is for identifying the entry. When placing a call on the destination extensions, both the number and the 'Name' are presented in the CLI.
- Determine the method which the system should use to match the incoming CLI with the numbers in the table, that is, Match from last digit of CLI or Match from first digit of CLI Based Routing Table.

Index	Telephone Number	Name	Port Type	Port Number
1	2640459	MidasBiz	Routing Group	02
2	022281110001	Jet Set	SLT	004
:				:
10	2640075	Bacchus	Routing Group	03

Configuring CLI Based Routing using Jeeves

- Log in as System Engineer.

- Under **Configuration**, click **CLI Based Routing**.

- In **Method for matching received CLI**, select the method according to which you want the system to match the received CLI with the numbers stored in the CLI table. You can select:
 - Match from last digit of CLI
 - Match from first digit of the CLI

The method you select will be applicable to all the numbers configured in the CLI Based Routing Table.

- In the CLI table each number is to be stored at a Location Index numbered from 0001 to 2000.

There are 100 entries on each page. To go to the next 100 Index numbers, click the tabs 0101-0200, 0201-0300, 0301-0400 , 0301-0400.....1901-2000.

- At each Location Index, enter the information for the following parameters:
 - **Calling Party's Number:** enter the number of the calling party, not exceeding 16 digits. You can also enter '+' in the number string.
 - **Calling Party's Name:** enter the name of the calling party. You can enter a maximum of 8 characters in this field.
 - **Destination Type:** select the landing destination extension. It may be an SLT, a DKP, an ISDN Terminal, SIP extension, a Routing Group, a Virtual Extension or Voice Mail Auto Attendant.
 - **Port Number:** enter the port number (software port or routing group number) to which the landing destination is connected. This is applicable for Destination Types — SLT, DKP, ISDN Terminal, SIP Extension or Routing Group.

If you have selected *Virtual Extension* as the Destination Type, enter the software port of landing destination of the Virtual Extension.

If you have selected a *Routing Group* as the Destination Type, enter the number of the Routing Group (01 to 96) in this field.

- **Voice Mail Auto Attendant (VMAA) Menu:** if you have selected the *Voice Mail Auto Attendant* as the Destination Type, select the VMAA Menu to be assigned to the respective calling party.

You may click the *Voice Mail Auto Attendant (VMAA) Menu* link to edit the parameters of desired VMAA Menu. For details, see ["Voice Mail Auto-Attendant Menu"](#).

- Click **Submit** to save entries.
- Enable CLI Based Routing for the desired Trunks in their ["Trunk Feature Template"](#). Refer the topic ["Customizing Trunk Feature Templates"](#) for instructions.

Configuring CLI Based Routing Table using a Telephone

- Enter SE mode from a DKP/SLT.

To add the calling party telephone number in the CLI Based Routing table, dial:

- **4101-Index-Telephone Number-#***

Where,

Index is from 0001 to 2000.

Telephone Number is the calling party's telephone number (Max. 16 digits).

Terminate the command with #*, if the number is less than 16 digits.

To enter '+' in the number string, dial #8

For Example: to enter 2640459 at Index Location 001, dial **4101-001-2640459-#***

To clear a telephone number from the CLI Based Routing table, dial:

- **4101-Index-#***

To enter the name of the calling party corresponding to the calling party's telephone number, dial:

- **4102-Index-Name-#***

Where, Index is from 0001 to 2000.

Name can be a maximum of 8 characters.

Terminate the name with #*, if less than 8 characters.

For Example: to enter the name Midas Biz for the number 2640459 at Index Location 001, dial **4102-001-MidasBiz**

To clear the name stored at a location index in the CLI table, dial:

- **4102-Index-#***

To assign the landing destination extension in the CLI table, dial:

- **4103-Index-Port Type-Port Number**

Where,

Index is from 0001 to 2000.

Port Type is

00 for Null

01 for SLT

02 for DKP

20 for Routing Group

28 for ISDN Terminal

34 for SIP Extension

36 for Virtual Extension

Port Number is Software Port number of SLT/DKP/ISDN Terminal/SIP Extension.

Port Number of SLT is from 001 to 240.

Port Number of DKP is from 001 to 96.

Port Number of ISDN Terminal is 01 to 64.

Port Number of Routing Group is from 01 to 96.
Port Number of SIP Extension is from 001 to 999.
Port Number of Virtual Extension is from 01 to 64.

For Example: to assign an SLT connected at Software Port number 004 as the landing destination for calls from Midas Biz 2640459, dial **4103-001-01-004**

To clear a location index in the CLI Based Routing table, dial:

- **4104-Index** to clear a single location Index.
Where,
Index is from 0001 to 2000.

By using these commands, the telephone number, name and the Port type-Port number will be cleared from the location index.

- Exit SE mode.

Clock Synchronization

What's this?

When data is transmitted from the SARVAM UCS to external lines or when SARVAM UCS receives data from the external lines, it is necessary that the transmitter and receiver be properly synchronized. If not clock slips can occur. A clock slip can generate a loss or addition of data to the data stream.

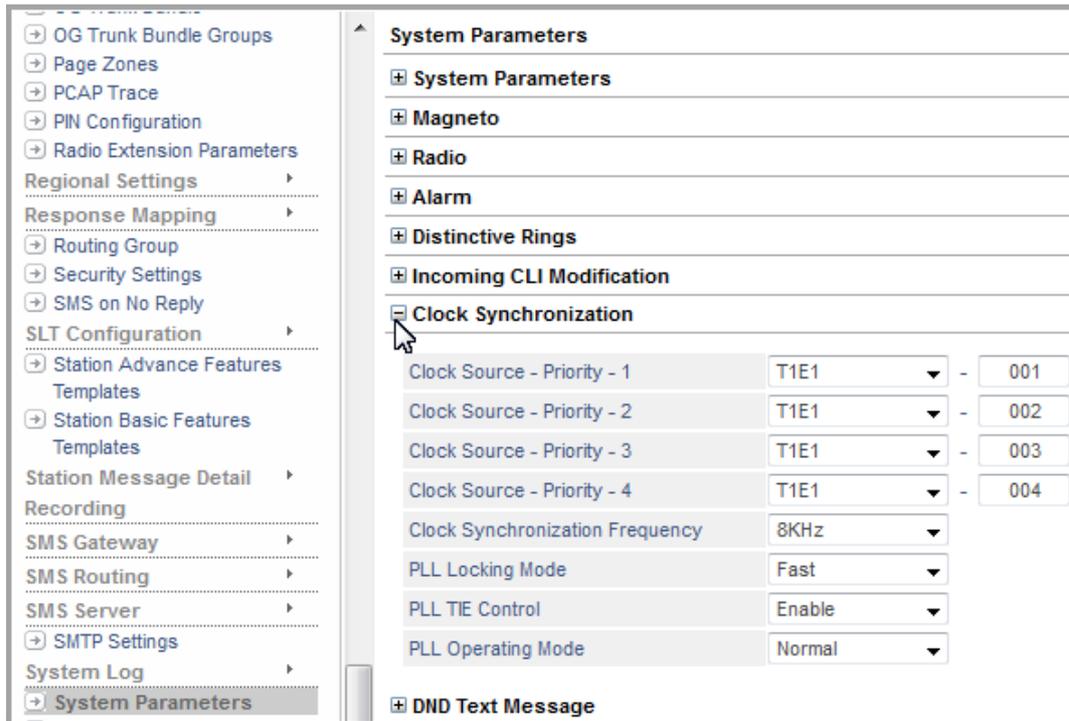

How it works

- This can be done in three ways viz. using the data clock or using the external clock (clock is sent by the network on a dedicated cable pair) or using the internal clock. SARVAM UCS does not support external clock. When the SARVAM UCS is connected to the PSTN, then it is recommended to extract the clock from the incoming data whereas if the SARVAM UCS is used to form a private network, you are recommended to use the internal clock. For example, if a private network is formed by connecting three SARVAM UCS systems, then one system should be programmed as master clock whereas other two should be programmed in the slave mode.
- If two or more T1E1 Ports are connected to the PSTN (or a Private Network) then in such case, clock will be extracted from the first T1E1 Software port whereas the transmit data on all other ports whether connected to PSTN or private network will be clocked as per received.

How to configure

Configuring Clock Synchronization using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **System Parameters**.
- Click **Clock Synchronization** to expand.

- **Clock Source - Priority 1 to 4:** In the Priority levels, Clock Source Priority-1 to Clock Source Priority-4, select the Clock Source option as per your preference.

By Default: Priority 1 is T1E1-001, Priority 2 is T1E1-002, Priority 3 is T1E1-003 and Priority 4 is T1E1-004.

- **Clock Synchronization Frequency:** Select Clock Synchronization Frequency in this field. You can select from the following options:
 - 8 KHz Derived
 - 8 KHz
 - 2.048 MHz
 - 1.54 MHz

By Default, Clock Synchronization Frequency is set to 8 KHz.

The system will restart when the frequency is changed.

- **PLL Locking Mode:** Depending upon the speed required for clock synchronization, select the speed for PLL Locking Mode. You can set PLL Locking Mode to either fast or slow. By default, it is slow.
- **PLL TIE Control:** You can enable or disable PLL TIE Control. By default, it is disabled.
- **PLL Operating Mode:** Select the PLL Operating Mode in this field. You can select from the following options:
 - Normal
 - Hold Over
 - Free Run

By default, PLL Operating Mode is Normal.

You can program PLL TIE Control and PLL Operating Mode only using Jeeves.

Configuring Clock Synchronization using a Telephone

Clock Source for 'Master Clock Synchronization'

The SARVAM UCS supports 4 clock sources which can be programmed for the specific port.

Use the following command to configure the clock sources:

5341-Clock Source Index-Port Type-Port Offset

Where,

Port Offset is 01 to 32.

Clock Source Index is from 1 to 4.

Port Type	Meaning	Port Offset
05	T1E1	01-08
04	BRI	01-32
00	Null	000

0 is a valid port to follow internal clock.

Default Table for the clock source, programmed in the system

Clock Source Index	Port Type-Port Offset
1	T1E1-1
2	T1E1-2
3	T1E1-3
4	T1E1-4

The system checks this table for a master clock. If none of the ports is synchronized out of this table, the system gives priority to the internal clock. If any one port is synchronized, the system selects that port as a system clock master. Here index is given priority, that is, if the second port of this table is selected as clock master and suddenly first port is synchronized, then the system changes its master from 2nd port to first port. Now if first port has lost its synchronization then in this case again, the second port is selected as master clock of the system.

Clock Synchronization Frequency

Use following command to select Clock Synchronization Frequency:

5342-Clock Synchronization Frequency

Where,

Clock Synchronization Frequency is from 1 to 4.

System Clock Synchronization	Meaning
1	8 KHz Derived

System Clock Synchronization	Meaning
2	8 KHz
3	2.048 MHz
4	1.54 MHz

By Default, 'System Clock Synchronization' is 2.048 MHz for India and other countries except USA. For USA, default 'System Clock Synchronization' is 1.54 MHz.

PLL Locking Mode

This parameter is used to select the suitable speed of the PLL locking in the system.

Use following command to select the 'PLL Locking Mode':

5343-PLL Locking Mode

Where,

PLL Locking Mode is from 1 to 2.

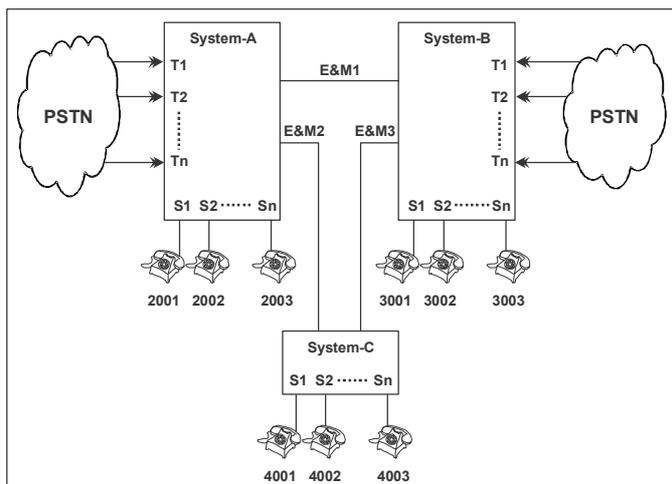

PLL Locking Mode	Meaning
1	Fast
2	Slow

By default, PLL Locking Mode is 'Slow'.

Closed User Group (CUG)

What's this?

To have private networks, few systems can be connected to each other using E&M, T1/E1, QSIG, as well as over the IP Network. The requirement demands that the systems connected to each other forming the network behave as a single group. The users need not dial a separate code to access an extension user of other system. The entire network should behave as a single unit. Users will not know whether they are dialing an extension number of their own system or of the other system. This is called Closed User Group.

In the above figure, 3 Systems are connected through E&M connectivity.

- T1 to Tn are trunk lines from the local central office (CO).
- S1 to Sn are extensions.
- E&M1 to E&M3 are E&M lines between the three Systems.

How it works

For Closed User Group, you must:

- have unique extension number in all the systems, that is, one cannot have extension number 2001 in System-A as well as in System-B or System-C.
- enable Closed User Group (CUG) in the Class of Service assigned to the extension users.

Few new words have been used to explain this application, each of these words have been explained below:

- **Closed User Group Table:** This table has the following parameters viz. Route Index, Route Code, OG Trunk Bundle Group, Strip Digit Count, Self Route check box, Apply Toll Control check box and Apply Call Cost check box. The closed user group programming works according to this table.

Index	Route Code	OGTBG	Strip Digit Count	Self Route	Dialed Digit Count	Apply Toll Control	Apply Call Cost
001							
002							
003							
:							
250							

- **Index:** Maximum 250 different routes (001-250) can be programmed.
- **Route Code:** Route code could be of maximum sixteen digits. Valid Digits: 0 to 9, * # A B C D F P, where P is Pause, F is Flash, A to D is DTMF Digits. Generally route code will be a truncated number of the extension numbers. For example in the figure given above, route code for System-B can be defined as '3' and that for System-C can be defined as '4'.

If System-B were having extension numbers from 3100 to 3199 and System-C were having extension numbers from 3200 to 3299 then route code for System-B can be defined as '31' and that for System-C can be defined as '32'. If System-B were having extension numbers from 301 to 399 and 401 to 499 then two route codes can be defined for System-B viz. '3' and '4'. Likewise for System-C.

- **OG Trunk Bundle Group:** An OG Trunk Bundle Group (OGTBG) is assigned to each route code. Whenever a call is to be made on that route, a free trunk from the OGTBG is selected and the extension number is dialed on it. The same logic of Rotation On/Off for trunk selection from the OGTBG is used. If rotation is OFF then always the first trunk in the OGTBG is selected. If it is busy then the next trunk in the group is selected. This helps to select an alternate route. Whereas if Rotation is ON then the trunks in the OGTBG are selected in round robin fashion.
- **Strip Digit Count:** For the Closed User Group application, configure this parameter as 0. This parameter is relevant when you are configuring "[Closed User Group-With Exchange ID](#)".
- **Self-Route:** For the Closed User Group application make sure this is disabled. This parameter is relevant when you are configuring "[Closed User Group-With Exchange ID](#)".
- **Dialed Digit Count:** When digits are dialed on the trunk, the system waits for inter digit timer after the last digit is dialed. In order to avoid this timer and number of digits dialed to be routed without further delay, count for the number of digits to be programmed in this field. If the number of digits received are equal to the parameters programmed then the number is dialed out immediately without waiting for the inter digit timer. If the number of digits dialed by the user are not equal to the digits programmed, the number is dialed after inter digit timer.
- **Apply Toll Control:** When Self Route check box is disabled, system will check this parameter.

By default, the Apply Toll Control check box is enabled. The system will apply toll control to all the outgoing calls. Disable this check box, if you do not want to apply toll control to the CUG numbers dialed by you.

For detailed information, see [“Toll Control”](#).

Apply Call Cost: By default, this check box is enabled and the system will calculate the cost of each call.

For certain calls (internal calls) you do not require the call cost calculation, clear the check box corresponding to these entries. You can also set the filter **Calls with units more than** to generate a report according to the Call Cost. For details, see [“Station Message Detail Recording-Report”](#).

The SARVAM UCS has only one routing table. The same table is used for Closed User Group and Close User Group-With Exchange ID applications. Hence the table has to be programmed keeping the application in mind.

Configuring using Jeeves

To configure the Closed User Groups,

- Log in as System Engineer.
- Under **Configuration**, click **Closed User Groups**.

Index	Route Code	OG Trunk Bundle Group	Strip Digit Count
1		01	0
2		01	0
3		01	0
4		01	0
5		01	0
6		01	0
7		01	0
8		01	0
9		01	0
10		01	0

Against each Index configure the following parameters:

- **Route Code:** Route code could be of maximum sixteen digits. Valid Digits: 0 to 9, * # A B C D F P, where P is Pause, F is Flash, A to D is DTMF Digits. Generally route code will be a truncated number of the extension numbers. For example in the figure given above, route code for System-B can be defined as '3' and that for System-C can be defined as '4'.

If System-B were having extension numbers from 3100 to 3199 and System-C were having extension numbers from 3200 to 3299 then route code for System-B can be defined as '31' and that for System-C

can be defined as '32'. If System-B were having extension numbers from 301 to 399 and 401 to 499 then two route codes can be defined for System-B viz. '3' and '4'. Likewise for System-C.

- **OG Trunk Bundle Group:** An OG Trunk Bundle Group (OGTBG) is assigned to each route code. Whenever a call is to be made on that route, a free trunk from the OGTBG is selected and the extension number is dialed on it. The same logic of Rotation On/Off for trunk selection from the OGTBG is used. If rotation is OFF then always the first trunk in the OGTBG is selected. If it is busy then the next trunk in the group is selected. This helps to select an alternate route. Whereas if Rotation is ON then the trunks in the OGTBG are selected in round robin fashion.
- **Strip Digit Count:** It has no significance for Closed User Group application. But it has to be programmed as 0.
- **Self-Route:** It has no significance for Closed User Group application. But it has to be programmed as 0.
- **Dialed Digit Count:** When digits are dialed on the trunk, the system waits for inter digit timer after the last digit is dialed. In order to avoid this timer and number of digits dialed to be routed without further delay, count for the number of digits to be programmed in this field. If the number of digits received are equal to the parameters programmed then the number is dialed out immediately without waiting for the inter digit timer. If the number of digits dialed by the user are not equal to the digits programmed, the number is dialed after inter digit timer.
- **Apply Toll Control:** By default, this check box is enabled. The system will apply toll control to all the outgoing calls. Disable this check box, if you do not want to apply toll control to the CUG numbers dialed by you.
- **Apply Call Cost:** By default, this check box is enabled and the system will calculate the cost of each call.

For certain calls (internal calls) you do not require the call cost calculation, clear the check box corresponding to these entries.

- Click **Submit** to save entries.

Configuring using a Telephone

The commands explained below should be referred as:
To configure a single port: XXXX-1
To configure a range of ports: XXXX-2
To configure all the ports: XXXX-*

Step 1

Use following command to configure route code:

4502-1-Route Index-Route Code-#*

4502-2-Route Index-Route Index-Route Code-#*

4502-*-Route Code-#*

Where,

Route Index is from 001 to 250.

Route Code is a sixteen digits string of numbers.

Use following command to clear a particular route code:

4502-1-Route Index-#*

4502-2-Route Index-Route Index-#*

4502-*-#*

Where,

Route Index is from 001 to 250.

By default, Program Route Code is Blank.

Step 2

Use following command to assign OG Trunk Bundle Group to the route code:

4503-1-Route Index-OG Trunk Bundle Group

4503-2-Route Index-Route Index-OGTBG

4503-*-OG Trunk Bundle Group

Where,

Route Index is from 001 to 250.

OG Trunk Bundle Group is from 01 to 32.

By default, OG Trunk Bundle Group is 01.

Step 3

Use following command to configure strip digit count for a route:

4504-1-Route Index-Strip Digit Count

4504-2-Route Index-Route Index-Strip Digit Count

4504-*-Strip Digit Count

Where,

Router Index is from 001 to 250.

Strip Digit Count is from 0 to 9.

By default, Strip Digit Count is 0.

Step 4

Use following command to configure self-route check box for a route:

4505-1-Route Index-Code

4505-2-Route Index-Route Index-Code

4505-*-Code

Where,

Route Index is from 001 to 250.

Code	Meaning
0	Disable Self-route check box
1	Enable Self-route check box

By default, Self-route check box is disabled.

Step 5

Use following command to configure maximum dialed digits to select router for a route code:

4506-1-Route Index-Dialed Digit Count

4506-2-Route Index-Route Index-Dialed Digit Count

4506-*-Dialed Digit Count

Where,

Route Index is from 001 to 250.

Maximum dialed digits is from 00 to 99.

Step 6

Use following command to clear an entry in a routing table:

4501-1-Route Index

4501-2-Route Index-Route Index

4501-*

Where,

Route Index is from 001 to 250.

Closed User Group-With Exchange ID

What's this?

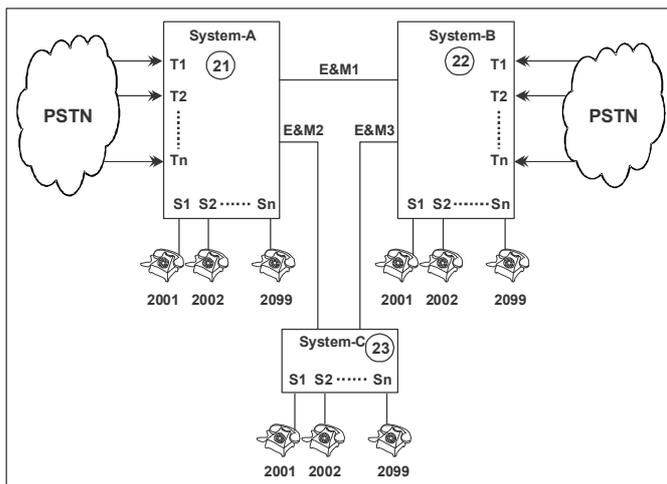

To have private networks, few systems can be connected to each other using E&M, T1/E1, QSIG, as well as over the IP Network. The requirement demands that the systems connected to each other forming the network behave as a single group. The users need not dial a separate code to access an extension user of other System. The entire network should behave as a single unit. The extension users will not know whether they are dialing an extension number of their own system or other system. This is called Closed User Group. However, it is possible that the Systems connected to form a network may have same extension numbers. Also, all the exchanges within the network may have their own identity (called Exchange ID). In such cases, the routing scheme (the routing table) has to be programmed keeping the Exchange ID (SID) in mind. This is known as Closed User Group-With Exchange ID.

This facility is generally used in PLCC Applications wherein new power extensions (and hence Systems) are added in the network. It is not feasible to have unique extension numbers throughout the network. In such cases, an Exchange ID is assigned to the newly added System and a routing table is programmed in the exchange. Also, the routing tables of other exchanges are modified to include the newly added exchange in the network.

Figure 1: Open User Group Application

In the below figure, 3 Systems are connected through E&M connectivity.

- T1 to Tn are trunk lines from the local central office (CO).
- S1 to Sn are extensions.
- E&M1 to E&M3 are E&M lines between the three Systems.

How it works

In this application, it is possible to have same extension numbers in two or more Systems of the network, but you must enable Closed User Group (CUG) in the Class of Service assigned to the extension users.

Few new words have been used to explain Closed User Group-With Exchange ID application, each of these words have been explained above.

- **Closed User Group Routing Table:** This table has following parameters viz. Route Index, Route Code, OG Trunk Bundle Group, Strip Digit Count, Self Route check box, Apply Toll Control check box and Apply Call Cost check box. The Closed User Group-With Exchange ID programming works according to this table.

Index	Route Code	OGTBG	Strip Digit Count	Self Route	Dialed Digit Count	Apply Toll Control	Apply Call Cost
001							
:							
250							

- **Index:** Maximum 250 different routes (001-250) can be programmed.
- **Route Code:** Route code could be of maximum sixteen digits. Valid Digits: 0 to 9, * # A B C D F P, where P is Pause, F is Flash, A to D is DTMF Digits. Generally, route code will be a unique number. The route code should not clash with any of the extension numbers of same System. For example in the figure given above, route code for System-A can be defined as '21', route code for System-B can be defined as '22' and that for System-C can be defined as '23'. This means that no extension in System-A can start with '22' or '23'. Similarly, no extension in System-B can start with '21' or '23' and no extension in System-C start with '21' and '22'.
- **OG Trunk Bundle Group:** An OG Trunk Bundle Group (OGTBG) is assigned to each route code. Whenever a call is to be made on that route, a free trunk from the OGTBG is selected and the extension number is dialed on it. The same logic of rotation On/Off for trunk selection from the OGTBG is used. If rotation is OFF then always the first trunk in the OGTBG is selected. If it is busy then the next trunk in the group is selected. This helps to select an alternate route. Whereas if rotation is ON then the trunks in the OGTBG are selected in round robin fashion.
- **Strip Digit Count:** This count signifies the number of digits to be stripped off while dialing/decoding a number. To elaborate: Consider figure 1. The requirement is that if extension 2001 of System-B dials 212002 and if E&M 1 is busy then the call should reach extension 2002 of System-A through alternate route. In this case the strip digit count of System-A should be programmed as 2 and that of System-B and System-C should be programmed as 0. Doing so, when extension 2001 of System-B dials 212002 and if E&M1 is busy then the call is routed through System-C. In this case, System-B dials 212002 on E&M3, System-C receive this code and dials out the same code, that is, 212002 on E&M2 without striping of any digit. On receiving 212002, System-A strips of two digits as per the programming and routes the call to extension 2002.
- **Self-Route:** This flag signifies that the digits being dialed are for the same System and are not to be dialed on the E&M trunk.
- **Dialed Digit Count:** When digits are dialed on the trunk, the system waits for inter digit timer after the last digit is dialed. In order to avoid this timer and number of digits dialed to be routed without further delay, count for the number of digits to be programmed in this field. If the number of digits received are equal to the parameters programmed then the number is dialed out immediately without waiting for the inter digit timer. If the number of digits dialed by the user are not equal to the digits programmed, the number is dialed after inter digit timer.

- **Apply Toll Control:** This parameter is not relevant as Self Route flag is enabled. This parameter is relevant when you are configuring [“Closed User Group \(CUG\)”](#).
- **Apply Call Cost:** By default, this check box is enabled and the system will calculate the cost of each call.

For certain calls (internal calls) you do not require the call cost calculation, clear the check box corresponding to these entries. You can also set the filter **Calls with units more than** to generate a report according to the Call Cost. For details, see [“Station Message Detail Recording-Report”](#).

Please note that the SARVAM UCS has only one routing table. The same table is used for Closed User Group and Closed User Group-With Exchange ID. Hence the table has to be programmed keeping the application in mind.

How to configure

- To configure the Closed User Groups with Exchange ID, refer [“Closed User Group \(CUG\)”](#).
- To configure the OG Trunk Bundle Group (OGTBG), refer [“OG Trunk Bundle Group”](#).
- To configure the E&M template parameters, refer [“E&M Feature Template”](#)

Communication Ports

What's this?

SARVAM UCS supports two communication ports for ETERNITY GENX platform. The first COM Port is inbuilt on the CPU Card and the other can be used by connecting the USB to COM²⁷⁵ converter in the “[External USB Port \(Device Port\) 3.0](#)” of the CPU Card.

SARVAM UCS supports only one communication port for ETERNITY LENX and MENX platform. This can be used by connecting the USB to COM converter in the “[External USB Port \(Device Port\) 3.0](#)” of the CPU Card.

SARVAM UCS supports serial, asynchronous, DB-9 connector for the Communication Ports.

A Communication Port (COM or USB to COM) is used for the following facilities:

- Programming SARVAM UCS using a PC
- PMS Interface (see SARVAM UCS Hospitality System Manual)
- SMDR Reports
- SMDR Online
- SMDR Posting
- System Activity Log
- System Fault Log
- Hotel-Motel Activity Log (see SARVAM UCS Hospitality System Manual)

A Communication Port is necessary for programming SARVAM UCS using a PC, whereas for other above listed facilities, Communication Port may or may not be used²⁷⁶.

How to configure

In order for each of the above listed facilities to work, a Communication Port (COM or USB to COM Port) must be assigned first as the 'Destination Port' and the attributes of the COM or USB to COM Port of SARVAM UCS and the Communication Port of the PC to which it is connected must be programmed to match.

Communication Port as Destination Port

COM or USB to COM Port can be assigned as Destination Port using Jeeves as well as by dialing SE commands from a Telephone. For instructions, refer the individual topics:

- PMS Interface
- “[Station Message Detail Recording-Report](#)”
- “[Station Message Detail Recording-Online](#)”
- “[Station Message Detail Recording-Posting](#)”
- “[System Activity Log](#)”
- “[System Fault Log](#)”
- Hotel-Motel Activity Log
- Print Check-out Report
- “[System Debug](#)”
- “[Loop Back Tests](#)”

275. ETERNITY PENX supports 1 COM Port. This can be used by connecting the USB to COM Converter to the External USB Port.

276. PMS can be interfaced on the LAN/WAN Port. For SMDR-Posting LAN/WAN Port can be used.

You may assign the destination port as Communication Port (COM Port or USB to COM) to multiple facilities as mentioned above, but at a time only one facility will be served by each Communication Port. The facility assigned first will be served first.

Communication Port Attributes

The functioning of the COM or USB to COM Port is controlled by the following attributes:

- Speed in bps.
- Number of data bits.
- Number of stop bits.
- Parity

These attributes must be programmed keeping in mind the application for which the communication port is used (for instance, Programming through PC, generating SMDR Reports, etc.)

The Communication Port attributes can be changed using Jeeves and dialing SE commands from a telephone.

Changing the Communication Port attributes using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Communication Ports** to open the page.

Parameter	COM Port	USB to COM
Speed (bps)	115200	115200
Data Bits	8	8
Parity	None	None
Stop Bits	1	1

USB to COM Port Status: Up

Submit Default

- Set the desired values for COM Port and USB to COM Port:
 - Speed (Bps)
 - Data Bits
 - Parity
 - Stop Bits
- Click **Submit** to save changes.

When the USB to COM converter is connected to the External USB Port, the same will be notified on this page.

Any one of the following USB to COM status will be displayed:

Status	Description
Up	This will be displayed when the USB to COM converter is connected, the port is available and functioning.
Down	This will be displayed when the USB to COM converter is not connected or not detected. Try re-plugging the device. The status will be updated accordingly.
Fail	This will be displayed when the USB to COM converter is connected but the internal registration fails. You may change any of the above parameter values or set the page to default to re-initiate the registration process. The status will be updated accordingly.

Changing Communication Port attributes using a Telephone

The SE Commands mentioned below are applicable only for COM Port and not for USB to COM Port.

- Enter SE mode from a DKP/SLT.

To set Data Transfer rate for COM Port, dial:

- **3201-Port-Speed**

Where,

Port is

1 for COM Port

Speed is

0 for 1200 bps

1 for 2400 bps

2 for 4800 bps

3 for 9600 bps

4 for 19200 bps

5 for 38400 bps

6 for 57600 bps

7 for 115200 bps

By default, Data Transfer Speed is 115200 bps.

To set Data Bits for COM Port, dial:

- **3202-Port-Data Bits**

Where,

Port is

1 for COM Port

Data Bits are

0 for 7 data bits

1 for 8 data bits

By default, Data Bits are 8.

To set Parity for COM Port, dial:

- **3203-Port-Parity**

Where,

Port is

1 for COM Port

Parity is

0 for None

1 for Odd

2 for Even

3 for Mark

4 for Space

By default, Parity is set as 'None'.

To set Stop Bits for COM Port, dial:

- **3204-Port-Stop Bits**

Where,

Port is

1 for COM Port

Stop Bits are

0 for 1 stop bit

1 for 2 stop bit

By default, Stop Bits are 1.

To assign default parameters to COM Port, dial:

- **3210-Port**

Where,

Port is

1 for COM Port

- Exit SE Mode.

Example 1: Configure COM Port parameters with these values:

- Speed = 9600 bps.
- Data Bits = 8 bits.
- Parity = None.
- Stop Bits = 1.

To do this, dial the following SE commands:

3201-1-3

3202-1-1

3203-1-0

3204-1-0

For connecting SARVAM UCS to a Computer/programming SARVAM UCS through a computer set the Communication Port parameters to the following values (recommended):

Speed = 9600 bps.

Data Bits = 8.
Parity = None.
Stop Bits = 1.

How to use

For SARVAM UCS to communicate with a PC through the Communication Port, it must be connected with the Communication Port of the PC.

Connecting SARVAM UCS with a Computer over COM/USB to COM Port

To connect the SARVAM UCS with a PC over COM or USB to COM Port, use the communication cable supplied by Matrix²⁷⁷. This communication cable is provided with DB-9 female connectors on both ends.

You may connect any end to the SARVAM UCS and the other end to the PC. If the PC supports only USB connectivity, use a USB-to-DB-9 converter of any standard make.

Refer the following Table for pin-out details of the COM Port.

Pin No.	Signal Name
1	NC
2	Receive Data (RXD)
3	Transmit Data (TXD)
4	NC
5	Ground (GND)
6	NC
7	NC
8	NC
9	NC

²⁷⁷. This cable is supplied as an optional item. Contact your Matrix Dealer or the company to obtain this cable.

Conference-3 Party

What's this?

SARVAM UCS offers three types of conference calls: Conference-3 Party, “Conference Dial-In”, and “Conference-Multiparty”.

Conference-3 Party (also referred to as Three-Way Calling) is a telephone call, in which the calling party can have two other persons participate in the call.

A 3-Party Conference is initiated by dialing the number of the first person one wishes to talk to. The first person is informed about the conference and put on Consultation Hold. The number of the second person one wishes to talk to is dialed. When the second person answers, s/he is informed about the conference. Three-way speech is established by pressing Flash-*3.

An already connected two-way speech can be converted into a conference by adding a second person, without disconnecting the call with the first person.

Thus, a 3-Party Conference may be planned or conducted on the spur of the moment.

A 3-Party Conference can be conducted with extensions of SARVAM UCS and between extensions and external numbers.

It is also possible to conduct an Unsupervised 3-Party Conference, wherein the operator (assistant) connects two trunks through the system and withdraws from the three-way speech. For confidential discussions where the parties need to know that the operator has withdrawn, the system provides facility to play beeps.

Beeps will be played:

- when the operator is present in the conference at regular intervals
- when the operator has left the conference

The maximum number of simultaneous 3-Party conferences supported by each model is mentioned in the table below:

Model	Max. number of simultaneous 3-Party conferences supported
ETERNITY LENX	15
ETERNITY MENX	15
ETERNITY GENX	20
ETERNITY PENX	16

How it works

A, B, C are extensions.

D and E are external numbers.

3-Party Conference between extensions

- A is in speech with B.
 - A and B want to include C in their conversation.
 - A presses the 'Conference' Key. B is put on Consultation Hold.
 - A gets feature tone. B gets on-hold music.
 - A dials C's extension number. A gets ring back tone.
 - A is in speech with C. B cannot hear their conversation.
 - A presses the 'Conference' key a three-way speech is established.
 - A, B, and C are now in speech.
-
- Any of them can disconnect to withdraw from the conference.
 - If C disconnects, A and B will be in two-way speech.
 - A and B can carry on the conversation or can have a conference with another trunk (external number) or with another extension.

3-Party Conference between two extensions and a trunk

- A is in speech with B.
 - A and B want to include D in their conversation.
 - A presses the 'Conference' Key. B is put on Consultation Hold.
 - A gets feature tone. B gets on-hold music.
 - A grabs a Trunk and dials D's extension number. A gets ring back tone.
 - A is in speech with D. B cannot hear their conversation.
 - A presses the 'Conference' Key to enable three-way speech.
 - A, B, and D are now in speech.
-
- Any of them can disconnect to withdraw from the conference.
 - If B disconnects, A and D will be in two-way speech.
 - A can now conduct a conference with another extension or trunk.

3-Party Conference between an extension and two trunks

- A is in speech with D.
 - A and D want to include E in their conversation.
 - A presses the 'Conference' Key. D is put on Consultation Hold.
 - A gets feature tone. D gets on-hold music.
 - A grabs a Trunk and dials E's number.
 - A is in speech with E. D cannot hear their conversation.
 - A presses the 'Conference' Key to enable three-way speech.
 - A, D, and E are now in speech.
-
- Any of them can disconnect to withdraw from the conference.
 - If A disconnects, D and E are now in two-way speech.

3-Party Confidential Conference established by Operator

- F is in speech with D.
- F wants to include E in their conversation.
- F presses the 'Conference' Key. D is put on Consultation Hold.
- F gets feature tone. D gets on-hold music.
- F grabs a Trunk and dials E's number.
- F is in speech with E. D cannot hear their conversation.
- F presses the 'Conference' Key to enable three-way speech.

- F, D, and E are now in speech.
- D and E will hear Assistant Present beeps²⁷⁸ as long as F is present in the conference.
- For confidential conversation between D and E to be initiated, F must leave the conference.
- D and E will hear Assistant Leave beeps as soon as F leaves the conference.
- D and E are now in two-way speech.

- *A, B and C are in speech. When A disconnects, either B and C are also disconnected or speech is established between them depending on the option you select in **If the Extension creating 3 party conference, disconnects during Conference** in the System Parameters.*
- *The Conference can be broken only by the master DKP/Extended IP Phone that has initiated the Conference.*
- *If a call put on hold is to be included in a Conference, it must be retrieved first.*
- *If all the parties to the conference are SIP Extensions/Trunks and if the initiator of the Conference goes on-Hook during the conference, the other parties will still remain in conversation. This is known as Transfer on Conference Hangup.*

How to configure

For this feature to work, the feature 'Conference' must be enabled in the Class of Service group of the extensions that are to be allowed this feature.

For confidential conference to be established by Operator(Assistant), you must:

- Enable the **Play beeps when Assistant present in Multiparty Conference** check box. For instructions, see [“System Parameters”](#).
- Enable the **Play beeps when Assistant leaves the Conference** check box. For instructions, see [“System Parameters”](#).
- Configure the desired interval time in **Conference – Assistant Present Beep Interval (sec)**. For instructions, see [“System Timers and Counts”](#).
- Make sure you select **Station Type** as **Assistant** for the Operator Extension. For instructions, see [“Configuring SLT Extensions”](#), [“Configuring DKP Extensions”](#), [“Configuring Matrix SPARSH VP248”](#), [“Configuring Matrix SPARSH VP310”](#), [“Configuring Matrix SPARSH VP330”](#), [“Configuring Matrix SPARSH VP210”](#), [“Configuring Matrix SPARSH VP510”](#), [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#) and [“Configuring Matrix VARTA WIN200 UC Client”](#).

If extension users at remote locations are to be allowed to initiate the 3-party conference, [“Direct Inward System Access \(DISA\)”](#) or [“Auto Attendant”](#) must be enabled on the trunk on which their call lands.

3-Party Conference in Class of Service

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all the extensions of the SARVAM UCS. The Station Basic Feature Template 01 is assigned CoS group 01 which has 'Conference' enabled. So, all extensions of the SARVAM UCS can make Conference calls.

If you want to deny 3-Party Conference to selected extensions, follow these steps:

1. Define a CoS group with 'Conference' disabled.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the [“Time Zones”](#).

²⁷⁸. The total Beep Time = Beep Cadence + Wait Timer. The Wait Timer(non-programmable) is fixed as 2 seconds by the system.

3. Assign this new Template to the extensions to which Conference is to be denied.
Refer the topics “[Class of Service \(COS\)](#)” and “[Station Basic Feature Template](#)” for detailed instructions and programming.

The feature 'Conference' in the Class of Service also includes Dial-In and Multi-party Conference. Extensions that are denied 'Conference' in their Class of Service will not be allowed all three types of conferences - 3-Party, Dial-In and Multi-party Conference.

How to use

For EON and Extended IP Phone Users

- Speech with Party 1 on trunk/extension.
- Press 'Conference' Key. Party 1 put on Consultation Hold.
- Dial the number of Party 2.

If Party 2 is a trunk,

- Dial Trunk Access Code, to grab a trunk.
- You get Trunk dial tone.
- Dial telephone number of Party 2. You get ring back tone.
- Speech with Party 2.
- Press the 'Conference' Key.
- Three-way speech is established.

When the Conference is established, the Conference Key LED will glow continuously and you will get a message “Conference” on your phone display.

For SLT Users

- Speech with Party 1 on trunk/extension.
- Dial Flash. You get Feature tone. Party 1 put on Consultation Hold.
- Dial the number of Party 2.

If Party 2 is a trunk,

- Dial Trunk Access Code to grab a trunk. You get Trunk dial tone.
- Dial telephone number of Party 2. You get ring back tone.
- Speech with Party 2.

- Dial Flash-*3.
- Three-way speech is established.

Conference-Multiparty

What's this?

Like the Dial-In Conference, a Multi-party conference allows speech between more than three participants.

The key difference between Dial-In and Multi-party conference is that in a Dial-In conference participants can include themselves in the conference by dialing into it without assistance, whereas in a Multi-party Conference the party initiating the conference must include the participants by dialing their numbers.

In a 3-party Conference, when you add the fourth participant, a Multiparty Conference is initiated.

A Multiparty conference may be

- between extensions
- between extensions and trunks, that is, external numbers.

Any participant in a Multiparty Conference can Include a party, Remove a party, Leave a conference temporarily or can Cancel a conference. When any participant is included in the conference, the system plays a beep to indicate the inclusion.

A conference may also include the Operator(Assistant). For confidential discussions, where the parties need to know that the operator has withdrawn, the system provides facility to play beeps.

Beeps²⁷⁹ will be played:

- when the operator is present in the conference at regular intervals
- when the operator has left the conference

External callers can initiate multiparty conference using "[Direct Inward System Access \(DISA\)](#)".

Depending on the model you are using, refer below table for the details regarding the multiparty conferences supported.

Model	Maximum conference participants	Maximum simultaneous conferences (If all the conferences involve 3 parties)	Maximum parties included in a conference (If all the parties are in a single conference)
ETERNITY LENX	45	15	21
ETERNITY MENX	45	15	21
ETERNITY GENX	62	20	21
ETERNITY PENX	48	16	15

How it works

A, B, C, and D are extension users.

E and F are external numbers.

A decides to hold a teleconference with B, C, D, E and F.

G is the Operator.

279. The total Beep Time = Beep Cadence + Wait Timer. The Wait Timer(non-programmable) is fixed as 2 seconds by the system.

Initiating a Multiparty Conference

- A has initiated a 3-party conference with B and C.
- If A dials the D's number followed by the 3-party conference code. D is included in the conference.
- If A dials the G's number followed by the 3-party conference code. G is included in the conference. The system plays a beep to indicate the inclusion.

Now, the 3-party Conference is converted into a Multiparty Conference.

- The system will play beeps at regular intervals indicating that one of the participants present in the conference is the Operator (Assistant).

After the Conference has been initiated, conference participants can:

- **Include a Party in an on-going Multiparty Conference.**

Internal as well as external callers can be included in an ongoing conference by the any of the participants.

To include external callers, in this case, E and F. A must dial the Trunk Access Code followed by E's number and the 3-party conference code, Similarly F can be included.

- **Remove a Participant from an on-going Multiparty Conference.**

Only DKP or Extended IP Phone users can remove another participant from the Multiparty Conference. The DKP/Extended IP phone displays the numbers of all the participants, select the number of the participant to be removed from this list.

If the last Operator (Assistant) in the conference leaves the group, a beep will be played.

- **Temporarily Leave a Multiparty Conference.**

Any participant in a conference can dial the Temporarily Leave Conference code to leave the conference for a short time period.

If all participants, Temporarily Leave the conference one-by-one, the system will start the 'Release Conference if idle for more than (Minutes) Timer'. This Timer is programmable, and by default it is set to 002 Minutes. If no participant rejoins the conference before the expiry of this Timer, the system will free the resource occupied by the conference on the conferencing circuit.

- **Rejoin a Multiparty Conference.**

The participants who leave temporarily can rejoin the conference at a later stage by going Off-Hook and dialing the Rejoin Conference conference code.

- **Permanently Leave from a Multiparty Conference.**

Participants in a conference can exclude themselves by going ON-Hook. Once any participant goes ON-Hook, he/she cannot rejoin the conference.

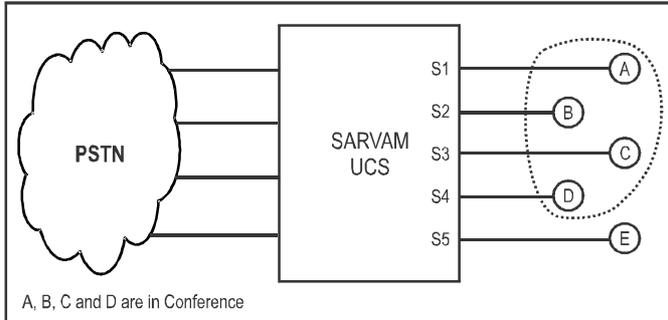

- **Cancel a Multiparty Conference.**

Any participant in a conference can dial the Cancel conference code to end the conference.

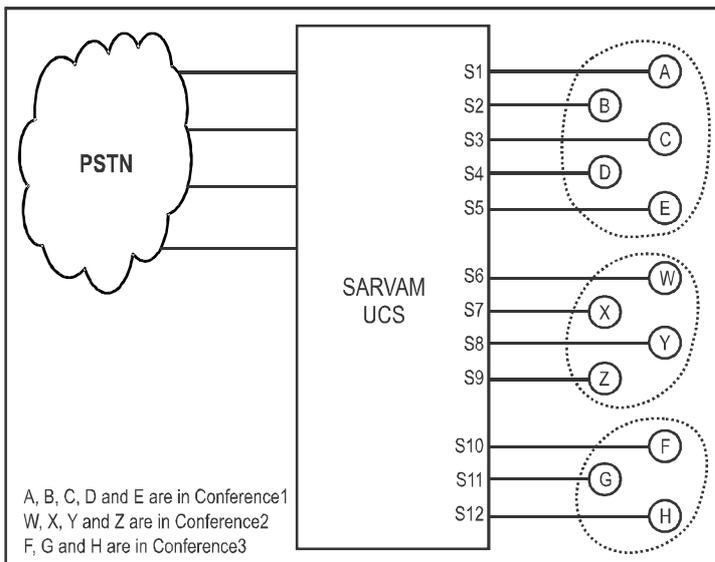

All participants will get Error Tone and the system resource occupied by the conference will be freed.

Examples of Multi-party Conferences:

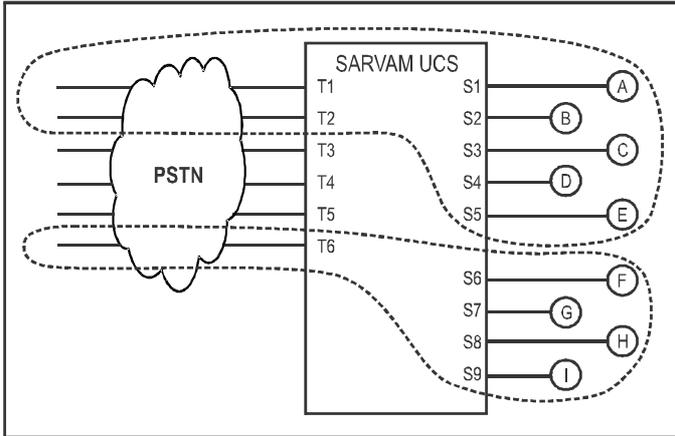

A Multiparty conference between extensions.

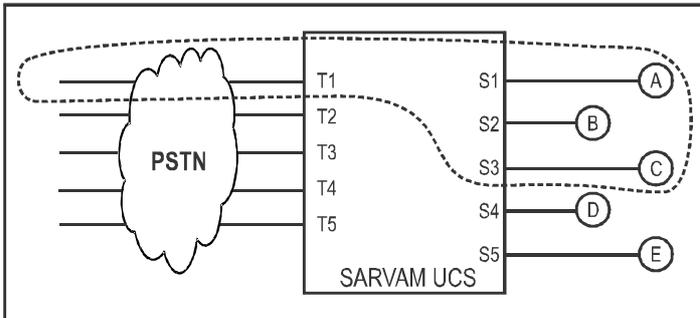

Simultaneous Multi Party conferences between extensions.

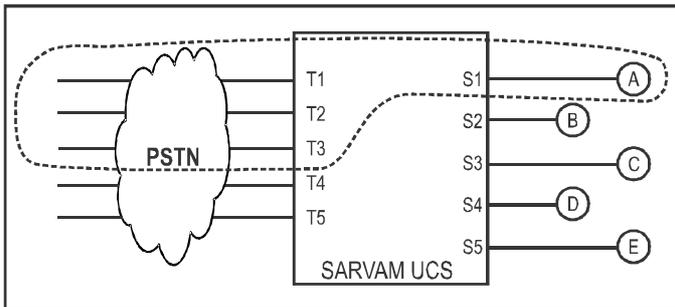

Multiple Multiparty Conferences between trunks and extensions.

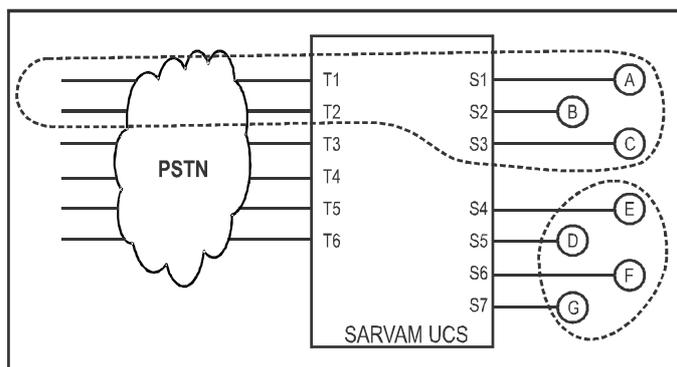

Multiparty Conferences between one trunk and a few extensions.

Multiparty Conference between a few trunks and one extension.

Simultaneous Multiparty Conference between a few trunks and extensions and between extensions.

How to configure

To provide this feature to extensions,

- You must enable the feature 'Conference' in the **Class of Service (COS)** of the extensions in their **Station Basic Feature Template**. By default, this feature is enabled on all extensions, so all extensions can use this feature.

The feature 'Conference' in the Class of Service also includes 3-Party and Multi-party Conference.

Extensions that are denied 'Conference' in their Class of Service will not be allowed Dial-In as well as 3-Party and Multi-party Conference.

For confidential conferences, you must:

- Enable the **Play beeps when Assistant present in Multiparty Conference** check box. For instructions, see **System Parameters**.
- Enable the **Play beeps when Assistant leaves the Conference** check box. For instructions, see **System Parameters**.
- Configure the desired interval time in **Conference – Assistant Present Beep Interval (sec)**. For instructions, see **System Timers and Counts**.
- Make sure you select **Station Type** as **Assistant** for the Operator Extension. For instructions, see **Configuring SLT Extensions**, **Configuring DKP Extensions**, **Configuring Matrix SPARSH VP248**, **Configuring Matrix SPARSH VP310**, **Configuring Matrix SPARSH VP330**, **Configuring Matrix SPARSH VP510**, **Configuring Matrix SPARSH VP210**, **Configuring Matrix VARTA ADR100/AMP100 UC Clients** and **Configuring Matrix VARTA WIN200 UC Client**.
- If desired, you may also change default value of the **Release Conference if Idle for more than (min.) Timer**. See **System Timers and Counts**.
- If external parties are to be allowed to initiate or join the Conference, **Direct Inward System Access (DISA)** must be enabled on the trunk on which they call.
- You can program a DSS key for Terminating a Conference, Temporarily Leave/Rejoining a Conference, if required. Refer the topic **DSS Keys Programming** for instructions.

How to use

For EON and Extended IP Phone Users

To initiate multiparty conference:

- Dial the number of party 1.
- When you are in speech with party 1, press 'Conference' Key.
- Party 1 is put on hold and gets on-hold music.
- You get feature tone. Dial number of party 2.
- When you are in speech with party 2, press the 'Conference' Key.
- Party 2 is included in the conference. A 3-way speech is established.
- Press the 'Conference' Key. Dial the number of party 3.
- When in speech with party 3, press the 'Conference' Key.
- A Multiparty Conference is initiated. Press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option Include Party and dial the number.
- When you are in speech with the party, press the 'Conference' Key.
- Repeat the above steps to add new participants in the conference (max. 21).

To include a party in a multiparty conference:

- After the Multiparty Conference has been initiated. Press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option Include Party and dial the number.
- When you are in speech with the party, press the 'Conference' Key.
- Repeat the above steps to add new participants in the conference (max. 21).

To temporarily leave multiparty conference:

- While in Conference, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option 'Leave Temporary' and press the Enter Key.

OR

- Press the DSS key assigned to Temporary Leave Conference/Rejoin Conference.

To rejoin multiparty conference:

- Press the 'Conference' Key.

OR

- Press the DSS key assigned to 'Temporary Leave' Conference/Rejoin Conference.

To remove a party from multiparty conference:

- While in Conference, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option 'Remove Party from Conf'
- The LCD displays the numbers of all the participants.
- Select the number of the participant you want to remove and press the Enter Key.

- The selected participant is disconnected.

To permanently leave from the multiparty conference:

- While in Conference, go ON-Hook.

To cancel multiparty conference:

- While in Conference, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option 'Terminate Conference' and press the Enter Key.

OR

- Press the DSS key assigned to Terminate Conference.
- All the participants will get an Error Tone and the system resource occupied by the conference will be freed.

For SLT Users

To initiate multiparty conference:

- Lift handset.
- Dial number of party 1.
- Speech with party 1.
- Dial Flash.
- Dial number of party 2.
- Speech with party 2. Dial Flash-*3. A 3-way speech is established.
- Dial Flash.
- Dial number of party 3.
- Speech with party 3. Dial Flash-*3. A multiparty conference is established.

To include a party in a multiparty conference:

- Lift handset.
- Dial number of party 1.
- Speech with party 1.
- Dial Flash.
- Dial number of party 2.
- Speech with party 2. Dial Flash-*3. A 3-way speech is established.
- Dial Flash.
- Dial number of party 3.
- Speech with party 3. Dial Flash-*3.
- Repeat the steps to include the desired number of parties (max. 21).

To temporarily leave from the multiparty conference:

- While you are all in speech, dial Flash-191.

To rejoin the multiparty conference:

- Go OFF-Hook.
- Dial 191.

To permanently leave from the multiparty conference:

- Go ON-Hook.

To cancel multiparty conference:

- While you are all in speech, dial Flash-190.

SLT users cannot Remove any participant from the Multiparty Conference.

To use Multiparty Conference from DISA mode, you may see the instructions [“Dial-In Conference using DISA”](#) under [“Conference Dial-In”](#).

Conference Dial-In

What's this?

Dial-In Conference is a multi-party conference held at a pre-defined time. Extension users can schedule a Dial-In Conference and inform other participants to join in the conference at the scheduled time. Dial-In Conference can be used to conduct client meetings or sales presentations, project meetings and updates, regular team meetings, and to communicate with coworkers who operate in different locations. Thus, this feature helps to increase productivity by saving time and cost of travel for out-of-office meetings.

A conference may also include the Operator (Assistant). For confidential discussions, where the parties need to know that the operator has withdrawn, the system provides facility to play beeps.

Beeps²⁸⁰ will be played:

- when the operator is present in the conference at regular intervals
- when the operator has left the conference

Depending on the model you are using, refer below table for the details regarding the Dial-In conferences supported.

Model	Maximum conference participants	Maximum simultaneous conferences (If all the conferences involve 3 parties)	Maximum parties included in a conference (If all the parties are in a single conference)
ETERNITY LENX	45	15	21
ETERNITY MENX	45	15	21
ETERNITY GENX	62	20	21
ETERNITY PENX	48	16	15

How it works

- A Dial-In Conference can be scheduled by dialing the access code for Dial-In conference followed by the conference number and a password.

- The **Conference Number** can be: **01 to 20**.

The Conference Number must correspond with the number of simultaneous Dial-In Conferences supported by the ETERNITY GENX (01 to 20), ETERNITY LENX/MENX (01 to 15) and ETERNITY PENX (01 to 16). If a user dials a conference number other than this, system will play an Error Tone.

- The **Conference Password** is a four digit number string. The default conference password is **1111** and must be changed before using this feature.

To avoid unauthorized access, make sure the password is strong and is provided to the participants only.

- All the other participants must be informed about the conference.

280. The total Beep Time = Beep Cadence + Wait Timer. The Wait Timer (non-programmable) is fixed as 2 seconds by the system.

You can also have external callers join the conference by providing them the DISA login.

Let us understand how Dial-In Conference works with the following example.

- Extension user A wants to schedule a Dial-In Conference at 4:30 p.m. with B, C, D, E and F.
- B and C are extension users. C is an extension user who has been provided a DISA login to access an extension of SARVAM UCS.
- D, E and F are external parties.
- Any extension user can initiate the conference, in this case A initiates the conference.

Scheduling a Dial-In Conference

- A schedules a Dial-In Conference for 4.30 pm.
- A informs B, C, D, E and F about the conference and provides them conference number, for example, '1' and the password, '4040'.

If C wants to schedule a conference, C must log into his extension from DISA mode.

Initiating a Dial-In Conference

- Any extension user can initiate the Dial-In conference by dialing the feature access code for Dial-In conference followed by the two-digit conference number and the password, for instance: '01' and '4040'. In this case, A initiates the conference, the system plays a beep.

After the Conference has been initiated, conference participants can:

- **Join a Dial-In Conference.**

In this, example, B can join the conference by dialing the feature access code to join the conference followed by the two-digit conference number and password. When B joins a beep will be played.

C can join the conference from the DISA mode.

When a new party joins the conference, the system plays beeps to the existing participants, to inform them of the new inclusion. Beeps are programmable (default: enabled).

- **Include a Party in an on-going Dial-In Conference.**

Internal as well as external callers can be included in an ongoing conference by the any of the participants.

To include external callers, in this case D, E and F, A must dial the Trunk Access Code followed by the their numbers.

- **Remove a Participant from an on-going Dial-In Conference.**

Only DKP or Extended IP Phone users can remove another participant from the Dial-In conference. The DKP/Extended IP phone displays the numbers of all the participants, select the number of the participant to be removed from this list.

- **Temporarily Leave a Dial-In Conference.**

Any participant in a conference can dial the Temporarily Leave Conference code to leave the conference for a short time period.

If all participants, *Temporarily Leave the conference one-by-one*, the system will start the 'Release Conference if idle for more than (Minutes) Timer'. This Timer is programmable, and by default it is set to 002 Minutes. If no participant rejoins the conference before the expiry of this Timer, the system will free the resource occupied by the conference on the conferencing circuit.

- **Rejoin a Dial-In Conference.**

The participants who leave temporarily can rejoin the conference at a later stage by going Off-Hook and dialing the Rejoin Conference conference code.

- **Permanently Leave from a Dial-In Conference.**

Participants in a conference can exclude themselves by going ON-Hook. Once any participant goes ON-Hook, he/she cannot rejoin the conference.

- **Cancel a Dial-In Conference.**

Any participant in a conference can dial the Cancel conference code to end the conference.

All participants will get Error Tone and the system resource occupied by the conference will be freed.

The conference can also be canceled by logging into the SA mode.

How to configure

To provide this feature to extensions,

- You must enable the feature 'Conference' in the **Class of Service (COS)** of the extensions in their **Station Basic Feature Template**. By default, this feature is enabled on all extensions, so all extensions can use this feature.

The feature 'Conference' in the Class of Service also includes 3-Party and Multi-party Conference. Extensions that are denied 'Conference' in their Class of Service will not be allowed Dial-In as well as 3-Party and Multi-party Conference.

- If you want beeps to be played when any one joins the conference, enable **Play Beep when Raid/Conference/Dial-in Conference begins**. See **System Parameters**, for instructions.

For confidential conferences, you must:

- Enable the **Play beeps when Assistant present in Multiparty Conference** check box. For instructions, see **System Parameters**.
- Enable the **Play beeps when Assistant leaves the Conference** check box. For instructions, see **System Parameters**.
- Configure the desired interval time in **Conference – Assistant Present Beep Interval (sec)**. For instructions, see **System Timers and Counts**.
- Make sure you select **Station Type** as **Assistant** for the Operator Extension. For instructions, see **Configuring SLT Extensions**, **Configuring DKP Extensions**, **Configuring Matrix SPARSH VP248**, **Configuring Matrix SPARSH VP310**, **Configuring Matrix SPARSH VP330**, **Configuring Matrix SPARSH VP510**, **Configuring Matrix SPARSH VP210**, **Configuring Matrix VARTA ADR100/AMP100 UC Clients** and **Configuring Matrix VARTA WIN200 UC Client**.
- If desired, you may also change default value of the **Release Conference if Idle for more than (min.) Timer**. See **System Timers and Counts**.

- If external parties are to be allowed to initiate or join the Conference, [“Direct Inward System Access \(DISA\)”](#) must be enabled on the trunk on which they call.
- You can program a DSS key for Dial-In Conference, Terminating a Conference, Temporarily Leave/ Rejoining a Conference, if required. Refer the topic [“DSS Keys Programming”](#) for instructions.

How to use

For EON and Extended IP Phone Users

To Schedule a Dial-In Conference:

- Go OFF-Hook.
- Press the DSS key assigned for Dial-In Conference.
OR
- Dial *19.
- The Dial-In Conference menu appears on the LCD.
- Select the option 'Schedule a Conf' and press the Enter Key.
- Enter Conference Number on the prompt.
- Enter Conference Password on the prompt.
- You get confirmation tone and the message 'Conf <number> Scheduled' on your phone's display.
- Go ON-Hook.
- Call all participants and inform them of the time of the Dial-In conference, the Conference Number and Password.

To join the Dial-In Conference:

- Go OFF-Hook.
- Press the DSS key assigned for Dial-In Conference.
OR
- Dial *19.
- The Dial-In Conference menu appears on the LCD.
- Select the option 'Include in Schd Conf' and press the Enter Key.
- Enter the Conference Number on the prompt.
- Enter the Conference Password on the prompt. If you enter the wrong password, you get the message 'Check Conf P/w' on your phone's display.
- Conference is initiated.
- You will hear speech if any other participant has joined it. You will hear silence if no other participant has joined it.
- If you hear silence, wait for others to join in.
OR
- Include the other participants in the conference, if you initiated the conference.

To include a party in the Dial-In conference:

- After initiating the conference and while you are all in speech, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option 'Include Party in Conf' and dial the desired number to be included in the conference. You get Ring Back Tone.
- When you are in speech with the party, press the 'Conference' Key The party is included in the conference.

To remove a participant from the Dial-In conference:

- While in Conference, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.

- Select the option 'Remove Party from Conf'.
- The numbers of the participants appear on your phone's display.
- Scroll to select the participant you want to remove.
- Press 'Enter' key.
- You get confirmation tone. The extension user is now excluded from the conference.

To temporarily leave Dial-In conference:

- While in Conference, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option 'Leave Temporary' and press the Enter Key.
OR
- Press the DSS key assigned to Temporary Leave Conference/Rejoin Conference.

To rejoin Dial-In conference:

- Press the 'Conference' Key.
OR
- Press the DSS key assigned to 'Temporary Leave /Rejoin Conference'.

If you have configured a DSS key for Temporary Leave and you leave the Conference by pressing the DSS key, to Rejoin the Conference press the DSS key again.

To permanently leave from the Dial-In conference:

While in Conference, go ON-Hook.

To cancel Dial-In conference:

- While in Conference, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option 'Terminate Conference' and press the Enter Key.
OR
- Press the DSS key assigned to Terminate Conference.
- All the participants will get an Error Tone and the system resource occupied by the conference will be freed.

To cancel a Dial-In Conference from the **System Administrator (SA) Mode:**

- Enter SA mode from a DKP/SLT/Extended IP Phone.
- Dial 1072-026-Conference Number.
- You get confirmation, the conference is released.

You can also cancel a Dial-In Conference from System Administrator (SA) Mode using Jeeves. To do this,

- Open Jeeves.
- Log in as System Administrator.

- Click the **Dial-In Conference - Cancel** link.

- Enter the two-digit conference number (01 to 20) which you want to cancel in the **Cancel Dial-In Conference Number** field.
- Click **Submit** button.
- Log out of Jeeves.

For SLT Users

- Lift the handset.
- You get dial tone.

Make sure you enter the two-digit Conference Number — 01 to 20.

To schedule a Dial-In conference:

- Dial *191-Conference Number-Conference Password.
- You get confirmation tone.
- Replace Handset.
- Inform all intended participants about the time, conference number and password.

To initiate the Dial-In conference:

- Dial *192-Conference Number-Conference Password.
- Talk, if you hear speech, or wait for others to join in.
OR
- Include any participant in the conference.

To join the Dial-In conference:

- Dial *192-Conference Number-Conference Password.
- Talk, if you hear speech, or wait for others to join in.
OR
- Include any participant in the conference.

To include a participant in Dial-In conference:

- After initiating the conference, or when in speech,
- Dial Flash.
- Dial the number of the desired party.
- Speech with party, dial Flash-*3.

To temporarily leave from the Dial-In conference:

- While you are all in speech, dial Flash-191.

To rejoin the Dial-In conference:

- Go OFF-Hook.
- Dial 191.

To permanently leave from the Dial-In conference:

- Go ON-Hook.

To cancel a Dial-In conference:

- While you are all in speech, dial Flash-190.

SLT users cannot Remove any participant from the Dial-In Conference.

Dial-In Conference using DISA**To schedule a Dial-In Conference:**

- Dial a DISA enabled Trunk
- Dial DISA Login Code 1079-Extension Number-User Password, if PIN Authentication is required.
- After DISA Login beeps, dial *191-Conference Number-Conference Password.

To initiate or join a Dial-In Conference:

- After DISA Login beeps, dial *192-Conference Number-Conference Password.

To include a party midway of the Conference:

- Dial #2.
- You get dial tone.
- Dial the extension number to be included in the conference. You get Ring Back Tone.
- When you are in speech with the extension user, dial #2.
- You get feature tone, and the extension user is played music on hold.
- Dial *3. Both of you are now included in the conference.

To temporarily leave the Conference:

- Dial Flash-191.

To rejoin the Conference

- Go Off-Hook Dial 191.

To permanently leave the Conference:

- Dial #0 to go ON-Hook.
- Dial #0#9 to end DISA session.

When you enter DISA mode, you get beeps, dial digits before the DISA Inactivity Timer elapses.

Never dial 'Flash' when in DISA mode, you will get disconnected.

Keep dialing any digit to continue the conference.

See "[Direct Inward System Access \(DISA\)](#)" to know more.

Join Dial-In Conference using VMAA

Users can also Join a Dial-In Conference using the trunks on which the Voice Mail Auto Attendant is enabled. To know more refer to "[Join Conference Dial-In using VMS](#)". After joining the conference users can Temporary Leave, Rejoin or Permanently Leave the Conference also.

Conflict Dialing

What's this?

You may recall that [“Access Codes”](#) are dialed at different call phases. No two Access Codes must be the same in the same call phase.

For example, the same access code cannot be used for two different features like Call Forward and Redial, since both these features are invoked in the 'Dial' phase. Similarly, Station (Extension) and Logical Group Codes too must be unique and should not match with any of the features invoked in the 'Dial' phase.

However, SARVAM UCS allows overlaps within Feature Codes and [“Flexible Numbers”](#) (Station Codes). One Feature Access Code can be a part of (subset) another code, for example, 4, 41, 412; Flexible Numbers of extensions can be 201, 2011 etc.

So, when such overlapping access codes are dialed, the system matches the first digit. On finding more than one Access code starting with the same digit, the system will not know how to interpret the instruction and act accordingly.

Conflict Dialing feature resolves this confusion. When an access code that is a subset of any other access code is dialed, the system waits for some time for the extension user to dial the next digit. If the user does not dial any digit within that time, the system interprets it as the smaller Access Code, and invokes the associated feature.

The time for which the system waits for the next digit to be dialed before resolving the Access Codes is called "Conflict Dialing Timer". This timer is set to 2 seconds and is programmable.

Refer the topics [“Access Codes”](#) to know more.

How it works

You may set,

- The Access code of Call Pick Up as '4'.
- The Access code for Alarms as '41'.
- The Access code for Department Group 01 as '412'.

- Extension user A dials '4'.
- The system finds three access codes starting with '4' (4, 41, 412).
- So, it waits for 2 seconds, which is the default duration of the Conflict Dialing Timer, for the next digit to be dialed.
- If A does not dial any other digit before the Timer expires, the system interprets the code as '4' and invokes Call Pick-Up.

- If A dials '1' before the Timer elapses,
 - The system interprets it as '41'.
 - The system detects another access code starting with '41'.
 - So it waits for 2 seconds again for the next digit to be dialed.

- If A does not dial any other digit before the Timer elapses, the system interprets the code as '41' and invokes the Alarm feature.

- If A dials '2' before the Timer elapses,
 - The system interprets the code as '412' and invokes Department Call to Group 01, provided there are no other access codes like 4121, 4123, etc.
- If such access codes exist, the system again waits for the duration of the Conflict Dialing Timer for another digit to be dialed.
- Thus, only when the conflict in the access codes is resolved will the system respond accordingly.

How to configure

The working of this feature is controlled by the Conflict Dialing Timer, which is set by default to 2 seconds and can be changed as desired.

If the duration of the Conflict Dialing Timer is long, it may cause delay in the system's response to the feature. If the duration is less, the system may misinterpret the access codes. Ensure that the value of the Timer is programmed optimally (that is, at least the default value).

Changing Conflict Dialing Wait Timer using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **System Timers and Counts**.
- Scroll to **Other Features** and set the time in seconds as desired for the **Conflict Dialing Timer**.

System Timers	
Call Park Timer (min)	002
Call Park Release Timer (min)	003
LCS Timer (sec)	010
Message Wait Ring Count	010
Message Wait Ring Timer (sec)	030
Message Wait Ring Interval Timer (min)	030
Conflict Dialing Timer (sec)	002
Extension - Inter Digit Wait Timer (sec)	007
SA Command - Inter Digit Wait Timer(sec)	015
Trunk - First Digit Wait Timer (sec)	025
Trunk - Inter Digit Wait Timer (sec)	003
Global Hold Retrieval Timer (sec)	120
Exclusive Hold Retrieval Timer (min)	002
RCOC Record Delete Timer (min)	999

- Click **Submit** at the bottom of the page to save changes.
- Log out of Jeeves or continue programming further.

Changing Conflict Dialing Wait Timer using a Telephone

- Enter SE mode from a DKP/SLT.
- Dial command **5351-Seconds**
Where,
Seconds is from 001 to 255 seconds.
Default: 002 seconds.
- Exit SE mode.

Conversation Recording

What's this?

Conversation Recording allows extension users to record their talk with other extension users or external parties, after or without informing the opposite party.

This feature can be used to record verbal agreements, important discussions, instructions, interviews, client requirements, take or place orders, etc.

Extensions must have a mailbox assigned to them for recording conversations. So, a VMS Module must be installed on the CPU Card of the system for this feature to work.

SARVAM UCS supports recording of 20 calls²⁸¹ simultaneously.

- Use this feature in accordance with the local laws.
- Matrix Comsec is not responsible for any mis-/abuse of this feature by users.

On SIP extensions, SARVAM UCS supports Conversation Recording using INFO Message. For a list of IP phones on which this feature has been tested, see [“SARVAM UCS Features tested on IP Phones of different Brands”](#) in the Appendix.

It is not possible to pause the Conversation Recording in SIP Extension. So, when SIP Extension puts the call on hold and then retrieves the call then for the hold duration, silence will be recorded in the recorded file.

How it works

A and B are extensions. Both are assigned a mailbox each.

C and D are external parties.

- A calls C.
- C answers the call.
- A presses the Transfer Key.
- C is put on Consultation Hold.
- A dials the command for Conversation Recording.
- The system sends a string of digits to the Voice Mail System to initiate Conversation Recording.
- A and C are in speech again.
- The conversation recording starts in A's mailbox. The system plays beeps, if Conversation Recording Beeps are enabled.
- A or C disconnects the call.
- Conversation recording ends.
- A can listen to the recorded conversation by invoking the Voice mail feature.

The same is repeated when B calls A. As both have mailboxes assigned, both can record the conversation.

²⁸¹. ETERNITY PENX supports 16 calls simultaneously.

How to configure

The functioning of this feature is controlled by three parameters: 'Class of Service', 'Mailbox', and 'Conversation Recording Beeps'. These parameters can be programmed using Jeeves or by dialing SE Commands from a telephone.

Conversation Recording in Class of Service

Conversation Recording must be enabled in the COS group of the extensions to which this feature is to be allowed.

In the default Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS, CoS group 01 is assigned as default. Conversation Recording is disabled in CoS group 01. So, none of the extensions of the SARVAM UCS can record conversations.

Decide which extensions should be allowed Conversation Recording.

If you want to allow this feature to all extensions, simply enable Conversation Recording in the default CoS group 01.

If you want to allow Conversation Recording to selected extensions,

1. Define a CoS group with Conversation Recording enabled.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the ["Time Zones"](#).
3. Assign this new Template to the extensions to which Conversation Recording is to be allowed.

Refer the topics ["Class of Service \(COS\)"](#) and ["Station Basic Feature Template"](#) for detailed instructions and programming.

Mailbox

Extensions that are to be allowed Conversation Recording must also have a mailbox. Refer ["Configuring SLT Parameters using a Telephone"](#), ["Configuring DKP Extensions using a Telephone"](#), ["Configuring ISDN Terminals using a Telephone"](#), ["Viewing SIP Extension Status"](#) for more information and programming instructions.

Conversation Recording Beeps

Decide whether you want Beeps to be played during Conversation Recording. Follow the instructions given below.

Programming Conversation Recording Beeps using Jeeves

- Log in as System Engineer.

- Under **Configuration**, click **System Parameters** to open the page.

- Go to **Play Beep when Call Taping/Conversation Recording starts**. Click the check box to enable or clear the check box to disable this feature.
- Click **Submit** at the bottom of the page to save changes.
- Log out of Jeeves or continue with further programming.

Programming Conversation Recording Beeps using a Telephone

- Enter SE mode from a DKP/SLT.
 - Dial command **5332-Code**.
Where,
Code is
0 for Disable
1 for Enable
- Exit SE mode.

How to use

For EON and Extended IP Phone Users

To record a conversation:

- You are in speech with another extension/external number.
- Press DSS Key assigned to Conversation Recording (if programmed).

OR

Press Transfer Key and Dial **1095**.

- You get beeps (if enabled).

- Speech with party re-established.
- Recording starts.
- Go ON-Hook, after conversation ends.

To listen to a recorded conversation:

- Press 'Voice Mail' Key

OR

Dial **3931**²⁸²

- Follow Voice Mail Prompts.
- Go Idle or you get dial tone after 3 seconds.

Conversations are recorded as New Messages. So, follow the voice mail prompts for listening to new messages.

For SLT Users

To record a conversation:

- You are in speech with another extension/external number.
- Dial **Flash-1095**
- You get beeps (if enabled).
- Speech with party reestablished.
- Recording starts.
- Replace handset when conversation ends.

To listen to a recorded conversation:

- Lift the handset
- Dial **3931**
- Follow Voice Mail Prompts.
- Replace handset.

²⁸². This is the default Voice Mail Feature Access Code. Verify with you System Engineer if this has been changed and use the new code.

Customer Name

What's this?

Customer Name is the name of the organization/enterprise that has deployed SARVAM UCS. As the User, you can enter the name of your company/organization in the system.

When Customer Name is assigned in the system, this name will appear as header on the various System Reports generated and printed by the SARVAM UCS like SMDR Incoming, Outgoing and Internal Call Reports, T1E1PRI Performance reports, Alarm Status reports, etc.

The Customer Name may consist of a maximum of 80 alphanumeric characters, including punctuation marks. So, you can enter the organization's address along with the Customer Name.

How to configure

Customer Name can be programmed using Jeeves and dialing SE commands from a Telephone at the time of installation, or any time thereafter. It can also be corrected or changed any time.

Programming Customer Name using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **System Parameters** to open the page.

System Parameters	
Customer Name	Prudent Investment, 701 Sunshine Boulevard,
Customer Profile	Enterprise
Onsite configuration	<input type="checkbox"/>
Station Name Pattern	Name Only
Default Call Hold Type	Exclusive Hold
Store Internal Calls in Missed Call Log	<input checked="" type="checkbox"/>
Store Internal Calls in Dialed Call Log	<input checked="" type="checkbox"/>
Store Internal Calls in Answered Call Log	<input checked="" type="checkbox"/>
MoH Source when Station kept on Hold	Internal (VM-01)
MoH Source when Trunk kept on Hold	Internal (VM-01)
Play MOH to Queued Internal Calls on DKP/SIP Extension	<input type="checkbox"/>
Give Off-hook Alert to Operator	<input type="checkbox"/>

- Enter the name (and address, if desired) of the organization/enterprise in the field **Customer Name**. For example: Prudent Investment, 701 Sunshine Boulevard, Bannerghatta, Bangalore.
- Click **Submit** to save changes.

Programming Customer Name using a Telephone

- Enter SE mode from a DKP.

To enter Customer Name, dial:

- **5401-Customer Name-#***

To clear the Customer Name, dial:

- **5401-#***

- Exit SE mode

- *Use EON to assign Customer Name, as SLT does not support alphanumeric dialing.*
- *The method of entering Customer Name from EON is similar to typing text messages from the mobile phone.*

COSEC Integration

SARVAM UCS supports integration with COSEC for “[Building Intercom](#)” solutions, that is, few Systems can be connected to each other using VoIP and these are also integrated with the Matrix COSEC Door Controllers. However, COSEC Integration can also be used in VIP Apartments and Villa’s, wherein ETERNITY LENX/MENX/GENX/PENX is installed.

With this integration the users — SLT, DKP and Extended IP— of SARVAM UCS can unlock the COSEC Door Controller.

Matrix COSEC is an enterprise-grade people mobility management solution for organizations covering Time-Attendance, Access Control, Visitor Management, Employee Self Service Portal, Roster Management, Contract Workers Management and Cafeteria Management. To know more about Matrix COSEC, refer to COSEC documentation or visit our website: www.MatrixComSec.com.

How it works

- Group together extensions of SARVAM UCS that need to access the same COSEC Door Controller. Assign a Group ID to each group. You can create 50 groups. Each group must have a unique Group ID.
- In SARVAM UCS for integration a User Name and Password is configured. Make sure the same User Name and Password is configured in each COSEC Door Controller you have installed. You can integrate 50 such Door Controllers with SARVAM UCS.
- Each COSEC Door Controller has a unique IP Address and port.
- Each Group ID is mapped to the IP Address and Port of the COSEC Door Controller. The extensions in the same Group ID can only unlock the COSEC Door mapped with their Group ID.
- The extension users can open the door by dialing *7 (access code to unlock the COSEC Door, programmable, see “[Access Codes](#)”) or by pressing the DSS key assigned to COSEC Door Open.

*Standard SIP Phone users can put a call on hold by dialing #2. These users can also unlock the COSEC Door by dialing *7.*

Let us understand how this feature works with the help of an example.

- ABC Limited has SARVAM UCS with Building Intercom Application installed, where there are 10 residential towers. Each tower has around 100 flats. Each flat has an SLT extension.
- The users in Tower 1 are grouped together, that is extensions from 200 to 300. They are assigned a Group ID 01.
- Each tower has its own gate with COSEC Door Controller installed. At each gate there is an extension for visitors.
- Group 01 is mapped to the COSEC Door Controller IP Address 192.168.101.200:8080

When there is a visitor at the main gate the security guides the visitor to the Tower 1. The visitor makes a call to the flat owner, extension 205. After confirming the identity of the visitor, the tower door needs to be opened.

The flat owner puts the caller on hold and dial *7 (access code to unlock the door) or press the DSS key assigned to COSEC Door Open.

The system checks the Group ID of the flat owners extension and the corresponding Door Controller mapped to it. The system sends the request along with the User Name and Password to the COSEC Door Controller.

If within 10 seconds (Response Timer, not programmable) a success response is received from the COSEC Door, the door is unlocked. If a response is not received or if failure response is received the user will get an error tone.

*The COSEC Door access code can be dialed in Idle state also, that is, if the flat owner has received the call on his/her mobile from the visitor and needs to open the door, the flat owner can lift the handset and dial *7.*

How to configure

For this feature to work, you must:

- On a piece of paper make four columns and enter the details as given below (taking the above example further):

User Name	Extension Number	Group ID	COSEC Door they need to access	COSEC Door IP Address and Port
James William	200	01	Tower 1	192.168.101.200:8080
Jessica James	201	01	Tower 1	192.168.101.200:8080
Kelly	302	02	Tower 2	192.168.101.205:8080
.	.	.	.	
.	.	.	.	
.	.	.	.	
.	.	.	.	
William	505	05	Tower 5	192.168.101.250:8080

You can create 50 groups. Assign each group a Group ID. Range of the Group ID is from 00 to 50.

- Configure the COSEC Integration table.
- Assign each user the Group ID.

To configure the COSEC Integration table,

- Login as System Engineer.

- Under **Configuration**, click **COSEC Integration** to open the page.

Group ID	Door Access controller IP Address & Port
1	000 . 000 . 000 . 000 : 00080
2	000 . 000 . 000 . 000 : 00080
3	000 . 000 . 000 . 000 : 00080
4	000 . 000 . 000 . 000 : 00080
5	000 . 000 . 000 . 000 : 00080
6	000 . 000 . 000 . 000 : 00080
7	000 . 000 . 000 . 000 : 00080
8	000 . 000 . 000 . 000 : 00080
9	000 . 000 . 000 . 000 : 00080
10	000 . 000 . 000 . 000 : 00080
11	000 . 000 . 000 . 000 : 00080
12	000 . 000 . 000 . 000 : 00080

- For COSEC Integration, enter the **User Name** and **Password**. Default User Name: admin, Password: 1234.

The User Name can be a maximum of 24 characters. Valid characters: 0 - 9, a - z, A - Z.

The Password can be a maximum of 24 characters. Valid characters are 0 - 9, a - z, A - Z, !, @, *, (,), -, ., +, / and comma

Make sure the same User Name and Password is configured in the COSEC Door Controllers you have installed.

- Against each **Group ID**, enter the **COSEC Door Controller IP Address** and **Port**.

The IP Address can be a maximum of 15 characters (only IPv4 Addresses are supported).

The Port can be a maximum of 5 digits. Valid range: 1025 - 65535 or 80.

The same COSEC Door Controller IP Address and Port cannot be assigned to different Group ID's.

- Click **Submit**.

To assign Group IDs to SLT users, see parameter COSEC Door Group in [“Configuring SLT Extensions”](#).

To assign Group IDs to DKP users, see parameter COSEC Door Group in [“Configuring DKP Extensions”](#).

To assign Group IDs to SIP users, see parameter COSEC Door Group in [“Configuring Matrix SPARSH VP248”](#), [“Configuring Matrix SPARSH VP310”](#), [“Configuring Matrix SPARSH VP330”](#), [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#), [“Configuring Matrix SPARSH VP510”](#), [“Configuring Matrix SPARSH VP210”](#), [“Configuring Matrix VARTA WIN200 UC Client”](#) and [“Configuring Standard SIP Phones”](#)

To assign a DSS key to COSEC Door Open, see [“DSS Keys Programming”](#).

Day Night Mode

What's this?

Certain features of the SARVAM UCS like Operator, Class of Service, Toll Control, Outgoing Trunk Bundle Access Groups, Trunk Landing Group, Auto Attendant, Direct Inward System Access (DISA), Security Alarms, etc, require extensions and trunks to behave differently according to the working hours, non-working hours and break hours, which are referred to as Time Zones.

These Time Zone-dependant features and facilities are operated automatically according to the Time Tables programmed in the system. In a Time Table, the Time Zones - Working Hours, Non-Working Hours, Break Hours - are defined for the entire week. Time Table is assigned to trunks, extensions and other time-zone dependant features. The system executes the Time-Zone dependent features and facilities automatically according to the Time Table.

To know more refer the topic "[Time Tables](#)".

Day/Night Mode allows you to manually change the Time Zone of the system at any point in time, by issuing a command or by pressing the DSS key on the phone. For example, the office is to be closed on account of an unplanned holiday or emergency. So, the Time Zones of all extensions and trunks must be set to Non-working hours to route outgoing calls and land incoming calls from/to the appropriate destination. You can set the SARVAM UCS to Night Mode until the office remains closed and set it back to operate as per the Time Table, when work is resumed.

To cite another example, the office must work for extended hours. You can set the SARVAM UCS to Day Mode and set it back to operate as per the Time Table.

When you set the system in Day/Night Mode, the system overrides the Time Tables assigned to Trunks, Extensions and Operator. According to the mode you selected, it applies Working Hours/Non-Working Hours to run all the Time-Zone dependent features of the system.

When the system is set to Day Mode, it applies Working Hours as the Time Zone for all extensions, trunks and time zone dependant features and facilities. When the system is set to Night Mode, it applies Non-Working Hours as the Time Zone on Time-Zone dependent features of the system.

Thus, Day/Night Mode forces the system to work in a particular Time Zone, until it is changed again, manually.

Day/Night mode can be set by the System Engineer (SE mode) as well as by the System Administrator (SA Mode). It can be done using Jeeves or by dialing a command from a Telephone.

How to configure

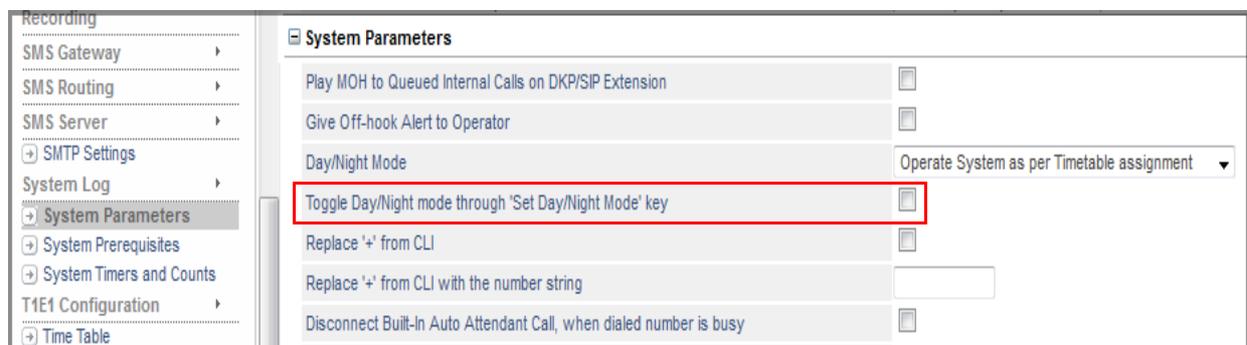

Setting Day/Night Mode from SE mode using Jeeves

- Log into Jeeves as System Engineer.

- Under **Configuration**, click **System Parameters** to open the page.

- Click **System Parameters** to expand.
- Go to **Day/ Night Mode**. Select the desired option:
 - Set System in Day Mode (Working Hrs)
 - Set System in Night Mode (Non-Working Hrs)
 - Set System in Break Hours Mode
 - Operate System as per Timetable assignment (default).

- Select the **Toggle Day/Night mode through 'Set Day/Night Mode' key** check box to switch to Day Mode (Working Hours) or Night Mode (Non-Working Hours) on pressing the DSS Key. Default: Disabled.
- Click **Submit** at the bottom of the page.
- Log out of Jeeves or continue, as desired.

Setting Day/Night Mode from SA mode using Jeeves

- Log into Jeeves as System Administrator.

- Click **Day/Night Mode** to open the page.

- Select the desired option:
 - Set System in Day Mode (Working Hours)
 - Set System in Night Mode (Non-Working Hours)
 - Set System in Break Mode
 - Operate System as per Timetable assignment (default).
- Click **Submit** at the bottom of the page.
- Log out of Jeeves or continue, as desired.

Setting Day/Night Mode using DSS key

SARVAM UCS offers to the extension users the flexibility to manually switch to **Day/Night Mode**, at any point in time, by pressing the DSS key.

How to configure

- Log into Jeeves as System Engineer.
- Assign a DSS Key for **Day/Night Mode** to the required extension. To know more about assigning a DSS Key for a specific feature, refer to [“DSS Keys Programming”](#).
- Enable the toggle functionality for the DSS Key by selecting the check box for the parameter **Toggle Day/Night mode through ‘Set Day/Night Mode Key’**. To know more, refer to [“Setting Day/Night Mode from SE mode using Jeeves”](#).

When you enable this check-box, you can switch to Day Mode (Working Hrs) or Night Mode (Non-Working Hrs) as per your requirement. By default, this is disabled.

You cannot switch to Break Hours or As per Timetable assignment using the DSS key. This can be achieved only by logging in Jeeves or through telephone.

How to use

For EON and Extended IP Phone Users

- Press DSS Key assigned to Day/Night Mode.

When you press the DSS Key of extension, the system overrides the Time Table assigned to that extension. According to the current Day/Night Mode, it switches to Working Hours/Non-Working Hours.

If you are setting Day/Night Mode from a DKP/IP Phone using a DSS key with Toggle functionality disabled, refer the LED indication in table below.

LED Indication on DSS Key assigned to Day/Night Mode (without Toggle)

Model	Event	Color	Cadence
EON48/EON310/ EON510/SPARSH VP248/SPARSH VP310/SPARSH VP510	Day Mode Set	Blue	Continuous ON
	Night Mode Set	Red	Continuous ON
	Break Hours Mode	Violet	Continuous ON
	System set to work as per Time Table	--	OFF

If you are setting Day/Night Mode from a DKP/IP Phone using a DSS key with Toggle functionality enabled, refer the LED indication in table below.

LED Indication on DSS Key assigned to Day/Night Mode (with Toggle enabled)

Model	Present Mode	Next mode when user presses Day/Night Mode DSS Key	LED Color after toggle	Cadence
EON48/EON310/ EON510/ SPARSH VP248/ SPARSH VP310/ SPARSH VP510	As per Time Table (Day Mode)	Night Mode	Red	Continuous ON
	As per Time Table (Night Mode)	Day Mode	Blue	Continuous ON
	As per Time Table (Break Hour Mode)	Day Mode	Blue	Continuous ON
	Day Mode	Night Mode	Red	Continuous ON
	Night Mode	Day Mode	Blue	Continuous ON
	Break Hour Mode	Day Mode	Blue	Continuous ON

Setting Day/Night Mode from SE mode using a Telephone

- Enter SE mode from a DKP/SLT.

To set the system in Day/Night mode, dial:

- **4801-Code**

Where,

Code is from 1 to 4

1 is for Day Mode

2 is for Night Mode

3 is for Operate system as per Time Table.

4 is for Break Hours

- Exit SE mode.

Setting Day/Night Mode from SA mode using a Telephone

- Enter SA mode from a DKP/SLT.
- Dial **1072-018-Code**
Where,
Code is from 1 to 4
1 is for Day Mode
2 is for Night Mode
3 is for Operate system as per Time Table.
4 is for Break Hours
- Exit SA mode.

Daylight Saving Time (DST)

What's this?

Daylight Saving Time (DST) is the practice of advancing clocks so that afternoons have more daylight and mornings have less. Typically clocks are adjusted forward one hour near the start of spring and are adjusted backward in autumn.

Many countries of the world use DST, though the start and end dates of DST vary with location and year. Even within countries, uniform DST may not be observed. For example the states of Arizona and Hawaii do not observe DST. Certain countries may observe DST in certain years, for instance Guatemala, while in most countries of Asia and Africa, and in certain countries of South America, DST is not observed at all.

When SARVAM UCS is installed in a country/region where DST is used, it is necessary to synchronize the Real Time Clock of SARVAM UCS with the local time.

So, if you are installing SARVAM UCS in a country where DST is used, find out the DST convention currently in use in that country, and adjust DST accordingly.

How it works

The forward and backward adjustment of clocks can be Scheduled or Manual.

- **Scheduled DST Adjustment:** The Real Time Clock of the SARVAM UCS is advanced and set backward automatically according to the DST convention of the country/region where the SARVAM UCS is installed.

Scheduled DST Adjustment is useful in countries/regions where DST Time is fixed, such as in Europe, USA and Canada, without yearly variations.

The table below gives describes the DST conventions followed in the different countries for which SARVAM UCS will automatically adjust DST.

SARVAM UCS supports 18 DST Types for Scheduled DST Adjustment.

DST Type	DST Timings		Applicable in Countries
	Start Time	End Time	
01	Last Sun MAR From 01:59 to 03:00	Last Sun OCT From 02:59 to 02:00	Austria, Poland, Russia, Spain
02	Last Sun OCT From 01:59 to 03:00	Last Sun MAR From 02:59 to 02:00	Australia, Australia-Tasmania, Belgium, France, Germany, Greece, Hungary, Italy, Sweden, Switzerland
03	Second Sunday MAR From 01:59 to 03:00	First Sunday NOV From 01:59 to 01:00	Bahrain, Mexico, Turkey, United States
04	First Sun NOV From 23:59 to 01:00	Third Sun FEB From 23:59 to 23:00	Brazil

DST Type	DST Timings		Applicable in Countries
	Start Time	End Time	
05	Second Sunday MAR From 01:59 to 03:00	First Sunday NOV From 01:59 to 01:00	Canada
06	Second Sat OCT From 23:59 to 01:00	Second Sat MAR From 23:59 to 23:00	Chile
07	Last Sun MAR 00:59 02:00	Last Sun OCT 01:59 01:00	Denmark, Ireland, Portugal, United Kingdom
08	Last Sun MAR 02:59 04:00	Last Sun OCT 03:59 03:00	Finland
09	First APR 02:59 04:00	First OCT 03:59 03:00	Iraq
10	Last Sun MAR 02:29 03:30	Last Sun OCT 02:29 01:30	Kyrgyzstan
11	Last Fri APRIL 23:59 01:00	Last Thu SEP 23:59 23:00	Egypt
12	Last Sun MAR 23:59 01:00	Last Sun OCT 23:59 23:00	Lebanon
13	First Sun SEP 01:59 03:00	First Sun APRIL 01:59 01:00	Namibia
14	Last Sun SEP 01:59 03:00	First Sun APR 02:59 02:00	New Zealand
15	Last Sun MAR 01:59 03:00	Last Sun OCT 02:59 02:00	Norway
16	First Sun OCT 23:59 01:00	First Sun APRIL 23:59 23:00	Paraguay
17	First APRIL 23:59 01:00	First OCT 23:59 23:00	Syria
18	First APRIL 23:59 01:00	Last Sun OCT 23:59 23:00	Cuba

The DST Type is to be selected according to the country/region where the system is installed.

When DST Mode is set to 'Scheduled' and the DST Type is selected, the system will automatically adjust DST at the preset dates and time for the country/region where the system is installed.

For example, if SARVAM UCS is installed Spain, the DST Type 01 applicable to this country should be programmed as Scheduled DST. The system will automatically advance the clock on the last Sunday of March at 01.59.03:00 am every year (the start date of DST) and set the clock backward on the last Sunday of October at 02.59.02:00 am of the same year.

- **Manual DST Adjustment:** The Real Time Clock of the SARVAM UCS is advanced and set backward manually according to the DST convention of the country/region where the SARVAM UCS is installed.

Manual DST Adjustment is to be used in regions/countries that have no fixed DST Convention and where yearly variations in DST practices are likely.

When DST Mode is set as 'Manual', you must set the start and the end time, that is, the time at which the clock is to be advanced and the time at which the clock is to be delayed.

There are two ways to adjust DST manually:

1. The 'Day of Month' method, which specifies a day of the month DST will start or end. For example: starting on the 2nd Sunday of March and ending on 1st Sunday of November.
2. The 'Date and Month' method, which specifies a date of the month that DST will start or end. For example: starting on March 11 and ending on November 4.

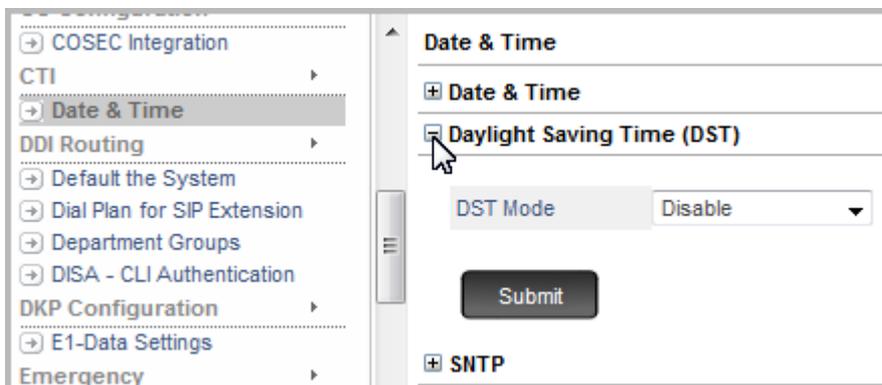

DST is not applicable in certain regions/countries, like Asia and South America. In such cases, the DST Mode is to be 'Disabled'.

How to configure

Adjusting DST using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Date and Time**.
- Click **Day Light Saving Time** to expand.

- Set the **DST Mode** to **Manual** or **Scheduled** as per your requirement.

Scheduled DST Adjustment

- If you have selected **Scheduled** as DST mode, in the **Region** list, select the name of the country/region where your system is installed.

The screenshot shows a web interface for configuring Daylight Saving Time (DST). At the top, there is a section titled "Daylight Saving Time (DST)". Below this, there is a "DST Mode" dropdown menu currently set to "Scheduled". Underneath, there is a section titled "Scheduled Time Adjustment". This section contains a "Region" dropdown menu with the text "01-Last Sun MAR 01:59 03:00-Last Sun OCT 02:59 02:00-Austria;Grmny;Poland;Russia;Itly;Spain". At the bottom of the form is a "Submit" button.

- Click **Submit** at the bottom of the page to save your DST setting.
- If you do not find your region on this list, you are recommended to set DST Mode to 'Manual' and adjust DST manually.

Manual DST Adjustment

- If you have selected **Manual** as DST Mode, set the **Forward and Backward Time Adjustments**.
- Go to the option **Forward Time Adjustment** to advance the time when DST starts.

- To **Forward Time**, select the desired option:

Daylight Saving Time (DST)

DST Mode Manual

Forward Time Adjustment

Forward Time None

Date-Month Wise Date-Month Wise

On 01 January change Time from 00 : 00 to 00 : 00

Day-Month Wise

On 1st Sunday of January change Time from 00 : 00 to 00 : 00

Backward Time Adjustment

Set Time back None

Date-Month Wise

On 01 January change Time from 00 : 00 to 00 : 00

Day-Month Wise

On 1st Sunday of January change Time from 00 : 00 to 00 : 00

Submit

- **Day-Month Wise** to specify the day of the month DST will start.

OR

- **Date-Month Wise** to specify the date of the month DST will start.

If you select 'Day-Month Wise' option, the 'Date-Month Wise' option will be disabled, and vice versa.

Day-Month Wise

- If you select the 'Day-Month Wise' option, you should now select the desired options in each of the following:
 - **Ordinal number:** Select the Ordinal number of the day of the month, that is, the 1st, 2nd, 3rd, 4th, 5th day, when DST begins.
 - **Day:** Select the day of the month - Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday - when DST begins.
 - **Month:** Select the month when DST begins (January-December).
 - **Change Time From:** Select the time when DST will begin to change. The time mode is 24 hours, with options from 00 to 23 hours and 00 to 59 minutes.

- **To:** Select the time to which the DST is advanced. The time mode is 24 hours, with options from 00 to 23 hours and 00 to 59 minutes.

Date-Month Wise

- If you select 'Date-Month Wise' option, you should now select the desired options in each of the following:
 - **Date:** The date on which DST begins (1-31).
 - **Month:** The name of the month when DST begins (January-December).
 - **Change Time From:** The time when DST will begin to change. The time mode is 24 hours, with options from 00 to 23 hours and 00 to 59 minutes.
 - **To:** The time to which the DST is advanced. The time mode is 24 hours, with options from 00 to 23 hours and 00 to 59 minutes.
- Now, go to the option **Backward Time Adjustments** to set the time back (that is, end DST and begin standard time).

On 1st Sunday of January change Time from 00 : 00 to 00 : 00

Submit

- Follow the same steps described above (step no. 4 to 6) to set the day/date, month, hours and minutes except, here you must set these parameters according to the time when DST ends.
- Click **Submit** at the bottom of the page to save your DST settings.

- SARVAM UCS gives you the flexibility to set the 'Forward DST Adjustment' according to Date-Month, while the Backward DST Adjustment according to Day-Month. Similarly, the reverse is also possible, that is, Forward DST may be set according to Day-Month, while the Backward DST may be set as Date-Month. This flexibility is particularly useful for setting DST of countries where the start of DST is defined by date and month, like the First of April, but the end of DST is defined by Day and Month, such as the last Sunday of October (as observed in Cuba).
- When the DST of a particular country starts or ends on the Last Sunday or any other day, for example, the last Tuesday, last Friday of the month, always set the Ordinal Number as '5th'.
- Wherever time adjustments are made at 00:00 hours, use the previous date and set DST start time (that is, "from" time) at 23:59 hrs.
- If you synchronize the RTC with the SNTP Server and the Date and Time changes, the DST will be applicable as per the new Date and Time.

Adjusting DST using a Telephone

- Enter SE mode.

To set the DST Mode, dial:

- **1010-DST Mode**

Where,

DST Mode is

0 for Disabled

1 for Manual

2 for Scheduled

If DST Mode is selected as 'Manual'.

To set the start time of DST, dial:

- **1011-Date-Month-Current Time-Advance Time**

Where,

Date is from 01 to 31. Use leading zero in case of single digit date (Default 01).

Month is from 01 to 12. Use leading zero in case of single digit month (Default 01).

Current Time²⁸³ is in HH:MM format,

HH from 00 to 23 (use leading zero)

MM from 00 to 59 (use leading zero) (Default 00:00).

Advance Time²⁸⁴ is in HH:MM format,

HH is from 00 to 23 (use leading zero)

MM from 00 to 59 (use leading zero) (Default 00:00).

Please note that the advance time will be greater than the current time.

To set the end time of DST, dial:

283. The current time is the time that is presently followed by the system.

284. This is the time to which the Real Time Clock should be advanced.

- **1012-Date-Month-Current Time-Delay Time**

Where,

Date is from 01 to 31 (use leading zero for single digit date) (Default 01).

Month is from 01 to 12 (use leading zero for single digit month) (Default 01).

Current Time is in HH:MM format (use leading zero),

HH is from 00 to 23

MM is from 00 to 59 (Default 00:00).

Delay Time²⁸⁵ is in HH:MM format (use leading zero must)

HH is from 00 to 23

MM is from 00 to 59 (Default 00:00).

Please note that the delay time will be less than the current time.

If DST Mode is selected as 'Scheduled'

To select the DST Type, dial:

- **1013-DST Type**

Where,

DST Type	Applicable in Countries
01	Austria, Poland, Russia, Spain
02	Australia, Australia-Tasmania, Belgium, Cote d'Ivoire, France, Germany, Greece, Hungary, Italy, Sweden, Switzerland
03	Bahrain, Mexico, Turkey, United States
04	Brazil
05	Canada
06	Chile
07	Denmark, Ireland, Portugal, United Kingdom
08	Finland
09	Iraq
10	Kyrgyzstan
11	Egypt
12	Lebanon
13	Namibia
14	New Zealand
15	Norway
16	Paraguay
17	Syria
18	Cuba

For example: to select DST Type for Brazil, dial: **1013-04**.

²⁸⁵. This is the time to which the Real Time Clock should be set back to.

- Exit SE mode.

Department Call

What's this?

Department Call enables you to group together extensions of a particular department so that callers can reach anyone in the department by dialing a common access code assigned to the department.

Calls made to such groups of extensions are called Department Calls and the access code used to make department calls is called Department Number.

This feature is useful in situations where any member of a department may interact with callers, as for instance in a information counter, a customer care cell, a technical support team, etc.

Callers can also reach individual extensions in a Department group by dialing the extension number.

SARVAM UCS supports the formation of 24 department groups²⁸⁶. The *member* extensions of a department group may be single line telephones (SLT), digital key phones (DKP), SIP Extensions, ISDN Terminals or Virtual Extensions.

Each Department Group can also be assigned a mailbox for voice mail, which any member extension can access.

Each Department Group can forward its calls to an extension or to its voice mail, or to another Department Group.

How it works

Extensions A, B, C, D are grouped as a Department with the access code 3901.

Internal Calls

- Extension E dials 3901 to call the Department.
- The system checks E's Class of Service for the Department Call feature.
- The feature is enabled. The system checks if Rotation is enabled in the routing group assigned to the Department.
- The Rotation flag is enabled. The system lands the call on the extension which is set to ring first.
- Extension A, configured as the first landing destination rings for the duration of the Ring Timer (configurable; default: 15 seconds).
- A answers the call. Speech established between A and E.

- If A does not answer, the system hunts for the next extension in the group to land the call, say B.
- B starts ringing for the duration of the Ring Timer.
- If Continuous Ring is enabled on A, A will continue to ring even as B is ringing.
- If B does not answer the call at the end of the timer, the system hunts for the next extension, C.
- If B has Continuous Ring enabled, B will continue to ring even as C is ringing.
- If the call is not answered even after hunting the last extension, the system will loop back and start from the first extension once again.

286. ETERNITY LENX /MENX supports 32 Department Groups and ETERNITY PENX supports 16 Department Groups.

External Calls

Department Calls can be made using Auto Attendant - Built-In Auto Attendant or VMS Auto Attendant. For example, a company may use the Built-In Auto Attendant to have callers who want information only to dial the Information Department instead of waiting for the Operator.

- An external caller places a call to Department 3901 using the Built-In Auto Attendant.
- The system checks if Rotation is enabled in the routing group assigned to the Department.
- As the Rotation flag is enabled, and the first call was landed on A, the system lands the call on the next extension B.
- Extension B rings for the duration of the Ring Timer (configurable; default: 15 seconds). If the Continuous Ring flag is enabled for B, it will continue to ring, even as the system hunts for another extension in the group to land the call.

- A third call internal/external made to Department 3901.
- The same process as described above will be repeated.
- But the system will land the call on extension C first, because Rotation flag is enabled on this routing group.
- The subsequent incoming calls will land on the extension which is next to the one that received the last call. So the next call to the Department will land on extension D, the one thereafter on A, and so forth.

Thus for each call, the system will hunt for a landing extension as per the Rotation set for the routing group. The extensions will ring for the duration of the Ring Timer, either continuously or one-by-one (as per the Continuous Flag configured), and according to the sequence in which the extensions in the group are arranged.

Rotation ensures equal distribution of call traffic. If Rotation is disabled, the fresh call will always land on first extension of the Department group.

Department Group and ISDN Terminal: *When more than two ISDN terminals connected to the same BRI port are configured as members of a Department group, if a call is made to this group using the department group access code, only two ISDN terminals connected to the BRI port will ring. This limitation is because of the BRI protocol.*

Voice Mail

A Department Group can be assigned a common mailbox for Voice Mail, called the *Department Group Mailbox*. For this a VMS module must be installed in the system. This common mailbox for the group is called Department Group Mailbox. You can assign Department Group Mailbox to selected extensions or to *all* extensions in the Department.

To take the example of Extensions A, B, C, D with the Department Access Code 3901 further,

- Extensions A, B, C and D are all members of Department Group 1 with the Access Code 3901.
- Department Group Mailbox is assigned to all the four extensions.
- When there is a new message in the Group Mailbox, all four extensions - A, B, C, D - will get the Message Wait Notification.
- The message wait indication may be a Stuttered Dial Tone or a Voice Message when the extension user goes OFF-Hook, or blinking of the LED Lamp on the extension, or a Ring.²⁸⁷

287. This will depend on the type of Message Wait Indication configured for the Extension's Voice Mail Settings.

- To the first extension that answers the notification call, for example, Extension A, the Voice Mail System informs about the new message(s) waiting in the Department Group Mailbox and in the Personal Mailbox. *"You have <x> new Message in your Personal Mail Box. You have <y> new Messages in your Department Group Mail Box."*
 - If there is no new message in both mailboxes, the VMS will play the message: *"You have Zero new Message."*
 - If there is a new message in the Department Group Mailbox, but none in the Personal Mailbox, the VMS will play the message: *"You have <x> new Message in your Department Group Mailbox."*
 - If there is no new message in the Department Group Mailbox, but new message in the Personal Mailbox, the VMS will play the message: *"You have <x> new Message in your Personal Mailbox."*
- The VMS prompts Extension A to access the Group mailbox: *"To go to Personal Mailbox, press 1. To go to Department Group Mailbox, press 2."*
- The user of Extension A presses 2, and is taken to the Department Group Mailbox,
- VMS prompts A: "Enter your mailbox password". Enter your department group mailbox password.
- The VMS checks the utilized mailbox memory,
 - if 80% of the mailbox memory has been consumed, the VMS prompts the caller: "Your Mailbox is 80% Full. Please Delete few messages."
 - if 100% of the mailbox memory has been consumed, the VMS prompts the caller: "Your Mailbox is Full. Please Delete few messages."
- VMS prompts: "To listen to new messages press '1', to listen to old messages press '2', to send a message press '3', to change your mailbox settings press '4'."
- Extension A presses 1.
- VMS plays the new messages.
- After playing the new messages, the VMS cancels Message Wait Notification set for extensions B, C and D.

Call Forward

Just as calls can be forwarded to a Department Group, a Department Group can also forward its calls to:

- an extension
- its own Department Group Mailbox
- another Department Group

For Department Groups, SARVAM UCS does not support Call Forward to an external destination number. You can set Call Forward for Department Group from the SA Mode only.

SARVAM UCS supports the following Call Forward options for Department Groups:

- **Call Forward - unconditionally:** calls are forwarded to the destination number, without checking the status or waiting for a response from the Department Group.

- **Call Forward- if Busy:** calls are placed on the Department Group as per the Rotation configured for it and are forwarded to the set destination, only when all the member extensions of the Department Group are found to be busy.
- **Call Forward- if No Reply:** when a call is made to the Department group, SARVAM UCS will place the call as per the Rotation configured for the Department Group for the duration of the '*Call Forward No Reply Timer for Department*' (default: 30sec). If none of the member extensions answers the call before the expiry of this timer, the call is forwarded to the destination.

If you select this option, you may set the *Call Forward No Reply Timer for Department* to the desired value. This Timer is commonly applied on all Department Groups which set Call Forward No Reply.

- **Call Forward - if Busy/No Reply:** calls made to the Department Group will be routed to the destination, if all members of the Department Group are busy or when none of the member extensions answered the call within the Call Forward No Reply Timer for the Department.

- *Call Forward - Dual Ring is not supported for Department Groups.*
- *Member extensions of a Department Group can set Call Forward on their extensions. However, Call Forward set for the Department Group will have precedence over Call Forward set by individual member extensions.*
- *Call Forward set by member extensions in a routing group will be ignored by the system if, the Ignore call forward set by member extension, when call is routed on Routing/Dept. Group flag is enabled. See [“System Parameters”](#) for more information.*
- *Call Forward for a Department Group can also be set from SA Mode. See [“Setting Call Forward for Department Group”](#).*

Again, taking the above example of Department Group 1 further, here's how call forward will work:

- Extensions A, B, C, D of Department Group 1 are allowed Call Forward Department Group in their Class of Service.
- Any of them can set Call Forward for Department Group 1. Extensions A, B, C and D can also set Call Forward on their own extensions.
- When any extension or an external caller (also using Auto Attendant or Direct Inward System Access) dials the Access Code 3901 to call Department Group1, SARVAM UCS will check the Call Forward option set for the Department Group and route the call accordingly.
- If Call Forward - unconditionally is set, the call will be routed to the destination number, if the *Ignore call forward set by member extension, when call is routed on Routing/Dept. Group is enabled.*
- If Call Forward - Busy is set, and the first extension in the Department Group is busy, the system will hunt for the next free extension in the group. It will continue to hunt for a free extension. If all extensions in the group are busy, the call will be forwarded to the destination number.

Call Forward unconditional, busy, or busy/No reply set by any member extension will not work.

- If Call Forward - No Reply is set, the system will start the Call Forward No Reply Timer Department Group and place the call as per the Rotation set for the Department Group. If the call is not answered by any of the extensions before the timer expires, the call will be forwarded to the destination number.

If a member extension that is offered the call has set Call Forward-Unconditional, and the Call Forward No Reply Timer Department Group has not expired, the call forward set by the extension will be applied. If the timer expires, the Call Forward No Reply set for the Department Group will be applied.

If a member extension that is offered the call has set Call Forward-No Reply, or No-Reply/Busy, the Call Forward No Reply Timer (for individual extension) will start simultaneously with the Call Forward No-Reply Timer Department Group. If the No Reply Timer for the extension expires first, the call will be forwarded to the destination set for the extension. If the No Reply Timer of the Department Group expires first, before the call is answered, the call will be forwarded to the destination set for the Department Group.

Call Forward-No Reply Timer can be set from the SE Mode only.

How to configure

The functioning of this feature requires you to do the following:

- create Department Groups.
- configure “[Routing Group](#)” (each routing group consisting of extensions related to a Department) and assign the routing groups and appropriate access codes to the department groups.

If you want to provide voice mail facility to the Department Group, you must:

- assign a Mailbox to the Department Group.
- allow member extensions access to the Department Group Mailbox.

If you want to enable Call Forward to the Department Group, you must:

- enable 'Department Group Call Forward' in the Class of Service (CoS) of the member extensions.
- change, if required the default value of the *Call Forward No Reply Timer for Department Group*.

Creating Department Groups

- On a sheet of paper, draw a table.
- Decide the number of department groups you want to create, e.g.: 4 groups.
- Group all the extensions you want to put in each department group. You cannot group more than 32 extensions in a single department group.
- Decide in what sequence the extensions in each group should ring, that is, which extensions should ring first, second, third, and so forth.
- Decide the access code you want to assign to each department group.
- You may also assign a name to the department group.
- Your table may look like this:

Department Group Index	Access Code to be assigned	Name	Extensions to be included as members			
			SLT	DKP	SIP Extension	ISDN Terminal
1	3901		2001, 2002, 2003	3010, 3011, 3012	3301, 3302	

Department Group Index	Access Code to be assigned	Name	Extensions to be included as members			
			SLT	DKP	SIP Extension	ISDN Terminal
2	3902		2015, 2020, 2021	3015, 3020	3305	
3	3903		2017, 2028	3021	3305	
4	3904		2023, 2024, 2025	3025	3315	

The access codes for the department groups and extensions in this table are default access codes.

- Now, with this information ready, you may configure the department groups using Jeeves or dialing the relevant SE commands from a Telephone.

Enabling Call Forward for Department Call in Class of Service

To be able to set Call Forward for the Department Group, member extensions must have this feature enabled in their COS.

In the default Station Basic Feature Template Number 01 is assigned to all the extensions of SARVAM UCS, the default COS group 01 in the template has 'Department Group Call Forward' enabled. So, all extensions of SARVAM UCS can set Call Forward Department Group.

If you wish to allow this feature to member extensions only, retain this feature 'Department Group Call Forward' in the COS group of member extensions, and disable Call Forward feature in the COS of all the extensions. For this, you may create separate templates for member extensions and other extensions.

Refer the topic "[Class of Service \(COS\)](#)" and "[Station Basic Feature Template](#)" for instructions.

Configuring Department Groups using Jeeves

- Log in as System Engineer.

- Under **Configuration**, click **Department Groups**.

Department Group	Access Code	Name	Routing Group	Voice Mail Settings
1	3901		01	Voice Mail Settings
2	3902		01	Voice Mail Settings
3	3903		01	Voice Mail Settings
4	3904		01	Voice Mail Settings
5	3905		01	Voice Mail Settings
6	3906		01	Voice Mail Settings
7	3907		01	Voice Mail Settings
8	3908		01	Voice Mail Settings
9	3909		01	Voice Mail Settings
10	3910		01	Voice Mail Settings
11	3911		01	Voice Mail Settings
12	3912		01	Voice Mail Settings
13	3913		01	Voice Mail Settings
14	3914		01	Voice Mail Settings
15	3915		01	Voice Mail Settings
16	3916		01	Voice Mail Settings
17			01	
18			01	
19			01	
20			01	

Creating Department Groups

- To create a Department group, assign an **Access Code** for the department group against the Index Number.

By default, the Access Codes assigned to Department groups for Index Numbers 1 to 16 are 3901 to 3916 and for Index Numbers 17 to 24 is blank.

If you decide not to use the default access codes, ensure that the access code you assign to each department group is unique and does not match with any SLT, DKP, ISDN, SIP access code or any feature access code of the Dial Phase. Refer the topic "[Access Codes](#)" to know more.

To assign Station Access Codes according to your preference and requirement to a range of Department Groups, see "[Assigning Access Codes to a Range of Extensions](#)".

- You may also assign a **Name** to the department group to facilitate identification. This name will appear in the Dial by Name directory along with the department group number. The Name can be a maximum of 18 characters.
- Now, enter the **Routing Group**, that is, the number of the group you created for this department. Where multiple departments exist, you must create separate routing groups for each department group.

This can be done in two ways:

- create the routing groups first and simply enter the relevant routing group number against the Department Group Index (to which you have assigned the access code).

OR

- in Routing Group, click the **Routing Group** link. The Routing Group page opens. Now create the Routing Group as per your requirement. For details, see “[Routing Group](#)”.

Routing Group	Name	Rotation	When member rejects the call, place the call again	Member 1				
				Member Type	Port Number	Voice Mail Auto Attendant (VMAA) Menu	Ring Timer(sec)	Continuous Ring
1		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>
2		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>
3		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>
4		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>
5		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>
6		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>
7		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>
8		<input checked="" type="checkbox"/>	<input type="checkbox"/>	DKP	0001	Working Hour	015	<input type="checkbox"/>

- In **Voice Mail Settings**, click the Voice Mail Settings link. The respective Extension Voice Mail Settings window will open. You may edit the parameters. For details, see “[Extension Voice Mail Settings](#)”.

The Voice Mail Settings link will be visible only if you have configured the respective access codes.

Click **Close** to close the window.

- Click **Submit** to save your settings.

For example:

The Customer Care Department of a company has four extensions: 201, 202, 203 and 204 (on software ports 001, 002, 003, and 004 respectively), which needs to be grouped for Department Calls.

Extensions 201 and 202 are SLTs. Extensions 203 and 204 are DKPs.

Requirement: The company wants the following:

1. Call traffic should be distributed equally on all four extensions.
2. Ring sequence should be 201, 202, 203, and 204 (first to last).
3. First 201 should ring for 20 seconds.
4. If no reply, 201 should continue to ring and 202 should ring for 10 seconds.
5. If still no reply, 201 should continue to ring and 203 should ring for 15 seconds.
6. If still no reply, 201 should continue to ring and 204 should ring for 20 seconds.
7. 51 should be the access code for this department group.

Solution: Select a routing group e.g. 03, and configure as follows:

1. 201 as member 01, with member type SLT, and Port number 001.
2. 202 as member 02, with member type SLT, and Port number 002.
3. 203 as member 03, with member type DKP, and Port number 003
4. 204 as member 04, with member type DKP, and Port number 004.

Set 'member type' of members 5 to 32 in Routing Group 3 to 'None'.

1. Enable the 'Rotation Flag' on routing group number 03 to distribute call traffic.
2. Enable the 'Continuous Ring Flag' for member 01 (201) and set the 'Ring Timer' to '20 seconds.
3. Set the Ring Timer of member 02 (202) to 10 seconds. Disable 'Continuous Ring' flag.
4. Retain the Ring Timer of member 03 (203) as default 15 seconds. Disable 'Continuous Ring' flag.
5. Set the Ring Timer of member 04 (204) to 20 seconds. Disable 'Continuous Ring' flag.
6. Assign 51 as access code and routing group 03 to the Customer Care Department.

Remember to click **Submit** to save your settings.

Setting Call Forward for Department Group

You can set Call Forward for Department Group from SA Mode only.

To set Call Forward,

- Log in to Jeeves as System Administrator.
- Click **Department Group Properties**.

- Click the desired Department Group Number tab for which you want to set Call Forward.
- Click **Call Forward** to expand.
- You have two options for Call Forward:
 - To forward all department calls to Voice Mail, select the **Forward Calls to Voice Mail** and select the Call Forward type from the combo box.
 - To forward all department calls to a specific number, select **Forward Calls-to Phone** and enter an extension number where the call is to be forwarded.
- Click the **Apply Call Forward** button.

The color of the text indicating that Call Forward is set will change to red.

To cancel Call Forward,

- Click the **Cancel Call Forward** button.

The color of the text indicating that Call Forward is not set will change to black.

Setting Call Forward No Reply Timer for Department Group

If you have enabled Call Forward Department Group, you may change, if required, the Call Forward No Reply Timer for Department Group. You can change this timer only from SE Mode. By default the Timer is set to 30 seconds.

To change the Call Forward No Reply Timer,

- Log in as System Engineer.
- Under **Configuration**, click **System Timers and Count**.

The screenshot shows the SLT Configuration interface. On the left is a navigation menu with options like Station Advance Features, Station Basic Features, Station Message Detail, Recording, SMS Gateway, SMS Routing, SMS Server, System Log, System Parameters, System Prerequisites, and System Timers and Counts. The right pane is titled 'System Timers' and contains a table of 'Call Progress Tones' with various timer settings. The 'Call Forward - No Reply Timer for Department Group (sec)' is highlighted with a red box and has a value of 030.

Call Progress Tones	
Dial Tone Timer (sec)	007
Ring Back Tone Timer (sec)	045
Busy Tone Timer (sec)	007
Error Tone Timer (sec)	030
Feature Confirmation Tone Timer (sec)	007
Programming Error Tone Timer (sec)	003
Programming Confirmation Tone Timer (sec)	003
Tone Demo Timer (sec)	030
Call Forward - No Reply Timer for Department Group (sec)	030

- Scroll with the vertical bar to **Call Forward No-Reply Timer for Department Group (sec)**.
- Set the timer to the desired value. The range of this timer is 1 to 255 seconds.
- Click **Submit** to save your timer setting.

Configuring Department Groups using a Telephone

- Enter SE mode from a DKP/SLT.

To create a routing group with members, dial:

- **6502-1-Routing Group-Destination Index-Port Type-Port Number**

Where,

Routing Group is the number of the Routing Group 01 to 96.

Destination Index is from 01 to 32.

Port Type is the 'Member type':

00 for None

01 for SLT

02 for DKP

28 for ISDN terminal

34 for SIP Extension

36 for Virtual Extension

16 for OTBG

Port Number is the Software port number on which the member extension SLT, DKP, SIP Extension, ISDN Terminal is attached.

Software port number of the SLT, from 001 to 240.

Software port number of the DKP, from 001 to 096.

Software port number of the ISDN Terminal, from 01 to 64.

Software port number of the SIP extension, from 001 to 999.

Virtual Extension is from 01 to 64.

OGTBG Number is from 01 to 32.

E.g.: To include the four extensions in the above example in Routing Group 03, dial:

- **6502-1-03-01-01-001** to include extension 201.
- **6502-1-03-02-01-002** to include extension 202.
- **6502-1-03-03-02-003** to include extension 203.
- **6502-1-03-04-02-004** to include extension 204.

To set the Ring Timer for each member extension in the routing group, dial:

- **6503-1-Routing Group-Destination Index-Ring Timer**

Where,

Routing Group is the number of the Routing Group 01 to 96.

Destination Index is number of the member extension in the routing group from 01 to 32.

Ring Timer is from 000 to 255 seconds. (Default: 015 seconds)

E.g.: To set the Ring Timer for the individual extensions of the Routing Group 03 in the above example, dial:

- **6503-1-03-01-020** to make extension 201 ring for 20 seconds.
- **6503-1-03-02-010** to make extension 202 ring for 10 seconds.
- **6503-1-03-03-015** to make extension 203 ring for 15 seconds.
- **6503-1-03-04-020** to make extension 204 ring for 20 seconds.

To set the Continuous Ring Flag for extensions in the routing group, dial:

- **6504-1-Routing Group-Destination Index-Flag**

Where,

Routing Group is the number of the Routing Group 01 to 96.

Destination Index is the number of the member extension in the routing group from 01 to 32.

Continuous Ring Flag is:

0 for disable continuous ring (each member extension in the group will ring for the duration of the 'Ring Timer' for the group).

1 for enable continuous ring (the first extension in the group will ring till the call is answered).

E.g.: To enable/disable the Continuous Ring Flag for the individual extensions of the Routing Group 03 in the above example, dial:

- **6503-1-03-01-1** to enable the flag on extension 201.
- **6503-1-03-02-0** to disable the flag on extension 202.
- **6503-1-03-03-0** to disable the flag on extension 203.
- **6503-1-03-04-0** to disable the flag on extension 204.

To turn Rotation ON for the Routing Group, dial:

- **6505-1-Routing Group-Rotation Flag** to enable rotation on a single routing group.

- **6505-2-*Routing Group-Routing Group-Rotation Flag*** to enable rotation on a range of routing groups.
- **6505-**-Rotation Flag*** to enable rotation on all routing groups.
Where,
Routing Group is the number of the Routing Group 01 to 96.
Rotation Flag is:
0 for Disable (fresh call lands on the first extension within the group).
1 for Enable (fresh call lands on the extension next to the one that received the previous calls).
E.g.: To enable Rotation Flag for Routing Group 03 as in the above example, dial **6505-1-03-1**.

To assign routing group to the department group, dial:

- **2001-1-*Department Group Index-Routing Group***
Where,
Department Group Index is from 01 to 24.
Routing Group is from 01 to 96. Default: 01.

E.g.: To assign Routing Group 03 to Department Group 01 (Customer Care) as in the above example, dial **2001-1-01-03**.

To clear the routing group assigned to department group, dial:

- **2001-1-*Department Group Index-00*** to clear the routing group of a single department group.
- **2001-2-*Department Group Index-Department Group Index-00*** to clear the routing groups of a range of department groups.
- **2001-**-00*** to clear the routing groups of all department groups.

To assign an access code (that is, Department Number) to a department group, dial:

- **3113-1-*Department Group Index-Access Code***
- **3113-2-*Department Group Index-Department Group Index-Access Code***
- **3113-**-Access Code***

Where,
Department Group Index is from 01 to 24.
Access Code is a string of a maximum of 6 digits.
Terminate the command string with **#*** if the Access Code has fewer than 6 digits.

E.g.: To assign '51' as Access Code for the Department Group 01 as in the above example, dial **3113-1-01-51-#***

To clear the access code assigned to a department group, dial:

- **3113-1-*Department Group Index-#**** to clear access code assigned to a single department group.
- **3113-2-*Department Group Index-Department Group Index-#**** to clear access codes assigned to a range of department groups.
- **3113-**-#**** to clear access codes of all department groups.

To default the access codes assigned to Department groups, dial:

- **3163-1-*Department Group Index*** to default the access code of a single department group.
 - **3163-2-*Department Group Index-Department Group Index*** to default the access codes of a range of department groups.
 - **3163-***** to default the access codes of all department groups.
- Exit SE mode.

How to use

Making a Department Call

Making a department call is the same as calling another extension.

For EON and Extended IP Phone Users

- Press DSS Key assigned to the desired Department Group.
OR
- Dial the desired Department Group Number (default: 3901-3916).
- You get Ring Back Tone as the call lands on an extension within the department group.
- Talk when the call is answered.
- Go Idle or you get dial tone after 3 seconds.

For SLT Users

- Lift handset
- Dial the desired Department Group Number (default: 3901-3916).
- You get Ring Back Tone as the call lands on an extension within the department group.
- Talk when the call is answered.
- Replace handset.

Accessing Department Group Voice Mail

For EON and Extended IP Phone Users

When LED of Voice Mail Key is turned on to indicate new message,

- Press Voice Mail key.
- VMS informs you about new message(s) in your Department Group mailbox and Personal Mailbox.
- Follow Voice Mail prompts to access Department Group mailbox.
- Press 2 to go to Department Group mailbox.
- Press 1 to listen to new messages.
- Go ON-Hook or follow voice prompts for the desired option.

For SLT Users

New messages in your mailbox will be notified according to the type of Message Wait Notification set on your extension phone.

When the LED Lamp of the Message Waiting Key glows,
OR

When your phone plays Message Wait Ring²⁸⁸,

- Lift the handset.
- Dial **3931**.
- Follow voice prompts.
- Press **2** for Department Group mailbox.
- Press **1** to listen to new messages.
- Replace handset after listening to messages. Or you may follow voice prompts.

²⁸⁸. Refer "[Distinctive Rings](#)" for description.

If you hear Stuttered Dial Tone/Voice Message when you go OFF-Hook,

- Dial **3931**.
- Follow voice prompts.
- Press **2** for Department Group mailbox.
- Press **1** to listen to new messages.
- Replace handset after listening to messages or follow voice prompts to continue.

Setting Call Forward for Department Group

For EON and Extended IP Phone Users

- Press DSS Key assigned to the Call Forward Department Group.
OR
- Dial **1179** (users worldwide). Users in the Philippines, dial **1108**.
- Enter the Department Group Number whose calls are to be forwarded.
- Scroll to select Call Forward Type from the following options:
 - Cancel Call Forward
 - Forward Unconditionally
 - Forward when Busy
 - Forward when No Reply
 - Forward when Busy/No Reply
- Press Enter key.
- Enter Destination number (extension number or voice mail)
- You get confirmation tone and message on your phone's LCD.
- Go Idle.

For SLT Users

- Lift handset.
- Dial **1179** (users worldwide). Users in the Philippines, dial **1108**.
- Dial the Department Group Number whose calls are to be forwarded.
- Dial Call Forward Type:
 - **1** for Forward Unconditionally
 - **2** for Forward when Busy
 - **3** for Forward when No Reply
 - **4** for Forward when Busy/No Reply
 - **0** to Cancel Call Forward
- Dial Destination number (number of the desired extension or voice mail)
- You get confirmation tone.
- Replace handset.

Dial By Name

What's this?

Dial By Name enables extension users to call another extension or an external party by dialing the name of the person, instead of dialing their telephone number.

This feature is accessible only to users of the proprietary Digital Key Phones and the Extended IP phones of Matrix.

With Dial By Name users need not remember the desired party's telephone number or short codes, that is, "Abbreviated Dialing" codes.

For each extension, the database for names used in Dial by Name is drawn from:

- the **Personal Directory**, which is assigned to each extension, wherein up to 25 external party numbers along with their names may be stored. The system uses the Personal Directory to dial external parties by their names. See "Abbreviated Dialing" to know more.
- the **Global Directory**, which is assigned to the extension in its "Class of Service (COS)". The Global Directory is a system-wide list of external party numbers and names. Up to 999 numbers can be stored in this directory, and parts of the Global Directory (Part 1, 2, 3) can be assigned to each extension in its Class of Service. See "Abbreviated Dialing" to know more.
- **Names of Extensions**, which are names of users/departments groups. Their names are assigned to SLT, DKP and SIP extensions to identify the extension users. Names of Extensions are necessary for making internal calls using the Dial By Name feature.

How it works

- Extension user presses the DSS Key assigned to 'Dial By Name' feature.
- On EON48 models and on SPARSH VP248, press the 'Names' key. On EON310/SPARSH VP310, press the 'Contacts' key.
- The prompt <Name: > appears on the phone display.
- User enters the name of the desired party²⁸⁹.
- For example, user wants to call Midas Biz, and enters the letter 'M' using the keypad.
- The system displays in alphabetical order, all names starting with 'M'. These numbers are drawn from the Personal and Global Directories assigned to the extension and the Extension Names programmed in the system.
- User scrolls the list using the Up/Down navigation keys to reach the desired contact's name.

OR

Instead of scrolling the entire list, the user enters more than one initial letter of the contact's name. The search is narrowed down to more accurate matches. The phone displays the matching entries in the directory.

- The user must select the desired name by pressing 'Enter' Key.

²⁸⁹. The process of entering the names is the same as when writing text messages (SMS) from a cell phone. The keys must be pressed multiple times in quick succession to enter the desired alphabet.

- The system dials out the number stored under the selected name. The name and number are displayed on the user's phone.

How to configure

For this feature to work, the following must be programmed:

1. **DSS Key:** A direct station selection (DSS) key must be programmed for the Dial by Name feature. Without the DSS Key this feature will not be accessible.

The factory-default key map of EON48 and SPARSH VP248, phones have the DSS Key labeled as 'Names'. EON310/SPARSH VP310 have a fixed feature key 'Contacts'

2. **Global Directory:** The names of the external parties must be programmed against their respective telephone numbers in the directory. Refer the topic "[Abbreviated Dialing](#)" for instructions on programming the Global Directories.
3. **Personal Directory:** The names of the external parties must be programmed against their respective telephone numbers in the Personal Directory. Refer the topic "[Abbreviated Dialing](#)" for instructions on programming the Personal Directories.
4. **Extension Names:** Extensions may be SLTs, DKPs, ISDN Terminals or SIP extensions. Refer the topics related to configuration of extensions²⁹⁰.
5. **Class of Service:** Dial By Name is allowed to all DKP users. However, the use of this feature is related to the following features, which must be enabled in the Class of Service of the DKP and SIP extension users:
 - Internal Calls - This is a part of the Basic Features. By default these are enabled.
 - Global Directory Part 1
 - Global Directory Part 2
 - Global Directory Part 3.

If you want the names to be drawn from Global Directory Part 1, Part 2 and Part 3, provided these are programmed, you must enable these directories in the CoS of the DKP and SIP extensions.

Refer "[Abbreviated Dialing](#)", for instructions on programming the Global Directory.

Refer "[Class of Service \(COS\)](#)" and "[Station Basic Feature Template](#)" for programming instructions on how to enable a feature in the CoS and how to apply it on extensions.

The system will display the names exactly as they have been programmed in the Personal and Global Directories and the SLT/DKP/ISDN Parameters.

290. You may also refer the instructions provided under the topic *Configuring Extensions*: "[Configuring SLT Extensions](#)", "[Configuring DKP Extensions](#)", "[Configuring ISDN Terminals](#)", "[Configuring Matrix SPARSH VP330](#)", "[Configuring Matrix SPARSH VP248](#)", "[Configuring Matrix SPARSH VP310](#)", "[Configuring Matrix SPARSH VP510](#)", "[Configuring Matrix SPARSH VP210](#)"

How to use

For EON48 and Extended IP Phone Users

- Press 'Names' key.
- You get the prompt: 'Name'.
- Enter the initial letters for the contact's name.
- The number of matching entries that will appear at a time on your phone's display will vary according to your phone's LCD display capacity.
- Scroll with the Up/Down navigation keys to reach the desired contact's name on the list.
- Press 'Enter' key to select the name.
- The system displays the name and number being dialed out.
- You get Ring Back Tone or Busy Tone.

Entered the wrong alphabet?

- Go ON-Hook.
- Go OFF-Hook.
- Press the DSS Key labeled 'Names' again.
- Enter the name/initial letters of the contact's name.

Dialed Number Directory

What's this?

Dialed Number Directory feature is available only to the users of the proprietary DKP, EON and Extended IP Phones.

It is the list of numbers dialed out from the phone, similar to the call history of recently dialed calls on a cell phone.

SARVAM UCS retains up to 16 numbers dialed out from a phone in a directory.

These numbers may have been dialed out using features like Abbreviated Dialing, Quick Dial, Redial, Walk-In Class of Service, or may be a simple outgoing call made by directly dialing the external number.

How it works

- When a DKP/IP Phone extension user makes an outgoing call, the number is stored in the Redial Number List.

*By default the system stores only the external numbers in the Last Number Redial List. If you want the system to store internal calls in this list, make sure you enable the **Store Internal Calls in Redial Call Log** check box in the [“System Parameters”](#).*

- The list has a capacity of storing a maximum of 16 recently dialed numbers.
- The list is updated using the First-In First-Out logic, whereby the earliest dialed number is replaced with the most recently dialed number.
- To use this feature, the phone user must invoke the [“Last Number Redial”](#) feature.
- Doing so, the Redial Number List will appear on the phone display.
- The user may now navigate the list, select the number to be dialed out.
- The system will dial out the selected number using the same Outgoing Trunk Bundle Group used to place this call earlier.
- If the number had been dialed earlier using Abbreviated Dialing, the system will check for Toll Control when dialing out the number again from the dialed number directory²⁹¹.

²⁹¹. Recall that the system does not check for Toll Control when Abbreviated Dialing is used.

How to configure

No specific programming required.

How to use

For EON and Extended IP Phone Users Only

- Press the 'Redial' Key.

OR

Dial 7

- The list of last dialed calls appear on your phone's display.
- Scroll with up/down navigation key to reach the desired number.
- Press 'Enter' key.
- The desired number is dialed out and appears on your phone's display.
- You get ring back tone.
- Talk when speech is established.
- Go ON-Hook after the conversation has ended.

Dial Plan for SIP Extension

What's this?

SARVAM UCS supports 8 Dial Plans with total 32 entries in each table. The Dial Plan contains a series of digits and/or wild card characters.

When a user dials a number, it is compared with the Rule configured in the Dial Plan. If a match is found, the IP Phone routes the call immediately without waiting for End of Dialing and if a match is not found, the IP Phone will wait for the End of Dialing and then route the call.

How to configure

Programming the Dial Plan involves the following steps:

- Selecting a Dial Plan and configuring the rules in the Dial Plan.
- Assigning the Dial Plan to the desired SIP Extensions.

Programming Dial Plan using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Dial Plan for SIP Extension**.

Index	Rule
1	
2	
3	
4	
5	
6	
7	
8	
9	
10	
11	
12	
13	
14	
15	
16	
17	

- Click the desired Dial Plan number. The **Dial Plan for SIP Extension - VP110/VP710** page opens.

- Against each **Index** configure the **Rule** according to which you want the system to process the call. You can configure a maximum of 32 Rules in each Dial Plan.

For example, if you want that users should be able to dial extension numbers from 3000 to 3999 without any delay, configure the Rule as 3XXX.

For more details to configure the rules, refer to the topic *Dial Plan* in the *SPARSH VP110 User Guide*.

- Click **Submit**.

Assigning Dial Plan to SIP Extensions

To assign the Dial Plan you configured for VP110,

- Under **VoIP Configuration**, click **SIP Extension Settings**.
- Click the location at which you have registered SPARSH VP110, for example, **Location 1**.

- Scroll to **DSS Key Settings and Dial Plan**.
- Select the **Dial Plan** number you configured.
- Click **Submit**.

To assign the Dial Plan you configured for VP710,

- Under **VoIP Configuration**, click **SIP Extension Settings**.

- Click the location at which you have registered SPARSH VP710, for example, **Location 1**.
- Scroll to **Dial Plan**.
- Select the **Dial Plan** number you configured.
- Click **Submit**.

Digest Authentication

What's this?

Digest Authentication is a challenge-based authentication service of SIP to authenticate the identity of the originator of SIP request in the INVITE message. The recipient of the request can ascertain whether or not the originator of the request is authorised to make the request. When the digest credentials of the originator—User Name and Password—in the INVITE message are authenticated and accepted by the recipient, the originator and the recipient are connected.

SARVAM UCS supports Digest Authentication. You may use Digest Authentication to

- restrict access to SARVAM UCS to specific callers.
- prevent unwanted or malicious calls.

How it works

The Digest Authentication feature works on the basis of the Digest Authentication Table, in which the credentials, namely the User Name and Passwords of trusted/authorised calling party SIP devices are stored. You must configure this table. The Digest Authentication Table is common for all SIP trunks on which this feature is enabled.

When you enable this feature on a SIP trunk, for all incoming calls (SIP requests),

- SARVAM UCS will challenge the identity of the calling party (the SIP device initiating the request) to send its digest credentials.
- When the calling party sends its credentials, SARVAM UCS authenticates the credentials by matching it with its Digest Authentication Table.
- If a match is found, the calling party will be authenticated and the call will be allowed on the SIP trunk.
- If no match is found, SARVAM UCS will consider it as invalid authentication information and reject the call.

How to configure

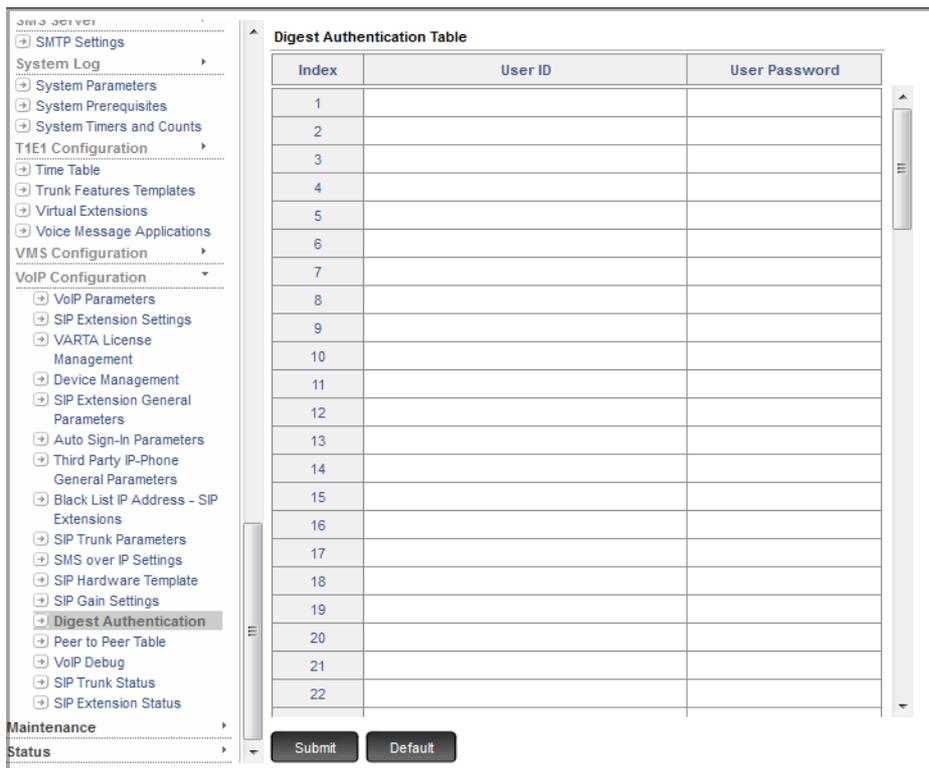

To use this feature on SIP Trunks, you must do the following:

- Enable Digest Authentication on the SIP trunks you want to use this feature.
- Configure the Digest Authentication Table.

You can configure the Digest Authentication Table using Jeeves and from a telephone.

Configuring Digest Authentication using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click the **VoIP Configuration** link.
- Click **Digest Authentication**.

The Digest Authentication table opens.

- In the **User ID** field, enter the User ID to be authenticated. The User ID must be within 40 characters.
- In the **User Password** field, enter the corresponding Password. The Password must be within 16 characters.

To avoid unauthorized access, we recommend you to change the Password regularly. Make sure it is strong and is kept confidential.

- Click **Submit** to save entries.
- Now, enable Digest Authentication on the desired SIP trunks. For instructions, see [“Configuring SIP Trunks”](#).

Configuring Digest Authentication using a Telephone

- Enter SE mode from a DKP/SLT.

To configure the User Password for the User ID, dial:

- **4119-Index-User Password**

Where,

Index is from 01 to 99. The User Password should be configured at the same index as the User ID.

User Password may have a maximum for 16 characters. If the User Password has fewer than 16 characters, terminate the command string with **#*** if using an SLT or press the 'Enter' key if using a DKP.
Default: Blank.

- Exit SE mode.

For SE Command for enabling Digest Authentication on SIP trunks, see [“Configuring SIP Trunks”](#).

Digital Key Phone-Operation

EON - the Proprietary Digital Key Phone

Matrix offers 'EON', the proprietary digital key phone (DKP). Matrix offers various models of EON. Each of these is explained later. These are powerful stations, supporting a host of phone and System features, as listed below.

DKP Features

- Status of other ports (Tri-color LED indication)
- Programmable Direct Station Selection (DSS) Keys and Feature keys
- LCD notification messages
- Ringer Tune selection
- Adjustable Speech level
- Adjustable Ringer Volume
- Adjustable Backlight and Contrast levels
- Hands-free operation - Speaker key and headset connectivity.
- Call Logs - last 20 Missed, Answered and Dialed Calls.
- Operator, Executive, Hotel Attendant and Guest Functionality
- Message Paging
- Menu based operation of System features
- Multiple Language support.

System Features

Listed below are the features of SARVAM UCS that require a Digital Key Phone:

- Abbreviated Dialing
- Auto Answer
- Call Chaining
- Call Cost Display
- Call Duration Display
- Call Mute
- Dialed Number Directory
- Directory Dialing by Name
- Dynamic Lock
- Forced Answer
- Keypad Lock
- Live Call Screening
- Message Paging
- Off-Hook Alert
- Room Monitor
- Text Message Reply
- Time Zone Display
- User Status (Presence)

Models of EON at a Glance

Feature	Models			
	EON48S	EON48P	EON310	EON510
Total number of keys	48	48	42	49
Number of programmable keys	29	29	21	22

Context Sensitive keys	No	No	No	Yes
Feature keys	12	12	9	8
DSS keys	16	16	12	16
LCD display	2 lines x 24 characters	6 lines x 24 characters	2 lines x 24 characters	240 x 64 Pixel Graphical LCD display
LCD with backlight	Yes	Yes	Yes	Yes
Headset Interface	Yes	Yes	Yes	Yes
Ringer Lamp (LED)	Yes	Yes	Yes	Yes
Speaker Phone	Full duplex	Full duplex	Full duplex	Full duplex

EON48

EON48S

2 lines and 24 characters LCD display, full duplex, capsense feature keys

EON48P

6 lines and 24 characters LCD display, full duplex, capsense feature keys.

LCD Display

The LCD display of EON48 is backlit and can be tilted at a convenient angle for a clear view of the text/characters displayed.

The LCD backlight can be turned on and off as well as adjusted for contrast and brightness from the "Phone Settings" of the DKP Phone Menu.

Ringer LED

The Ringer LED indicates incoming internal and external calls. The LED Cadence will match with the Ring Cadence of the incoming internal/external call.

The Ringer LED cadence changes according to the type of call, as described in the table below.

Type of Call	Cadence
Internal Call	Short, very slow (750ms ON, 2250ms OFF)
External Call	Double (400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Alarm	Long, fast (1500ms ON, 500ms OFF)
Auto Redial Call	Long, very slow (2000ms ON, 4000ms OFF)
Auto Call Back Call	Short, slow (750ms ON, 2250ms OFF)
Priority	Triple (400ms ON, 200ms OFF, 400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Programming mode	Continuous

Navigation Keys

These are 5 capsense keys. The functions of each are described briefly below.

- **Enter Key:** To enter the Menu; when the phone is in the idle state (without any incoming or outgoing call being made), if you tap the 'Enter' key, you will enter into the 'Menu'.

Enter key is also used to make a selection from the Menu/sub-menu options or to complete an action.

- **Up Key:** To scroll upwards while navigating the Menu/sub-menu.
- **Down Key:** To scroll downwards while navigating the Menu/sub-menu.
- **Forward Key:** To move forward when dialing a number.
- **Back Key:** To move backwards when dialing a number; to go back one level in the Menu.

Feature Keys

These are 12 capsense keys assigned to important or frequently accessed features of SARVAM UCS. Refer to the table given below:

Sr.No.	Description	LED
1.	Voice Mail	Single Color - Blue
2.	Call Back	Single Color - Blue
3.	Cancel	No
4.	Mute	Single Color - Blue
5.	Conference	No
6.	Transfer	No
7.	Forward	Single Color - Blue
8.	DND	Single Color - Blue
9.	Names	No
10.	Redial	No
11.	Release	No
12.	Hold	No

These Feature keys are programmable. Refer the [“DSS Keys Programming”](#) topic for instructions on programming these keys. You cannot change the labels of these keys and therefore it is recommended that you avoid programming these keys.

A few of these Feature keys are equipped with an LED to indicate the status of the feature assigned to it. You may re-assign other features to these keys. We recommend you to assign those features that require LED indication to the Feature keys equipped with an LED.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a feature key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the Feature key to which the Auto Redial feature has been assigned will glow Blue, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

Direct Station Selection (DSS) Keys

These are 16 programmable keys that can be assigned to Stations and Trunks and important or frequently accessed features of SARVAM UCS.

Refer the [“DSS Keys Programming”](#) topic for instructions on programming these keys.

DSS Key LEDs

Each DSS key is equipped with an LED which glows to indicate the status of the Trunk/Station or Feature assigned to it.

- **Status of Stations and Trunks:** The LED of DSS keys assigned to Stations/Trunks glow in three colors to indicate status of the call event on the Stations/Trunks and on the DKP.

Thus, the status of the DKP user's own Station as well as that of the other Stations and the status of Trunk lines are indicated by the LED of the DSS keys assigned to those Stations and Trunks on the DKP.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Blue	The key assigned to the Station you are in speech with.	The key assigned to the Station you have kept on hold.	The key assigned to the Station you are calling or from which you are being called.
Red	The key assigned to the Station that is now busy with another Station/Trunk.	The key assigned to the Station which has put another Station/Trunk on hold.	The key assigned to the Station/Trunk that is called or being called by another.
Violet	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Blue** indicates the state of the station/trunk you access. For example, when you make a call to another Station 203, the LED of the DSS key assigned to Station 203 blinks Blue to indicate ringing at the Station. If you have successfully established speech with Station 203 the LED glows Blue continuously.
- **Red** indicates the state of other Stations/Trunks. For example, if the LED of the DSS key assigned to Station 201 is glowing Red continuously, it means Station 201 is busy with another Station or Trunk.
- **Violet** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1 the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.
- **Status of Features:** The LED of a DSS key is activated when the feature assigned to this key is used.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a DSS key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will glow Red, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

The LEDs of the Call Appearance (CA) Keys will function in the same manner as the DSS Key LEDs.

Dial Pad

The dial pad consists of 12 fixed keys for the digits 0, 1-9, and the characters * and #. The dial pad is used for dialing numbers of stations, external parties, and for dialing the programming and feature access codes.

Speaker Key

The speaker key sets the phone in 'Speaker mode' for hands-free operation. The Speaker key is programmable, you can assign any other feature/function on this key.

Speaker Key LED

The Speaker Key on EON48 is equipped with a single color LED which glows Blue when pressed for the speaker mode and is turned off, when you exit the speaker mode.

Volume Keys

- **"+" (plus)**: This is the increase key, to raise the volume of speech while talking and to increase the Ringer volume, when the phone is ringing.
- **"-" (minus)**: This is the decrease key, to lower the volume of speech while talking and to decrease the Ringer volume when the phone is ringing.

Headset Connectivity

The EON48 provides two Headset interfaces: A 2.5mm Audio Jack and an RJ9 connector at the bottom of the phone body.

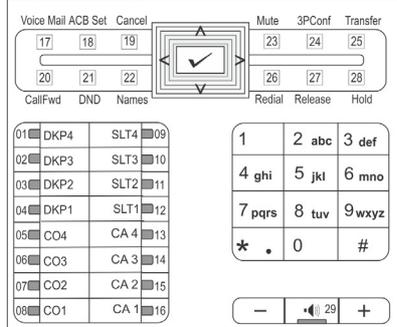

So you can use any stereo headset of standard make with a 2.5 mm single connector or a headset with an RJ9 connector.

You can also assign Headset key function to any of the DSS keys. Refer the topic ["DSS Keys Programming"](#) for instructions.

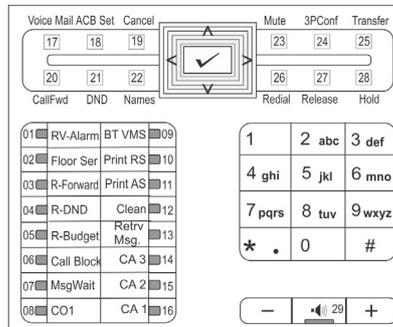

Key Maps

As EON48 may be the extension of the Operator/s and Executives in an enterprise, and the extension of the Front Desk Attendant and Guest in hotels, to meet the varied requirements of each user group, SARVAM UCS provides Key Maps for Operator, Executive1, Executive2, Executive3, Hotel Attendant and Hotel Guest.

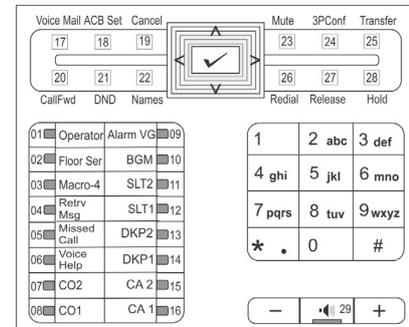

Operator/Executive

Hotel Attendant

Guest

The key maps of the Operator and Executive 1, 2, 3 are the same.

These key maps can be customized to match the exact requirement of individual users. Refer the topic [“DSS Keys Programming”](#) for instructions on customizing the Key Maps.

Phone Menu

You can access the following System and phone features from the Menu of EON48:

Menu option	Description
Call Logs	To view call history of internal and external Missed, Answered and Dialed calls. You can also edit numbers in the call logs and store them in the Personal Directory.
Call Forward	To set and cancel Call Forward-Busy, Call-Forward No Reply, Call-Forward-Unconditional, and Follow Me.
Dynamic Lock	To change the Toll Control level of the phone.
User Status	To set User Present or User Absent.
Keypad Lock	To lock the keypad of the phone.
Do Not Disturb	To set/cancel Do Not Disturb on the phone, that is, block incoming internal and external calls.
Call Cost Display	To view the cost of calls made from the phone.
Hotline	To set/cancel Hotline and Delayed Hotline.
Alarm	To set/cancel Personalized and Automated Alarms.
Change User Password	To change User Password.
One Touch Transfer	To configure the fixed destination number for One Touch Transfer.
Phone Settings	To customize settings of the phone such as Speech and Ringer Controls, LCD Display settings (Brightness and Contrast, Backlight ON/OFF), Headset Connectivity, Call Answering Mode (manual/auto answer).

Navigating the Phone Menu

To navigate the menu,

- Tap on Enter key when the phone is idle.
- Scroll by tapping the Up/Down Navigation Key to reach the desired Menu option.
- Tap on Enter key to select the desired Menu option.
- Scroll by tapping on the Up/Down Navigation Key to reach the desired sub-menu option.
- Tap on Enter key to select the desired sub-menu option.

To exit menu,

- Press Cancel key.

Or

- Go ON-Hook.

Call Waiting Indication

For EON48 V2 and earlier

During an on-going call, if there is another incoming call, an indication will be provided to you for the waiting call.

- The call waiting indication depends on the **Call Waiting Tone** option you select — Beep Once, Beep until answered or Off.
- the LCD will display the Caller ID of the extension/trunk.

For EON48 V3 and later

During an on-going call, if there is another incoming call, an indication will be provided to you for the waiting call.

Ringer Mode — Ring if Idle, Ring Immediately or Ring After Delay

If you are in speech using the handset/headset and there is a waiting call for you,

- the ring will be played on the speaker.
- the LCD will display the Caller ID of the extension/trunk.

If you are in speech on a speaker and there is a waiting call for you,

- the Call Waiting Tone will be played as per the option you select — Beep Once, Beep until answered or Off.
- the LCD will display the Caller ID of the extension/trunk.

Ringer Mode — Silent

If you are in speech using the handset/headset/speaker and there is a waiting call for you,

- the LCD will display the Caller ID of the extension/trunk.

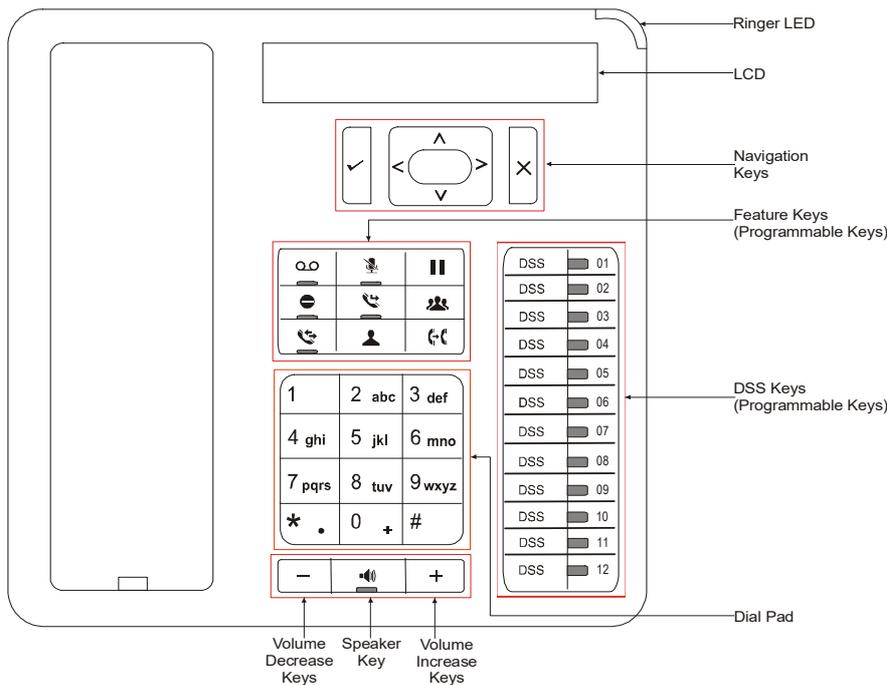

Operating EON48

Please refer the EON48_310_SPARSH VP248_310 User Guide for instructions on operating the features of SARVAM UCS using EON.

EON310

2 lines and 24 characters LCD display, full duplex, fixed feature keys.

LCD Display

The LCD display of EON310 is backlit for a clear view of the text/characters displayed.

The LCD backlight can be turned on and off as well as adjusted for contrast and brightness from the "Phone Settings" of the DKP Phone Menu.

Ringer LED

The Ringer LED will glow in Blue to indicate incoming internal and external calls.

Navigation Keys

These are 6 keys. The functions of each are described briefly below.

- **Enter Key:** To enter the Menu; when the phone is in the idle state (without any incoming or outgoing call being made), if you tap the 'Enter' key, you will enter into the 'Menu'.

Enter key is also used to make a selection from the Menu/sub-menu options or to complete an action.

- **Cancel Key:** To exit a menu; To abort a function/process; To delete a digit.
- **Up Key:** To scroll upwards while navigating the Menu/sub-menu.
- **Down Key:** To scroll downwards while navigating the Menu/sub-menu.
- **Forward Key:** To move forward when dialing a number.
- **Back Key:** To move backwards when dialing a number; to go back one level in the Menu.

Feature Keys

Sr.No.	Feature Icon	Assigned Feature	LED
1.		Voice Mail	Single Color - Blue
2.		Mute	Single Color - Blue
3.		Hold	No
4.		Do Not Disturb (DND)	Single Color - Blue
5.		Forward	Single Color - Blue
6.		Conference	No
7.		Logs	Single Color - Blue
8.		Contacts	No
9.		Transfer	No

These Feature keys are programmable. Refer the topic [“DSS Keys Programming”](#) for instructions on programming these keys. You cannot change the labels of these keys and therefore it is recommended that you avoid programming these keys.

A few of these Feature keys are equipped with an LED to indicate the status of the feature assigned to it. You may re-assign other features to these keys. We recommend you to assign those features that require LED indication to the Feature keys equipped with an LED.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a feature key, the LED of the key remains inactive, when Call Pick-Up is accessed. Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the Feature key to which the Auto Redial feature has been assigned will glow Blue, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

Direct Station Selection (DSS) Keys

These are 6 programmable keys that can be assigned to Stations and Trunks and important or frequently accessed features of SARVAM UCS.

Refer the topic [“DSS Keys Programming”](#) for instructions on programming these keys.

DSS Key LEDs

Each DSS key is equipped with an LED which glows to indicate the status of the Trunk/Station or Feature assigned to it.

- **Status of Stations and Trunks:** The LED of DSS keys assigned to Stations/Trunks glow in three colors to indicate status of the call event on the Stations/Trunks and on the DKP.

Thus, the status of the DKP user's own Station as well as that of the other Stations and the status of Trunk lines are indicated by the LED of the DSS keys assigned to those Stations and Trunks on the DKP.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Blue	The key assigned to the Station you are in speech with.	The key assigned to the Station you have kept on hold.	The key assigned to the Station you are calling or from which you are being called.
Red	The key assigned to the Station that is now busy with another Station/Trunk.	The key assigned to the Station which has put another Station/Trunk on hold.	The key assigned to the Station/Trunk that is called or being called by another.
Violet	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Blue** indicates the state of the station/trunk you access. For example, when you make a call to another Station 203, the LED of the DSS key assigned to Station 203 blinks Blue to indicate ringing at the Station. If you have successfully established speech with Station 203 the LED glows Blue continuously.
- **Red** indicates the state of other Stations/Trunks. For example, if the LED of the DSS key assigned to Station 201 is glowing Red continuously, it means Station 201 is busy with another Station or Trunk.

- **Violet** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1 the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.
- **Status of Features:** The LED of a DSS key is activated when the feature assigned to this key is used.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a DSS key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will glow Red, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

The LEDs of the Call Appearance (CA) Keys will function in the same manner as the DSS Key LEDs.

Dial Pad

The dial pad consists of 12 fixed keys for the digits 0, 1-9, and the characters * and #. The dial pad is used for dialing numbers of stations, external parties, and for dialing the programming and feature access codes.

Speaker Key

The speaker key sets the phone in 'Speaker mode' for hands-free operation.

Speaker Key LED

The Speaker Key on EON310 is equipped with a single color LED which glows Blue when pressed for the speaker mode and is turned off, when you exit the speaker mode.

Volume Keys

- **"+" (plus):** This is the increase key, to raise the volume of speech while talking and to increase the Ringer volume, when the phone is ringing.
- **"-" (minus):** This is the decrease key, to lower the volume of speech while talking and to decrease the Ringer volume when the phone is ringing.

Headset Connectivity

The EON310 provides two Headset interfaces: A 3.5mm Audio Jack and an RJ12 connector at the bottom of the phone body.

So you can use any headset of standard make with a 3.5 mm single connector or a stereo headset with an RJ9 connector.

You can also assign Headset key function to any of the DSS keys. Refer the topic ["DSS Keys Programming"](#) for instructions.

Key Maps

As EON310 may be the extension of the Operator/s and Executives in an enterprise, and the extension of the Front Desk Attendant and Guest in hotels, to meet the varied requirements of each user group, SARVAM UCS provides Key Maps for Operator, Executive1, Executive2, Executive3, Hotel Attendant, and Hotel Guest.

The key maps of Executive 1, 2, 3 are the same.

These key maps can be customized to match the exact requirement of individual users. Refer the topic [“DSS Keys Programming”](#) for instructions on customizing the Key Maps.

Phone Menu

You can access the following System and phone features from the Menu of EON310:

Menu option	Description
Call Logs	To view call history of internal and external Missed, Answered and Dialed calls. You can also edit numbers in the call logs and store them in the Personal Directory.
Contacts	To add, edit, delete names and numbers of contacts in the Global Directory Part 1.
Call Forward	To set and cancel Call Forward-Busy, Call-Forward No Reply, Call-Forward-Unconditional, and Follow Me.
Dynamic Lock	To change the Toll Control level of the phone.
User Status	To set User Present or User Absent.
Keypad Lock	To lock the keypad of the phone.
Do Not Disturb	To set/cancel Do Not Disturb on the phone, that is, block incoming internal and external calls.
Call Cost Display	To view the cost of calls made from the phone.
Hotline	To set/cancel Hotline and Delayed Hotline.
Alarm	To set/cancel Personalized and Automated Alarms.
Change User Password	To change User Password.
One Touch Transfer	To configure the fixed destination number for One Touch Transfer.
Phone Settings	To customize settings of the phone such as Speech and Ringer Controls, LCD Display settings (Brightness and Contrast, Backlight ON/OFF), Headset Connectivity, Call Answering Mode (manual/auto answer).

Navigating the Phone Menu

To navigate the menu,

- Tap on Enter key when the phone is idle.
- Scroll by tapping the Up/Down Navigation Key to reach the desired Menu option.
- Tap on Enter key to select the desired Menu option.
- Scroll by tapping on the Up/Down Navigation Key to reach the desired sub-menu option.
- Tap on Enter key to select the desired sub-menu option.

To exit menu,

- Press Cancel key.
- Or
- Go ON-Hook.

Call Waiting Indication

During an on-going call, if there is another incoming call, an indication will be provided to you for the waiting call.

The call waiting indication depends on the Call Waiting Tone option you select — Beep Once, Beep until answered or Off.

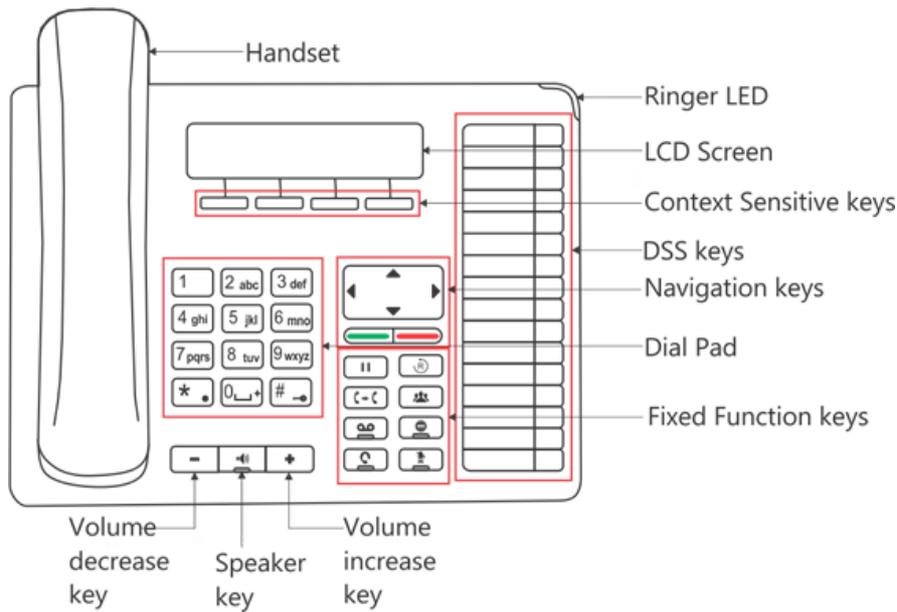

Operating EON310

Please refer the EON48_310_SPARSH VP248_310 User Guide for instructions on operating the features of SARVAM UCS using EON.

EON510

240 x 64 Pixel Graphical LCD display, full duplex, fixed feature keys.

LCD Display

The LCD display of the phone is backlit. The LCD backlight can be turned on and off as well as adjusted for contrast and brightness from the Phone Menu.

Ringer LED

The Ringer LED indicates incoming internal and external calls. The LED Cadence will match with the Ring Cadence of the incoming internal/external call.

The Ringer LED cadence changes according to the type of call, as described in the table below.

Type of Call	Cadence
Internal Call	Short, very slow (750ms ON, 2250ms OFF)
External Call	Double (400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Alarm	Long, fast (1500ms ON, 500ms OFF)
Auto Redial Call	Long, very slow (2000ms ON, 4000ms OFF)
Auto Call Back Call	Short, slow (750ms ON, 2250ms OFF)
Priority	Triple (400ms ON, 200ms OFF, 400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Programming mode	Continuous

Navigation Keys

The function of each Navigation key is described below.

- **Up Key:** To scroll upwards while navigating the Menu/sub-menu.
- **Down Key:** To scroll downwards while navigating the Menu/sub-menu.

- **Forward Key:** To move forward when dialing a number or scroll to view the Context Sensitive Key options.
- **Back Key:** To move backwards when dialing a number, to go back one level in the Menu or scroll backwards to view the Context Key options.
- **Menu or Select / OK Key**  : To enter the Menu; when the phone is in the idle state (without any incoming or outgoing call being made).

Menu Key functions as the **Select / OK Key** to make a selection from the Menu/sub-menu options or to complete an action. When there is an incoming call it functions as the **Answer Key**.

- **Cancel Key**  : To Cancel all features set by you or exit the Menu/sub-menu.

Feature Keys

EON510 supports following feature keys. Default features assigned to these keys are as follows.

Feature icon	Assigned Feature	LED	Programmable
	Hold	No	Yes
	Redial	No	Yes
	Transfer	No	Yes
	Conference	No	Yes
	Voicemail	Single Color - Blue	Yes
	Do Not Disturb	Single Color - Blue	Yes
	Headset	Single Color - Blue	No
	Mute	Single Color - Blue	No

All Feature keys are programmable except Headset  and Mute  key. Refer the topic "[DSS Keys Programming](#)" for instructions on programming these keys. You cannot change the labels of these keys and therefore it is recommended that you avoid programming these keys.

A few of these Feature keys are equipped with an LED to indicate the status of the feature assigned to it. You may re-assign other features to these keys. We recommend you to assign those features that require LED indication to the Feature keys equipped with an LED.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a feature key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the Feature key to which the Auto Redial feature has been assigned will glow Blue, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

Direct Station Selection (DSS) Keys

There are 16 programmable keys that can be assigned to Extensions and Trunks and important or frequently accessed features of SARVAM UCS.

Refer the topic [“DSS Keys Programming”](#) for instructions on programming these keys.

DSS Key LEDs

Each DSS Key is equipped with an LED which glows to indicate the status of the Trunk/Extension or Feature assigned to it.

- **Status of Extensions and Trunks:** The LED of DSS keys assigned to Extensions/Trunks glow in three colors to indicate status of the call event on the Extensions/Trunks and on the phone.

Thus, the status of the phone user's own Extension as well as that of the other Extensions and the status of Trunk lines are indicated by the LED of the DSS keys assigned to those Extensions and Trunks on the phone.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Blue	The key assigned to the Extension you are in speech with.	The key assigned to the Extension you have kept on hold.	The key assigned to the Extension you are calling or from which you are being called.
Red	The key assigned to the Extension that is now busy with another Extension/Trunk.	The key assigned to the Extension which has put another Extension/Trunk on hold.	The key assigned to the Extension/Trunk that is called or being called by another.
Violet	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Blue** indicates the state of the extension/trunk you access. For example, when you make a call to another Extension 203, the LED of the DSS key assigned to Extension 203 blinks Blue to indicate ringing at the Extension. If you have successfully established speech with Extension 203 the LED glows Blue continuously.
- **Red** indicates the state of other Extension/Trunks. For example, if the LED of the DSS key assigned to Extension 201 is glowing Red continuously, it means Extension 201 is busy with another Extension or Trunk.
- **Violet** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1 the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.
- **Status of Features:** The LED of a DSS key is activated when the feature assigned to this key is used.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a DSS key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will glow Red, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

The LEDs of the Call Appearance (CA) Keys will function in the same manner as the DSS Key LEDs.

Dial Pad

The dial pad consists of 12 fixed keys for the digits 0, 1-9, and the characters *, #, Lock. The dial pad is used for dialing numbers of extensions, external parties, and for dialing the programming and feature access codes.

Speaker Key

The speaker key sets the phone in 'Speaker mode' for hands-free operation.

Speaker Key LED

The Speaker Key on the phone is equipped with a single color LED which glows Blue when pressed for the speaker mode and is turned off, when you exit the speaker mode.

Volume Keys

- **"+" (plus):** This is the increase key, to raise the volume of speech while talking and to increase the Ringer volume, when the phone is ringing.
- **"-" (minus):** This is the decrease key, to lower the volume of speech while talking and to decrease the Ringer volume when the phone is ringing.

Headset Connectivity

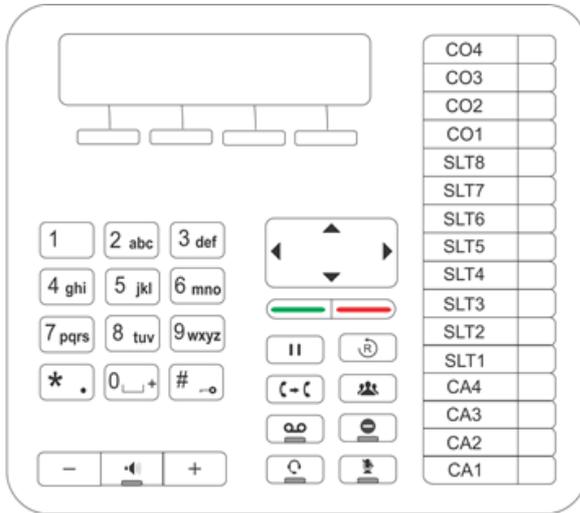

The phone provides two Headset interfaces: A 3.5mm Audio Jack and an RJ9 connector at the bottom of the phone body.

So, you can use any stereo headset of standard make with a 3.5 mm single connector or a stereo headset with an RJ9 connector.

To use the Headset, a Headset Key is assigned on the phone. The Headset Key on the phone is equipped with a single color LED which glows Blue when pressed for the headset mode and is turned off, when you exit the headset mode.

Key Maps

As EON510 may be the extension of the Operator/s and Executives in an enterprise, to meet the varied requirements of each user group, SARVAM UCS provides Key Maps for Operator and Executives. These key maps can be customized to match the exact requirement of individual users. All the key maps of the EON510 are the same.

Refer the topic [“DSS Keys Programming”](#) for instructions on programming these keys.

Phone Menu

You can access the following System and phone features from the Menu of the phone:

Menu option	Description
Call Logs	To view call history of internal and external Missed, Answered and Dialed calls. You can also edit numbers in the call logs and store them in the Personal Directory.
Call Forward	To set and cancel Call Forward-Busy, Call-Forward No Reply, Call-Forward-Unconditional, and Follow Me.
Dynamic Lock	To change the Toll Control level of the phone.
User Status	To set User Present or User Absent.
Keypad Lock	To lock the keypad of the phone.
Do Not Disturb	To set/cancel Do Not Disturb on the phone, that is, block incoming internal and external calls.
Call Cost Display	To view the cost of calls made from the phone.
Hotline	To set/cancel Hotline and Delayed Hotline.
Alarm	To set/cancel Personalized and Automated Alarms.
Change User Password	To change User Password.
One Touch Transfer	To configure the fixed destination number for One Touch Transfer.

Menu option	Description
Phone Settings	To customize settings of the phone such as Speech and Ringer Controls, LCD Display settings (Brightness and Contrast, Backlight ON/OFF), Headset Connectivity, Call Answering Mode (manual/auto answer).

Navigating the Phone Menu

To navigate the menu,

- Press the Menu Key when the phone is idle.
- Scroll by pressing the Up/Down Navigation Key to reach the desired Menu option.
- Press the Select or OK Key to select the desired Menu option.
- Scroll by pressing the Up/Down Navigation Key to reach the desired sub-menu option.
- Press the Select or OK Key to select the desired sub-menu option.

To exit menu,

- Press Cancel Key.
or
Go ON-Hook.

Call Waiting Indication

During an on-going call, if there is another incoming call, an indication will be provided to you for the waiting call.

The call waiting indication depends on the Call Waiting Tone option you select — Beep Once, Beep until answered or Off.

Operating EON510

Please refer the *EON510_SPARSH VP510 User Guide* for instructions on operating the features of SARVAM UCS using EON.

EONSOFT

The EONSOFT is a PC-based Digital Key Phone. Based on a graphic user Interface (GUI), the EONSOFT offers all the features of EON48, making it a substitute for the Digital Key Phone. Its integration with the SARVAM UCS obviates the need for a separate telephone instrument.

The EONSOFT can be installed on any personal computer with Windows or NT operating system.

Two PC-based DSS64 Consoles are available to be used with the EONSOFT. You can use either one or both DSS64 Consoles.

The EONSOFT occupies only a single port, even when both PC-based DSS64 Consoles are used. Thus it supports all the features of the Digital Key Phone and the DSS64 Console on a single window.

DKP Port

The DKP port connects EONSOFT to the DKP port of SARVAM UCS's DKP Card.

Handset Port

The Handset port connects the Receiver of the phone, to be used for speech.

The EONSOFT has the provision for attaching a Handset. A handset with spring cord is supplied by Matrix and is to be connected to the handset jack (RJ12) on the Dongle.

Headset connectivity

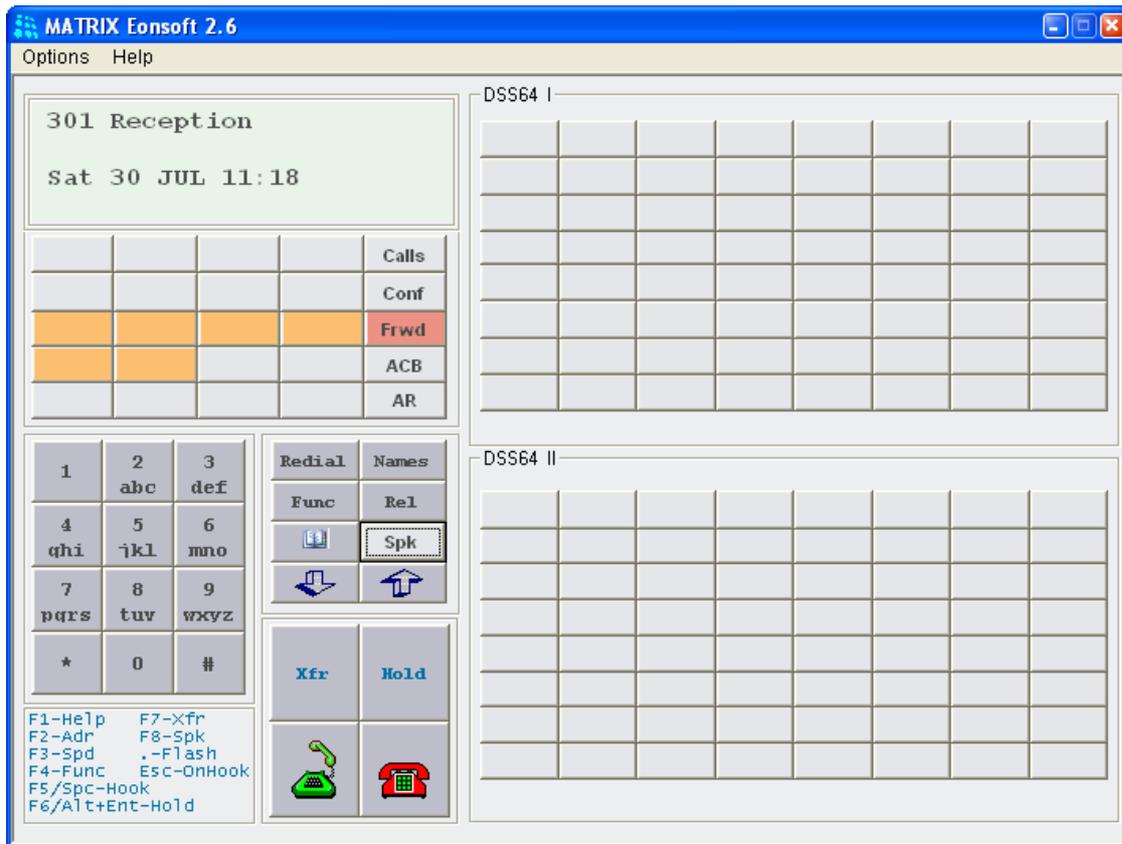

EONSOFT supports headset connectivity, providing a MIC and a Speaker interface. Any stereo Headset of standard make, with dual connectors can be connected to the MIC and the Speaker on the Dongle.

COM Port

The COM port connects EONSOFT to a PC (COM Port).

After EONSOFT has been successfully installed on a PC and the DKP parameters have been configured, each time you open EONSOFT, the display and keypad of the phone will appear on your PC screen.

The illustration below shows EONSOFT with two DSS64 Consoles attached to it.

Phone Display

The EONSOFT has a 2-line and 24-character display. In the ON-Hook or idle condition, the first line displays the Station Number and the Station name. The second line displays the Day, Date and Time.

When there is an incoming call, the calling party's number is displayed on Line 2 of the LCD²⁹².

The LCD messages for various call events (dial, transfer, forward, hold, etc.), for prompts, alerts, confirmation, errors, text messages, are displayed.

Direct Station Selection (DSS) Keys

These are a set of 25 keys programmable keys, allowing you to assign Stations, Trunks or Features to them, so that you can access any of these by pressing the respective key.

Refer the topic “[DSS Keys Programming](#)” for instructions on assigning stations, trunks, features to keys.

DSS Key LEDs

Each DSS key is equipped with an LED which changes the color to indicate the status of the Trunk/Station or Feature assigned to it.

292. Only if the Station, to which EONSOFT is connected, has been allowed CLIP facility in its Class of Service.

- **Status of Stations and Trunks:** The LED of DSS keys assigned to Stations/Trunks may change in three different colors to indicate status of the call event on the Stations/Trunks on EONSOFT.

Thus the status of the Stations and the Trunk lines are indicated by the LED of the DSS keys assigned to those Stations and Trunks on EONSOFT.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Green	The key assigned to the Station you are in speech with.	The key assigned to the Station you have kept on hold.	The key assigned to the Station you are calling or from which you are being called.
Red	The key assigned to the Station that is now busy with another Station/ Trunk.	The key assigned to the Station which has put another Station/Trunk on hold.	The key assigned to the Station/ Trunk that is called or being called by another.
Orange	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Green** indicates the state of the station/trunk you access. For example, when you make a call to another Station 203, the LED of the DSS key assigned to Station 203 blinks Green to indicate ringing at the Station. If you have successfully established speech with Station 203 the LED is Green continuously.
- **Red** indicates the state of other Stations/Trunks. For example, if the LED of the DSS key assigned to Station 201 is Red continuously, it means Station 201 is busy with another Station or Trunk.
- **Orange** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1 the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.

The LEDs of DSS Keys that are designated as Call Appearance (CA) Keys will function as follows:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Green	When you are in speech with a Station (internal call)	When you have put a Station on hold (internal call)	When any Station is calling (internal call)
Orange	When you are in speech with Trunk (external call)	When you have put a Trunk on hold (external call)	When any Trunk is calling (external call)

- **Status of Features:** The LED of a DSS key is activated when the feature assigned to this key is used.

The LED of DSS keys assigned to Stations/Trunks turn Red to indicate status of the call event on the Stations/Trunks.

- *Not all features require LED indication. Hence the LED on a DSS Key is activated only if the feature assigned to that key requires LED.*
- *For example, Call Pick-Up; this feature does not require an LED. So when a DSS key is assigned to this feature, the LED of the key remains inactive, when Call Pick-Up is accessed.*
- *A feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will turn Red, when Auto-Redial is set, and the LED is turned off when the feature is canceled.*
- *Thus the LEDs of the DSS keys function only if the LED is relevant for the feature/ function assigned to the keys, otherwise it remains inactive.*
- *The LEDs of DSS keys to which features like Raid, Interrupt Request, Barge-In, Last Caller Recall are assigned, will not change color.*

Dial Pad

The dial pad consists of 12 keys (non-programmable), which include the digit keys for 0, 1-9, and character keys for * and #.

Function Keys

These are non-programmable keys on the keypad of EONSOFT which have fixed functions.

- **Redial:** This key is used for redialing the last external number.
- **Func Key:** This key is used for accessing the Phone menu.
- **Names:** This key is used to dial by Name.
-  : This key is used for accessing the Address Book. The EONSOFT provides the facility of an Address Book that is integrated with the Standard Windows Address Book, for storing the numbers and addresses of contacts. So, when a call is to be made, you can select and dial the desired number from the directory.
- **Rel:** This key is used to disconnect an on-going call.
- **Xfr:** This key is used for transferring calls to another destination
- **Hold:** This key is used for putting the caller on hold. This key is also used to make a selection in the Phone Menu.
-  : This key is used for going OFF-Hook. It simulates lifting of the handset, pressing of the speaker key to make or receive calls.
-  : This key is used for going ON-Hook. It simulates replacing of the handset, pressing of the speaker key to disconnect.

Volume Control Keys

The ↑ and ↓ keys are used for increasing or decreasing the phone volume. Volume can be increased by clicking ↑ and decreased by clicking ↓.

Navigation Keys

The following keys are used for navigating the phone menu:

- **'Func' key:** This key is used for entering the Phone menu and to go back one level in the menu.
- **Up and Down keys:** The ↑ and ↓ keys function as the Up and Down keys to scroll the Menu and sub-menu options. You can scroll up down the menu by clicking ↑ and scroll up the menu by clicking ↓.
- **'Hold' key:** This key is used to make a selection in the Menu.

Speaker key

The 'Spk' key sets the phone in 'Speaker mode' for hands-free operation. The Speaker key is programmable; you can assign any other feature/function to this key.

Shortcut keys

You can use the Keyboard of the PC to operate EONSOFT, with the help of "shortcut keys". The following table describes the functions performed when shortcut keys on the keyboard are pressed:

Short Cut Key Label	Description
F1	Help
F2	Windows Address Book
F3	Spd
F4	Func
F5	Space Bar - Hook
F6	Alt+Enter - Hold
F7	Xfr
F8	Spk
Esc	ON-Hook
. (dot/period)	Flash
↑ (Up Arrow Key)	Volume key. To increase volume of ringer and speech
↓ (Down Arrow Key)	Volume key. To decrease volume of ringer and speech
Ctrl+C	To open COM Port Settings Dialog Box
Ctrl+T	To open Trunk Access Code Dialog Box
Tab → (Tab Forward)	Forward shifting of selection
Tab ← (Tab Backward)	Backward shifting of selection
Shift + Enter ↵	To press the button with selection

Short Cut Key Label	Description
Num Pad	Dial out a number

Key Maps

EONSOFT can function as a Station for the Operator, Executive, and Hotel Attendant, also Guest (though unlikely to be used by guests).

Phone Menu

The Phone menu is the same as EON48.

Navigating the Phone Menu

To navigate the menu,

- Click 'Func' key when the phone is idle.
- Scroll by clicking the Up/Down Key to reach the desired Menu option.
- Click 'Hold' key to select the desired Menu option.
- Scroll by clicking the with Up/Down Key to reach the desired sub-menu option.
- Click 'Hold' key to select the desired sub-menu option.

To exit menu,

- Press the 'Func' key repeatedly to go back one level in the menu, till you reach 'Menu'.

Or

- Press Cancel key, if programmed.

If you want to use the Keyboard, press the Shortcut key for the desired function.

Tool Tips

You can assign labels and tool tips for the DSS keys, which are displayed to the user on mouse over. You can assign the function of each key as Tool Tip, to help user in intuitive operation of EONSOFT.

To assign a tool tip,

- right click the desired DSS key.
- The dialog box will show the Key Number.
- Enter the label for the key.
- Enter the Tool Tip for the key.
- Click 'OK'.
- Repeat the same steps to configure Tool Tip on another key.

Each time you move the mouse on the key, the Tool Tip you programmed for this key will be displayed.

Call Indication

Incoming Calls are indicated by:

- Popping up of the EONSOFT window, when the window is minimized.
- Flashing of the Title Bar of the EONSOFT window, when the window is maximized.

In order for the EONSOFT window to pop up, you must have enabled the 'PopUp When Ring' option. When this option is enabled and the EONSOFT window is minimized a new incoming call causes the window to pop up to its full size notifying the user about the new call. When this option is enabled and the EONSOFT window is maximized, a new incoming call is indicated by the flashing of the Title bar of the window.

When the 'PopUp When Ring' option is disabled and the EONSOFT window is minimized, a new incoming call is indicated by the flashing of the EONSOFT Title at the bottom bar of the PC screen.

By default, the 'PopUp When Ring' option is enabled.

Second Call Indication

When you are in an on-going conversation and there is a second incoming call, EONSOFT will indicate the second incoming call. The second call indication depends on the type of Ringer Mode selected by you.

The tables below describes the second call indications for each Ringer Mode.

Ringer Mode - Ring if Idle

Second call indication, when the first call is on the Speaker	Second call indication, when the first call is on the Handset	Second call indication, when the first call is on the Headset
Call Waiting Tone is played and the LCD displays the Caller ID of the station/trunk.	Call Waiting Tone is played and the LCD displays the Caller ID of the station/trunk.	NA

Ringer Mode - Ring Immediately

Second call indication, when the first call is on the Speaker	Second call indication, when the first call is on the Handset	Second call indication, when the first call is on the Headset
Call Waiting Tone is played and the LCD displays the Caller ID of the station/trunk.	Ring on the speaker and the LCD displays the Caller ID of the station/trunk.	NA

Ringer Mode - Ring After Delay

Second call indication, when the first call is on the Speaker	Second call indication, when the first call is on the Handset	Second call indication, when the first call is on the Headset
The LCD displays the Caller ID of the station/trunk and the Call Waiting Tone is played after the expiry of the Ring Delay Timer.	The LCD displays the Caller ID of the station/trunk and there is a Ring on the speaker after the expiry of the Ring Delay Timer.	NA

Ringer Mode - Silent

The LCD will display the Caller ID of the station/trunk..

Operating EONSOFT

EONSOFT can be operated using the keyboard and the mouse.

Making calls

To make calls,

- Click the desired digits on the dial pad.
- The number will be dialed out.
- Talk.
- Click ON-Hook key to disconnect.

To make calls from Headset mode,

- Click OFF-Hook key.
- Click the desired digits on the dial pad.
- The number will be dialed out.

To make calls from Speaker mode,

- Click 'Spk' key.
- Click the desired digits on the dial pad.
- The number will be dialed out.

- *A headset must be connected and 'Headset Connectivity' must be enabled in the 'DKP Parameters'. Refer "[DSS Keys Programming](#)" for instructions.*

- *If you are using the keyboard instead of the mouse, press the appropriate Shortcut Keys listed above and use the Number pad on the keyboard to dial digits.*

Receiving calls

- When window pops up to indicate a call,
- Click 'Spk' key or 'OFF-Hook' Key.
- Talk.
- Click 'ON-Hook' key to disconnect.

Direct Dialing-In (DDI)

What's this?

DDI is the service feature provided to the customers by the ISDN exchanges / ITSPs over digital trunks / SIP Trunks. DDIs are Direct Dial-In numbers. These are additional numbers that can be associated with the main number assigned to the ISDN line/SIP Trunk. They are normally used with the system to provide separate numbers to extension users.

When there is an incoming call on the a specific DDI number it is routed through to the required extension without operator intervention.

Before we understand how DDI routing works, we must understand the following terms:

- **Pilot Number/ISDN Number:** It is a single number assigned by the service provider to a single ISDN/IP trunk. This is the combination of MSN Number and the first DDI Number. The Pilot Number is of maximum 16 digits. This is also known as ISDN Installation Number/ISDN Number. The MSN is a fixed series and is given by the service provider whereas the DDI Numbers can be selected by the user and these series vary. For example, if the Pilot Number is 2630555, the MSN is 2630 and the DDI Number is 555. However the number of digits to be used as DDI Numbers is informed by the service provider as they may differ for each service provider.
- **Multiple Subscriber Number (MSN):** In India, the MSN are the first four digits of the Pilot Number, which remain fixed and are provided by the service provider. The number of fixed digits may vary depending on the service provider.
- **DDI Numbers:** These are additional numbers, which can be selected by you but are allotted by the service provider. These are sequential numbers. In the DDI number only the last 3 or 4 digits vary. These are known a DDI numbers. However the number of DDI digits which vary are provided by the service provider. These numbers are normally used with a PBX and are assigned to the extension user.

How it works

Let us understand this with the help of an example:

- A BRI line has been connected to the PBX.
- 50 DDI numbers have been given by the service provider.
- Incoming calls on the DDI numbers can be routed to different landing destinations as extension users, department groups or other trunks within the organization.
- To assign DDI numbers to the extension users and to route calls as per the DDI numbers, you need to configure the following:
 - Incoming Reference Table
 - Outgoing Reference Table
 - DDI Routing Table

Handling Incoming Calls

Pre-requisites to route incoming calls as per the DDI logic,

- Assign an Incoming (IC) Reference ID to the BRI port. This Incoming (IC) Reference ID acts as a link between the port settings and the Incoming Reference Table.
- In the Incoming Reference Table against the same Incoming (IC) Reference ID, configure the Start Channel No., Total Channel Count, DDI Routing Ref. ID, Route on First Destination, Ring Timer (sec), When No Reply, When Busy, Trunk Features Template as per your requirement.
- To route and place the call on the final destination, the system refers to the DDI Routing Ref. ID configured in the Incoming Reference Table. As per this ID the system checks the DDI Routing Table. The DDI Routing Ref. ID acts as a link between the Incoming Reference Table and the DDI Routing Table. The system places the call on the final destination as configured against the DDI Routing Reference ID in the DDI Routing Table.

When there is an incoming call on the BRI port,

- As per the time zone, the system checks the Incoming (IC) Reference ID assigned to the BRI port
- If the Incoming (IC) Reference ID has been configured, the system then hunts for the same ID in the Incoming Reference Table.

If no channel match is found in the Incoming Reference Table, the call is routed as per the Trunk Feature Template assigned to the BRI port.

If a match is found, the system verifies the channels on which the routing logic is to be applied. These are defined in the parameters Start Channel Number and the Total Channel Count. Hence the system also matches the channel number on which the incoming call landed and the channel configured.

- For the matching entry, the system checks the corresponding DDI Routing Reference ID. The DDI Routing Reference ID acts as a link between the Incoming Reference Table and the DDI Routing Table.
- The system hunts for the same DDI Routing Reference ID in the DDI Routing Table. In the DDI Routing Table, a range of DDI numbers and their respective landing destinations are configured. You can configure as many as 224 DDI Reference ID's with different DDI numbers and their corresponding landing destinations. From this table the system fetches the extension number configured as the landing destination.
- When a match is found in the DDI Routing Table for the incoming call on the respective DDI number, the system places the call on the corresponding landing destination configured by you.

When the call is not answered by the landing destination or if the landing destination is busy, the system again checks the Incoming Reference Table for the options you have selected for the parameters, When No Reply and When busy. You may select from the following options - Disconnect, Route to a TLG, Greet and Disconnect, Greet and Route to TLG or Route to VMS.

- If no match is found for the DDI number in the DDI Routing Table, the call is routed as per the Trunk Feature Template assigned in the Incoming Reference Table.

Handling Outgoing Calls

Reverse DDI is when you want the DDI numbers assigned to the extension users to be displayed as the CLI to the called party. For this you must configure the DDI Routing Table and the Outgoing Reference Table.

When an outgoing call is made by the extension user, the DDI numbers will be sent as CLI to the called parties only if, the service provider supports this facility. If this facility is not supported by the service provider and if SARVAM UCS sends the DDI Number, this number will be swapped by with the Pilot number by the service provider and then the call will be routed further.

Pre-requisites to route outgoing calls as per the DDI logic,

- Assign an Outgoing Reference ID to the BRI port. This Outgoing Reference ID acts as a link between the port settings and the Outgoing Reference Table.
- In the Outgoing Reference Table against the same OG Reference ID, configure the Start Channel No., Total Channel Count, DDI Routing Ref. ID and the ISDN Number as per your requirement.
- To fetch the DDI number the system refers to the DDI Routing Ref. ID configured in the Outgoing Reference Table. As per this ID the system checks the DDI Routing Table. The DDI Routing Ref. ID acts as a link between the Outgoing Reference Table and the DDI Routing Table.

When an outgoing call is made using the BRI port,

- The extensions user dials a trunk access code to grab the BRI line to out-dial a number.
- As per the time zone, the system checks for the Outgoing (OG) Reference ID assigned to the BRI port.
- If the OG Reference ID has been configured, the system then hunts for the same ID in the Outgoing Reference Table.

If a match is found, the system verifies the channels assigned to the user for making an outgoing call. These are defined in the parameters Start Channel Number and the Total Channel Count. Hence the system also matches the channel assigned for making the outgoing call with the channel configured in the table.

- The system the checks the corresponding DDI Routing Reference ID. The DDI Routing Reference ID acts as a link between the Outgoing Reference Table and the DDI Routing Table.
- The system hunts for the same DDI Routing Reference ID in the DDI Routing Table. From this table the system fetches the DDI number assigned to the extension user. You can configure as many as 224 DDI Reference ID's with different DDI numbers.
- When a match is found in the DDI Routing Table, the system sends the MSN Number + DDI number of the extension in the calling party field to the called party.
- If no match is found in the DDI table, the ISDN Number, that is the MSN Number + the first DDI number is sent in the calling party field to called party.

Configuring using Jeeves

To route incoming calls as per the DDI logic you must configure the following:

- Assign the Incoming Reference ID on the respective port.
- Incoming Reference Table
- DDI Routing Table

To configure the Incoming Reference Table,

- Determine the ISDN ports/SIP trunk on which you want to apply the DDI logic, for example, BRI port.
- On the BRI port, assign an Incoming Reference ID number. To do this,
 - Log into Jeeves as System Engineer.
 - Under **Configuration**, click **BRI Configuration**.
 - Click **BRI Parameters**.
 - Scroll to **Incoming (IC) Reference ID**.
 - Assign an **Incoming (IC) Reference ID** number for each time zone.
- Under **Configuration**, click **DDI Routing**.
- Click **Incoming Reference Table** and configure the following parameters:
 - **IC Reference ID**: You must configure the parameters to apply DDI Routing against the same ID as assigned on the BRI port. This ID is a link between the port settings and the Incoming Reference Table.
 - **Start Channel Number**: The system starts applying the routing logic from this channel of the trunk.
 - **Total Channel Count**: This is the total number of channels of the trunk on which the system applies the routing logic.
 - **DDI Routing Reference ID**: Enter the DDI Routing Reference ID number. As per the this reference number the system checks the DDI Routing Table and determines the final landing destination for placing the call.

This ID is a link between the Incoming Reference Table and the DDI Routing Table.
 - **Route on First Destination**: When the final destination extension is identified as per the DDI number table, the system checks if this check box is enabled. If it is enabled, every incoming call will always be placed on the first extension configured in the DDI Table. If the check box is clear, the call is routed to the respective extension number.
 - **Ring Timer**: This timer signifies the time for which the extension on which the incoming call is placed must ring. On expiry of this timer if the call is not answered the call is routed as per the option you configure for the parameter **When No Reply**.
 - **When No Reply**: When the call is not answered by the DDI extension, the system checks the option you have selected for this parameter and processes the call further. You may select any option from the following:

- Disconnect the call
 - Route the call to Trunk Landing Group
 - Answer the call automatically, greet the caller with a voice message, and on completion of message disconnect the call.
 - Answer the call, greet the caller with a voice message, and on completion of the message route the call to Trunk Landing Group.
 - Route the call to Voice Mail, that is to the Mail box assigned to the DDI extension. For this, a mail box must be assigned to the extensions. If the extension is not assigned mail box, the caller will hear the welcome message of the VMS, but will not be able to access the mail box.
- **When Busy:** If the DDI extension is busy, the system checks the option you have selected for this parameter and processes the call further. You may select any option from the following:
 - Disconnect the call.
 - Route the call to Trunk Landing Group.
 - Answer the call automatically, greet the caller with a voice message, and on completion of message disconnect the call.
 - Answer the call, greet the caller with a voice message, and on completion of the message route the call to Trunk Landing Group.
 - Route the call to Voice Mail, that is to the Mail box of the DDI extension. For this, a mail box must be assigned to the extensions. If the extension is not assigned mail box, the caller will hear the welcome message of the VMS, but will not be able to access the mail box.
 - **Trunk Feature Template:** A Trunk feature template is assigned to each Incoming Reference ID. You can enable different features in the Trunk Feature Templates. A different Trunk Feature Template can be assigned to each channel or a range of channels, such as set Auto Answer Time Zone wise, allow DID according to the time zone. Hence incoming calls can be answered and routed in different ways. For more details refer the topic "[Trunk Feature Template](#)".
 - Click **Submit** to save the settings.
 - Similarly, to assign IC Reference ID to T1E1 ports, under **Configuration**, click **T1E1 Configuration**. Click **Port Parameters**.
 - To assign IC Reference ID to SIP Trunks, under **Configuration**, click **VoIP Configuration**. Click **SIP Trunk Parameters**.
- After the Incoming Reference Table has been configured you must configure the DDI Routing Table.

DDI numbers can be assigned to extensions users, Department Groups, Routing Groups or to different port types, depending on the organizations requirement.

You can configure as many as 224 DDI Reference ID's with different DDI numbers and landing destinations. To configure the DDI Routing Table,

- Under **Configuration**, click **DDI Routing**.
- Click **DDI Routing Table** and configure the following parameters:
 - **DDI Routing Reference ID:** You must configure the parameters to apply DDI Routing against the same ID as assigned in the Incoming Reference Table. This ID is a link between the Incoming Reference Table and the DDI Routing Table.

DDI Routing Ref. ID's in the DDI Routing Table act as identifiers. This Reference ID is assigned in the Incoming Reference Table.

When there is an incoming call the system checks the Incoming Reference ID assigned to the port/trunk. The system tracks this ID from the Incoming Reference Table.

- **Start DDI Number:** This is the first DDI Number from where the DDI range starts. You must only enter the DDI number. For example, if the Pilot Number is 2630555. If 10 DDI numbers have been taken, then the DDI Number range is from 555 to 564. The Start DDI Number in this case is 555.
- **Total DDI Numbers:** The total number of DDI numbers for you want to set the same landing destination. For example, if the Start DDI Number is 555, Total DDI Number is 1, then the landing destination selected will only be for the DDI Number 555. If Start DDI number is 556 and the Total DDI Numbers is configured as 10, then the landing destination will be for the entire range of numbers, that is from 556 to 565.
- **DDI Number of Digit:** The number of digits in a DDI number. Suppose 100 DDI numbers are supported on an ISDN Trunk, then the Number of Digits for that Trunk should be configured as 3. Suppose 10 DDI numbers are supported on another ISDN Trunk, then the Number of Digits for that Trunk should be configured as 2.
- **Route to Destination:** The incoming calls on the DDI numbers can be placed on extensions users, Department Groups, Routing Groups or to different port types, depending on the organizations requirement.

Configure the following for the parameters for the landing destination:

- **Port Type:** Select the port type to place the DDI call from the following:
 - BRI
 - T1E1
 - E&M
 - AOP
 - Department Group
 - Quick Dial
 - Routing Group
 - Voice Mail Auto Attendant
 - Mobile
 - SIP Trunk
 - Flexible Number
 - Virtual Extension

For example, to use SARVAM UCS as a gateway select Port Type as Mobile, BRI, T1E1 etc.

To place incoming calls on the extensions, select Flexible Number as the Port Type.

- **Port Number:** For the Port Type you have selected, enter the Port Number/Group Number. The Port Number range depends on the Port Type you have selected.
- **Start DDI Flexible Number:** If you have selected the Port Type as Flexible Number, enter the first extension number to which you want to assign the first DDI Number. As per the Total DDI numbers configured, the system automatically maps the DDI numbers with the extension numbers. Both the DDI numbers and the extensions numbers are mapped sequentially. For example, if the Start DDI

number is 2630555, the Total DDI Numbers are 10 and Start DDI Flexible Number 2001, the system maps the DDI numbers with the extensions numbers as follows:

DDI Number	Start Flexible Number
555	2001
556	2002
.	.
.	.
.	.
.	.
.	.
564	2010

Hence the call for the respective DDI Number is placed on the respective extension number.

- **Voice Mail Auto Attendant (VMAA) Menu:** if you have selected the *Voice Mail Auto Attendant* as the Port Type, select the VMAA Menu to be assigned to the respective DDI Routing Table entry.

You may click the *Voice Mail Auto Attendant (VMAA) Menu* link to edit the parameters of desired VMAA Menu. For details, see "[Voice Mail Auto-Attendant Menu](#)".

- Click **Submit** to save the settings.

DDI Routing is not supported on T1/E1 trunk line if you have selected *E&M* as the *Signal Type*.

If you want to apply Reverse DDI, that is if you want DDI numbers to be displayed as the CLI to the called party, you must configure the Outgoing Reference Table. The system uses the same DDI Routing Table to trace the extension users and their respective DDI numbers when an outgoing call is made.

To assign the Outgoing Reference ID and to configure the Outgoing Reference Table you must,

- Determine the ISDN ports/SIP trunk on which you want to apply the Reverse DDI logic, for example, BRI port.
- On the BRI port, assign an Outgoing Reference ID number. To do this,
 - Log into Jeeves as System Engineer.
 - Under **Configuration**, click **BRI Configuration**.
 - Click **BRI Parameters**.
 - Scroll to **Outgoing (OG) Reference ID**.
 - Assign an **Outgoing (OG) Reference ID** number for each time zone.
- Under **Configuration**, click **DDI Routing**.
- Click **Outgoing Reference Table** and configure the following parameters:

- **Outgoing Reference ID:** To apply DDI Routing configure the parameters given below against the same ID as assigned on the BRI port. This ID is a link between the port settings and the Outgoing Reference Table.
- **Start Channel Number:** The system starts applying the routing logic from this channel of the trunk.
- **Channel Count:** This is the total number of channels of the trunk on which the system applies the routing logic.
- **ISDN Number:** Each ISDN Trunk is given an Pilot Number by the Service Provider. This is the combination of MSN Number and the first DDI Number. The Number is of maximum 16 digits. This is also known as ISDN Installation Number/ISDN Number. The MSN number is given by the service provider whereas the DDI Numbers can be selected by the user. However the number of digits to be used for the DDI Number is informed by the service provider.
- **DDI Routing Reference ID:** Enter the DDI Routing Reference ID number. As per the this reference number the system checks the DDI Routing Table and determines the DDI number assigned to the extension user. The system then swaps this DDI number with the ISDN number when an outgoing call is made. This DDI number is displayed as the CLI to the called party.

The DDI numbers will be displayed as CLI to the called party only if the service provider supports this facility over the ISDN Trunk/SIP Trunk.

- Click **Submit** to save the settings.
- Similarly, to assign OG Reference ID to T1E1 ports, under **Configuration**, click **T1E1 Configuration**. Click **Port Parameters**.
- To assign OG Reference ID to SIP Trunks, under **Configuration**, click **VoIP Configuration**. Click **SIP Trunk Parameters**.

Configuring IC Reference Table using a Telephone

- Enter SE mode from a DKP/SLT.
- To program IC Reference Table Index, dial:
 - **6302-1-IC Reference Table Index-Feature Number-Value**
 - **6302-2-IC Ref. Table Index-IC Ref. Table Index-Feature Number-Value**
 - **6302-*-Feature Number-Value**
 Where,
 IC Reference Table Index is from 01 to 64.
 Feature Number is from 01 to 09.

See the table at the end of this topic for Feature numbers and the codes.

- To restore default IC Reference Table Index, dial:
 - **6301-1-IC Reference Table Index** to restore default of a single index.
 - **6301-2-IC Ref. Table Index-IC Ref. Table Index** to restore defaults of a range of index.
 - **6301-*** to restore defaults of the entire table.
 Where,
 IC Reference Table Index is from 01 to 64.
- Exit SE mode.

Default values of the IC Reference Table

Feature No.	01	02	03	04	05	06	07	08	09
Feature Name/Table Index	IC Ref. ID	Start Channel No.	Total Channel Count	DDI Routing Ref. ID	Route on First Dest.	DDI Ring Timer (Sec.)	When No-Reply	When Busy	Trunk Feature Template
01	00	01	00	00	Disable	045	Disconnect	Disconnect	01
02	00	01	00	00	Disable	045	Disconnect	Disconnect	01
:	:	:	:	:	:	:	:	:	:
64	00	01	00	00	Disable	045	Disconnect	Disconnect	01

Parameters Value:

Code	0	00-99	01-30	00-30	00-99	Disable	001-255	Disconnect	Disconnect	01-50
1						Enable		Route to TLG	Route to TLG	
2								Greet and Disconnect	Greet and Disconnect	
3								Greet and Route to TLG	Greet and Route to TLG	
4								Route to Voice Mail Auto Attendant	Route to Voice Mail Auto Attendant	

Configuring OG Reference Table using a Telephone

- Enter SE mode from a DKP/SLT.
- To program OG Reference Table Index, dial:
 - **6312-1-OG Reference Table Index-Parameter Number-Value**
 - **6312-2-OG Reference Table Index-OG Reference Table Index-Parameter Number-Value**
 - **6312-*-Parameter Number-Value**
 Where,
 OG Reference Table Index is from 01 to 64.
 Parameter Number is from 1 to 5.
- To default an OG Reference Table:
 - **6311-1-OG Reference Table Index**
 - **6311-2-OG Reference Table Index-OG Reference Table Index**
 - **6311-***
 Where,
 OG Reference Table Index is from 01 to 64.
- Exit SE mode.

Default values of OG reference table as given below:

Parameter No.	1	2	3	4	5
Parameter Name/ Index	OG Ref. ID	Start Channel No.	Channel Count	ISDN Number	DDI Routing Ref. ID
01	00	01	00	Blank	000
02	00	01	00	Blank	000
03-63	Same as 02				
64	00	01	00	Blank	000

Parameter Value:

Code	01-99	01-02	01-30	16 digits	001-128
		01-30			

Configuring DDI Routing Table using a Telephone

- Enter SE mode from a DKP/SLT.
- To configure the feature in a DDI Routing Table:
 - **6322-1-DDI Routing Table ID-Parameter Number-Value**
 - **6322-2-DDI Routing Table ID-DDI Routing Table ID-Parameter Number-Value**
 - **6322-*-Parameter Number-Value**
 Where,
 DDI Routing Table ID is from 001 to 224.
 Parameter Value is from 01 to 06. Refer the DDI Routing Table for Parameter Values and their codes.
- To default a DDI Routing Table:
 - **6321-1-DDI Routing Table ID**
 - **6321-2-DDI Routing Table ID-DDI Routing Table ID**
 - **6321-***
 Where,
 DDI Routing Table ID is from 001 to 224.
- Exit SE mode.

Following table shows default DDI Routing Table

Para. No./ Table ID	01	02	03	04	05		06
	DDI Routing Ref. ID	Start DDI Numbers	Total DDI Numbers	DDI Number of Digit	Port Type	Port Number	Start Flexible Number
001	00	000000	000000	0	None	Blank	Blank
002	00	000000	000000	0	None	Blank	Blank
003-223	Same as 224						
224	00	000000	000000	0	None	Blank	Blank

Parameter Value:

Code	00	00-99	000001-999999	000000-999999	0-4	None	--	Max. 6-digits
	04					BRI	01-32	
	05					T1E1PRI	1-8	
	06					E&M	01-32	
	11					Dept Grp	01-24	
	12					Quick Dial	001-999	
	20					Routing Group	01-32	
	25					Mobile	01-40	
	26					SIP	01-32	
	27					Flex. No.	4-digits	
	36					Virtual Extension	01-64	

- Refer to above table. Whenever Flexible number is selected as the port type, the range concept of Start flexible number becomes relevant. In all other cases, range concept is not relevant.
- Flexible Number includes SIP Extension Numbers.
- When a call is placed on SLT/DKP port, the calling party number is displayed on the terminal.

When the call is placed on BRI-NT or PRI-NT, the calling party number and the called party number both are sent to the NT port. Doing so, the system connected to the NT port can resolve the DDI number and place the call on the programmed extension.

Direct Inward System Access (DISA)

What's this?

With Direct Inward System Access (DISA) remote users can access and use the system's features and facilities using Trunks, on which this feature is enabled.

Using DISA, remote users can:

- call any extension.
- make external calls.
- use features and facilities of the system.
- configure features and facilities of the system and administer the system.

All these can be done as if being done from a local extension of the SARVAM UCS.

DISA Variants

SARVAM UCS offers three types of DISA, each with a different method of authentication and level of access:

- PIN Authentication-Multiple Calls
- DISA with CLI Authentication-Multiple Calls
- DISA with CLI Authentication-Single Calls

PIN Authentication - Multiple Calls

Callers can access an extension of SARVAM UCS by dialing the DISA Login Code that consists of:

- the DISA Feature Access Code.
- the extension number they want to access.
- the User Password of that extension.

Callers are authenticated and allowed to use the extension on which they are logged in.

The callers must dial special digits or codes to go On-hook, Off-hook. They are allowed to make as many trunk calls and internal calls for as long as they remain logged in to the DISA mode.

To end the DISA login session, callers must dial the Termination code or disconnect from the remote end.

Callers can access an extension to use DISA PIN Authentication-Multiple Calls only if the extension has DISA feature enabled in its Class of Service.

DISA with CLI Authentication - Multiple Calls

The system authenticates the caller by matching the caller's CLI with the entries of the *DISA-CLI Authentication Table* and logs the caller in to the extension configured as 'Auto Login' extension for the CLI.

Callers are not required to dial any DISA Login Code or any password.

When a caller is authenticated on the basis of CLI, the system plays the ('internal' system) Dial Tone to the caller.

The callers must dial special digits or codes to go On-hook, Off-hook. They are allowed to make as many trunk calls and internal calls for as long as they remain logged in to the DISA mode.

To end the DISA login session, callers must dial the Termination code or disconnect from the remote end.

For this type of DISA, the DISA CLI Authentication Table must be configured first.

DISA with CLI Authentication - One Call

This type of DISA is similar to the previous one. The system authenticates callers by matching the callers' CLI with the entries of the DISA-CLI Authentication Table and logs the callers in to the extension designated as 'Auto Login' extension for the CLI.

When the caller is authenticated on the basis of CLI, the system gives the caller direct access to the Outgoing Trunks selected for TAC-1 for the current time zone (working hours, break hours, non-working hours) in the "[Station Basic Feature Template](#)" assigned to the Auto Login extension. It plays the dial tone.

Callers are allowed to make a single external call. The system ends the DISA session on the completion of the call by the caller or by the other remote party.

For this type of DISA, the DISA CLI Authentication Table must be configured first.

To make another call, the caller must enter the DISA mode again, by calling the SARVAM UCS from the remote location.

DISA with CLI Authentication - One Call Answer Signaling is generally used when SARVAM UCS is deployed in the Gateway Mode, where SARVAM UCS is configured to send an answer signal to the caller/calling device, receive the DTMF digits dialed by the caller/calling device and dial out the digits dialed by the caller/calling device. To know more, see "[Gateway Application-Answer Signaling](#)".

How it works

For this feature to work, you must enable the desired DISA variant on the desired trunks: CO, Mobile, SIP, T1E1PRI, BRI.

- A call lands on a DISA enabled Trunk.
- The system checks if a DISA variant is enabled on the trunk for the current time zone, that is, working hours, break-hours and non-working hours.
- If a DISA variant is enabled on the trunk, the system processes the call according to the DISA variant enabled on the trunk.
- If **DISA with PIN Authentication - Multiple Calls** is enabled,
 - The system plays Welcome Greeting message to the caller²⁹³.
 - The caller must dial the DISA Login Code consisting of:
 - the DISA Feature Access Code.
 - the number of the extension the caller wants to access.
 - the user password of the extension.
 - On successful login, the system starts the *DISA Idle State Timer* (configurable; default: 20 seconds). The system waits for the caller to go Off-hook²⁹⁴.

293. If no voice message is recorded, the system plays music-on-hold to the caller.

294. If the caller does not go Off-hook within this timer, the system releases the call.

- When the caller goes Off-hook by dialing the Off-hook code #1, the system plays the internal dial tone and waits for the caller to dial digits.
- If the caller dials an external number using a CO trunk, the system starts the *DISA Inactivity Timer* (configurable; default: 2 minutes)²⁹⁵.
- The system waits for the caller to dial digits within the DISA Inactivity Timer.
- The system reloads this timer each time it receives digits from the caller. If the caller fails to dial any digit within this timer, the system plays beeps for the duration of the *DISA Warning Beeps Timer* (fixed; 15 seconds). If no digit is received at the end of the Warning Beeps, the system terminates the DISA session. If digits are received before the end of the Warning Beeps, the system reloads the DISA Inactivity Timer.
- The caller can make as many trunk calls and internal calls as the caller wants.
- The caller can terminate the DISA login session either by disconnecting from the remote end or by dialing the Termination Code #9.
- If **DISA with CLI Authentication - Multiple Calls** is enabled,
 - The system compares the CLI of the caller with the *Calling Party Numbers* configured in the CLI Authentication Table.
 - If the CLI matches with any of the Calling Party Numbers in the Table, the system provides access to the extension configured as *Auto Login* extension for this Calling Party Number in the Table²⁹⁶.
 - The caller gets logged into the Auto Login extension and gets the dial tone of SARVAM UCS.
 - At the end of the call, the caller dials the On-hook code #0 to go On-hook. To make another call, the caller dials Off-hook code #1 and dials the desired number. Thus the caller dials the On-hook and Off-hook codes to make as many trunk and internal calls as desired.
 - If the caller dials an external number using a CO trunk, the system starts the *DISA Inactivity Timer* (configurable; default: 2 minutes)²⁹⁷. The system waits for the caller to dial digits within the DISA Inactivity Timer.
 - The system reloads this timer each time it receives digits from the caller. If the caller fails to dial any digit within this timer, the system plays beeps for the duration of the *DISA Warning Beeps Timer* (fixed; 15 seconds). If no digit is received at the end of the Warning Beeps, the system terminates the DISA session. If digits are received before the end of the Warning Beeps, the system reloads the DISA Inactivity Timer.
- If **DISA with CLI Authentication - One Call Answer Signaling** is enabled,
 - The system compares the CLI of the caller with the *Calling Party Numbers* configured in the CLI Authentication Table.

295. *DISA Inactivity Timer is not applicable for T1E1PRI lines, BRI lines, SIP and Mobile trunks.*

296. *If no match is found for the CLI of the caller in the Table, the call will be routed as per the Incoming Call Routing configured in SARVAM UCS.*

297. *DISA Inactivity Timer is not applicable for T1E1PRI line, BRI, SIP and Mobile trunks.*

- If the CLI matches with any of the Calling Party Numbers in the Table, the system provides access to the extension configured as *Auto Login* extension for this Calling Party Number in the Table²⁹⁸.
- The caller gets logged into the Auto Login extension and gets dial tone of the outgoing trunks selected for TAC-1 for the current Time Zone (working hours, break hours, non-working hours).
- If the caller dials an external number using a CO trunk, the system starts the *DISA Inactivity Timer* (configured; default: 2 minutes).
- The system waits for the caller to dial digits within the DISA Inactivity Timer. If the caller fails to dial any digit within this timer, the system plays beeps for the duration of the *DISA Warning Beeps Timer* (fixed; 15 seconds). If no digit is received at the end of the Warning Beeps, the system terminates the DISA session. If digits are received before the end of the Warning Beeps, the system reloads the DISA Inactivity Timer.
- After the external call is completed, that is, the caller disconnects from the remote end or the other remote called party has disconnected, the caller is logged out.
- To make another external call, the caller must call the DISA enabled trunk of SARVAM UCS again.

In all the variants of DISA, the caller can use all the features allowed in the “[Class of Service \(COS\)](#)” of the extension the caller is logged in to (using PIN Authentication or CLI Authentication).

- *DISA calls in the SMDR report are marked as “O” in the remarks column. See “[Station Message Detail Recording-Report](#)”.*
- *If DISA is disabled, SARVAM UCS will route the call by Auto Attendant logic, if Auto Attendant is enabled.*
- *If DISA and Auto Attendant both are disabled, the incoming call will be routed as per the incoming call routing configured. To know more, see “[Auto Attendant](#)”.*

WARNING! *This feature allows access to system resources to remote users, and therefore has serious implications for your system's security. There is a risk of fraudulent calls being made from your system, if a third party comes to know the authentication PIN or the User Password of an extension number. The cost of such fraudulent calls will have to be borne by the owner of SARVAM UCS.*

To avoid unauthorized access, we recommend you to change the PIN regularly. Make sure it is strong and is provided to users who need to access the system using DISA only.

Feature Interaction:

- If both, Built-In Auto Attendant and DISA are enabled on the trunk, SARVAM UCS supports all types of DISA.
- If both, VMS Auto Attendant and DISA are enabled on the trunk, SARVAM UCS supports only PIN Authentication-Multiple Calls. To know how the VMS handles a DISA call, see “[VMS DISA Login](#)”.

²⁹⁸. *If no match is found for the CLI of the caller in the Table, the call will be routed as per the Incoming Call Routing configured in the SARVAM UCS.*

How to configure

To provide DISA to remote users you need to do the following configuration:

- Select the DISA variant for the Trunks on which you want to apply this feature in their [“Trunk Feature Template”](#).
- Enable DISA in the [“Class of Service \(COS\)”](#) of the extensions which you want to allow callers to access using DISA. This is applicable for DISA PIN Authentication-Multiple Calls only. DISA CLI Authentication-Single Call/Multiple Calls is not dependant on COS.
- Change the User Password of the DISA extensions, if you selected DISA PIN Authentication-Multiple Calls. If you selected *DISA PIN Authentication-Multiple Calls* on a trunk, the default User Password (1111) will not work. See [“User Password”](#) and [“System Security”](#) more information and instructions.
- Configure the related timers, *DISA Idle State Timer* and *DISA Inactivity Timer*, if required. See [“System Timers and Counts”](#) for instructions.
- If you have selected the *DISA CLI Authentication-Multiple Calls* or *CLI Authentication-One Call Answer Signaling* on a trunk, you must configure the **CLI Authentication Table**.

Configuring DISA CLI Authentication Table using Jeeves

To configure the DISA CLI Authentication Table,

- Make a list of remote users and their numbers whom you want to allow DISA.
- For each remote user’s number on your list, write the Extension number of the SARVAM UCS you want to allow this extension user to log in.
- Open Jeeves.
- Log in as System Engineer.

- Under **Configuration**, click **DISA - CLI Authentication**. The CLI Authentication Table page opens.

The screenshot shows the 'DISA - CLI Authentication' configuration page. On the left is a navigation menu with various configuration options. The 'DISA - CLI Authentication' option is highlighted. The main content area features a table with 12 rows, indexed 1 to 12. Each row has columns for 'Index', 'Calling Party's Number', and 'Auto Login as'. The 'Auto Login as' column is further divided into 'Port Type' and 'Port Number'. The 'Port Type' column currently shows 'None' for all entries, and the 'Port Number' column shows '0000'. Below the table are three buttons: 'Submit', 'Default', and 'Default One'.

Index	Calling Party's Number	Auto Login as	
		Port Type	Port Number
1		None	0000
2		None	0000
3		None	0000
4		None	0000
5		None	0000
6		None	0000
7		None	0000
8		None	0000
9		None	0000
10		None	0000
11		None	0000
12		None	0000

- You can configure as many as 999 numbers in this table, by clicking the tabs of the index on the top of the table.
- Refer to the list of remote user numbers and the corresponding SARVAM UCS extension numbers you made.
- In the **Calling Party's Number** column, enter the number of the remote users whom you want to allow access to DISA using CLI Authentication. The system will match the CLI of the callers with the numbers you store here.
- For each Calling Party Number, in the **Auto Login as** field, select the extension **Port Type** (SLT, DKP, SIP Extension, ISDN Terminal, Virtual Extension) and **Port Number** you want to allow access to after the Calling Party Number is authenticated.
- Click **Submit** button to save your entries.
- You may log out of Jeeves.

Configuring DISA CLI Authentication Table using a Telephone

- Enter SE mode from a DKP/SLT.

To enter Calling Number in the CLI Authentication Table, dial:

- **4111-Index-Calling Number-#***

Where,

Index is from 001 to 999.

Calling Number may contain a maximum of 16 digits. The allowed digits are 0-9, #, *, A, B, C, D, +. Use following codes to enter these digits:

Special Digit	Code
A	#4
B	#5
C	#6
D	#7
+	#8
*	**
#	##

To assign Port Type and Port Number, dial:

- **4112-Index-Port Type-Port Number**

Where,

Index is from 001 to 999.

Port Type and Port Number are:

Port Type	Port Number	Meaning
00	000	None
01	001 to 512	SLT
02	001 to 128	DKP
28	01 to 64	ISDN Terminal
34	001 to 999	SIP Extension
36	01 to 64	Virtual Extension

For example, to configure extension '3001', which is a DKP with port number 001, as auto login station in Index 001 of the Table, you must dial **4112-001-02-001**.

- Exit SE mode.

How to use

If you are a Remote user, to be able to use DISA, you must know:

- the number of the Trunk on which DISA is enabled and the variant of DISA enabled on this trunk.
- the number of the extension and the user password which you want to access, if using DISA with PIN Authentication.

- the duration of the DISA related Timers: The *DISA Idle State Timer* and the *DISA Inactivity Timer*, so that you may dial digits accordingly, without delay.
- the special digits to be dialed during a DISA login session.

Dialing Special Digits

After successful login, you will be required to go on-hook, go off-hook, use 'flash', use 'pause' or dial characters like A, B, C, D, from your remote device to use the features and facilities of SARVAM UCS.

However, SARVAM UCS will not be able to understand the conventional way of dialing 'flash' key or going on-hook with momentary make/break of loop current. Therefore, SARVAM UCS supports specific codes for specific activities. If these codes are received during a DISA session, SARVAM UCS interprets it and performs the associated activity.

When you are in DISA mode, use the following codes to indicate an activity:

Special Digit/activity	Code to be dialed
on-hook	#0
off-hook	#1
Flash	#2
Pause	#3
A	#4
B	#5
C	#6
D	#7
+	#8
To Terminate the DISA	#9
#	##
End of String	#*
To program # when in SE Mode	####

To use DISA,

- Dial the number of the Trunk on which DISA is enabled for the current time zone, Working, Break, Non-working hours.
- SARVAM UCS answers the call. You will get music or Built-In Auto Attendant Voice Message, if configured.

If **DISA PIN Authentication-Multiple Calls** is enabled,

- You will get beeps at the end of music/Built-In Auto Attendant Voice Message.
- Dial DISA Login Code 1079 during the beeps.
- Dial the extension number. You will get beeps.
- Dial the User Password for the extension during the beeps.

- You get feature tone on successful login.
- Dial the special digits **#0** to go On-hook and then **#1** to go Off-hook, you get the dial tone. Dial the number to make your calls like any local extension. For example, making an external call, dial Trunk Access Code '0' to grab a trunk and dial the number.
- To terminate DISA session dial **#9** or disconnect the call from your (remote) end.

If **DISA CLI Authentication-Multiple Calls** is enabled,

- You will get system dial tone.
- Dial the special digits **#1** to go Off-hook, **#0** to go On-hook, and make your calls like any local extension.
- To terminate DISA session dial **#9** or disconnect the call from your (remote) end.

If **DISA CLI Authentication - One Call Answer Signaling** is enabled,

- You will get Trunk dial tone.
- Dial the external number, without the Trunk Access Code.
- The DISA session will be terminated when you or the remote called party disconnects.
- To make another call, you must dial the number of the DISA enabled trunk again.

The features listed below are not supported in the DISA mode.

- *Auto Call Back*
- *Auto Redial*
- *Call Park*
- *Call Chaining*
- *Self Ring Test*
- *Trunk Reservation*
- *Walk-In Class of Service*
- *Live Call Supervision*

Direct Station Selection Console

The Direct Station Selection (DSS) Console is an add-on module with tri-color LEDs for the Digital Key Phones (DKP) and SPARSH VP510. It provides you quick access to Stations, Trunks, Features/Functions of SARVAM UCS; also making calling operations easy.

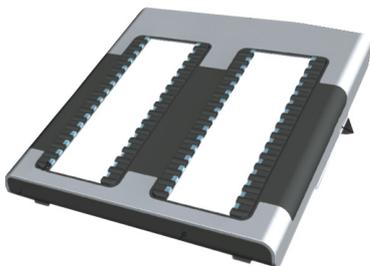

While the DSS Console is generally used by the Operator/receptionist in an organization, it is also meant to be used by anyone who needs to access various features of SARVAM UCS at a touch of a single key.

Matrix offers two types of DSS Consoles:

- **DSS64:** This can be attached only with EON48 and EON310.
- **DSS532:** This can be attached only with EON510 and SPARSH VP510.

Maximum 32 DSS Consoles (DSS64 or DSS532)²⁹⁹ are supported by SARVAM UCS.

DSS64

A maximum of two DSS64 can be attached to a single DKP. Each DSS Console occupies a Digital Key Phone Port. For example, if you attach two DSS consoles to a single DKP, three DKP ports would be occupied. The DSS Console can be attached with SARVAM UCS in the same way as the DKP and is programmed as an attachment of the DKP.

Each DSS Console that is attached to a DKP occupies a DKP port. Hence, the more DSS Consoles you attach to DKPs, the lesser number of DKP ports will be available on SARVAM UCS.

When a single DSS64 is attached with a DKP, the DSS keys of the DKP as well as all the 64 keys of the DSS64 can be used. Similarly, if two DSS64 are attached to a DKP, 128 additional keys are at your disposal to be used as DSS keys.

To install and configure the DSS Consoles, refer [“Installing DSS64”](#) and [“Programming DSS Console Keys”](#).

299. ETERNITY PENX supports maximum of 6 DSS Consoles.

DSS532

A maximum of four DSS532 can be attached to EON510 or SPARSH VP510. Unlike DSS64, the DSS532 does not occupy a DKP port. Although DSS64 and DSS532 work in a similar manner.

With each DSS532, 32 additional keys are at your disposal to be used as DSS keys. When all four DSS532 are connected, you get 128 additional DSS keys at your disposal to be used.

For instructions:

- to install the DSS532 with SPARSH VP510, see ["Installing DSS532 with SPARSH VP510"](#).
- to install the DSS532 with EON510, see ["Installing DSS532 with EON510"](#).
- to configure the DSS keys of the Console, see ["Programming DSS Console Keys"](#).

DSS Keys

You can assign Station numbers or features/functions to the keys on the DSS Console, so that they can be accessed easily simply by pressing a single key.

LEDs

Each DSS Key is equipped with an LED which glows to indicate the status of the Trunk/Extension or Feature assigned to it.

Status of Extensions and Trunks

The LED of DSS keys assigned to Extensions/Trunks glow in three colors to indicate status of the call event on the Extensions/Trunks and on the phone.

Thus, the status of user's own Extension, status of other Extensions and status of the trunk lines are indicated by the LED of the DSS keys assigned to those Extensions and Trunks on the phone.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Blue	The key assigned to the Extension you are in speech with.	The key assigned to the Extension you have kept on hold.	The key assigned to the Extension you are calling or from which you are being called.

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Red	The key assigned to the Extension that is now busy with another Extension/Trunk.	The key assigned to the Extension which has put another Extension/Trunk on hold.	The key assigned to the Extension/Trunk that is called or being called by another.
Violet	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Blue** indicates the state of the extension/trunk you access. For example, when you make a call to another Extension 203, the LED of the DSS key assigned to Extension 203 blinks Blue to indicate ringing at the Extension. If you have successfully established speech with Extension 203 the LED glows Blue continuously.
- **Red** indicates the state of other Extension/Trunks. For example, if the LED of the DSS key assigned to Extension 201 is glowing Red continuously, it means Extension 201 is busy with another Extension or Trunk.
- **Violet** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1, the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.

Status of Features

The LED of a DSS key is activated when the feature assigned to this key is used.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a DSS key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will glow Red, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

Distinctive Rings

What's this?

Distinctive Rings are ringing patterns used for distinguishing between different types of call events.

SARVAM UCS supports the following types of call events:

1. Internal Call
2. Priority Internal Call
3. External Call
4. Alarm Call
5. Auto Call Back Call
6. Auto Redial Call
7. Message Wait Call
8. SE Mode (Programming Ring)
9. Operator Alarm
10. Emergency
11. Self Ring
12. Call Supervision
13. Presence
14. Emergency Conference
15. Conference

With Distinctive Rings, it is possible to use ring cadence of user's choice for each of these call events. For instance, Triple ring can be set for 'Priority Internal Calls' and long rings can be set for 'Alarm Calls'.

A set of ring types is called Distinctive Ring type. The default Distinctive Ring Types are:

Call Event	Ring Type - T1	Ring Type - T2	Ring Type- T3
Internal Call	Short Very Slow	Double	Double
Trunk Call	Double	Long Slow	Long Slow
Auto Call Back	Short Slow	Short Slow	Short Slow
Auto Redial	Long Very Slow	Long Very Slow	Long Very Slow
Self Alarm	Long Fast	Long Fast	Long Fast
Emergency	Long Fast	Long Fast	Long Fast
Operator Alarm	Long Fast	Long Fast	Long Fast
Message Wait Call	Short Fast	Short Fast	Short Fast
Programming Ring	Continuous	Continuous	Continuous
Self Ring	Short Slow	Short Slow	Short Slow
Priority	Triple	Triple	Triple
Call Supervision	Continuous	Continuous	Continuous

Call Event	Ring Type - T1	Ring Type - T2	Ring Type- T3
Presence	Continuous	Continuous	Continuous
Emergency Conference	Triple	Triple	Triple
Conference	Triple	Triple	Triple

These ring types have the following ring cadence:

Ring Pattern	Cadence (in milliseconds)
Short Fast	750-750
Short Long	500-1500
Short Very Slow	750-2250
Long Fast	1500-500
Long Slow	1000-4000
Very Long Slow	2000-4000
Double	400-200-400-2000
Triple	400-200-400-200-400-2000

Ring cadence is not programmable.

Distinctive Rings on SIP Extensions

On SIP Extensions, SARVAM UCS supports Distinctive Rings using Alert-INFO field in the INVITE message. To indicate the different call events, SARVAM UCS sends the Ring Text for the respective Ring Type.

The default Distinctive Ring Types and their corresponding Ring Texts are given below.

Call Events	Ring Type - T1	Ring Text
Internal Call	Short Very Slow	internal
Trunk Call	Double	external
Auto Call Back (ACB)	Short Slow	acb
Auto Redial (AR)	Long Very Slow	autord
Self Alarm	Long Fast	selfalarm
Emergency	Long Fast	emergency
Operator Alarm	Long Fast	operatoralarm
Message Wait	Short Fast	msgwait
Programming Ring	Continuous	prog
Ring Test	Short Slow	test

Call Events	Ring Type - T1	Ring Text
Priority	Triple	priority
Call Supervision	Continuous	callsup
Presence	Continuous	presence
Emergency Conference	Triple	emergencyconf
Conference	Triple	conf

The Ring Text is sent in the Alert-INFO field of the INVITE message and the corresponding Ring Type is played on terminal registered as the SIP Extension, if the terminal supports Distinctive Rings.

The Ring Text is programmable. You can change the Ring Text, if required.

How to configure

At the time of installation, when you select the “[Region](#)” (as per the geographical location of the system), and set the system to default, SARVAM UCS loads the country-specific Distinctive Ring Type defined for the selected Region.

Refer the topic “[Default Settings](#)” for the default Distinctive Ring Type applied to your country/region.

However, if required, you can change the default Ring Pattern and the Ring Text (for SIP Extensions) loaded by the system.

When you change the Ring Texts for the Ring Types in SARVAM UCS, you must configure the same Ring Text in the SIP phones.

Programming Distinctive Rings using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **System Parameters**.

- Click **Distinctive Rings** to expand.

The screenshot shows a web interface for configuring system parameters. On the left is a navigation menu with 'System Parameters' selected. The main area is titled 'System Parameters' and contains a section for 'Distinctive Rings'. Below this is a table with three columns: 'Feature', 'Ring Type', and 'Ring Text'. The table lists various call events and their corresponding ring patterns and text. A 'Submit' button is located at the bottom of the configuration area.

Feature	Ring Type	Ring Text
Internal Call	Short, very slow	internal
Trunk Call	Double	external
Auto Call Back	Short, slow	acb
Auto Redial	Long, very slow	autord
Alarm	Long, fast	selfalarm
Emergency	Long, fast	emergency
Operator Alarm	Long, fast	operatoralarm
Message Wait	Short, fast	msgwait
Programming Ring	Continuous	prog
Ring Test	Short, slow	test
Priority	Triple	priority
Call Supervision	Continuous	callsup

- Select the desired Ring Pattern (Ring Type) for each call event that you want to customize.
- You can also customize the Ring Text of each call event on SIP extensions. The text can be a maximum of 20 alphanumeric characters.
- Click **Submit** to save changes.
- Log out of Jeeves or continue programming as required.

Programming Distinctive Rings using a Telephone

- Enter SE mode from a DKP/SLT.

To change Ring Pattern for the call event, dial:

- **4002-Event-Ring Pattern**

Where,
Event is:

- 01 for Internal Call
- 02 for Trunk Call
- 03 for Auto Call Back Call
- 04 for Auto Redial Call
- 05 for Self Alarm Call
- 06 for Emergency
- 07 for Operator Alarm
- 08 for Message Wait Call
- 09 for Programming Ring
- 10 for Self Ring
- 11 for Priority Call
- 12 for Call Supervision
- 14 for Presence

15 for Emergency Conference
16 for Conference

Ring Pattern is:

00 for OFF
01 for Continuous
02 for Short Fast
03 Short Slow
04 Short Very Slow
05 Long Fast
06 Long Slow
07 Long Very Slow
08 Double
09 Triple

To default ring patterns of events:

- Dial command **4001**
- Exit SE mode.

Demonstration of rings

It is possible to demonstrate Ring Types to users by dialing the SE commands on DKP, Extended IP Phone and SLT extensions of SARVAM UCS.

By default, the system will play each Ring Type as demonstration for 30 seconds.

Users of SARVAM UCS may be acquainted with the different Distinctive Rings played by the system so that they can associate the terms used to describe the rings with the sound emitted by the system for each ring.

For EON and Extended IP Phone Users

- Enter SE mode.
- Dial command **4003-Ring Pattern**
Where,
Ring Pattern is

01 for Continuous
02 for Short Fast
03 for Short Slow
04 for Short Very Slow
05 for Long Fast
06 for Long Slow
07 for Long Very Slow
08 for Double
09 for Triple
- After dialing the desired Ring Pattern Code,
- Press 'Enter' key.

- You get the prompt 'Go Idle for Ring' on your phone display.
- Go Idle.
- The Ring Pattern you selected will be played.
- You may repeat the SE commands to demonstrate another Ring Pattern.
- Exit SE mode.

For SLT Users

- Enter SE mode.
- Dial command **4003-Ring Pattern**
Where,
Ring Pattern is

01 for Continuous
02 for Short Fast
03 for Short Slow
04 for Short Very Slow
05 for Long Fast
06 for Long Slow
07 for Long Very Slow
08 for Double
09 for Triple
- Go Idle, after dialing the desired Ring Pattern Code.
- The Ring Pattern you selected will be played.
- You may repeat the SE commands to demonstrate another Ring Pattern.
- Exit SE mode.

Do Not Disturb (DND)

What's this?

Extension users may restrict calls to their extensions in order to work uninterrupted by frequent phone calls. The feature, Do Not Disturb, enables users accomplish this. This feature is useful to extension users who are in the middle of a meeting or any important work that requires their undivided attention.

Using DND users can restrict—all calls, internal calls or external calls. However even if DND is set, users can route their incoming calls to an Intercept Destination. This destination can be the extension users own mailbox or another extension. In this way, extension users can ensure that they do not miss any important calls.

If required, when DND is set, a Stuttered Dial Tone can be played to the user for notification.

DND can be set and canceled by

- Extension users
- Operator for extension users, referred to as DND-Remote.

Doing so, calls — all, internal or external— will be barred. However, the extension user would continue to receive:

- Alarm calls.
- Reminder calls.
- Auto Call Back calls (Auto Callback as well as Auto Redial)
- Emergency Reporting Calls.

Also, the extension user can:

- use all the features of the System.
- make Outgoing calls and
- make Internal calls to other extensions.

DND has two supplementary features— DND-Override and Privacy from DND-Override.

The 'Do Not Disturb' feature bars calls to the phone on which DND is set. The 'DND-Override' feature breaks this bar and allowing the calls to land on the phone on which DND is set. Protection is also given to the phone on which DND-Override is attempted. If the phone on which DND-Override is attempted has 'Privacy from DND-Override' enabled, the calling phone shall not be able to Override the DND.

When a caller calls a phone on which DND is set, he/she gets Routing tone (Feature tone). The caller can dial DND-Override code. On dialing DND-Override code the call is placed on the called phone and the called phone starts ringing.

The DND-override feature works only if the calling phone has 'DND-Override' feature enabled in its CoS group.

DND-Override will not work if the called phone has 'Privacy from DND-Override' enabled in its Class of Service or if the called extension has opted for intercept routing.

So, using DND-Override feature, the users can be reached in case of some Emergency despite the DND set on the phone.

- *DND when set/canceled from the SA mode, will not depend on the assigned CoS.*
- *The system supports only single-point DND with Intercept Destination, which means, if the destination extension has also set DND with Intercept Destination, the call will not follow the forwarding path.*

How it works

For this feature to work,

- you must select the [“DND Call Type”](#).
- you may select the [“Intercept Destination for DND”](#).
- you may select the [“DND Text Message”](#) as per your requirement.
- you may assign a voice module for DND Notification. See [“Voice Message for DND Notification”](#).

DND Call Type

The extension user/Operator can select the type of calls to be restricted while enabling DND. They can select either All, Internal or External Calls.

Intercept Destination for DND

If the user wants that the calls are attended to even if DND is set, System Engineer must configure the Intercept Destination for the user. Incoming calls landing on the extension that has set DND will be routed to the Intercept Destination. This destination can be the users own mailbox or another extension (SLT, DKP, SIP).

DND Text Message

A DND Message is a short Text Message such as 'In a Meeting', 'In a Conference', 'On Vacation'.

When setting DND (also DND-Remote), the extension user/Operator can select an appropriate text message to be displayed to the calling extension.

This DND text message is displayed on the calling extension, only if the calling extension is the proprietary digital key phone, EON or an Extended IP Phone.

The SARVAM UCS supports 9 different DND Text Messages, out of which 8 messages can be changed as per user requirement by the System Engineer. User can select and set on their phones any of the DND messages programmed by the System Engineer.

Voice Message for DND Notification

Using this feature, a pre-recorded Voice Message can be played to the caller informing him/her about the DND set on the called extension. For example, "The dialed extension has activated Do Not Disturb".

When DND is set on an extension, callers who try to reach that extension will be played an error tone. Callers who are using EON/Extended IP Phones are displayed the DND Text Message set by the called extension, and thus come to know the cause of the error tone. Such a facility is not available to callers who are using SLTs, who can hear only the error tone and have no way of knowing the cause of the error tone.

Using Voice Message for DND Notification, a pre-recorded Voice Message can be played to the callers to notify them of the DND set on the called extension.

You must record and assign a Voice Module to play the pre-recorded voice messages as DND Notification to the callers.

Let us understand this feature with an example:

A, B and C are extension users.

B has EON, while C has an SLT.

B has DND-Override in his Class of Service, C does not have this feature.

DND Text messages as well as Voice Message Notification for DND have been programmed by the System Engineer.

- A has set DND on his extension with the DND Text message 'In Meeting'³⁰⁰.
- B calls A.
- As B has DND-Override, the Voice Message for DND Notification is played to B once, and the DND message 'In Meeting' set by A appears on B's phone display. B gets routing Beeps.
- To exercise DND-Override, B must dial '4' the feature access code for 'DND-Override' during either during the Voice Message or during the routing Beeps.
- B gets Ring Back Tone, if A's extension is free.
- B gets Busy Tone, if A's extension is busy.
- However, if A has Privacy from DND Override, B will get error tone and the DND message set by A appears on B's phone.

If B fails to dial the DND-Override code before the end of the routing beeps, error tone will be played to him.

Now, to take another example,

- C calls A.
- As C has an SLT, C will get only the Error tone.
- But as Voice Message for DND Notification is programmed in the system, C will be played the pre-recorded message once.
- Since C is not allowed 'DND-Override' in his Class of Service, he cannot exercise this feature during the Voice Message.
- At the end of the voice message, C will be played error tone.

In the above examples, if A has set E's extension as the Intercept Destination, then calls from B and C will be routed to E's extension.

Feature Interaction:

Call Forward: When DND and Call Forward-Unconditional are set on an extension, Call Forward is given priority. If any other type of Call Forward and DND are set on an extension, DND is given priority. However, if DND with Intercept Destination is set, it will not work. If an extension has set both Call Forward and DND, then Feature Tone will be played to the extension user.

If an extension A has set DND with Intercept Destination as E, incoming calls on A's extension will be routed to E's extension.

If E sets Call Forward or DND with Intercept Destination as B, incoming calls from A's extension will be still routed to E's extension. Only incoming calls on E's extension will be routed to the B's extension.

³⁰⁰. While DND and DND Text Message can be set from any phone, DND Text Message can be viewed on EON /Extended IP Phone only.

How to configure

For this feature to work, 'DND' must be enabled in the Class of Service of the group of the extensions which is to be allowed this feature.

Also, 'DND-Override' and 'Privacy from DND-Override' can be enabled in the Class of Service of the extensions to whom this features are to be provided.

Besides these, the System Engineer may program the DND Text Message, Stuttered Dial Tone when DND is set, Intercept Destination for DND and the Voice Message for DND Notification, as per user requirements.

The user can then select the type of calls for which he wants to set DND.

Programming DND in Class of Service

In the default Station Basic Feature Template 01 assigned to all extensions of the SARVAM UCS, the default CoS group 01 has DND enabled. So, all extensions of SARVAM UCS can set and cancel DND. DND-Override and Privacy from DND-Override are disabled in the default CoS group 01. So, none of the extensions can use DND-Override, or be exempt from DND.

While it makes sense to offer all extensions DND, providing DND-Override and Privacy from DND also to all extensions will not serve the purpose of DND.

Decide which extensions are to be allowed 'DND', which are to be allowed 'DND-Override', and which are to be allowed 'Privacy from DND-Override'. Generally, DND-Override is allowed to the Operator extension. It may be allowed to extensions of persons in senior positions in the organization. Similarly, Privacy from DND-Override may be allowed to persons in senior positions in the organization.

If you want to allow DND to all extensions, retain the default CoS group 01 in Station Basic Feature Template 01. However, if you want to allow DND only to selected extensions, disable this feature in the default CoS group 1.

Now, to assign DND to selected extensions, follow these steps:

1. Define a CoS group with DND enabled.
2. Prepare a Station Basic Template with this CoS group applicable in all the time zones.
3. Assign this newly prepared Station Basic Feature Template to the extensions on which 'DND' is to be enabled.

Similarly, if 'DND-Override' is to be to be allowed to the Operator and a few other extensions, follow these steps:

1. Define a CoS group with DND-Override enabled. If DND is also to be allowed, enable both DND-Override and DND in this CoS group.
2. Prepare a Station Basic Template with this CoS group applicable in all the time zones.
3. Assign this newly prepared Station Basic Feature Template to the Operator extension on which 'DND-Override' is to be enabled.

Repeat the same steps to allow 'Privacy from DND-Override' to selected extensions. For extensions that are to be allowed 'DND' as well as 'Privacy from DND-Override', enable both features in the CoS group in the Station Basic Feature Template applied on these extensions.

Similarly, for extensions that are to be allowed 'DND', 'DND-Override' and 'Privacy from DND-Override', enable all three features in the CoS group that you prepare for these extensions.

Refer the topics “[Class of Service \(COS\)](#)” and “[Station Basic Feature Template](#)” for detailed programming instructions on how to prepare a CoS in the Station Basic Feature Template and how to apply this template on extensions.

Programming DND Text Messages

By default, 9 DND Text Messages are programmed in the SARVAM UCS as listed below:

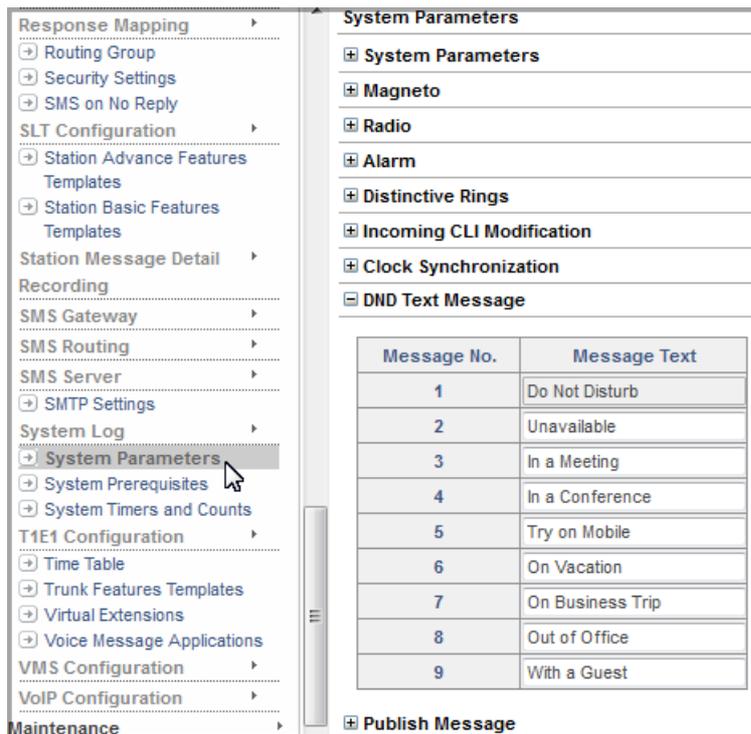

Message #	DND Message
1	Do Not Disturb
2	Unavailable
3	In a Meeting
4	In a Conference
5	Try on Mobile
6	On Vacation
7	On Business Trip
8	Out of Office
9	With a Guest

You can use these default message options or program messages from 2 to 9 as per user preferences.

Programming DND Messages using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **System Parameters** to open the page.

- Click **DND Text Message** to expand.

- All the default text messages appear in the DND message field. You may change the DND text messages 2 to 9 as per your requirement. Click the field and enter your custom DND text message.
- Click **Submit** to save the changes.

Programming Stuttered Dial Tone

If required by users, then the system will play Stuttered Dial Tone on the extension when DND is set.

For instructions, see [“System Parameters”](#).

Programming Intercept Destination for DND

By default, the Station Advanced Feature Template 01 is assigned to all extensions of the SARVAM UCS and in this template the Intercept Destination is configured as None.

You can either configure the Intercept Destination in this template or you may select another template and customize it as per your requirement. For instructions see [“Station Advanced Feature Template”](#).

Programming Voice Message for DND Notification

To be able to play a voice message to callers for DND notification, you must first record a Voice Module with the desired message.

ETERNITY LENX/MENX supports 16 Voice Modules, ETERNITY GENX supports 16 Voice Modules and ETERNITY PENX supports 16 Voice Modules. The duration of each module can be 16 seconds.

Record a Voice Module with the message “The dialed extension has activated Do Not Disturb” (recommended). To assign the Voice Module for 'DND Notification'. Refer the topic [“Voice Message Applications”](#) for programming instructions.

How to use

DND set/canceled by Extension Users

For EON and Extended IP Phone Users

To set DND:

- Press the 'DND' Key.

OR

- Dial 18
- Scroll to select the type of call:
 - All calls
 - Internal calls
 - External calls
- Press 'Enter' key.
- You get a text message 'DND Set' on the phone's display and confirmation tone.

To select a DND Message

- Press the 'DND' Key.

OR

- Dial 18
- Scroll to select the Set DND Message option.
- The list of DND messages appear on the phone's display:
 - Do Not Disturb
 - Unavailable
 - In a Meeting
 - In a Conference
 - Try on Mobile
 - On Vacation
 - On Business Trip
 - Out of Office
 - With a Guest
- Scroll to the desired option and press 'Enter' key.
- You get a text message 'DND Set' on the phone's display and confirmation tone.
- Go Idle or you get dial tone after the confirmation tone.

To cancel DND:

- Press the DND Key again.
- The following options appear on the phone's display
 - All calls
 - Internal calls
 - External calls
 - Cancel DND

- Select Cancel DND and press 'Enter' key.

OR

- Dial 18-0
- You get a text message 'DND Canceled' on the phone's display and confirmation tone.

For SLT Users

To set DND:

- Lift handset.
- Dial 18-1 to set DND for All calls
- Dial 18-2 to set DND for Internal calls
- Dial 18-3 to set DND for External calls
- Replace handset.

To select DND Message:

- Lift handset.
- Dial 18-4-1 for 'Do Not Disturb'
- Dial 18-4-2 for 'Unavailable'
- Dial 18-4-3 for 'In a Meeting'
- Dial 18-4-4 for 'In a Conference'
- Dial 18-4-5 for 'Try on Mobile'
- Dial 18-4-6 for 'On Vacation'
- Dial 18-4-7 for 'On Business Trip'
- Dial 18-4-8 for 'Out of Office'
- Dial 18-4-9 for 'With a Guest'
- Replace handset.

To cancel DND:

- Lift handset.
- Dial 18-0
- Replace handset.

DND-Remote

For EON and Extended IP Phone Users

To set DND for an extension user:

- Press the DSS Key assigned to DND-Remote.
OR
Dial 1072-001.
- Enter the extension number.
- Scroll to select the type of call:
 - All calls
 - Internal calls
 - External calls
- Press 'Enter' key.
- You get a text message 'DND Set on <Extension Number>' and confirmation tone.
- Go Idle or you get dial tone after confirmation tone.

To select a DND Message:

- Press the DSS Key assigned to DND-Remote.
OR
Dial 1072-001.
- Enter the extension number.
- Scroll to select the option Set DND Message
- The list of DND messages appear on the phone's display:
 - Do Not Disturb
 - Unavailable
 - In a Meeting
 - In a Conference
 - Try on Mobile
 - On Vacation
 - On Business Trip
 - Out of Office
 - With a Guest
- Scroll to the desired option and press 'Enter' key.
- You get a text message 'DND Set' on the phone's display and confirmation tone.
- Go Idle or you get dial tone after the confirmation tone.

To cancel DND-Remote:

- Press the key assigned Remote-DND function.
OR
Dial 1072-001.
- Enter the Extension Number.
- Scroll to select the message 'Cancel DND'.
- Press 'Enter' key.
- You get a text message 'DND Canceled on <Extension number>' and confirmation tone.
- Go Idle or you get dial tone after confirmation tone.

For SLT Users

To set DND for an extension user:

- Lift the handset.
- Dial 1072-001. You get feature tone.
- Dial Extension number. You get feature tone.
- Dial 1 for All Calls
- Dial 2 for Internal Calls
- Dial 3 for External Calls
- You get confirmation tone.
- Replace handset.

To select DND Message:

- Lift the handset.
- Dial 1072-001. You get feature tone.
 - Dial Extension number. You get feature tone.
 - Dial 4-1 for 'Do Not Disturb'
 - Dial 4-2 for 'Unavailable'
 - Dial 4-3 for 'In a Meeting'
 - Dial 4-4 for 'In a Conference'
 - Dial 4-5 for 'Try on Mobile'
 - Dial 4-6 for 'On Vacation'
 - Dial 4-7 for 'On Business Trip'
 - Dial 4-8 for 'Out of Office'

- Dial 4-9 for 'With a Guest'
- Replace handset.

To cancel DND set for an extension user:

- Pick up the handset.
- Dial 1072-001. You get feature tone.
- Dial Extension Number. You get feature tone.
- Dial '0' to cancel DND.
- You get confirmation tone.
- Replace handset.

DND-Override

For EON, Extended IP Phone Users and SLT Users

- Dial an extension number.
- You get routing beeps and a DND Notification message, if programmed (and a DND Text message, if using EON/Extended IP Phone)
- Dial '4', the DND-Override Code, during the message or the routing beeps.
- The called extension will start ringing.
- You will get Ring Back tone.
- If the dialed phone is busy, you will get busy tone.

DSS Call Pick-Up

What's this?

DSS Call Pick-Up allows DKP/Extended IP Phone users to answer calls ringing on other extensions or incoming calls on trunks by pressing the DSS Keys assigned to those extensions/trunks on their phones.

There are two types of DSS Call-Up:

- **DSS Call Pick-Up-Station** - internal or external calls ringing on any extension, can be picked-up by pressing the DSS Key assigned to that extension on your phone.
- **DSS Call Pick-Up-Trunk** - incoming calls on any trunk for any extension can be picked-up by pressing the key assigned to that trunk on your phone.

For T1E1 and BRI Trunks, DSS keys can be assigned for each channel. Similarly for SIP Trunks, DSS keys can be assigned for each Call Appearance.

If you have assigned a DSS key to All the Channels for T1E1/BRI Trunks or All the Call Appearances for SIP Trunks, you will only be able to grab the trunk to make outgoing calls. You will not be able to pick up incoming calls on these trunks.

How it works

For this feature to work, you must:

- enable the desired Call Pick-up in the COS of the extension user.
- assign DSS Keys with LED to the desired extensions/trunks on their DKP/Extended IP Phone.

This is how DSS Call Pick-Up works:

- Extension user A has configured a DSS Keys for extension 2007 and CO trunk 1 on his/her DKP/Extended IP Phone.
- When a call lands on extension 2007 and it rings, the DSS Key assigned to 2007 blinks fast in **Blue** color to indicate that the extension is ringing. A presses the DSS Key to pick-up the call ringing on extension 2007.

If DSS Call Pick-Up-Station is not enabled in the COS assigned to extension user A, the DSS Key blinks fast in **Red** color to indicate that the extension is ringing. However, A will not be able to pick-up the call ringing on extension 2007.

- Similarly when there is an incoming call on CO trunk 1, the DSS Key assigned to CO trunk 1 blinks fast in **Violet** color to indicate that there is an incoming call on the trunk. A presses the DSS Key to answer the call on the trunk.

If DSS Call Pick-Up-Trunk is not enabled in the COS assigned to extension user A, the DSS Key blinks fast in **Red** color to indicate that there is an incoming ringing call. However, A will not be able to pick-up the incoming ringing call on that trunk.

Feature Interactions:

- **Call States:** DSS Call Pick-Up-Station and DSS Call Pick-Up-Trunk are possible only when the calls are in ringing state.
- **Priority:** If multiple calls are ringing on an extension, when you press the DSS Key assigned to that extension, you will be connected to the ringing call with the highest priority. To know more, see [“Priority”](#).

How to configure

To provide this feature to extension users, you must

- enable these features in their Class of Service to be assigned to the users. For instructions, see [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#).
- configure the DSS Keys for the desired extensions and trunks on their DKP/Extended IP Phone. To know more about assigning DSS Keys, see [“DSS Keys Programming”](#).

How to use

For EON & Extended IP Phone Users

To use DSS Call Pick-Up-Station:

- When the DSS key assigned to the station blinks fast in blue color to indicate that the station is ringing, press the DSS Key.
- You are in speech with the calling party.
- You may talk.

To use DSS Call Pick-Up-Trunk:

- When the DSS key assigned to the trunk blinks fast in violet color to indicate that there is an incoming call on the trunk, press the DSS Key.
- You are in speech with the calling party.
- You may talk.

Dynamic Lock

What's this?

Dynamic Lock allows extension users to change the Toll Control Levels (Calling Permissions) of their extensions on their own by dialing a code.

The System Administrator/Operator can also change the Toll Control Levels of extensions using Dynamic Lock.

With this feature, extension users can prevent misuse of outgoing call facility from their extensions, especially in their absence.

Dynamic Lock also forms the basis of 'Call Privilege', which is feature of the Hotel Application of SARVAM UCS. Refer the *SARVAM UCS Hospitality System Manual* to know more.

There are four types of Toll Control Levels, starting from Level 0 to Level 3 that can be set for extension phones.

For each Toll Control Level from 0 to 3, a 'Call Privilege'³⁰¹ is to be assigned and corresponding numbers strings to be allowed and number strings to be denied for each Call Privilege are to be programmed.

- **Toll Control - Level 0** is Time Zone based, wherein the Call Privilege Type must be defined for each Time Zone, that is, Working Hours, Break Hours and Non-Working Hours. For instance, you may define 'All Calls' as Call Privilege for Working Hours, 'Local Calls' as Call Privilege for Break Hours and 'No Calls' as Call Privilege for 'Non-Working' Hours.

By default, Call Privilege 'No Calls' is selected for all three Time Zones.

- **Toll Control - Level 1** is not based on Time Zones. By default, the Call Privilege Type for this level is 'No Calls'.
- **Toll Control - Level 2** is not based on Time Zones. By default, the Call Privilege type set for this level is 'No Calls'.
- **Toll Control - Level 3** is not based on Time Zones. By default, Call Privilege 'No Calls' is selected for this level.

The Call Privilege for each of the above Toll Control Levels can be redefined according to user requirements. For example, Toll Control Level 3 can be programmed for allowing all types of calls by selecting 'All Calls' as Call Privilege Type and Level 0 can be programmed to allow only Local Calls, by programming the strings of 'Local Numbers'.

Refer the feature description for "[Toll Control](#)" to know more.

Extension users who are allowed the Dynamic Lock feature in their Class of Service, can set the Toll Control Level in two ways:

- **Manually:** the extension user changes the Toll Control Level of the extension whenever s/he wants by dialing the feature access code.

301. The Call Privilege types are: No Calls, Local Calls, Regional Calls, National Calls, International Calls, All Calls and Limited Calls.

For example, an extension user having Toll Control Level 2 (National calls) can restrict long distance dialing on his/her extension by setting the Toll Control Level to 1 (Local calls) before leaving the workplace. On return, the user can restore the previous Toll Control Level, by setting it back to Level 2.

Thus the extension user sets Dynamic Lock s/he manually selects the desired Toll Control Level for his/her extension and restores the original Toll Control Level assigned to the extension.

- **Automatically:** the extension user changes the Toll Control Level of the extension using the Dynamic Lock Timer. The user sets the Timer to the desired number of minutes. On the expiry of this Timer, the system restores the original Toll Control Level assigned to the extension.

For example, an organization has defined Toll Control Level 0 as Local Calls, and Level 3 as All Calls. An extension user of this organization is assigned Level 0. When this extension user wants to make international calls, he sets the Dynamic Lock Timer and selects Toll Control Level 3. At the end of the timer, Level 3 gets locked and Toll Control Level 0 is reapplied on the extension phone.

- *The changing of Toll Control level requires the user to dial the 4-digit User Password. The system will not accept the default User Password (1111). The extension user must first change the default User Password.*
- *The Dynamic Lock Timer can be set to a maximum of 99 minutes.*
- *The Dynamic Lock Timer must be set to '00' when using Manual Dynamic Lock.*
- *Dynamic Lock when set/canceled from the SA mode, will not depend on the assigned CoS.*

How it works

The Pre-requisites

- The Toll Control Levels 0 to 3 are programmed in the Station Basic Feature Template applied on the extension.
- Dynamic Lock is allowed to the extension in its Class of Service.

The Process

For Dynamic Lock - Manual

- The user of extension A sets the Dynamic Lock manually by entering the User Password and selecting the desired Toll Control Level.

OR

- The Operator sets Dynamic Lock manually for an extension by entering the extension number and selecting the Toll Control Level.

For Dynamic Lock - Automatic

- The user of extension A sets the Dynamic Lock by entering the User Password, setting the Dynamic Lock Timer, and selecting the desired Toll Control Level.

OR

- The Operator sets Dynamic Lock for an extension by entering the extension number, setting the Dynamic Lock Timer, and selecting the Toll Control Level.
- Now, whenever a call is made from extension A, the system checks for Toll Control Level.
- The system then checks the associated Lists of allowed and denied numbers.
 - If the Toll Control Level is 0, then Toll control is time zone based, that is, working hours, break hours and non-working hours. The outgoing call is allowed/denied as per the Call Privilege and the corresponding Allowed and Denied Number List programmed for that time of the day by the System Engineer.
 - If the Toll Control Level is 1, 2, 3 the outgoing call is allowed/denied as per the Call Privilege and the corresponding number list programmed for each level.
- If Dynamic Lock - Automatic has been set by user/Operator, the system waits for the duration of the Dynamic Lock Timer set for the extension. At the end of each outgoing call made during the period of this Timer, the system will restart the Timer again. The system will change the Toll Control back to the previous Level when no outgoing call is made till the expiry of this Timer.
- If Dynamic Lock - Automatic has been set by user/Operator, and an internal call is made during the period of the Dynamic Lock Timer, the system will check for the 'Decrement Dynamic Lock Timer Internal Calls' feature in the Class of Service of allowed to the extension. If this feature is enabled, the system will start the decrement of the Dynamic Lock Timer. The system will change the Toll Control back to the previous level on the expiry of this Timer. However, if the 'Decrement Dynamic Lock Timer' feature is disabled in the Class of Service, the system will reset the Toll Control as described in the previous step.
- If Dynamic Lock - Manual has been set, the extension user/Operator must set the Toll Control Level back to the previous Level.

Feature Interactions

- **Redial and Auto Redial:** The system will check for Toll Control Level when an extension on which Dynamic Lock is set, attempts Redial. The system will not check the same for Auto Redial.
- **Emergency Number Dialing:** All extensions will be able to dial Emergency numbers always, regardless of the Toll Control set on them.

SARVAM UCS provides for separate programming of Emergency Numbers, which remain unaffected by Dynamic Lock set on the phones. Refer the topic [“Emergency Dialing”](#) to know more about this feature.

How to configure

For this feature to work, it must be enabled in the Class of Service of the extensions; Toll Control Level must be programmed in the Station Basic Feature Template of the extensions. The user must change the default User Password.

Dynamic Lock in Class of Service

In the default Station Basic Feature Template 01 assigned to all extensions of the SARVAM UCS, the default COS group 01 has Dynamic Lock enabled. So, all extensions can set Dynamic Lock.

In the default COS group 01, 'Decrement Dynamic Lock Timer for Internal Calls' is disabled.

Retain the default template, if you want to allow this feature to all extensions and keep the Decrement Timer disabled.

If you want to deny Dynamic Lock to all extension, simply disable this feature in the default COS group 01 of Station Basic Feature Template 01.

If you want to allow Dynamic Lock and/or the Decrement Dynamic Lock Timer for Internal Calls only to selected extensions, then follow these steps:

- a. Define a new CoS group with Dynamic Lock and the Decrement Dynamic Lock Timer for Internal Calls enabled.
- b. Prepare a Station Basic Template with this CoS group applicable in all the time zones.
- c. Assign this newly prepared Station Basic Feature Template to the extension on which 'Dynamic Lock' and 'Decrement Dynamic Lock Timer' for Internal Call is to be allowed.

Similarly, if you want to deny Dynamic Lock/Decrement Dynamic Lock Timer to selected extension, prepare a new Station Basic Feature Template with this feature disabled in the CoS group. Assign this feature to those extensions which are to be denied this feature.

Refer the topics [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#) for programming instructions.

Toll Control Levels in Station Basic Feature Template

Program the Toll Control Levels in the Station Basic Feature Template that are assigned to the extensions which are to be allowed the Dynamic Lock feature. Refer the topic [“Toll Control”](#) for instructions.

How to use

Dynamic Lock, Manual and Automatic, can be set by extension users as well as from their own extensions or from the SA mode by the Operator.

The extension user/Operator must first set the Dynamic Lock Timer and then change the Dynamic Lock Level.

To set Dynamic Lock-Manual, the extension user/Operation must set the Dynamic Lock Timer to **00**.

Recall that

- *When the Dynamic Lock-Manual is set (Timer set to 00), the extension user/Operator must dial the feature access code to restore the previous Toll Control Level.*
- *When Dynamic Lock-Automatic is set (Timer set to desired number of minutes), the system will restore the previous Toll Control Level at the end of the Timer.*
- *The extension user must change the default User Password to be able to set the Dynamic Lock on his/her extension. Refer the topic [“User Password”](#) for instructions on changing the password.*

Changing Dynamic Lock by Extension Users

For EON and Extended IP Phone Users

To set Dynamic Lock-Manual:

- Press DSS Key assigned to Dynamic Lock.

OR

- Dial 142.

OR

- Enter Phone Menu by pressing 'Enter' key.
- You get the prompt <Enter User Password>
- Enter your User Password.
- You get the prompt: <Lock Timer = XX Minutes>.
- Enter 00
- You get the Text message <Lock Timer = 00 Minutes> and confirmation tone.

To set Dynamic Lock-Automatic:

- Press DSS Key assigned to Dynamic Lock.

OR

- Dial 142.

OR

- Enter Phone Menu by pressing 'Enter' key.
- You get the prompt <Enter User Password>
- Enter your User Password.
- You get the prompt: <Lock Timer = XX Minutes>.
- Enter the desired number of minutes (max. 99 minutes).
- You get the Text message <Lock Timer = xx Minutes> and confirmation tone.

To set Dynamic Lock Level:

- Press DSS Key assigned to Dynamic Lock.

OR

- Dial 141.

OR

- Enter Phone Menu by pressing 'Enter' key.
- You get the prompt: <Enter User Password>.
- Enter your User Password.
- Select the desired Toll Control Level:

- Toll Control Level 0
 - Toll Control Level 1
 - Toll Control Level 2
 - Toll Control Level 3
- Press Enter key.
 - You get the text message 'OK!' and a confirmation tone.

If you are still working with the default User Password, the system will prompt you to 'Change User Password' when you attempt to set Dynamic Lock. Change your User Password first, before you use this feature.

For SLT Users

To set Dynamic Lock-Manual:

- Lift the handset.
- Dial 142-User Password-00.
- You get Confirmation tone.
- Replace handset.

To set Dynamic Lock-Automatic:

- Lift the handset.
- Dial 142-User Password-Minutes (max. 99 minutes)
- You get Confirmation Tone.
- Replace handset.

To set Dynamic Lock Level:

- Lift the handset.
- Dial 141-User Password-Toll Control Level.
- Dial 0 Level 0.
- Dial 1 for Level 1.
- Dial 2 for Level 2.
- Dial 3 Level 3.
- You get Confirmation tone.
- Replace handset.

Changing Toll Control Level for an Extension (SA mode)

For EON and Extended IP Phone Users

To set Dynamic Lock-Manual:

- Press DSS key assigned to Dynamic Lock.

OR

- Dial 1072-002³⁰².

³⁰². Ensure that the feature 'SA Extension' is enabled in the "Class of Service (COS)" allowed to the extension from which this code is being dialed.

OR

- Enter Phone Menu.
- You get a text message 'Enter Room/Phone Number'.
- Enter the extension number for which you want to set Dynamic Lock.
- Select the option 'Change Lock Timer'.
- You get the following prompt: 'XX Minutes'.
- Enter 00
- You get the text message <Lock Timer = 00 Minutes> and confirmation tone.

To set Dynamic Lock-Automatic:

- Press DSS key assigned to Dynamic Lock.

OR

- Dial 1072-002³⁰³.

OR

- Enter Phone Menu.
- You get a text message 'Enter Room/Phone Number'.
- Enter the extension number for which you want to set Dynamic Lock.
- Select the option 'Change Lock Timer'.
- You get the following prompt: 'XX Minutes'.
- Enter the desired number of minutes (max. 99)
- You get the text message <Lock Timer = xx Minutes> and confirmation tone.

To set Dynamic Lock Level:

- Press DSS key assigned to Dynamic Lock.

OR

- Dial 1072-002³⁰⁴.

OR

- Enter Phone Menu.
- You get a text message 'Enter Room/Phone Number'.
- Enter the extension number for which you want to set Dynamic Lock.
- Select the option 'Change Toll Ctrl. Level'
- Press Enter key.
- Scroll to select the desired Toll Control Level:
 - Toll Control Level 0
 - Toll Control Level 1
 - Toll Control Level 2
 - Toll Control Level 3

303. Ensure that the feature 'SA Extension' is enabled in the "Class of Service (COS)" allowed to the extension from which this code is being dialed.

304. Ensure that the feature 'SA Extension' is enabled in the "Class of Service (COS)" allowed to the extension from which this code is being dialed.

- Press 'Enter' key.
- You get the confirmatory text message 'OK!' and confirmation tone.

For SLT Users

To set Dynamic Lock-Manual:

- Pick up the handset.
- Dial 1072-002, you get feature tone.
- Dial Extension Number, you get feature tone.
- Dial 2, the code for 'Change Lock Timer'.
- Dial 00.
- You get confirmation tone.
- Replace the Handset or you get dial tone after 3 seconds.

To set Dynamic Lock-Automatic:

- Pick up the handset.
- Dial 1072-002, you get feature tone.
- Dial Extension Number, you get feature tone.
- Dial 2, the code for 'Change Lock Timer'.
- Dial the number of Minutes you want to set the Timer.
- You get confirmation tone.
- Replace the Handset or you get dial tone after 3 seconds.

To change Dynamic Lock Level:

- Pick up the handset.
- Dial 1072-002, you get feature tone.
- Dial Extension Number, you get feature tone.
- Dial 1, the code for 'Change Toll Control Level'.
- Dial 0 for Level 0
- Dial 1 for Level 1
- Dial 2 for Level 2
- Dial 3 for Level 3
- You get confirmation tone.
- Replace the Handset or you get dial tone after 3 seconds.

E1/T1 Maintenance

What's this?

The E1 Maintenance consists of Error Counts (Performance Statistics), Alarms and Loop Back Tests. This is as per standards like G.704, G.706 and G.732. G.775 is also considered for detection of defect conditions like Loss of Signal (LOS), Loss of Frame (LOF), Alarm Indication Signal (AIS), etc.

To elaborate, the Digital line can have transmission errors. All the errors will not generate an Alarm. Few severe errors generate Alarms. However, all the errors are logged in the System Fault Log.

The SNIIC (Subscriber Network Interface Integrated Circuit), is used to interface E1 line to SARVAM UCS. It supports error counters listed in the table given below. See "[Error Counts \(Performance Statistics\)](#)".

Each error detected by the T1E1 port is sent to the CPU Card in the form of an event. The system counts these errors and prepares a statistical record if the condition matches. For example, Severely Errored Seconds Count is incremented when one OOF (Out of Frame) event detected by the system or more than 320 framing errors are detected by the system. This statistical record is updated and maintained by the system.

Facility-Associated and Non-Facility Associated Signaling:

Signaling on ISDN PRI trunks consists of messages transported over the D-Channel, which is channel 24 on T1 interface or channel 16 on E1 interface. This signaling can be provided by two methods:

- **FAS:** The D channel can provide signaling for the other B channels on the same interface. This is called 'Facility Associated Signaling' (FAS).
- **NFAS:** The D channel can provide signaling for the other B channels on more than one interface. This is called 'No facility Associated Signaling' (NFAS). The signaling arrangements, the capability is supported to designate a D channel on one interface to be a backup to a D channel on another interface in case of failure. This is called D channel backup.

Error Counts (Performance Statistics)

Error Counters supported by SNIIC in E1 Mode.

Errored Frame Alignment Signal	This counter is incremented on receipt of each errored FAS.
E-bit	This counter is incremented when either E1 or E2 bit is set in the transmit frame.
CRC-4 Error	This counter is incremented when the received frame has CRC-4 errors.
Line Code violation Error	This counter is incremented when a line code violation error occurs.
Excessive Zeros Error	This counter is incremented when excessive zeros are received or Line code violation error occurs.
Positive Slip Buffer	This counter is incremented every time a positive slip occurs.
Negative Slip Buffer	This counter is incremented every time a negative slip occurs.

Following parameters form the statistical record. This can be generated in the form of a report as shown below:

Performance Parameter	Seconds/Count
Error Seconds	000 to 255
Bursty Errored Seconds	000 to 255
Severely Errored Seconds	000 to 255
Severely Errored Framing Seconds	000 to 255
Unavailable Seconds	000 to 255
Positive Slip Seconds	000 to 255
Negative Slip Seconds	000 to 255
Loss of Frame Count	000 to 255
Line Errored Seconds	00000 to 65535
Excessive Zeroes Error Count	000 to 255
CRC-4 Error Count	00000 to 65535

Out Of Frame (OOF) - Out of Frame is the occurrence of a particular density of framing error events. OOF is declared when three consecutive frame alignment signals have been received with an error. OOF ends when;

- In frame N, the FAS is correct.
- In frame N+1, the FAS is absent.
- In frame N+2, the FAS is present and is correct.

Errored Seconds - It is defined as a second with one of the following:

- One FAS Errors.
- One or more OOF defects.
- One or more Slip events.
- A detected AIS defect.

Bursty Errored Seconds

Without CRC - It is a second with:

- More than one but less than 320 Errored FAS.
- No OOF.
- No SES.
- No AIS.

With CRC - It is a second with:

- More than one but less than 320 CRC errors.
- No OOF.
- No SES.
- No AIS.

Severely Errored Seconds

With CRC - It is a second with one of the following:

- 832 or more CRC error events.
- one or more OOF defects.

Without CRC - It is a second with one of the following:

- 2048 or framing errors.
- Slips are not included. This is not incremented during Unavailable seconds.

Severely Errored Framing Seconds (SEFS) - It is a second with either one or more OOF defects or a detected AIS defect.

Unavailable Seconds - It is defined as a second in which E1 service is unavailable. An unavailable state is declared at the onset of 10 consecutive severely errored seconds and is cleared on onset of 10 consecutive seconds with no severely errored seconds.

Positive Slip Seconds - It is defined as a second in which a frame is repeated to account for frequency drift between ET2 and the network.

Negative Slip Seconds - It is defined as a second in which a frame is deleted to account for frequency drift between ET2 and the network.

Loss of frame count - Loss of Frame is declared after 2.5 seconds of continuous loss of signal or OOF. LOF is cleared after 10 seconds of continuous no loss of signal or OOF.

Line Errored Seconds - It is a second in which one or more than one line code violation error occurs.

Excessive Zeroes Error Count - This counter is incremented when excessive zeroes are received on the line or when line code violation error occurs.

CRC-4 Error Count - This counter is incremented when a CRC-4 Error is detected. This is applicable for E1 ports only.

CRC-6 Error Count - This counter is incremented when a CRC-6 Error is detected. This is applicable for T1 ports only.

Parameters of Facility Data Link (FDL)

This parameter is applicable for T1 Ports only.

FDL is used for communicating general maintenance information or for transmitting user defined information within the T1 link. General maintenance information is in the form of Performance Message Report which is generated by the T1E1PRI Card and depending upon the T1 FDL Protocol, the Performance Message Report is sent every second or on request.

How to configure

The commands explained below should be referred as:
To program a single port: XXXX-1
To program a range of ports: XXXX-2
To program all the ports: XXXX-*

T1 FDL

T1 FDL can be enabled/disabled. This parameter is applicable only if Framing = ESF. If the Network (Public or Private) to which the SARVAM UCS is connected does not support FDL then T1 FDL will be disabled.

Use following command to enable/disable T1 FDL on a T1E1PRI port:

6164-1-T1E1PRI-T1 FDL

6164-2-T1E1PRI-T1E1PRI-T1 FDL

6164-*-T1 FDL

Where,

T1E1PRI is from 01 to 08.

T1 FDL	Meaning
0	Disable
1	Enable

By default, the T1 FDL is disabled.

T1 FDL Protocol

SARVAM UCS will support both the protocols of reporting the performance monitoring. This parameter is applicable only if T1 FDL is enabled and Framing = ESF. This parameter will match the protocol expected by the other end of the link.

Use following command to program the T1 FDL Protocol for a T1E1PRI port:

6165-1-T1E1PRI-T1 FDL Protocol

6165-2-T1E1PRI-T1E1PRI-T1 FDL Protocol

6165-*-T1 FDL Protocol

Where,

T1E1PRI is from 01 to 08.

T1 FDL Protocol	Meaning
0	Disable
1	AT&T 54016
2	ANSI T1.403

By default, the T1 FDL Protocol is ANSI T1.403.

ANSI T1.403

As per this standard, the receiving equipment transmits a performance report message (PRM) each second over the FDL. This PRM is not sent to any specific remote location, but is broadcast so that any PRM receiving device on the T1 line can intercept the message. The PRM contains error information pertaining to only the previous 4 seconds.

It is the responsibility of the PRM receiver to accumulate the information and store it for 24 hours or the time desired. This method allows performance monitoring points at different locations along the T1 network so that error localization is determined.

AT&T 54016

As per this standard, the receiving equipment collects the data but does not transmit it on its own based on time as done by ANSI. Instead, the transmitting end sends a request to the receiving end to transmit the performance data.

The Performance Message Report Format is as per ANSI T1.403.

ALARMS

Alarms are indicated on the LEDs of the T1E1PRI Card. The T1E1PRI Card has four LEDs, namely L1 to L4. L1 and L2 indicate alarms for T1E1 PRI Port1 whereas L3 and L4 indicate alarms for T1E1 PRI Port2. During normal conditions, the LED blinks green (1 sec ON, 1 sec. OFF).

RED Alarm

- This alarm is generated if Loss of Signal persists for 2.5 seconds.
- Received signal is more than 20 dB or 40 dB below nominal for at least 1ms.
- 32 consecutive zeroes are received.
- Loss of frame alignment occurs.
- This is indicated by flashing the LED Red (500ms ON, 500ms OFF).
- The system logs this event in the System Fault Log as RED Alarm <Slot No.> <Port No.> at HH:MM:SS.
- When RED Alarm is declared, Yellow Alarm is sent to the far end within 12ms of detection of LOS.
- RED Alarm is cleared when the signal is acquired back and persists for 10 seconds.
- The LED is turned OFF. The system logs this event in the System Fault Log as RED Alarm Cleared <Slot No.> <Port No.> at HH:MM:SS.

YELLOW Alarm

- This Alarm is also known as Remote Alarm Indication or Distant Alarm.
- This Alarm is generated when Yellow Alarm is sent by the far end (Yellow Alarm is sent by the far end to indicate that it has lost the incoming signal).
- Yellow Alarm is declared when the signal corresponding to Yellow Alarm persists for 0.5 seconds.
- This is indicated by flashing the LED Orange (500ms ON, 500ms OFF).
- The system logs this event in the System Fault Log as YELLOW Alarm <Slot No.> <Port No.> at HH:MM:SS.
- This alarm is cleared when No Yellow Alarm signal persists for 0.5 seconds.
- The LED is turned OFF. The system logs this event in the System Fault Log as YELLOW Alarm Cleared <Slot No.> <Port No.> at HH:MM:SS.
- Yellow Alarm is declared if Bit 3 of the receive NFAS is 1 on two consecutive occasions.
- Yellow Alarm is cleared if Bit 3 of the receive NFAS is 0.

If equipment is connected in downstream (Drop and insert mode, that is, NT mode) then on receipt of Yellow Alarm, a Blue Alarm will be sent on the port, which is configured in NT mode.

BLUE Alarm

- It is also known as Alarm Indication Signal (AIS).
- This alarm indicates that the upstream equipment connected to the SARVAM UCS has lost receiving its incoming signal.
- This alarm is generated when AIS persists for 2.5 seconds.
- This is indicated by flashing the LED Red (1 sec. ON, 1 sec. OFF).
- The system logs this event in the System Fault Log as BLUE Alarm <Slot No.> <Port No.> at HH:MM:SS.
- This alarm is cleared when clearance of AIS is detected for continuous 10 seconds.
- The LED is turned OFF. The system logs this event in the System Fault Log as BLUE Alarm Cleared <Slot No.> <Port No.> at HH:MM:SS.
- Blue Alarm (AIS) is declared if unframed all ones signal is received as a string of 512 bits containing fewer than three zero bits.
- When BLUE Alarm is declared, Yellow Alarm is sent to the downstream equipment connected to the SARVAM UCS.

Port1 Status

LED	Card Status	Port Status
L1 Green Flashing @1 Sec.	Card Heart Bit	Port 1 Layer is established
L1 Red Flashing @1 Sec.	Card Heart Bit	Port 1 Layer is not established LOS-Red alarm detected.
L1 Red Flashing @500 msec.	Card Heart Bit	Port 1 Layer is not established LBFA -Loss of Basic Frame Alignment.
L1 Red Flashing @100 msec.	Card Heart Bit	Port 1 Layer is not established- LMFA loss of multi-frame alignment.
L1 Yellow Flashing @1 Sec.	Card Heart Bit	Port 1 Layer is established -RAI (Yellow Alarm) is detected.
L2 Green		Port 1 achieves CRC4 synchronization.
L2 Yellow		Port1 does not achieve CRC4 synchronization.
L2 Green Flashing @1 Sec.		Port 1 achieves CRC4 synchronization-AIS (Blue Alarm) is detected.
L2 Yellow flashing @1 Sec.		Port 1 doesn't achieves CRC4 synchronization-AIS (Blue Alarm) is detected.

Port2 Status

LED	Card Status	Port Status
L2 Green Steady		Port2 Layer 1 is established.
L3 Red Flashing @1 Sec.		Port 2 Layer is not established-LOS-Red alarm detected.
L3 Red Flashing @500 msec.		Port 2 Layer is not established-LBFA-Loss of Multi Frame Alignment.
L3 Red Flashing @100 msec.		Port 2 Layer is not established-LMFA Loss of Multi Frame Alignment.
L3 Yellow Flashing @1 Sec.		Port 2 Layer is established-RAI (Yellow Alarm) is detected.
L4 Green		Port 2 achieves CRC4 synchronization-AIS (Blue alarm) is detected.

LED	Card Status	Port Status
L4 Yellow		Port2 doesn't achieves CRC4 synchronization-AIS (Blue Alarm) is detected.

Refer chapter "[Loop Back Tests](#)" for more details.

E&M Connectivity

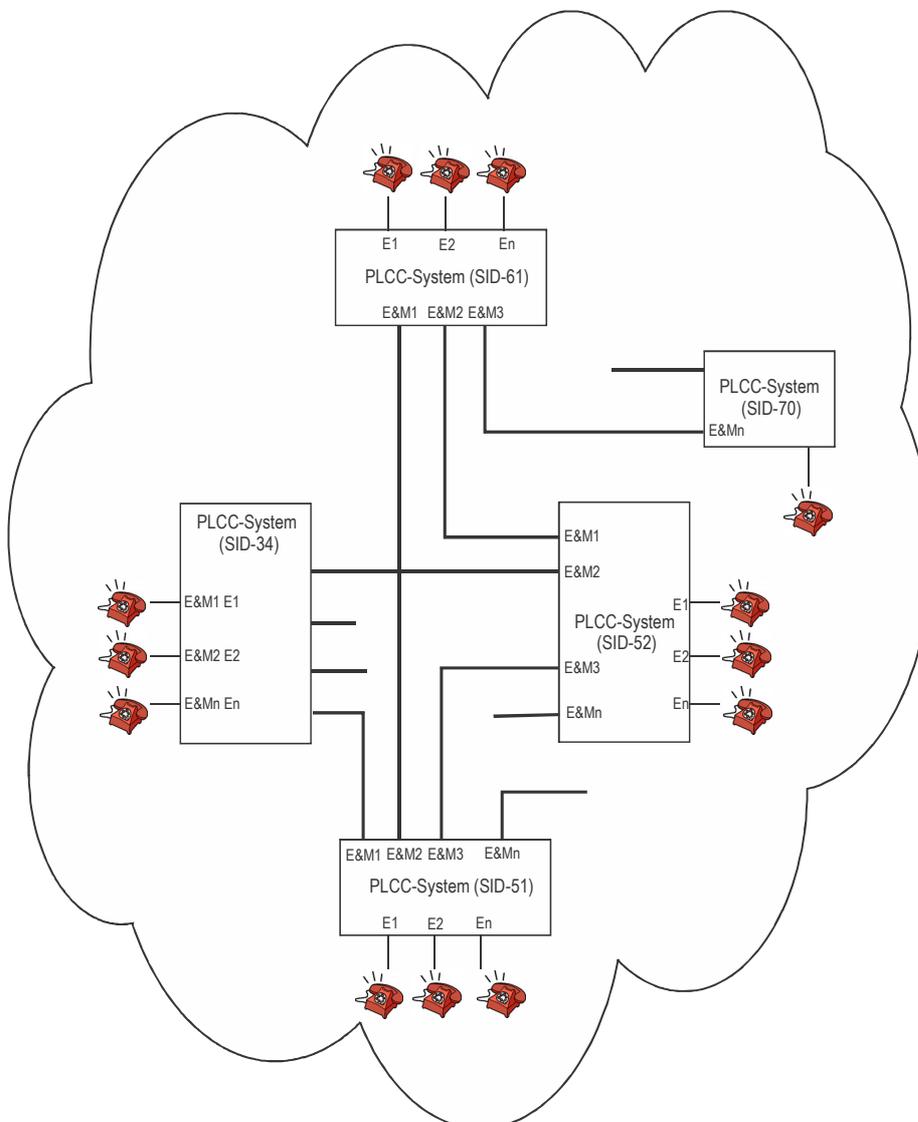

What's this?

E&M connectivity feature of SARVAM UCS offers seamless connectivity in PLCC network and also in between various communication products like PBX, Router, Lease Line. E&M interface is widely used interface to connect such diverse equipment. For example, in a PLCC network, number of PLCC System needs to be connected. As shown in the figure 1 of PLCC network, number of Systems are connected with each other through E&M tie lines.

Say, an existing System capacity needs to be expanded beyond the configuration limit of a System. Installing one more System and connecting both the Systems through E&M interfaces can get us the desired expansion.

Four different applications of E&M connectivity are shown below:

1. E&M Connectivity on PLCC-Network

How it works in PLCC Network

E&M interface is achieved using the E&M Card. An E&M port of the System has dual personality, both of a subscriber and a trunk. An E&M port works like a subscriber interface for any incoming call to it and works like a trunk interface when any subscriber makes an outgoing call through it. However, please note that a trunk line cannot be connected to an E&M port. Also a subscriber cannot be connected to an E&M port.

Incoming call on an E&M port in PLCC network

When any subscriber of PLCC System with SID-51 grabs an E&M2 port, s/he gets dial tone of SID-61. Now he can call any subscriber of SID-61 and use features like priority, conference, just like a normal subscriber would do. However, this E&M port needs to be programmed for the same.

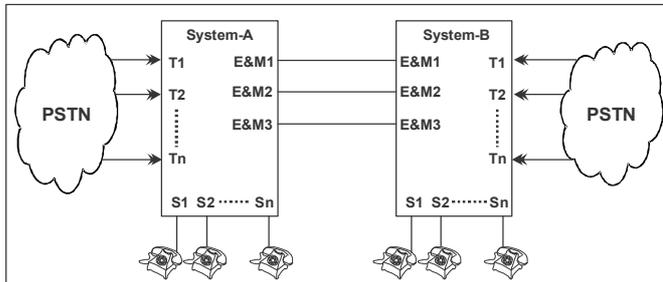

Outgoing call using E&M port in PLCC network

When any subscriber of PLCC System-34 dials network access code (as per programming) and dials SID say 52, an E&M1 port is grabbed (as it is programmed for the same). Now he can call any subscriber of SID-52 and establish speech. However, this E&M port needs to be programmed as any other normal trunk like enabling the port, programming the dial type.

All E&M ports can be put together in one single group depending on the requirement. A separate access code can be assigned to it. This makes the operations easy. Now the subscribers have at least two different access codes for making outgoing calls using trunk lines and other for making outgoing calls using E&M tie lines.

2. System EXPANSION (2-SYSTEMS)

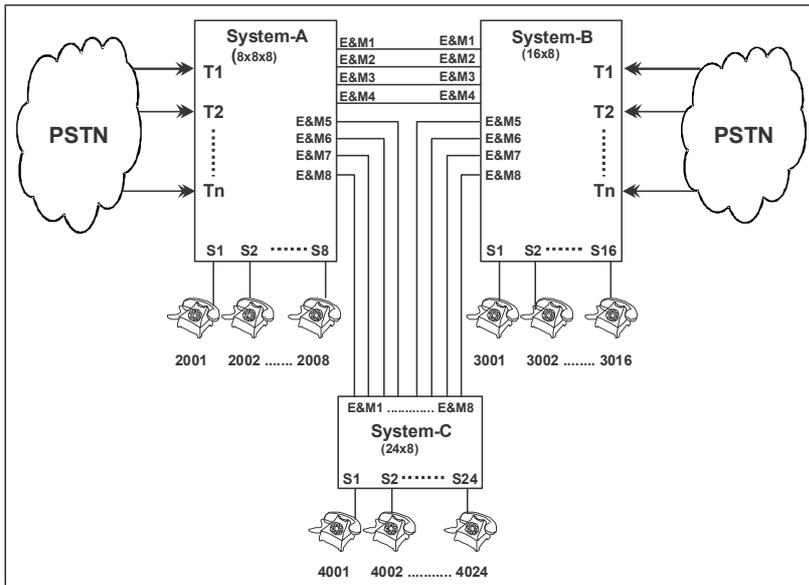

Two Systems are connected using E&M interface.

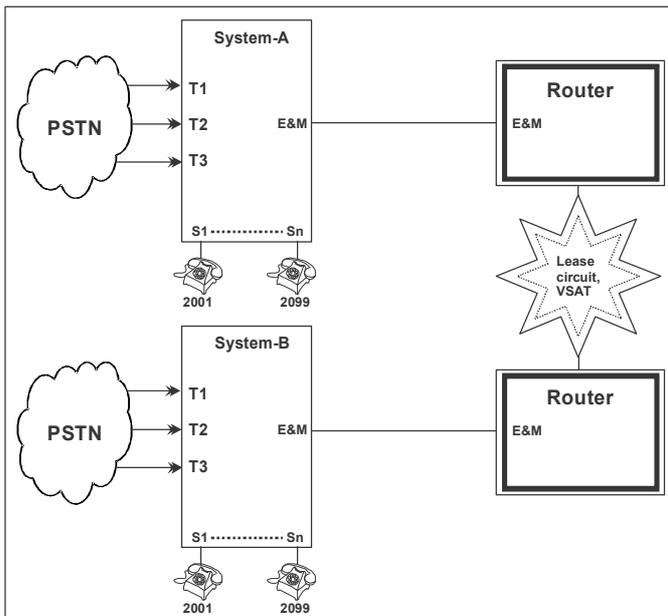

In the above figure,

- T1 to Tn are trunk lines from the local central office (CO).
- S1 to Sn are stations.
- E&M1 to E&Mn are E&M lines between two Systems.

3. Systems are connected through E&M connectivity

4. Two Systems located far from each other connected to each other using E&M connectivity.

How it works

E&M interface is achieved using the E&M Card. An E&M port has dual personality: both of a station and a trunk. An E&M port works like a station interface for any incoming call to it and works like a trunk interface when any station makes an outgoing call through it. However, please note that a trunk line cannot be connected to an E&M port. Also a SLT or DKP cannot be connected to an E&M port.

Incoming call on an E&M port

When any station of System B grabs an E&M port, he gets dial tone of System A. This port of System A behaves as a SLT port. Now he can call another station, grab a trunk, or use a feature like raid, just like a normal station would do. However, this E&M port needs to be programmed as any other normal station. Features like Class of Service, Toll Control, will apply to this port, if programmed.

Outgoing call using E&M port

When any station from System A makes an outgoing call through an E&M port, s/he dials trunk access code. The E&M port behaves as trunk interface and gives the station, the dial tone of System B. Now s/he can dial any station of System B or grab a trunk line of System B to make a call or use any feature depending on the station programming done by the SE of System B. Hence the E&M port of System A should be programmed as any other normal trunk by enabling the port, programming the dial type, etc.

All E&M ports can be put together in one single group or few groups depending on the requirement. A separate access code can be assigned to it. This makes the operations easy. In such case the stations can have at least two different access codes for making outgoing calls, one for making outgoing calls using trunk lines and other for making outgoing calls using E&M lines. Generally, E&M connectivity is used to expand the System capacity or connect two or more remotely located Systems. This forms a network of Systems. The requirement is that, the so formed network should work as one Group. This is commonly known as Closed User Group. Please refer [“Closed User Group \(CUG\)”](#) and [“Closed User Group-With Exchange ID”](#) for more details.

How to configure

Please refer [“Configuring E&M Lines”](#), [“Station Basic Feature Template”](#), [“Station Advanced Feature Template”](#), [“E&M Feature Template”](#) for more details.

Emergency Calls (911) - Reporting to PSAP

What's this?

Make sure:

- you have selected the **Region** as *USA* or *Canada*.
- in the *Emergency Table for the Number 911*, you have assigned the outgoing trunk bundle group with only T1 PRI lines. For instructions, see [“Configuring Emergency Number Dialing”](#).

If you are using the system in the Hospitality mode, to dial the Emergency Number 911, you must purchase the E911 license. For details, refer [“License Management”](#).

The SARVAM UCS allows you to assign Customer Emergency Services Identification (CESID) number to each extension user. When the user dials the Emergency number 911, the system sends the caller's CESID number to the network and the call is routed to the Public Safety Answering Point (PSAP).

The PSAP stores information, such as name, location, and CESID number of the users in an Automatic Line Information (ALI) database. The PSAP uses the CESID number that you have assigned to an extension to locate the user's information in the ALI database. Hence, the PSAP can provide user's the desired service without delay.

The CESID numbers are provided by the Service Provider. In case these are not provided, you can assign DDI numbers to extension users. See [“Direct Dialing-In \(DDI\)”](#) to know more.

Configuring CESID List using Jeeves

- Log in as System Engineer.
- After you have selected the **Region** and configured the **Emergency Number** table.
- Under **Configuration**, click **Emergency**.

- Click **CESID** to open the page.

The screenshot shows a web-based configuration interface. On the left is a navigation menu with various system settings categories. The 'Emergency' section is expanded, and 'CESID' is selected. The main area displays a table titled 'CESID List' with columns for 'Extension Number', 'Name', 'CESID Number', and 'Location'. The table contains 18 rows, numbered 2001 to 2018. At the top of the main area, there are tabs for 'SLT', 'DKP', and 'SIP', with 'SLT' currently selected. At the bottom of the main area, there are three buttons: 'Submit', 'Default', and 'Print'.

Extension Number	Name	CESID Number	Location
2001			
2002			
2003			
2004			
2005			
2006			
2007			
2008			
2009			
2010			
2011			
2012			
2013			
2014			
2015			
2016			
2017			
2018			

- Click the desired tab —**SLT, DKP, SIP**.
- The list of **Extension Number** and Extension **Name** of the users appear as configured by you.
- For each Extension Number assign the **CESID Number** and enter his/her **Location**.

The CESID Number can a maximum of upto 12 digits and the Location can be a maximum of upto 18 alphanumeric characters.

- Click **Submit**.

Emergency Conference

What's this?

Emergency Conference enables you to establish a Conference between a pre-defined group of extensions using a feature access code.

This feature can be used to call and consult with a group of people in emergency situations.

The number of parties that can be included in an Emergency Conference group depends on the Multiparty Conference capacity of the SARVAM UCS. For details, see ["Conference-Multiparty"](#).

How it works

For this feature to work, you must do the following:

- First decide the key persons in the organization who should be parties to the Emergency Conference.
- Form a Department Group with the extensions of these key persons as members. A single Department Group can have up to 32 extensions. For more information on forming Department Groups, see the topic ["Department Call"](#).

For example, you have formed a Department Group for Emergency Conference, with the extensions A to G as members. The Access Code assigned to the Department Group is 3901. H is the initiator of the conference as Emergency Conference is enabled in the Class of Service assigned to his/her extension.

Another Emergency Conference is formed with Department Group 3902, having extensions J to P as members and J as the initiator of the Conference as Emergency Conference is enabled in the Class of Service assigned to his/her extension.

Now, extension H wants to initiate an Emergency Conference.

This is how the feature will work:

Initiating an Emergency Conference

- H dials the feature access code for Emergency Conference, followed by access code of the Department Group (3901).
- All extensions in the Department Group (extensions A to G) which are free will start ringing. The system will play *Emergency Conference* ring (default: Triple Ring) on the Extensions. Extensions that are busy will not be included in the call.

If there are DKP/Extended IP Phone extensions in the group, and these phones have a Call Appearance free, the system will ring these extensions on the free Call Appearance, but will not wait for the extensions to become free.

When the Emergency Conference is initiated, the system will ring on the extensions that are not occupied in any other single multi-party or 3-party conference.

For more information regarding the number of single multi-party or 3-party conferences supported, refer [“Technical Specifications - SARVAM UCS”](#).

- Extension A goes Off-Hook to answer the call first. A gets connected to the initiator of the conference, extension H.
- Two-way speech is established with extension A and H. All other extensions continue to ring.
- When another extension, B goes Off-Hook to answer the call, A and H get a beep, and three-way speech is established between A, B, H.
- Thus, whenever a new member joins the conference, all other extensions already in conference will get a beep, if the flag *Play Beep when Conference/Dial-In Conference Starts* is enabled in the [“System Parameters”](#).
- If the conference initiator, extension H, goes idle, all other extensions in the conference will still be in conversation.

Merging Emergency Conferences

- Only the initiator of the conference, extension H, can merge the conference using the phone menu.
- While in Conference, H presses the ‘Conference’ Key.
- From the Multiparty Conference Menu, H selects Merge Conference to merge with another ongoing Emergency Conference.
- H selects 3902 from the list of ongoing Emergency Conferences. Both the Emergency Conferences (3901 and 3902) are merged.

Cancelling an Emergency Conference

- Only the initiator of the conference, extension H, can cancel the conference. The initiator of the conference can cancel the conference at two stages:
 - When speech is established with one or more member extensions of the Emergency Conference department group.
- Or
- During Ring Back Tone, as the system rings on the extensions of the group, after the initiator of the conference has dialed the feature access code.
- To cancel the Emergency Conference, extension H must dial the feature access code for Cancel Conference, 190 (default).

How to configure

To provide this feature to extensions,

- You must enable the feature **Emergency Conference** in the “[Class of Service \(COS\)](#)” of the extensions in their “[Station Basic Feature Template](#)”. By default, this feature is enabled on all extensions, so all extensions can use this feature.
- If the extension you are providing this feature is a DKP or an Extended IP phone, you may program a DSS key on the phone with this feature.
- You must also create a Department Group as Emergency Conference group. For instructions, see “[Department Call](#)”.
- By default, the system plays a beep when the Emergency Conference starts. If you do not want the beep to be played, you must disable the flag *Play Beep when Conference/Dial-In Conference Starts*. For instructions, see “[System Parameters](#)”.

This flag is common for other features like “[Conference-Multiparty](#)”, “[Conference Dial-In](#)” and “[Raid](#)”.

- By default, the system plays *Triple Ring* as Ring Type for Emergency Conference. If necessary, you may configure a different ring type. For more information and for instructions, see “[Distinctive Rings](#)”.

How to use

For EON and Extended IP Phone Users

To initiate an Emergency Conference:

- Press DSS Key assigned to Emergency Conference.
Or
- Dial **1177**
- Dial Department Group Number.
- All free extensions in the group will ring.
- You get connected to the extensions that answer.

If no resources are free, you will get the ‘Conf. Resource full’ message on your LCD.

You can initiate an Emergency Conference also using “[Direct Inward System Access \(DISA\)](#)”.

To merge Emergency Conferences:

- While in Conference, press the ‘Conference’ Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option ‘Merge Conferences’
- The LCD displays list of Department Number and Group Name of ongoing Emergency Conferences.
- Select the desired Department Group number and press the Enter Key.
- Both the conferences will be merged.

Emergency Conferences can be merged by DKP or Extended IP Phone users only through the Phone Menu.

To cancel an Emergency Conference while in speech with one or more extensions:

- While in Conference, press the 'Conference' Key.
- The Multiparty Conference menu appears on the LCD.
- Select the option 'Terminate Conference' and press the Enter Key.

OR

- Press the DSS key assigned to Terminate Conference.
- All the participants will get an Error Tone and the system resource occupied by the conference will be freed.

To cancel an Emergency Conference while the extensions are ringing:

- Go ON-Hook during Ring Back Tone.
- All extensions in the conference group will stop ringing.

You can cancel the conference only if you have initiated it.

For SLT Users

To initiate an Emergency Conference:

- Dial **1177**
- Dial Department Group Number.

To cancel an Emergency Conference while in speech with one or more extensions:

- Go ON-Hook and then go OFF-Hook.
- Dial **190**

To cancel an Emergency Conference while the extensions are ringing:

- Go ON-Hook during Ring Back Tone.

Emergency Detection and Reporting

If you are using the system in the Hospitality mode, to dial the Emergency Number 911, you must purchase the E911 license. For details, refer [“License Management”](#).

What’s this?

When an emergency call is made from an extension, the system dials out the number using any of the free trunks selected for routing the Emergency Numbers. Since the number is dialed out by the System, the Emergency Service that attends to the call will be able to locate the System, but *not* the extension that made the call.

Similarly, the Operator too has no way of knowing which of the extensions made the call, thus making it difficult to quickly reach and provide help to the extension that made the emergency call.

With the Emergency Detection and Reporting feature, the Operator can know from which extension the emergency call is being made. Whenever an Emergency call is made by an extension user, the system detects and reports it to the Operator.

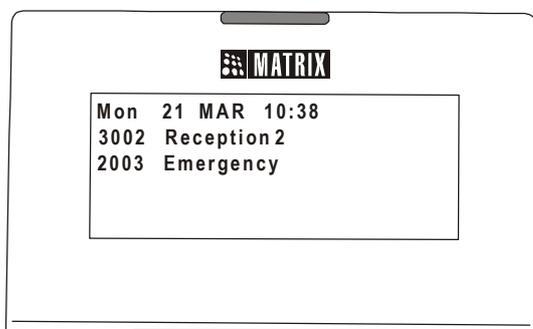

The system provides you an option to select the landing destination for reporting calls. You can:

- select the Operator as the landing destination
- define a separate Emergency Reporting Group

How it works

When an extension of SARVAM UCS makes an emergency call by dialing an Emergency Number,

- the system hunts for a free trunk in the OGTBG selected for routing the emergency number, and dials out the number from a free trunk.
- simultaneously, the system informs the Emergency Reporting Group/Operator by ringing on the desired extensions for the duration of the Emergency Reporting Call-Ring Timer (configurable; default: 10 minutes).
- If Emergency Reporting Group/Operator is a DKP or an Extended IP Phone, it will ring continuously, and an emergency message will be displayed on the LCD.

The emergency message shows the number of the extension which has made the emergency call, in this case, extension 2003.

- To acknowledge the Emergency call the Emergency Reporting Group/Operator must press the enter key. The acknowledged Emergency calls are logged into the System Activity Log.
- If the Emergency Call is not acknowledged by the Emergency Reporting Group/Operator, the emergency call is logged into the Emergency Alarms Log. To know more about the Emergency Alarms Log, see [“Emergency Alarms Log”](#) at the end of the topic.

Also see the topics [“Configuring Emergency Number Dialing”](#) and [“Emergency Dialing”](#).

How to configure

Configuring Emergency Reporting using the Jeeves

- Log in to the Jeeves as System Engineer.
- Under **Configuration**, click **Emergency**.
- Click **Emergency Reporting**.

- **Emergency Dialing Reporting:** By default this check box is enabled. The system will detect the extension that makes an emergency call.
- **Time Table:** A Time Table is a schedule of the three Time Zones, namely: Working Hours, Break Hours, Non-Working hours for a week.

You can define and select the Time Table for the Emergency Reporting Group as per you requirement.

There are 8 different Time Table templates to select from. By default, the Time Table 1 is selected. In Time Table 1, six days of the week - Monday to Saturday -have working hours from 9:00-18:00, break hours from 13:00-14:00 hours and non-working hours from 18:00 to 09:00. Sunday is a holiday, with all three Time Zones set to 00:00 hours.

You may also customize the default Time Table 1 OR customize and assign a different Time Table. Refer to [“Time Tables”](#) for more details.

- **Emergency Reporting Group:** By default **Operator assigned to extension** is selected as the landing destination group for placing emergency reporting calls, for all the time zones.

You can either customize the default group OR customize and assign a different group.

You can select a different group for each time zone, that is Working Hours (WH), Break Hours (BH) and Non-working Hours (NH).

- Click **Submit**.

If required, you can change the Emergency Reporting Call-Ring Timer, see "[System Timers and Counts](#)".

Emergency Alarms Log

Emergency Alarms Log is the log of unacknowledged Emergency Calls.

When an Emergency call is made by any extension user and is not acknowledged, that call is logged into the Emergency Alarms Log.

The log can be viewed by any DKP / Extended IP Phone user, using the DSS Key assigned to Emergency Alarms Log only. When an Emergency call is made by any extension user, the LED of the DSS Key glows continuous RED.

To view the log from any DKP / Extended IP Phone user,

- Press the DSS Key assigned to Emergency Alarms Log.
- A list of the last 20 unacknowledged Emergency calls appears with the following details:
 - Extension number from which the Emergency call was made.
 - Date and Time when the Emergency call was initiated from that Extension.
- Press the enter key to acknowledge the Emergency Call. The message "Emergency Acknowledged" appears on the screen.
- The system plays the Confirmation Tone followed by the Dial Tone.
- The acknowledged Emergency call is removed from the Emergency Alarms Log and is logged into the System Activity Log with the details of the extension that acknowledged the call.

Emergency Dialing

If you are using the system in the Hospitality mode, to dial the Emergency Number 911, you must purchase the E911 license. For details, refer [“License Management”](#).

What's this?

The SARVAM UCS supports dialing of Emergency number immediately without any blocking.

When an extension user dials an Emergency number, the system will hunt for a free trunk from the outgoing trunk bundle group selected for the emergency number. See [“Configuring Emergency Number Dialing”](#).

The system will not apply any of the following on the extension dialing the Emergency number:

- Toll Control (Allowed Denied Numbers, Dynamic Lock)
- Call Budget (even when call budget is consumed)
- Call Duration Control
- Automatic Number Translation

The system will allow the extension to dial the Emergency number even in the following conditions:

- the extension is in Off-Hook state.
- the extension is in Standby Mode.
- the extension has grabbed the trunk line (using Trunk access code or selective access)
- the call state is in any state: Ringing, Busy, Error, Confirmation.
- SIM card is not present in the Mobile port.
- Mobile port is not registered with the network.
- SIM PIN is not valid.
- the keypad of the extension phone is locked.

Emergency Numbers will always be out dialed through the OGTBG you have selected for the numbers.

Emergency Number will not be out dialed in the following cases:

- If the trunk port from which number is to be routed (CO, Mobile, T1E1PRI, BRI, SIP) is disabled.
- If the hardware related to dialing of Emergency number is not present.
- If the Emergency number is dialed from the SE Programming mode.

Emergency dialing will not work if Mains Power to the SARVAM UCS fails.

How to configure

The Emergency numbers are fixed as per the Region where SARVAM UCS is installed, you can add emergency numbers, as required. For instructions, see [“Configuring Emergency Number Dialing”](#).

How to use

To dial an Emergency number,

- Go Off-Hook
 - Dial the Emergency Number
- OR
- Dial Trunk Access Code-Emergency Number

For example:

Dial **0-112**

- *Wherever the Trunk Access Code conflicts with the Emergency Number, the emergency number should be dialed after dialing the Trunk Access Code.*
- *Let us take the example of Australia, where the emergency number is 000 and the trunk access code is 0. Now, when an extension user of SARVAM UCS located in Australia dials '0' of the emergency number, the system will consider it as trunk access code and will apply the trunk access code logic. Therefore, in such cases, the extension user must first dial the Trunk Access Code and then the Emergency Number. In this case, the extension user must dial 0-000 for emergency number dialing, so that the system will not wait for the Conflict Timer to apply the Trunk access code logic.*

Extended IP Phone/VARTA UC Client - Operation

Matrix offers the following proprietary Extended IP Phones/Mobile UC Clients:

- SPARSH VP248, the High-Definition Edge to your IP Communication. For Detailed description, see [“Matrix SPARSH VP248”](#).
- SPARSH VP310, the Executive IP Phone. For Detailed description, see [“Matrix SPARSH VP310”](#).
- SPARSH VP330, the Intuitive Touchscreen IP Phone. For detailed description, see [“Matrix SPARSH VP330”](#).
- SPARSH VP510, the Premium IP Phone. For detailed description, see [“Matrix SPARSH VP510”](#).
- Extended SPARSH VP710, the Smart Video IP Phone. For detailed description, see [“Matrix Extended SPARSH VP710”](#)
- SPARSH VP210, the Entry Level IP Phone. For detailed description, see [“Matrix SPARSH VP210”](#)
- Mobile UC Clients - VARTA ADR100, Mobile UC Client for Android Smart Phones and VARTA AMP100, Mobile UC Client for iPhones. See [“Matrix VARTA ADR100 UC Client”](#) and [“Matrix VARTA AMP100 UC Client”](#)
- MATRIX VARTA WIN200, UC Client for Windows. For detailed description, see [“MATRIX VARTA WIN200”](#).

To know the list of featured supported, refer to [“SARVAM UCS Features Supported in Terminals”](#).

Matrix SPARSH VP248

The Matrix SPARSH VP248, the proprietary Extended IP Phone is a feature-rich, VoIP (Voice over Internet Protocol) phone, providing voice communication over IP network. It looks and works like any normal phone, having all the traditional phone features such as redial, speed dial, call transfer, call hold, call forward, conference, and so forth. It allows you to make and receive calls using the handset, the headset (if connected) and the speaker.

The models of SPARSH VP248 are:

- **SPARSH VP248S** - the standard model, with a 2-line x 24-character LCD display.
- **SPARSH VP248P** - the premium model, with a 6-line x 24-character LCD display.

It is a powerful extension, supporting a host of phone and SARVAM UCS features, as listed below.

IP Phone Features

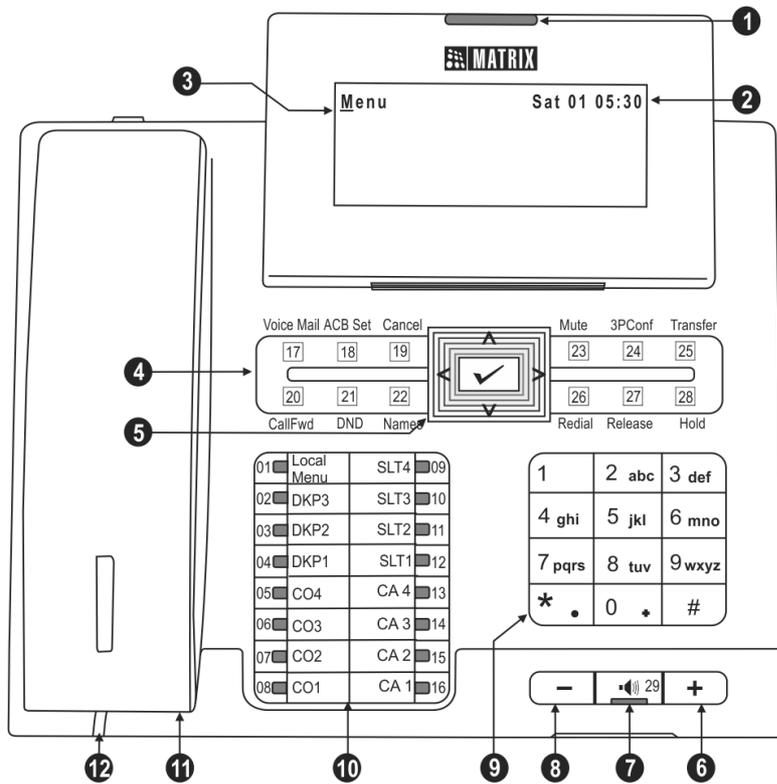

- Status of other ports (Tri-color LED indication)
- Programmable Direct Station Selection (DSS) Keys and Feature keys
- LCD notification messages
- Ringer Tune selection
- Adjustable Speech level
- Adjustable Ringer Volume
- Adjustable Backlight and Contrast levels
- Hands-free operation - Speaker key and headset connectivity.
- Call Logs - last 20 Missed, Answered and Dialed Calls.
- Message Paging
- Menu based operation of SARVAM UCS features
- Multiple Language support.

SARVAM UCS Features

The SPARSH VP248 supports SARVAM UCS features. A few of these are listed below:

- Abbreviated Dialing
- Auto Answer
- Call Chaining
- Call Cost Display
- Call Duration Display
- Call Mute
- Dialed Number Directory
- Directory Dialing by Name
- Dynamic Lock
- Forced Answer
- Keypad Lock
- Message Paging
- Off-Hook Alert
- Room Monitor
- User Status (Presence)

SPARSH VP248, Front View

| 5 Touch sense navigation keys | 11 Handset |
| 6 Volume increase key | 12 4P4C Spring Cord |

Models of SPARSH VP248 at a Glance

Feature	Model	
	SPARSH VP248S	SPARSH VP248P
Total number of keys	48	48
Number of programmable keys	29	29
Capsense keys	Yes	Yes
LCD display capacity	2 lines x 24 characters	6 lines x 24 characters
LCD with backlight	Yes	Yes
Headset Interface	Yes	Yes
Ringer Lamp (LED)	Yes	Yes
Speaker Phone	Full duplex	Full duplex

SPARSH VP248S

2 lines and 24 characters LCD display, full duplex, capsense feature keys

SPARSH VP248P

6 lines and 24 characters LCD display, full duplex, capsense feature keys.

LCD Display

The LCD display of SPARSH VP248 is backlit and can be tilted at a convenient angle for a clear view of the text/characters displayed.

The LCD backlight can be turned on and off as well as adjusted for contrast and brightness from the "Phone Settings" of the SPARSH VP248 Phone Menu.

Ringer LED

The Ringer LED indicates incoming internal and external calls. The LED Cadence will match with the Ring Cadence of the incoming internal/external call.

The Ringer LED cadence changes according to the type of call, as described in the table below.

Type of Call	Cadence
Internal Call	Short, very slow (750ms ON, 2250ms OFF)
External Call	Double (400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Alarm	Long, fast (1500ms ON, 500ms OFF)
Auto Redial Call	Long, very slow (2000ms ON, 4000ms OFF)
Auto Call Back Call	Short, slow (750ms ON, 2250ms OFF)
Priority	Triple (400ms ON, 200ms OFF, 400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Programming mode	Continuous

Navigation Keys

The phone has 5 touch sense navigation keys to be used to move the cursor and scroll through Menu options.

- ✓ is the Enter key, used to make a selection or to complete an action.
- ^ is the Up key, used to scroll upwards while navigating the 'Menu'.
- ∨ is the Down key, used to scroll downwards while navigating the 'Menu'.
- > is the Forward key, used to move the cursor.
- < is the Back key, used to move the cursor, return from the Sub-menu to the Main Menu.

Feature Keys

These are 12 capsense keys assigned to important or frequently accessed features of SARVAM UCS. Refer to the table given below:

Sr.No.	Description	LED
1.	Voice Mail	Single Color - Blue
2.	Call Back	Single Color - Blue
3.	Cancel	No
4.	Mute	Single Color - Blue
5.	Conference	No
6.	Transfer	No
7.	Forward	Single Color - Blue
8.	DND	Single Color - Blue
9.	Names	No
10.	Redial	No
11.	Release	No
12.	Hold	No

These keys are programmable. However, as you cannot change the labels, avoid programming these keys.

For instructions on programming these keys, see [“DSS Key Settings”](#) under [“Configuring Matrix SPARSH VP248”](#).

A few of these Feature keys are equipped with an LED to indicate the status of the feature assigned to it. You may re-assign other features to these keys. We recommend you to assign those features that require LED indication to the Feature keys equipped with an LED.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a feature key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the Feature key to which the Auto Redial feature has been assigned will glow Blue, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

Direct Station Selection (DSS) Keys

These are 16 programmable keys that can be assigned to Stations and Trunks and important or frequently accessed features of SARVAM UCS.

For instructions on programming these keys, see [“DSS Key Settings”](#) under [“Configuring Matrix SPARSH VP248”](#).

DSS Key LEDs

Each DSS key is equipped with an LED which glows to indicate the status of the Trunk/Extension or Feature assigned to it.

- **Status of Extensions and Trunks:** The LED of DSS keys assigned to Extensions/Trunks glow in three colors to indicate status of the call event on the Extensions/Trunks and on the Extended IP Phone.

Thus, the status of the Extended IP Phone user's own Extension as well as that of the other Extensions (i.e. Extended IP Phones and SLTs) and the status of Trunk lines are indicated by the LED of the DSS keys assigned to those Extensions and Trunks on the Extended IP Phone.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Blue	The key assigned to the Extension you are in speech with.	The key assigned to the Extension you have kept on hold.	The key assigned to the Extension you are calling or from which you are being called.
Red	The key assigned to the Extension that is now busy with another Extension/Trunk.	The key assigned to the Extension which has put another Extension/Trunk on hold.	The key assigned to the Extension/Trunk that is called or being called by another.
Violet	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Blue** indicates the state of the extension/trunk you access. For example, when you make a call to another Extension 203, the LED of the DSS key assigned to Extension 203 blinks Blue to indicate ringing at the Extension. If you have successfully established speech with Extension 203 the LED glows Blue continuously.
- **Red** indicates the state of other Extensions/Trunks. For example, if the LED of the DSS key assigned to Extension 201 is glowing Red continuously, it means Extension 201 is busy with another Extension or Trunk.
- **Violet** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1 the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.
- **Status of Features:** The LED of a DSS key is activated when the feature assigned to this key is used.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a DSS key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will glow Red, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

The LEDs of the Call Appearance (CA) Keys will function in the same manner as the DSS Key LEDs.

Dial Pad

The dial pad consists of 12 fixed keys for the digits 0, 1-9, and the characters * and #. The dial pad is used for dialing numbers of extensions, external parties, and for dialing the programming and feature access codes.

Speaker Key

The speaker key sets the phone in 'Speaker mode' for hands-free operation. The Speaker key is programmable, you can program any other feature/function on this key.

Speaker Key LED

The Speaker Key on SPARSH VP248 is equipped with a single color LED which glows Blue when pressed for the speaker mode and is turned off, when you exit the speaker mode.

Volume Keys

- **"+" (plus)**: This is the increase key, to raise the volume of speech while talking and to increase the Ringer volume, when the phone is ringing.
- **"-" (minus)**: This is the decrease key, to lower the volume of speech while talking and to decrease the Ringer volume when the phone is ringing.

Headset Connectivity

The SPARSH VP248 provides two Headset interfaces: a 2.5mm Audio Jack and an RJ9 connector at the bottom of the phone body.

So you can use any stereo headset of standard make with a 2.5 mm single connector or a headset with an RJ9 connector.

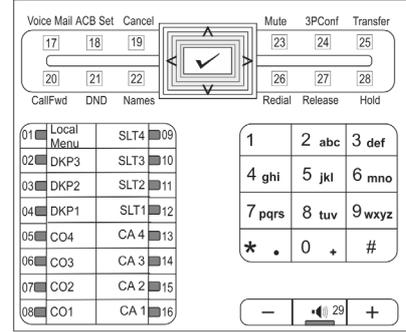

You can also program any of the DSS keys to function as the Headset key. For instructions on programming the key, see ["DSS Key Settings"](#) under ["Configuring Matrix SPARSH VP248"](#).

Key Maps

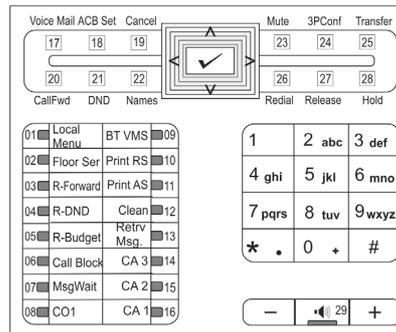

As SPARSH VP248 may be the extension of the Operators and Executives in an enterprise to meet the varied requirements of each user group, these key maps can be customized to match the exact requirement of individual users. For instructions on customizing the Key Maps, see ["Customizing Extended IP Phone Templates using Jeeves"](#). You can also personalize the key maps for each location, for instructions, see ["DSS Key Settings"](#) under ["Configuring Matrix SPARSH VP248"](#).

Matrix Extended IP Phone, SPARSH VP248 Key Template (default)

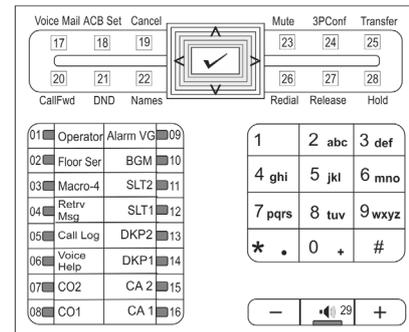

Operator/Executive

Hotel Attendant

Guest

The key maps of the Operator and Executive 1, 2, 3 are the same.

By using Key Templates you can prepare and assign common key maps to all or as many Extended IP Phones as you want, at one go.

SARVAM UCS also offers the flexibility to personalize the Key Maps of each Extended IP Phone, instead of using the Key Templates. For example, if you have assigned a common Executive Key Template to 12 Extended IP Phones, but you want to reassign some of the keys on two of these Extended IP Phones, SARVAM UCS allows you to selectively personalize the key maps of these two Extended IP Phones.

Phone Menu

You can access the following SARVAM UCS and phone features from the Menu of SPARSH VP248:

Menu option	Description
Call Logs	To view call history of internal and external Missed, Answered and Dialed calls. You can also edit numbers in the call logs and store them in the Personal Directory.
Contacts	To add, edit, delete names and numbers of contacts in the Global Directory Part 1.
Call Forward	To set and cancel Call Forward-Busy, Call-Forward No Reply, Call-Forward-Unconditional, and Follow Me.
Dynamic Lock	To change the Toll Control level of the phone.
User Status	To set User Present or User Absent.
Keypad Lock	To lock the keypad of the phone.
Do Not Disturb	To set/cancel Do Not Disturb on the phone, i.e. block incoming internal and external calls.
Call Cost Display	To view the cost of calls made from the phone.
Hotline	To set/cancel Hotline and Delayed Hotline.
Alarm	To set/cancel Personalized and Automated Alarms.
Change User Password	To change User Password.
One Touch Transfer	To set/clear Transfer Number.

Menu option	Description
Phone Settings	To customize settings of the phone such as Speech and Ringer Controls, LCD Display settings (Brightness and Contrast, Backlight ON/OFF), Headset Connectivity, Call Answering Mode (manual/auto answer).

Navigating the Phone Menu

To navigate the menu,

- Tap on Enter key when the phone is idle.
- Scroll by tapping the Up/Down Navigation Key to reach the desired Menu option.
- Tap on Enter key to select the desired Menu option.
- Scroll by tapping on the Up/Down Navigation Key to reach the desired sub-menu option.
- Tap on Enter key to select the desired sub-menu option.

To exit menu,

- Press Cancel key.
Or,
- Go ON-Hook.

Call Waiting Indication

During an on-going call, if there is another incoming call, an indication will be provided to you for the waiting call.

The call waiting indication depends on the **Call Waiting Tone (for SPARSH VP248/VP310/VP510)** option you select in General Parameters under SIP Extensions. See [“Configuring Matrix SPARSH VP248”](#) for instructions.

Connecting SPARSH VP248

For detailed instructions to connect SPARSH VP248, see [“Connecting SPARSH VP248 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY LENX, [“Connecting SPARSH VP248 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY MENX, [“Connecting SPARSH VP248 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY GENX and [“Connecting SPARSH VP248 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY PENX.

Configuring SPARSH VP248

For detailed instructions on how to configure SPARSH VP248, see [“Configuring Matrix SPARSH VP248”](#).

Operating SPARSH VP248

Please refer the EON48_310_SPARSH VP248_310 User Guide for instructions on operating the features of SARVAM UCS.

Matrix SPARSH VP310

SPARSH VP310, The Executive IP Phone is engineered to offer a contemporary design with crystal-clear audio and feature-rich capabilities at economical price. Elegant design, built-in programmable DSS Keys and plug-n-play connectivity makes SPARSH VP310 an easy to use phone for executives. SPARSH VP310 works in tight integration with SARVAM UCS for speed of operations and better workforce collaboration.

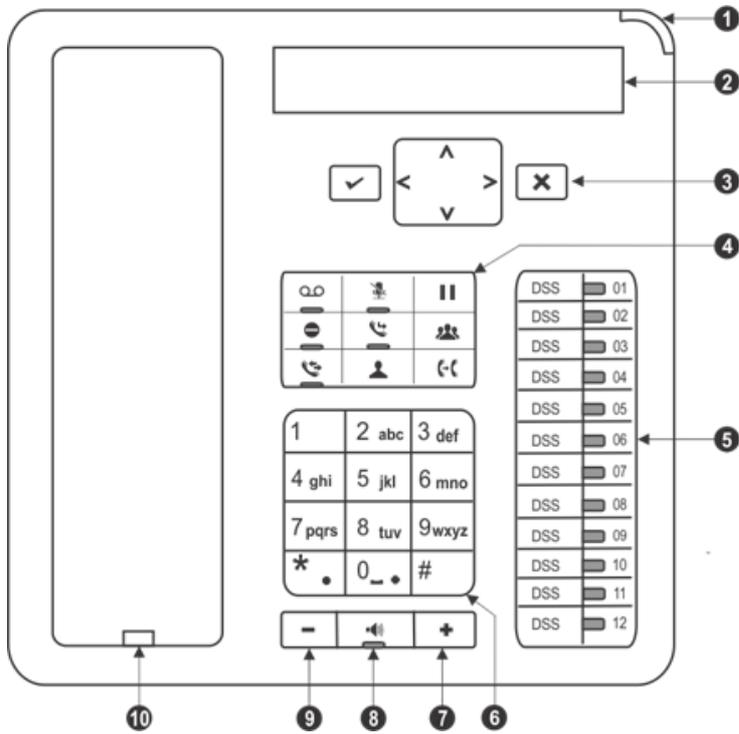

Key Features

- 2 Line LCD with Backlit
- Fixed Function Keys (With LED) - Voice Mail, Mute, Do Not Disturb, Forward, Logs, Speaker
- Fixed Function Keys (Without LED) - Hold, Conference, Contacts, Transfer
- Superior Voice Quality with HD Audio
- Full Duplex Speaker Phone
- PC and LAN Ethernet Ports
- Power over Ethernet (IEEE 802.3af)
- 12 DSS/BLF Keys for Feature, Line, Extension
- Message Wait and Ringer Lamp
- 3.5mm Headset Connectivity
- Adjustable Desk Stand
- Plug & Play

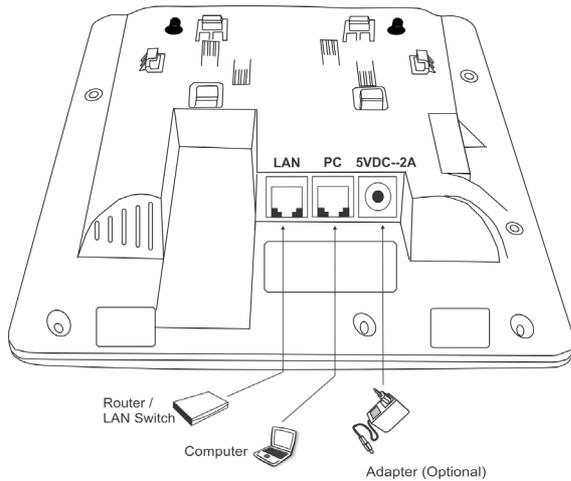

If any SPARSH VP310 extension is Off-Hook, the system will not be able to detect it. However, if any SLT/DKP is Off-Hook, Off-Hook Alert will be provided to SPARSH VP310 if it is the Operator phone.

SPARSH VP310, Front View

1	Ringer LED
2	LCD Screen
3	Navigation Keys
4	Fixed Function Keys
5	DSS (Direct Station Selection) Keys
6	Digit Keys/ Dial Pad Keys
7	Volume Increase Key/ "+" Key
8	Speaker Key
9	Volume Decrease Key/ "-" Key
10	Handset

Bottom View

LCD Display

The LCD display of SPARSH VP310 is backlit. The LCD backlight can be turned on and off as well as adjusted for contrast and brightness from the *Phone Settings* of the SPARSH VP310 Phone Menu.

Ringer LED

The Ringer LED indicates incoming internal and external calls. The LED Cadence will match with the Ring Cadence of the incoming internal/external call.

The Ringer LED changes according to the type of call, as described in the table below.

Type of Call	Cadence
Internal Call	Short, very slow (750ms ON, 2250ms OFF)
External Call	Double (400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Alarm	Long, fast (1500ms ON, 500ms OFF)
Auto Redial Call	Long, very slow (2000ms ON, 4000ms OFF)
Auto Call Back Call	Short, slow (750ms ON, 2250ms OFF)
Priority	Triple (400ms ON, 200ms OFF, 400ms ON, 200ms OFF, 400ms ON, 2000ms OFF)
Programming mode	Continuous

Navigation Keys

The phone has the following navigation keys which are used to move the cursor and scroll through Menu options.

- ✓ is the Enter key, used to make a selection or to complete an action.
- ^ is the Up key, used to scroll upwards while navigating the Menu.
- ∨ is the Down key, used to scroll downwards while navigating the Menu.

- > is the Forward key, used to move the cursor.
- < is the Back key, used to move the cursor, return from the Sub-menu to the Main Menu.
- ✕ is the Cancel key, used to exit a menu.

Feature Keys

There are 9 Feature keys assigned to important or frequently accessed features of SARVAM UCS.

Sr.No.	Feature icon	Description	LED
1.		Voice Mail	Single Color - Blue
2.		Mute	Single Color - Blue
3.		Hold	No
4.		DND	Single Color - Blue
5.		Call Forward	Single Color - Blue
6.		Conference	No
7.		Call Logs	Single Color - Blue
8.		Names	No
9.		Transfer	No

These keys are programmable. However, as you cannot change the labels avoid programming these keys.

For instructions on programming these keys, see [“DSS Key Settings”](#) under [“Configuring Matrix SPARSH VP310”](#).

A few of these Feature keys are equipped with an LED to indicate the status of the feature assigned to it. You may re-assign other features to these keys. We recommend you to assign those features that require LED indication to the Feature keys equipped with an LED.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a feature key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the Feature key to which the Auto Redial feature has been assigned will glow Blue, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

Direct Station Selection (DSS) Keys

These are 12 programmable keys that can be assigned to Stations and Trunks and important or frequently accessed features of SARVAM UCS.

For instructions on programming these keys, see [“DSS Key Settings”](#) under [“Configuring Matrix SPARSH VP310”](#).

DSS Key LEDs

Each DSS key is equipped with an LED which glows to indicate the status of the Trunk/Extension or Feature assigned to it.

- **Status of Extensions and Trunks:** The LED of DSS keys assigned to Extensions/Trunks glow in three colors to indicate status of the call event on the Extensions/Trunks and on the Extended IP Phone.

Thus, the status of the Extended IP Phone user's own Extension as well as that of the other Extensions (i.e. Extended IP Phones, SLTs) and the status of Trunk lines are indicated by the LED of the DSS keys assigned to those Extensions and Trunks on the Extended IP Phone.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Blue	The key assigned to the Extension you are in speech with.	The key assigned to the Extension you have kept on hold.	The key assigned to the Extension you are calling or from which you are being called.
Red	The key assigned to the Extension that is now busy with another Extension/ Trunk.	The key assigned to the Extension which has put another Extension/Trunk on hold.	The key assigned to the Extension/Trunk that is called or being called by another.
Violet	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Blue** indicates the state of the extension/trunk you access. For example, when you make a call to another Extension 203, the LED of the DSS key assigned to Extension 203 blinks Blue to indicate ringing at the Extension. If you have successfully established speech with Extension 203 the LED glows Blue continuously.
- **Red** indicates the state of other Extensions/Trunks. For example, if the LED of the DSS key assigned to Extension 201 is glowing Red continuously, it means Extension 201 is busy with another Extension or Trunk.
- **Violet** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1 the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.

- **Status of Features:** The LED of a DSS key is activated when the feature assigned to this key is used.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a DSS key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will glow Red, when Auto Redial is set, and the LED is turned off when the feature is canceled.

The LEDs of the Call Appearance (CA) Keys will function in the same manner as the DSS Key LEDs.

Dial Pad

The dial pad consists of 12 fixed keys for the digits 0-9, and the characters * and #. The dial pad is used for dialing numbers of extensions, external parties, and for dialing the programming and feature access codes.

Speaker Key

The speaker key sets the phone in 'Speaker mode' for hands-free operation.

Speaker Key LED

The Speaker Key on SPARSH VP310 is equipped with a single color LED which glows Blue when pressed for the speaker mode and is turned off, when you exit the speaker mode.

Volume Keys

- **"+" (plus):** This is the increase key, to raise the volume of speech while talking and to increase the Ringer volume, when the phone is ringing.
- **"-" (minus):** This is the decrease key, to lower the volume of speech while talking and to decrease the Ringer volume when the phone is ringing.

Headset Connectivity

The SPARSH VP310 provides two Headset interfaces: a 3.5mm Audio Jack and an RJ9 connector on the left side panel of the phone.

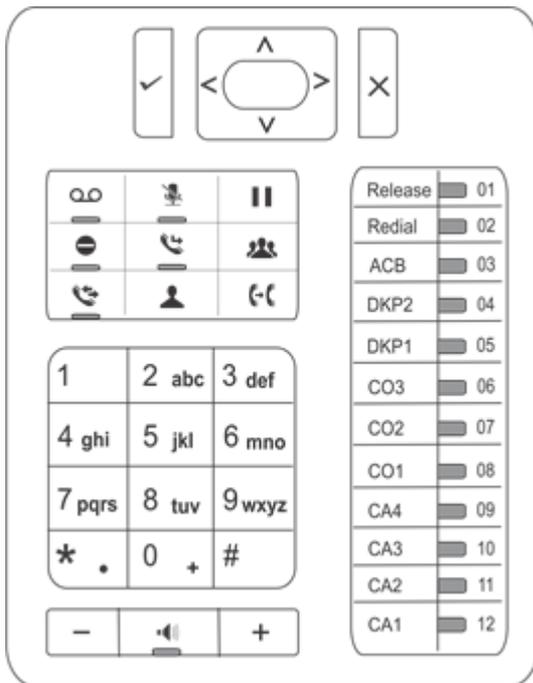

So you can use any stereo headset of standard make with a 3.5 mm single connector or a headset with an RJ9 connector.

You can also program any of the DSS keys to function as the Headset key. For instructions on programming the key, see ["DSS Key Settings"](#) under ["Configuring Matrix SPARSH VP310"](#).

Key Maps

As SPARSH VP310 may be the extension of the Operators and Executives in an enterprise to meet the varied requirements of each user group, these key maps can be customized to match the exact requirement of individual users. For instructions on customizing the Key Maps, see ["Customizing Extended IP Phone Templates using Jeeves"](#). You can also personalize the key maps for each location, for instructions, see ["DSS Key Settings"](#) under ["Configuring Matrix SPARSH VP310"](#).

Matrix Extended IP Phone, SPARSH VP310 Key Template (default)

The key maps of the Operator and Executive 1, 2, 3 are the same.

By using Key Templates you can prepare and assign common key maps to all or as many Extended IP Phones as you want, at one go.

SARVAM UCS also offers the flexibility to personalize the Key Maps of each Extended IP Phone, instead of using the Key Templates. For example, if you have assigned a common Executive Key Template to 12 Extended IP Phones, but you want to reassign some of the keys on two of these Extended IP Phones, SARVAM UCS allows you to selectively personalize the key maps of these two Extended IP Phones.

Phone Menu

Press the Enter key ✓ to access the Phone Menu.

You can access the following SARVAM UCS and phone features from the Menu of SPARSH VP310.

Menu option	Description
Call Logs	To view call history of internal and external Missed, Answered and Dialed calls. You can also edit numbers in the call logs and store them in the Personal Directory.
Call Forward	To set and cancel Call Forward-Busy, Call-Forward No Reply, Call-Forward-Unconditional, and Follow Me.
Dynamic Lock	To change the Toll Control level of the phone.
User Status	To set User Present or User Absent.
Keypad Lock	To lock the keypad of the phone. (when the keypad is locked, the features Call Log, Contact, Call Forward, Dynamic Lock, User Status, DND, Call Cost Display, Hotline, Alarm, Change User Password will not be accessible.)

Menu option	Description
Do Not Disturb	To set/cancel Do Not Disturb on the phone, i.e. block incoming internal and external calls.
Call Cost Display	To view the cost of calls made from the phone.
Hotline	To set/cancel Hotline and Delayed Hotline.
Alarm	To set/cancel Personalized and Automated Alarms.
Change User Password	To change User Password.
One Touch Transfer	To set/clear Transfer Number.
Phone Settings	To customize settings of the phone such as Speech and Ringer Controls, LCD Display settings (Brightness and Contrast, Backlight ON/OFF), Headset Connectivity, Call Answering Mode (manual/auto answer).

When the phone is in idle state,

- Press the Down key ▼ to access the Network Settings.
- Press the Up key ▲, if you wish to change the Ringtone and Play Key Tone.

Navigating the Phone Menu

To navigate the menu,

- Press on Enter key when the phone is idle.
- Scroll by tapping the Up/Down Navigation Key to reach the desired Menu option.
- Press on Enter key to select the desired Menu option.
- Scroll by tapping on the Up/Down Navigation Key to reach the desired sub-menu option.
- Press on Enter key to select the desired sub-menu option.

To exit menu,

- Press Cancel key.
- Or
- Go ON-Hook.

Call Waiting Indication

During an on-going call, if there is another incoming call, an indication will be provided to you for the waiting call.

The call waiting indication depends on the **Call Waiting Tone (for SPARSH VP248/VP310/VP510)** option you select in General Parameters under SIP Extensions. See [“Configuring Matrix SPARSH VP310”](#) for instructions.

Connecting SPARSH VP310

For detailed instructions to connect SPARSH VP310, see [“Connecting SPARSH VP310 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY LENX, [“Connecting SPARSH VP310 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY MENX, [“Connecting SPARSH VP310 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY GENX and [“Connecting SPARSH VP310 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY PENX.

Configuring SPARSH VP310

For detailed instructions on how to configure SPARSH VP310, see [“Configuring Matrix SPARSH VP310”](#).

Operating SPARSH VP310

Please refer the EON48_310_SPARSH VP248_310 User Guide for instructions on operating the features of SARVAM UCS.

Matrix SPARSH VP330

SPARSH VP330, the next generation feature rich SIP phone of Matrix with an intuitive GUI (Graphical User Interface) based touch-screen. It provides you an easy way of managing your communication needs to meet the day to day business requirements. Designed to change the way you communicate and collaborate, SPARSH VP330 delivers a seamless communication experience that is convenient and ready to use in real time, so that you can focus on the task in hand. Once it is registered with the SARVAM UCS, you can start operating the phone.

Key Features

- **Enhanced Call Management:** Dedicated one-touch feature keys and intuitive user interface provides quick access to full range of System call management features including Call Hold, Call Park, Call Transfer, Conference and Voicemail.
- **Access to Corporate Directory:** Easy integration with the enterprise's Corporate Directory (Global Directory) which allows you to easily locate and dial corporate contacts at one click.
- **Presence:** Provides intuitive Presence status display and supports changing your Presence status which is viewable to other extension users. You can also view the Presence Status of remote users.

- **Busy Lamp Field (BLF) Indication:** You can monitor the status of the extensions and trunks who are assigned DSS Soft keys. You can also pickup ringing extensions/trunks using DSS Soft keys.
- **Plug & Play:** Integrated Plug & Play feature that enables to power up the phone and start using it. On the other hand, it helps in mass deployment of the phones in your organization without requiring a lot of manual intervention to configure each of the phones separately.
- **Multiple Language Support:** The phone can be operated in six different languages including English, French, German, Spanish, Portuguese and Italian.
- **Capacitive Touch Screen:** 4.3 inch Capacitive Touch Screen LCD (Liquid Crystal Display) that delivers easy access to advanced features and a unique experience beyond traditional desk phones. Supports adjustable Brightness controls from the touch screen to suit your customized LCD requirement.
- **Easy-to-Use Hard Keys:** Supports following hard keys and LEDs:
 - 6 Fixed Feature Keys
 - 12 Alphanumeric Digit Keys (Dial pad Keys)
 - 1 Speaker Key.
 - 12 DSS (Direct Station Selection) keys.
 - 1 Ringer LED.
- **Improved Audio:** High Definition (HD) Audio output that delivers crystal clear voice and life like conversations over HD handset and hands-free speaker.
- **High Speed Ethernet connectivity:** Dual switched 10/100 Base-T auto-sensing Ethernet LAN connectivity allows unconstrained bandwidth from the network to the phone. LAN port is used to connect the phone to a Switch or a Hub or a Router or an xDSL Modem. You can connect your PC to the PC port of the phone.
- **Power over Ethernet (PoE):** Integrated IEEE 802.3f Power over Ethernet allows easy deployment with centralized powering without a need for external power adapter.
- **Wi-Fi Support:** Supports Wi-Fi (WLAN) connectivity using which the phone provides seamless connectivity to the corporate Wi-Fi network and offers flexibility to work from anywhere in the office. If your installation setup does not meet the requirements of suitable wired Ethernet connectivity due to any reason, then you can connect the compatible Wi-Fi Adapter supplied by Matrix to the USB port to register and use the phone.
- **Improved Audio:** High Definition (HD) Audio output that delivers crystal clear voice and life like conversations over HD handset and hands-free speaker.
- **Full-duplex Hands-free Speaker:** High quality speaker with acoustic echo cancellation to deliver natural and clear speech even for hands free operation without any distortion.

SPARSH VP330 Key Template (default)

All the key maps of the SPARSH VP330 are the same.

Feature Keys and DSS Keys

Feature Keys

There are 6 Feature Keys. Each Feature Key is accompanied by a feature icon that describes its function. Default features assigned to these keys are as follows.

SR. No.	Feature icon	Assigned Feature	LED
1		Voicemail	Single Color - Blue
2		Mute	Single Color - Blue
3		Headset	Single Color - Blue
4		Hold	No
5		Conference	No
6		Transfer	No

These Feature keys are programmable. You cannot change the labels of these keys and therefore it is recommended that you avoid programming these keys. However, if you still decide to reprogram features on these keys, keep a note of the changes you have made.

A few of these Feature keys are equipped with an LED to indicate the status of the feature assigned to it. You may re-assign other features to these keys. We recommend you to assign those features that require LED indication to the Feature keys equipped with an LED.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a feature key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the Feature key to which the Auto Redial feature has been assigned will glow Blue, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

DSS (Direct Station Selection) Keys

There are 12 DSS Keys which can be used for quick access to different features and facilities. For example, to dial an extension number at one key press, just press the DSS key assigned to that extension and the call will be placed automatically. These Keys have dual color LEDs - blue and red. Features/facilities assigned to these keys can be changed by the System Engineer.

As SPARSH VP330 may be the extension of the Operators and Executives in an enterprise to meet the varied requirements of each user group, these key maps can be customized to match the exact requirement of individual users. For instructions on customizing the Key Maps, see [“Customizing Extended IP Phone Templates using](#)

[Jeeves](#) . You can also personalize the key maps for each location, for instructions, see, [“DSS Key Settings”](#) under [“Configuring Matrix SPARSH VP330”](#).

For detailed information about SPARSH VP330, refer to the *SPARSH VP330 User Guide*.

Connecting SPARSH VP330

For detailed instructions to connect SPARSH VP330, see [“Connecting SPARSH VP330 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY LENX, [“Connecting SPARSH VP330 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY MENX, [“Connecting SPARSH VP330 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY GENX and [“Connecting SPARSH VP330 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY PENX.

Configuring SPARSH VP330

For detailed instructions on how to configure SPARSH VP330, see [“Configuring Matrix SPARSH VP330”](#).

Operating SPARSH VP330

Refer the *SPARSH VP330 User Guide* for instructions on operating the features of SARVAM UCS.

Matrix SPARSH VP510

SPARSH VP510, the Premium IP Phone sets the benchmark for quality performance with elegant design and crystal-clear voice. SPARSH VP510 features a Vivid LCD Graphical Display, Direct Station Selection (DSS) Keys, 3.5mm Headset connectivity, High Quality speakerphone and high definition audio quality.

Engineered to deliver full feature access of SARVAM UCS, SPARSH VP510 acts as face of your communication system covering wide array of business environments.

The State-of-the-art Deskphone is best suited to deployment for Reception, Supervisors, Managers, Executives, Call Center Agents and Office professionals. These phones offer flexibility to streamline communications and attain higher return over investment.

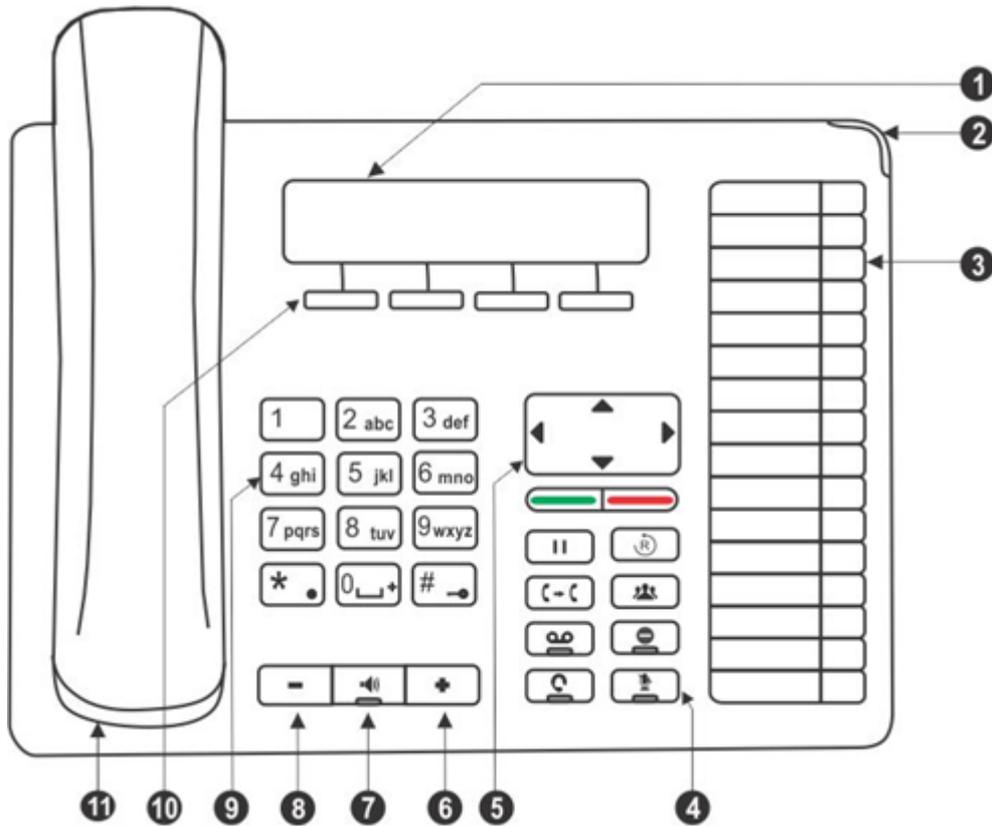

Key Features

- Minimum 240*64 pixel and above graphical LCD with Back light
- Message Wait and Ringer Lamp
- Built-in 16 DSS Keys for Feature, Line, Extension
- Add -on DSS module facility
- HD Voice,HD Handset, HD Speaker
- 4 Context Sensitive Keys
- 5 Features Keys (With LED) -Voice mail ,Headset ,Mute, DND, Speaker
- Fixed Function Keys (Without LED) - Hold , Conference, Redial, Transfer
- Tight integration with Server over SIP protocol /Proprietary Protocol
- HTTP Auto Provisioning
- Dual Color LED illuminated LED for line status
- One Touch Transfer
- Call logs
- Ringtone selection
- Wideband Codec : G722
- Narrowband Codec: G.711,G.723,G.729ab,GSM
- VAD,CNG,AEC,AJB,AGC
- Full Duplex speaker phone with AEC ,VAD ,CNG
- IP Assignment : Static /DHCP
- TCP/DNS-SRV
- AEC encryption for config file
- IEEE802.1x
- 3.5 mm / RJ9 headset port
- Dual port 10/100 Mbps Ethernet
- Stand with 2 adjustable angles
- PoE (IEEE 802.af) class2

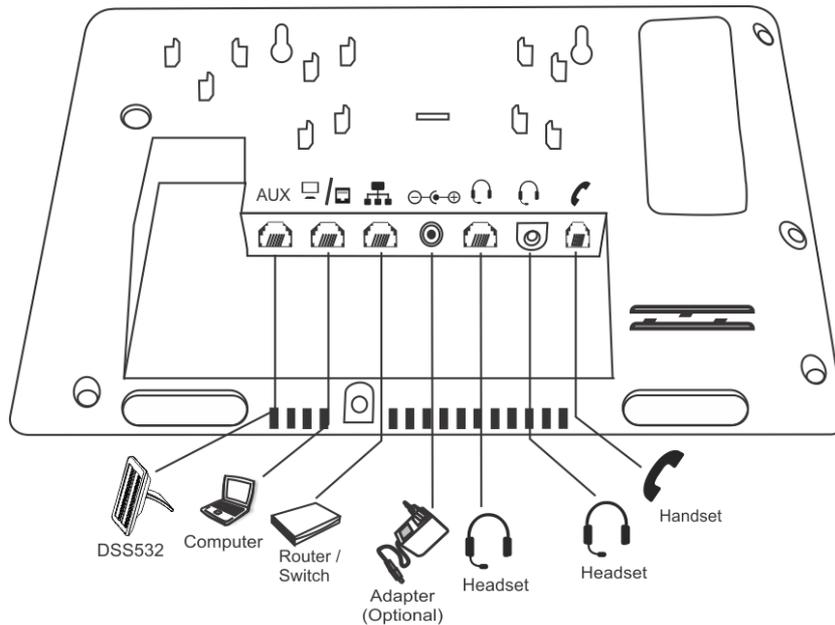

If any SPARSH VP510 extension is Off-Hook, the system will not be able to detect it. However, if any SLT/ DKP is Off-Hook, Off-Hook Alert will be provided to SPARSH VP510 if it is the Operator phone.

10	Context Sensitive Keys
11	Handset

Bottom View

LCD Display

The LCD display of the phone is backlit. The LCD backlight can be turned on and off as well as adjusted for contrast and brightness from the *Display Settings* of the Phone Menu.

Ringer LED

The Ringer LED will glow in Blue (1 sec ON – 500 msec OFF) to indicate incoming internal and external calls.

Navigation Keys

The functions of each are described briefly below.

- **Up Key:** To scroll upwards while navigating the Menu/sub-menu or to access Phone Settings and set the Ringtone (when phone is in the idle state).
- **Down Key:** To scroll downwards while navigating the Menu/sub-menu.
- **Forward Key:** To move forward when dialing a number or scroll to view the Context Sensitive Key options.
- **Back Key:** To move backwards when dialing a number, to go back one level in the Menu or scroll backwards to view the Context Key options.
- **Menu or Select / OK Key**  : To enter the Menu; when the phone is in the idle state (without any incoming or outgoing call being made).

Menu Key functions as the **Select / OK Key** to make a selection from the Menu/sub-menu options or to complete an action. When there is an incoming call it functions as the **Answer Key**.

- **Cancel Key**  : To Cancel all features set by you or exit the Menu/sub-menu.

Feature Keys

There are 8 Feature keys assigned to important or frequently accessed features of SARVAM UCS.

Feature icon	Assigned Feature	LED	Programmable
	Hold	No	Yes
	Redial	No	Yes
	Transfer	No	Yes
	Conference	No	Yes
	Voicemail	Single Color - Blue	Yes
	Do Not Disturb	Single Color - Blue	Yes
	Headset	Single Color - Blue	No
	Mute	Single Color - Blue	No

These keys are programmable. However, as you cannot change the labels avoid programming these keys.

For instructions on programming these keys, see [“DSS Key Settings”](#) under [“Configuring Matrix SPARSH VP510”](#).

A few of these Feature keys are equipped with an LED to indicate the status of the feature assigned to it. You may re-assign other features to these keys. We recommend you to assign those features that require LED indication to the Feature keys equipped with an LED.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a feature key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the Feature key to which the Auto Redial feature has been assigned will glow Blue, when Auto-Redial is set, and the LED is turned off when the feature is canceled.

Direct Station Selection (DSS) Keys

These are 16 programmable keys that can be assigned to Stations and Trunks and important or frequently accessed features of SARVAM UCS.

For instructions on programming these keys, see [“DSS Key Settings”](#) under [“Configuring Matrix SPARSH VP510”](#).

DSS Key LEDs

Each DSS key is equipped with an LED which glows to indicate the status of the Trunk/Extension or Feature assigned to it.

- **Status of Extensions and Trunks:** The LED of DSS keys assigned to Extensions/Trunks glow in three colors to indicate status of the call event on the Extensions/Trunks and on the Extended IP Phone. Thus, the status of the Extended IP Phone user's own Extension as well as that of the other Extensions (i.e. Extended IP Phones, SLTs) and the status of Trunk lines are indicated by the LED of the DSS keys assigned to those Extensions and Trunks on the Extended IP Phone.

The following table shows the relationship between the color of the LED and various events:

LED Color	LED Mode		
	Continuously ON	Slow Blink	Fast Blink
Blue	The key assigned to the Extension you are in speech with.	The key assigned to the Extension you have kept on hold.	The key assigned to the Extension you are calling or from which you are being called.
Red	The key assigned to the Extension that is now busy with another Extension/ Trunk.	The key assigned to the Extension which has put another Extension/Trunk on hold.	The key assigned to the Extension/Trunk that is called or being called by another.
Violet	You are talking on a Trunk (external call)	You have held a Trunk (external call)	You have an incoming call on the Trunk (external call)

- **Blue** indicates the state of the extension/trunk you access. For example, when you make a call to another Extension 203, the LED of the DSS key assigned to Extension 203 blinks Blue to indicate ringing at the Extension. If you have successfully established speech with Extension 203 the LED glows Blue continuously.
- **Red** indicates the state of other Extensions/Trunks. For example, if the LED of the DSS key assigned to Extension 201 is glowing Red continuously, it means Extension 201 is busy with another Extension or Trunk.
- **Violet** indicates the state of the trunk you are in speech with. For example, when you are in speech on an outgoing call on Trunk 1 the LED of the DSS Key assigned to Trunk 1 will be continuously ON. When you put the call on hold, the LED will blink slowly.
- **Status of Features:** The LED of a DSS key is activated when the feature assigned to this key is used.

Not all features require LED indication. For example, the feature Call Pick-Up does not require an LED. So when you assign this feature to a DSS key, the LED of the key remains inactive, when Call Pick-Up is accessed.

Feature like Auto Redial requires an LED to show that it has been set or canceled. So, the LED of the DSS key to which the Auto Redial feature has been assigned will glow Red, when Auto Redial is set, and the LED is turned off when the feature is canceled.

The LEDs of the Call Appearance (CA) Keys will function in the same manner as the DSS Key LEDs.

Dial Pad

The dial pad consists of 12 fixed keys for the digits 0, 1-9, and the characters Star (*), Hash (#), Lock (➔), Plus (+) and Dot. The dial pad is used for dialing numbers of stations, external parties, and for dialing the programming and feature access codes.

Speaker Key

The speaker key sets the phone in 'Speaker mode' for hands-free operation.

Speaker Key LED

The Speaker Key on the phone is equipped with a single color LED which glows Blue when pressed for the speaker mode and is turned off, when you exit the speaker mode.

Volume Keys

- **"+" (plus)**: This is the increase key, to raise the volume of speech while talking and to increase the Ringer volume, when the phone is ringing.
- **"-" (minus)**: This is the decrease key, to lower the volume of speech while talking and to decrease the Ringer volume when the phone is ringing.

Headset Connectivity

The phone provides two Headset interfaces: A 3.5mm Audio Jack and an RJ9 connector at the bottom of the phone body.

So you can use any stereo headset of standard make with a 3.5 mm single connector or a headset with an RJ9 connector.

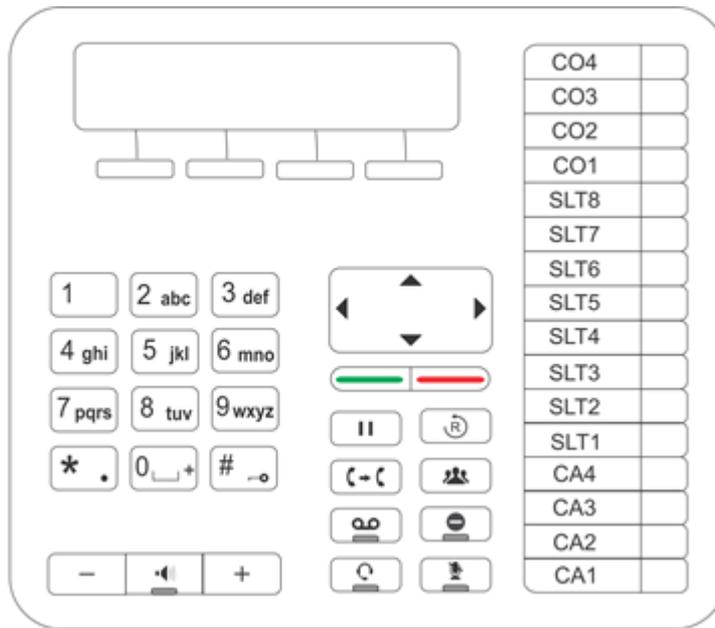

To use the Headset, a Headset Key is assigned on the phone. The Headset Key on the phone is equipped with a single color LED which glows Blue when pressed to indicate that the Headset mode is turned on and is turned off, when you press it again to indicate that you have exit the headset mode.

You can also program any of the DSS keys to function as the Headset key. For instructions on programming the key, see ["DSS Key Settings"](#) under ["Configuring Matrix SPARSH VP510"](#).

Key Maps

As SPARSH VP510 may be the extension of the Operators and Executives in an enterprise to meet the varied requirements of each user group, these key maps can be customized to match the exact requirement of individual users. For instructions on customizing the Key Maps, see ["Customizing Extended IP Phone Templates using Jeeves"](#). You can also personalize the key maps for each location, for instructions, see ["DSS Key Settings"](#) under ["Configuring Matrix SPARSH VP510"](#).

Matrix Extended IP Phone, SPARSH VP510 Key Template (default)

The key maps of the Operator and Executive 1, 2, 3 are the same.

By using Key Templates you can prepare and assign common key maps to all or as many Extended IP Phones as you want, at one go.

SARVAM UCS also offers the flexibility to personalize the Key Maps of each Extended IP Phone, instead of using the Key Templates. For example, if you have assigned a common Executive Key Template to 12 Extended IP Phones, but you want to reassign some of the keys on two of these Extended IP Phones, SARVAM UCS allows you to selectively personalize the key maps of these two Extended IP Phones.

Phone Menu

To access the Phone Menu, press the Enter Key. You can access the following System and phone features from the phone:

Menu option	Description
Call Logs	To view call history of internal and external Missed, Answered and Dialed calls. You can also edit numbers in the call logs and store them in the Personal Directory.
Contacts	To add, edit, delete names and numbers of contacts in the Global Directory Part 1.
Call Forward	To set and cancel Call Forward-Unconditional, Call Forward-Busy, Call Forward No Reply, Forward On Busy/No Reply and Follow Me.
Dynamic Lock	To change the Toll Control level of the phone.
User Status	To set User Present or User Absent and Presence Status.
Keypad Lock	To lock the keypad of the phone.
Do Not Disturb	To set/cancel Do Not Disturb on the phone, that is, block incoming internal and external calls.
Call Cost Display	To view the cost of calls made from the phone.

Menu option	Description
Hotline	To set/cancel Hotline and Delayed Hotline.
Alarm	To set/cancel Personalized and Automated Alarms.
Change User Password	To change User Password.
One Touch Transfer	To set/clear the fixed destination number for One Touch Transfer.
Phone Settings	To customize settings of the phone.

When the phone is in idle state,

- Press the Down key  to access the Network Settings.
- Press the Up key , if you wish to change the Ringtone and Play Key Tone.

Navigating the Phone Menu

To navigate the menu,

- Press the Menu Key when the phone is idle.
- Scroll by pressing the Up/Down Navigation Key to reach the desired Menu option.
- Press the Select / OK  Key to select the desired Menu option.
- Scroll by pressing the Up/Down Navigation Key to reach the desired sub-menu option.
- Press the Select / OK  Key to select the desired sub-menu option.

To exit menu,

- Press Cancel  Key.
or
Go ON-Hook.

Call Waiting Indication

During an on-going call, if there is another incoming call, an indication will be provided to you for the waiting call.

The call waiting indication depends on the **Call Waiting Tone (for SPARSH VP248/VP310/VP510)** option you select in General Parameters under SIP Extensions. See [“Configuring Matrix SPARSH VP510”](#) for instructions.

Connecting SPARSH VP510

For detailed instructions to connect SPARSH VP510, see [“Connecting SPARSH VP510 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY LENX, [“Connecting SPARSH VP510 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY MENX, [“Connecting SPARSH VP510 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY GENX and [“Connecting SPARSH VP510 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY PENX.

For detailed instructions on how to configure SPARSH VP510, see [“Configuring Matrix SPARSH VP510”](#).

Operating SPARSH VP510

Please refer the *EON510_SPARSH VP510 User Guide* for instructions on operating the features of SARVAM UCS.

Matrix Extended SPARSH VP710

Extended SPARSH VP710, the Smart Video IP Deskphone is engineered to deliver a seamless communication solution to the user with experience of an android touch screen. Extended SPARSH VP710 is an integration of SPARSH VP710, an android based deskphone with VARTA ADR100 application. This tight integration of the UC Client, VARTA ADR100 with SPARSH VP710 offers advance calling capabilities.

The IP Phone provides an easy way of managing the modern communication needs for meeting the day to day business requirements. With sophisticated looks and innovative features, it is the next step towards collaboration for offering flexibility and convenience in day to day communication. Deskphone is the perfect client to extract the capability of server and with a smarter deskphone you can optimize the return over investment by utilizing the UC features of the IP Phone. Once it is registered with the SARVAM UCS, you can start operating the IP Phone.

Key Features

- **Enhanced Call Management:** Dedicated one touch feature keys and intuitive user interface provides quick access to full range of PBX call management features including Call Hold, Call Park, Call Transfer, Conference and Voicemail.

The IP Phone also provides an easy way for businesses to integrate their enterprises' voice solutions within the Android OS family.

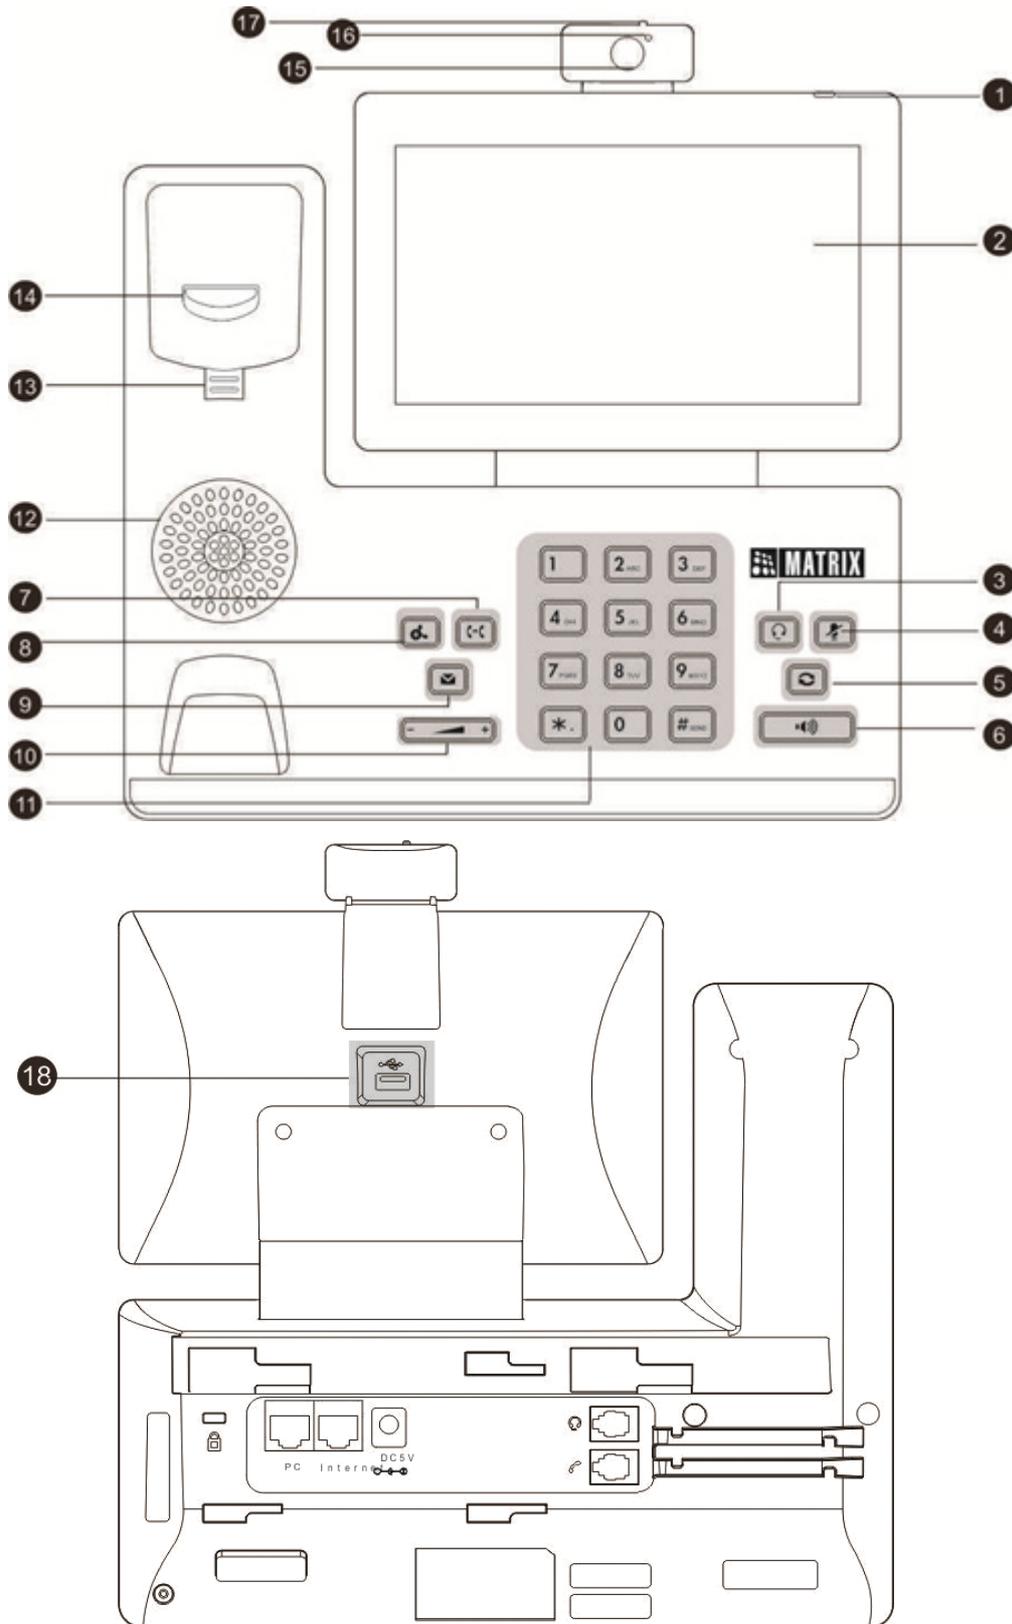

- **System Extension:** The IP Phone becomes an extension of the System. It provides users with a quicker and more user-friendly access to phone facilities, helping businesses optimize their employees' productivity.
- **Dial by Extension:** Flexibility to communicate with colleagues by dialing their respective extension numbers.

- **Smart Directory Access:** Provides you with the easy and quick way to access the extensions and other contacts through Smart Directory.
- **Presence:** You can set your presence status and view other extension users' presence statuses.
- **Voicemail Access:** Access to the corporate Voicemail System from any location ensures no opportunity is lost.
- **Multiple Call Support:** Easy handling of multiple incoming calls by keeping the ongoing call on hold and attending the higher priority call first. It also supports merging of calls to initiate a conference or splitting the conference to attend the calls separately.
- **Video Calling:** Video calling provides you the facility to make video calls to anyone, anywhere in the world. This makes it easier to conduct business meetings, discussions, demonstrations and presentations between people working at different locations.
- **Handover and vice-versa:** Using handover you can automatically move an active call from the IP Phone to your cellular number on the cellular network and vice-versa, without disconnecting the call and/or having to redial.
- **Busy Lamp Field (BLF):** Using BLF you can monitor the status of another extension or trunk and confirm whether it is available, busy, ringing or on hold.
- **IM and SMS:** Using this feature, you can send/receive IMs and SMSs to/from remote users.
- **One Touch Transfer:** You can transfer the ongoing call to a fixed extension without entering the number of that extension and without putting the call on hold. Similarly, you can also transfer a call from the fixed extension to your IP Phone.
- **Better Voice Quality:** Using customized codec settings, enhanced voice output is available. If you are aware of the bandwidth and the network criteria of your location, you can select the appropriate codec to get high quality voice output.
- **Standard Phone Features:** Provides intuitive access to Keypad, Contacts, Call Logs and more based on the Native Android design. One-touch access to call feature options during VoIP (Voice over IP) calls including Adding a New Call, Mute, Hold, Transfer and Speaker-phone.
- **Cost Effective Calling:** If you are using the enterprise Wi-Fi or Ethernet network to register the IP Phone with the System, calls made will be almost free.
- **Wi-Fi Support:** Supports Wi-Fi (WLAN) connectivity using which the IP Phone provides seamless connectivity to the corporate Wi-Fi network and offers flexibility to work from anywhere in the office. If your installation setup does not meet the requirements of suitable wired Ethernet connectivity due to any reason, then you can register the IP Phone through the Wi-Fi Network.
- **Advanced Call Capabilities:** Provides access to the features such as Callback, Dial-in Conference, Conversation Recording and many more.

If any Extended SPARSH VP710 extension is Off-Hook, the system will not be able to detect it. However, if any SLT/DKP is Off-Hook, Off-Hook Alert will be provided to Extended SPARSH VP710 if it is the Operator phone.

Extended SPARSH VP710, Front View and Bottom View

Key Label	Item	Description
1	Power Indicator LED	Indicates the status of calls, messages and voicemails. Also displays the registration status of the IP Phone.
2	Touch Screen	7 inch (1024 x 600) capacitive (5 point) touch screen. Tap to select and highlight screen items.
3	Headset Key	Toggles and indicates the headset mode. The key LED illuminates solid green when you activate the headset mode.
4	Mute Key	Toggles and indicates mute feature. The key LED illuminates solid red when you mute a call.
5	Call Log Key	Displays all the missed, received and dialed calls.
6	Speaker Key	Toggles and indicates the speaker mode. The key LED illuminates solid green when you activate the speaker mode.
7	Transfer Key	Transfers a call to another party.
8	Hold Key	Places a call on hold or resumes a held call.
9	Voicemail Key	Accesses voice mails.
10	Volume Key	Adjusts the volume of the handset, headset, speaker, ringer or media.
11	Keypad	Provides the digits and special characters.
12	Speaker	Provides speaker audio output.
13	Hookswitch Tab	Secures the handset in the handset cradle when the IP Phone is mounted vertically.
14	Hookswitch	Picking up the handset from the handset cradle, the hookswitch bounces and the phone connects to the line. Laying the handset down on the handset cradle, the phone disconnects from the line.
15	Camera Lens	2 Mega-pixel camera. Provides near-site video. The better distance between camera and images you want to capture should be in the range of 0.35 meters (1 foot) to 2 meters (6 feet).
16	Camera Indicator LED	Indicates the status of camera and video calls.
17	Shutter Switch	Covers and uncovers the camera. When the camera is switched off, the video image is black.
18	USB2.0 Port	Allows you to connect the USB flash drive/USB headset to the phone.

LED Indications

Power Indicator LED

LED Status	Description
Solid Red	When the Phone is not registered.

LED Status	Description
Fast Flashing Red	When the Phone is in ringing state.
Slow Flashing Red	When the Phone receives a missed call, message or voice mail.
Off	When the Phone is powered off. When the Phone is in busy state. When the Phone is idle. When the call is placed on hold. When the call is muted.

Camera Indicator LED

LED Status	Description
Solid Green	When the Phone is powered on and the camera is connected properly. When the camera is idle. When the phone receives an audio call.
Solid Red	When the Phone receives a video call. When there is an active video call. When the video call is muted. When the video call is placed on hold.
Off	When the Phone is powered off. When the camera is not connected properly. When the camera shutter switch is closed.

Connecting Extended SPARSH VP710

For detailed instructions to connect Extended SPARSH VP710, see [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY LENX, [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY MENX, [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY GENX and [“Connecting Extended SPARSH VP710 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY PENX.

Configuring Extended SPARSH VP710

For detailed instructions on how to configure Extended SPARSH VP710, see [“Configuring Matrix Extended SPARSH VP710”](#).

Operating Extended SPARSH VP710

Please refer the *EXTENDED SPARSH VP710 User Guide* for instructions on operating the features of SARVAM UCS.

Matrix SPARSH VP210

SPARSH VP210, the Entry Level IP Phone sets the benchmark for quality performance with elegant design and crystal-clear voice. SPARSH VP210 features a 3.1" Graphical LCD Display, SIP Line Keys, High Quality speaker-phone and high definition audio quality.

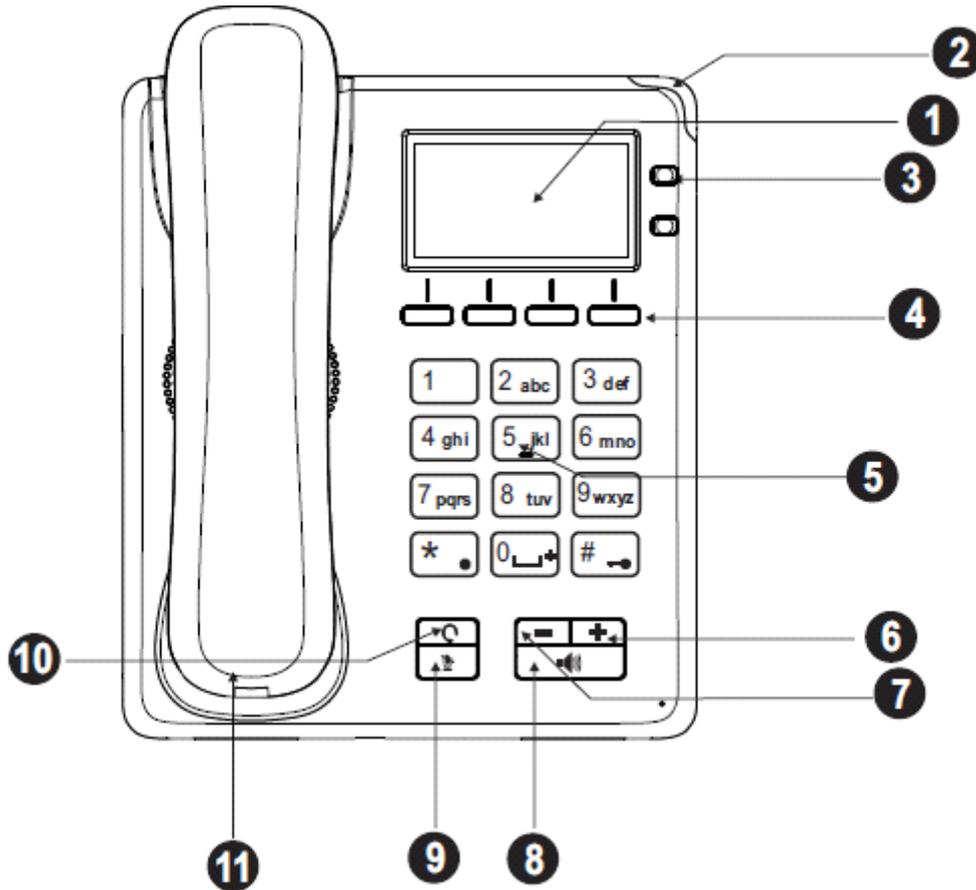

The State-of-the-art Deskphone is best suited for usage in lobbies, cafeterias, conference centers wherein the basic level endpoint security is sufficient. It can also be used by Administrative Staff, Hospitality guest rooms, knowledge workers etc. These phones offer flexibility to streamline communication and attain higher return over investment.

Key Features

- 128 x 64 Graphical LCD
- LED for Call and Message Wait Indication
- HD Voice, HD Handset, HD Speaker
- 4 Context Sensitive Keys
- 3 feature keys: Headset, Mute, Hands-free speaker phone
- Fixed Function Keys (Without LED) — Hold, Conference, Redial, Transfer
- Tight integration with Server over SIP protocol /Proprietary Protocol
- HTTP Auto Provisioning
- Dual Color illuminated LED for line status
- One Touch Transfer
- Call logs
- Ringtone selection
- Wideband Codec : G722
- Narrowband Codec: G.711(A/μ), G.729, G.726, G.723
- VAD, CNG, AEC, AJB, AGC
- Full Duplex speaker phone with AEC

- IP Assignment : Static / DHCP
- TCP/ DNS-SRV
- AEC encryption for config file
- IEEE802.1x
- RJ9 headset port
- Dual port 10/100 Mbps Ethernet
- Stand with 2 adjustable angles
- PoE (IEEE 802.af) class2

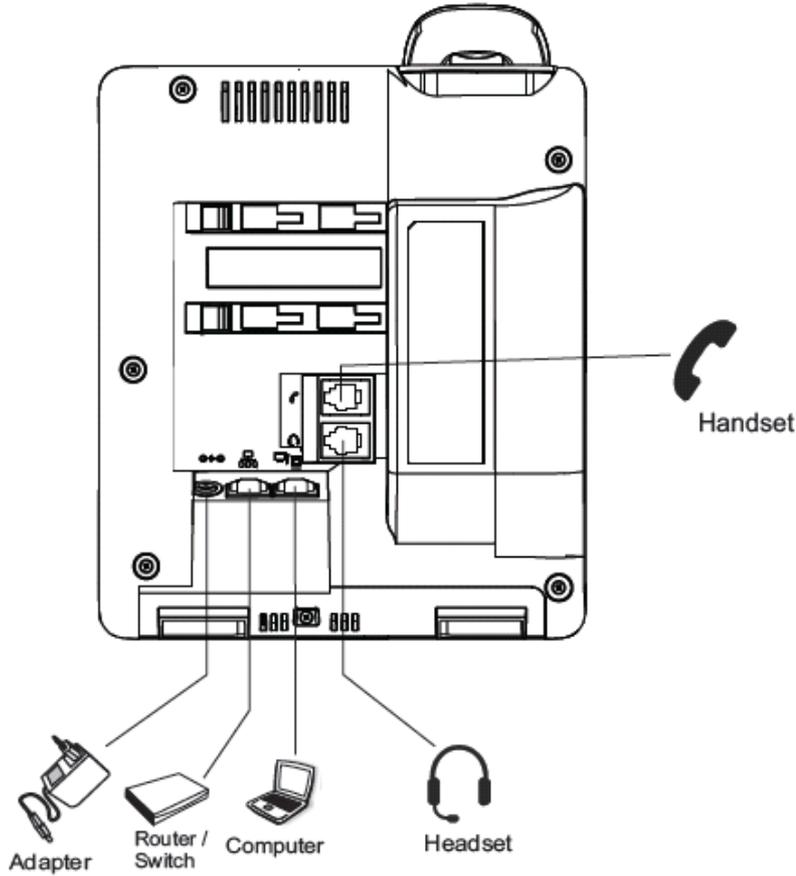

Front View

1	LCD Screen
2	Ringer LED
3	Navigation/Notification Keys
4	Context Sensitive Key
5	Dial Pad
6	Volume Increase Key
7	Volume Decrease Key
8	Speaker Key
9	Mute

10	Headset Key
11	Handset

Bottom View

It is a PoE enabled phone and can be powered over Ethernet by connecting it to a PoE enabled LAN Switch (IEEE 802.3af Compliant). If you do not want to use PoE, plug in the connector of the Adapter into the power jack (DC Jack) at the bottom of the phone. The IP phone should be used with Matrix original power adapter (5V/0.6A) only.

LCD Display

The LCD display of the phone is Dot Matrix Graphic LCD. The LCD backlight can be turned on and off as well as adjusted for contrast and brightness from the Phone Menu.

Ringer LED

The Ringer LED will glow in Blue (1 sec ON – 500 msec OFF) to indicate incoming internal and external calls.

Feature Keys

here are 3 Feature Keys. Each Feature Key is accompanied by a feature icon that describes its function. Default features assigned to these keys are as follows.

Feature icon	Assigned Feature	LED	Programmable
	Headset	No	No
	Mute	No	No
	Speaker	No	No

Navigation/Notification Keys

There are 2 Navigation Keys, Up/Down Keys.

When the phone is in idle state these keys are used for accessing the Notifications - Call Back, Auto Redial, Trunk Reservation, Contact Sync.

You can navigate sideways using the context keys, that is, **Left Navigation** < Key or **Right Navigation** > Key.

Dial Pad/Key Pad

The dial pad consists of 12 fixed keys for the digits 0, 1-9, and the characters Star (*), Hash (#), Lock (—●), Plus (+) and Dot. The dial pad is used for dialing numbers of stations or external parties.

Speaker Key

The speaker key sets the phone in 'Speaker mode' for hands-free operation.

Volume Keys

- **"+" (plus)**: This is the increase key, to raise the volume of speech while talking and to increase the Ringer volume, when the phone is ringing.
- **"-" (minus)**: This is the decrease key, to lower the volume of speech while talking and to decrease the Ringer volume when the phone is ringing.

Headset Connectivity

The phone provides an RJ9 connector at the bottom of the phone body to connect a headset.

To use the Headset, a Headset Key is assigned on the phone. Make sure you have enabled the **Use Headset** option.

Phone Menu

You can access the following PBX and phone features from the Menu of the phone:

Menu option	Description
Call Logs	To view call history of internal and external Missed, Answered and Dialed calls.
Contacts	To add, edit, delete names and numbers of contacts in the Global Directory Part 1.
Call Forward	To set and cancel Call Forward - Unconditional, Call Forward - Busy, Call Forward - No Reply, Call Forward - Busy/No Reply, Call Forward - Not Registered.
Dynamic Lock	To change the Toll Control level of the phone.
User Status	To set User Present or Absent.
Keypad Lock	To lock the keypad of the phone.
Do Not Disturb	To set/cancel Do Not Disturb on the phone, that is, block incoming internal and external calls.
Hotline	To set/cancel Hotline and Delayed Hotline.
Alarm & Reminder	To set/cancel Personalized and Automated Alarms/Reminders.
One Touch Transfer	To set/clear the fixed destination number for One Touch Transfer.
Pickup	To configure as well as access Group/Selective Call Pick-up
Voicemail	To access your Mailbox.
Dial-In Conference	To schedule as well as establish the Conference.
Call Retrieve	To retrieve a call parked in the Personal or General Orbit.
CLIR	To set/cancel CLIR.
Call Supervision	To configure as well as access Call Supervision.
Message Wait	To set/cancel Message Wait.
Paging	To configure the Page Zone and make the announcement.
Meet Me Paging	To access Meet be Paging.
Room Monitor	To configure and access Room Monitor.
Intercom	To configure and access Intercom.
Follow Me	To set Follow Me.
Walk-in	To set/cancel Walk-in.
PIN Dialing	To make calls using PIN.
Department Group Call Forward	To set/cancel Department Group Call Forward.
Open Cosec Door	To open the Cosec Door Lock.
Settings	To change the following settings: <ul style="list-style-type: none"> • User Password: To change User Password. • Phone Settings: To customize settings of the phone. • Network Settings: To change Network Settings. • PCAP: To Start/Stop PCAP
Phone Info	Displays the phone information.

Navigating the Phone Menu

To navigate the menu,

- Press the **Menu** Key when the phone is idle.
- Scroll by pressing the **Up/Down Navigation** Key to reach the desired Menu option.
- Press the **Select** Key to select the desired Menu option.
- Scroll by pressing the **Up/Down Navigation** Key to reach the desired sub-menu option.
- Press the **Select** Key to select the desired sub-menu option.

To exit menu,

- Press **Back** Key.
or
Go ON-Hook.

To scroll Up or Down you need to use the **Up/Down Navigation** Keys. To scroll sideways, you need to use the **Left Navigation** < Context Key or **Right Navigation** > Key.

Context Specific Keys (CSK)

SPARSH VP210 has the provision to program the four Context Keys. These keys enable you to access the most frequently used functions/features at the press of a single button.

You can configure these Keys from SARVAM UCS Jeeves only.

The screens — Idle Screen, Ringing Screen, Busy Screen, Call Screen, Conversation Recording Screen, all have different set of features that can be accessed. SPARSH VP210, enables you to customize these by allowing you to set the priorities of the features in each type of screen as per your preference. You can assign the features to the Context Keys depending on the state of the call.

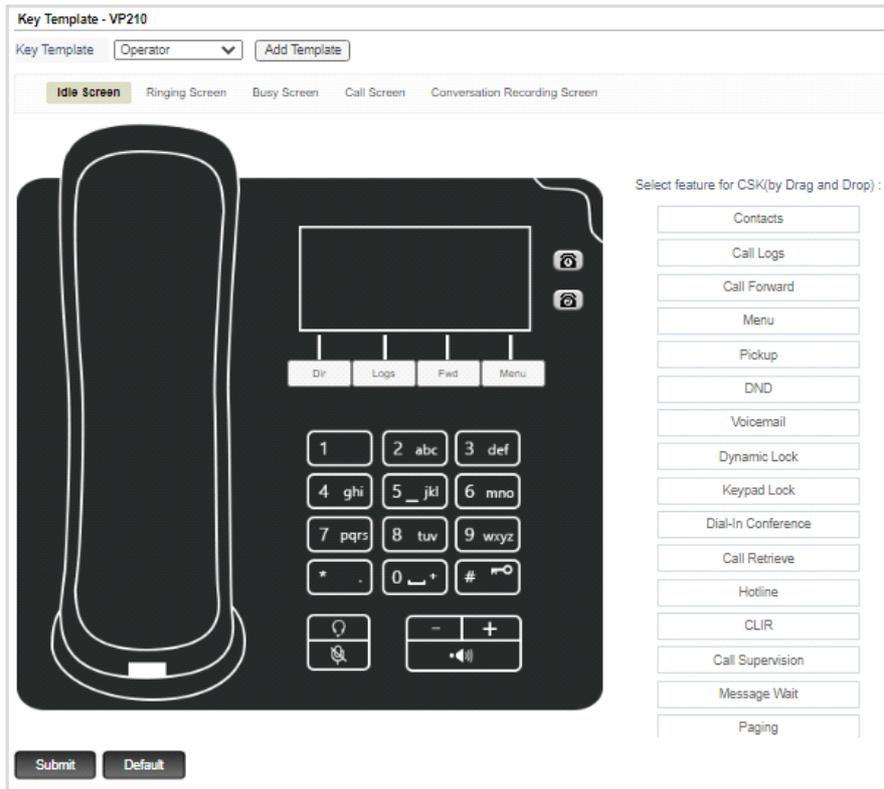

- In the Idle Screen you can assign the desired feature/function to the Context Keys as well as set their priorities as per your requirement.
- In the other Screens you can only set the priorities of the features.

Refer to [“Key Maps”](#), [“Customizing Extended IP Phone Templates using Jeeves”](#) as well as [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP210”](#).

Key Maps

As SPARSH VP210 may be the extension of the Operators and Executives in an enterprise to meet the varied requirements of each user group, these key maps can be customized to match the exact requirement of individual users. For instructions on customizing the Key Maps, see [“Customizing Extended IP Phone Templates using Jeeves”](#). You can also personalize the key maps for each location, for instructions, see [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP210”](#).

Matrix Extended IP Phone, SPARSH VP210 Key Template (default)

The key maps of the Operator and Executive 1, 2, 3, Hotel Attendant as well as Guest are the same.

By using Key Templates you can prepare and assign common key maps to all or as many Extended IP Phones as you want, at one go.

SARVAM UCS also offers the flexibility to personalize the Key Maps of each Extended IP Phone, instead of using the Key Templates. For example, if you have assigned a common Executive Key Template to 12 Extended IP Phones, but you want to reassign some of the keys on two of these Extended IP Phones, SARVAM UCS allows you to selectively personalize the key maps of these two Extended IP Phones.

Connecting SPARSH VP210

For detailed instructions to connect SPARSH VP210, see [“Connecting SPARSH VP210 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY LENX, [“Connecting SPARSH VP210 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY MENX, [“Connecting SPARSH VP210 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY GENX and [“Connecting SPARSH VP210 as Extended SIP Extension”](#) in SIP Extensions for ETERNITY PENX.

Configuring SPARSH VP210

For detailed instructions on how to configure SPARSH VP210, see [“Configuring Matrix SPARSH VP210”](#).

Operating SPARSH VP210

Refer the *SPARSH VP210 (Extended) User Guide* for instructions on operating the features of SARVAM UCS.

Matrix VARTA ADR100 UC Client

Matrix VARTA ADR100 is a proprietary SIP (Session Initiation Protocol) based UC Client running on Android Phones/Tablets, delivering full-array of Matrix SARVAM UCS features to the user on-the-go along with an added advantage of video calling. Through tight integration with the enterprise mobility features of the SARVAM UCS, Matrix VARTA ADR100 provides advance call capabilities including Conferencing, Corporate Directory Access (Global Directory), Call Logs and Conversation Recording with one-touch access. Other than these you can take the advantage of using UC features like Presence, IM, IM to SMS, Corporate VMS access to enhance your overall mobile experience.

Mobile workers can use any Wi-Fi or cellular data networks to stay connected with business communications while working from office, home or traveling to any location. An innovative and easy to understand user interface delivers all productivity features at fingertips that enhance speed of communication and collaboration with office users and customers.

Make sure the phone/tablet in which you install Matrix VARTA ADR100, runs on Android V5.0 or later.

To use MATRIX VARTA ADR100 make sure you have:

- Purchased and activated the VARTA Essential or VARTA Professional or VARTA Collaboration license. For more details, see [“License Management”](#).
- Assigned the desired license to the SIP Extension. For more details, see [“VARTA License Management”](#).

Key Features

- **System Extension:** Matrix VARTA ADR100 becomes a mobile extension of the SARVAM UCS. As an increased number of business professionals are using the collaborative tools found in smartphone devices to help them in their work activities, this application offers businesses an easy way to integrate their enterprises' voice solutions within the Android OS family.
- **Advanced Call Capabilities:** Access to features such as Callback, Dial-in Conference, Conversation Recording and many more.
- **Mobility:** Matrix VARTA ADR100 provides you the mobility that you need in today's highly competitive business environment; with the ability to access SARVAM UCS features easily once you are connected to

either Wi-Fi or 3G network. Considering the case of roaming users, one can register Matrix VARTA ADR100 with the SARVAM UCS using the enterprise Wi-Fi network when working within the office (that is within the organization's dedicated Wi-Fi coverage area). While working out of the office (where Wi-Fi network may not be available), one can register the application using the Mobile Data (3G) network.

- **Single Number Reach:** Retains the identity of the corporate phone system while working away from the office; so enhances business collaboration and lowers communication delays.
- **Dial by Extension:** Flexibility to reach to office users with direct extension number dialing.
- **Corporate Directory Access:** Enhance business collaboration with one-touch access to the Corporate Directory contacts using the SARVAM UCS Global Directory.
- **Video Support:** The application offers the added advantage of Video Calling.
- **Presence:** Supports changing your Presence status as well as you can view the Presence status of other extension users.
- **Busy Lamp Field (BLF):** Using BLF you can monitor the status of another extension or trunk and confirm whether it is available or busy or ringing or on hold.
- **IM and SMS:** The application allows you to send IM and SMS to remote users.
- **One Touch Transfer:** You can transfer an ongoing call to a fixed extension without entering the number of that extension and without putting the call on hold. Similarly, you can also transfer a call from the fixed extension to your application.
- **Voicemail Access:** Access to the corporate Voicemail System from any location ensures no opportunity is lost.
- **Multiple Call Support:** With multiple call support, you can easily handle multiple incoming calls, merge and split calls apart, and place users on hold with a simple tap. With this Android Application, it's like taking your deskphone on the road.
- **Wi-Fi to Cellular Handover and vice versa:** The application can automatically move an active call from the application to your cellular number on the cellular network and vice versa, without disconnecting the call and having to redial.
- **Better Voice Quality:** Using customized codec settings, enhanced voice output is available. If you are aware of the bandwidth and the network criteria of your location, you can select the proper codec from the application to get high quality voice output.
- **Standard Telephone Features:** Provides intuitive access to Keypad, Contacts, Call Logs and more, based on the Native Android design. One-touch access to call feature options during VoIP (Voice over IP) calls including Adding a New Call, Mute, Hold, Transfer and Speakerphone. Also provides DTMF support to enter numbers using an Auto Attendant.
- **Cost Effective Calling:** If you are using the enterprise Wi-Fi network to register Matrix VARTA ADR100 with the SARVAM UCS; calls made from the application will be almost free. Even if you are using the application via 3G network during roaming, external calls can be made using the SARVAM UCS trunks and thus reducing mobile calling and roaming charges.

- **Multiple Language Support:** The application can be viewed in six different languages including English, French, German, Spanish, Portuguese and Italian.
- **Application diagnostics:** Supports logging and sending of log files to concerned recipients by e-mail. These logs are used by the system engineer and/ or Matrix support engineers for troubleshooting.

Installing VARTA ADR100

For detailed instruction to install VARTA ADR100, refer to the *Matrix VARTA ADR100 User Guide*.

Configuring VARTA ADR100

For detailed instructions on how to configure VARTA ADR100, see [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

Operating VARTA ADR100

Refer to *Matrix VARTA ADR100 User Guide* for instructions on operating the features of SARVAM UCS.

Matrix VARTA AMP100 UC Client

Matrix VARTA AMP100 is a proprietary SIP (Session Initiation Protocol) based UC Client running on iPhones, delivering full-array of Matrix SARVAM UCS features to the user on-the-go along with an added advantage of video calling. Through tight integration with the enterprise mobility features of the SARVAM UCS, Matrix VARTA AMP100 provides advanced call capabilities including Conferencing, Corporate Directory Access (Global Directory), Call Logs and Conversation Recording with one-touch access. Other than these, you can take the advantage of using UC features like Presence, IM, IM to SMS, Corporate VMS access to enhance your overall mobile experience.

Mobile workers can use any Wi-Fi or cellular data networks to stay connected with business communications while working from office, home or travelling to any location. An innovative and easy to understand user interface delivers all productivity features at fingertips that enhances speed of communication and collaboration with office users and customers.

Make sure the phone in which you install Matrix VARTA AMP100, runs on **iOS9**.

Key Features

- **System Extension:** Matrix VARTA AMP100 becomes a mobile extension of the SARVAM UCS. As an increased number of business professionals are using the collaborative tools found in smartphone devices to help them in their work activities, this application offers businesses an easy way to integrate their enterprises' voice solutions within the iOS family.
- **Advanced Call Capabilities:** Access to features such as Callback, Dial-in Conference, Conversation Recording and many more.
- **Mobility:** Matrix VARTA AMP100 provides you the mobility that you need in today's highly competitive business environment; with the ability to access SARVAM UCS features easily once you are connected to either Wi-Fi or 3G network. Considering the case of roaming users, one can register Matrix VARTA AMP100 with the SARVAM UCS using the enterprise Wi-Fi network when working within the office (that is within the organization's dedicated Wi-Fi coverage area). While working out of the office (where Wi-Fi network may not be available), one can register the application using the Mobile Data (3G) network.
- **Single Number Reach:** Retains the identity of the corporate phone system while working away from the office; so enhances business collaboration and lowers communication delays.
- **Dial by Extension:** Flexibility to reach to office users with direct extension number dialing.
- **Corporate Directory Access:** Enhances business collaboration with one-touch access to the Corporate Directory contacts using the SARVAM UCS's Global Directory.
- **Video Support:** The application offers the added advantage of Video Calling.
- **Presence:** Supports changing your Presence status as well as viewing Presence status of other extension users.
- **Busy Lamp Field (BLF):** Using BLF you can monitor the status of another extension or trunk and confirm whether it is available or busy or ringing or on hold.
- **IM and SMS:** The application allows you to send IM and SMS to remote users. It also supports the Emoji keyboard to add Emoticons (Smileys) in your messages.
- **One Touch Transfer:** You can transfer an ongoing call to a fixed extension without entering the number of that extension and without putting the call on hold. Similarly, you can also transfer a call from the fixed extension to your application.
- **Voicemail Access:** Access to the corporate Voicemail from any location ensures no opportunity is lost.
- **Multiple Call Support:** With multiple call support, you can easily handle multiple incoming calls, merge and split calls apart, and place users on hold with a simple tap. With this iPhone application, it's like taking your deskphone on the road.
- **Cellular to Wi-Fi Handover and vice-versa:** You can move an active call from the Cellular number (on the Cellular network) to your application (registered using Wi-Fi network) without disconnecting or redialing the number. Similarly Wi-Fi to Cellular Handover is also possible where you can manually handover your call from the Wi-Fi to the Cellular network.

- **Better Voice and Video Quality:** Using customized codec settings and video quality preferences, enhanced voice output and video rendering are available. If you are aware of the bandwidth and the network criteria of your location, you can select the proper codec and video quality option from the application to get optimum audio and/or video output.
- **Standard Telephone Features:** Provides intuitive access to Keypad, Contacts, Call Logs and more. One touch access to call feature options during VoIP (Voice over IP) calls including Adding a New Call, Mute, Hold, Transfer and Speakerphone. Also provides DTMF support to enter numbers using an Auto Attendant.
- **Cost Effective Calling:** If you are using the enterprise Wi-Fi network to register Matrix VARTA AMP100 with the SARVAM UCS; calls made from the application will be almost free. Even if you are using the application via 3G network during roaming, external calls can be made using the SARVAM UCS trunks which reduces calling and roaming charges to a significant amount.
- **Multiple Language Support:** The application can be viewed in six different languages including English, French, German, Spanish, Portuguese and Italian.
- **Application Diagnostics:** Supports logging and sending of log files to concerned recipients by e-mail. These logs are used by the system engineer and/or the Matrix support engineers for troubleshooting.

Installing VARTA AMP100

For detailed instruction to install VARTA AMP100, refer to the *Matrix VARTA AMP100 User Guide*.

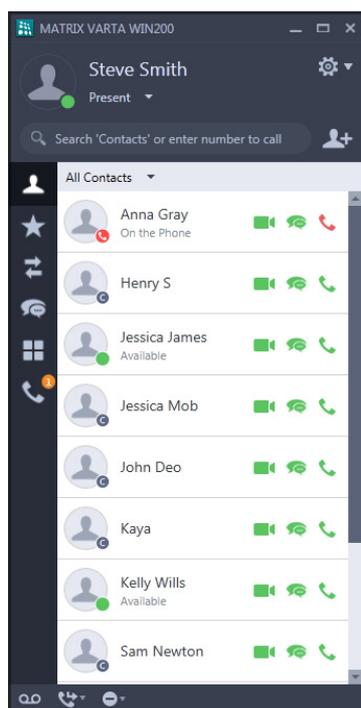

Configuring VARTA AMP100

For detailed instructions on how to configure VARTA AMP100, see [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).

Operating VARTA AMP100

Refer to *Matrix VARTA AMP100 User Guide* for instructions on operating the features of SARVAM UCS.

MATRIX VARTA WIN200

MATRIX VARTA WIN200, is a SIP (Session Initiation Protocol) based Unified Communication Client running on Windows OS, delivering full-array of the System features to the user on-the-go along with an added advantage of video calling. Through tight integration with the enterprise features of the System, UC Client provides advance call capabilities including Conferencing, Corporate Directory Access (Global Directory), Call Logs and Conversation Recording with one-touch access. Other than these you can take the advantage of using UC features like Presence, IM, IM to SMS, Corporate VMS access to enhance your overall mobile experience.

To use MATRIX VARTA WIN200 make sure you have:

- Purchased and activated the VARTA Essential or VARTA Professional or VARTA Collaboration license. For more details, see [“License Management”](#).
- Assigned the desired license to the SIP Extension. For more details, see [“VARTA License Management”](#).

Installing MATRIX VARTA WIN200

For detailed instruction to install MATRIX VARTA WIN200, refer to the *MATRIX VARTA WIN200 User Guide*.

Configuring MATRIX VARTA WIN200

For detailed instructions on how to configure MATRIX VARTA WIN200, see [“Configuring Matrix VARTA WIN200 UC Client”](#).

Operating MATRIX VARTA WIN200

Refer to *MATRIX VARTA WIN200 User Guide* for instructions on operating the features of SARVAM UCS.

Firestore Cloud Messaging (FCM) Support

What's this?

Firestore Cloud Messaging (commonly referred to as Android Push Notification or FCM) is a platform notification service created by Google LLC that enables third party application developers to send notification data to their applications installed on Android devices.

Previously, VoIP applications needed to maintain a persistent connection in order to receive calls. Keeping a connection open in the background, drains the battery as well as causes all kinds of problems when the application crashes or is terminated by users.

In Android 4.1 and above, Google has introduced FCM as part of their effort to improve battery life, performance and stability for VoIP applications such as Skype, WhatsApp, etc. FCM offers high-priority push notification with a large payload. The VoIP application receives the notification in the background, sets up the connection and displays a local notification to the user.

SARVAM UCS supports FCM for VARTA ADR100 Application only. Push Notifications will be sent for calls, new messages as well as for voicemail. Push Notifications will be sent to the MATRIX VARTA ADR100 Application only if it is in the background and when there is persistent internet connection. You will receive the Push Notifications even after you exit the application provided the check box *Calls and Messages after exit* is enabled in the VARTA ADR100 Application. For details refer to the VARTA ADR100 User Guide.

How it works

Pre-requisites for Push Notifications:

- Make sure that the server has a persistent internet connection and there is connectivity with the FCM Server. To check the connectivity, refer "[FCM Connectivity](#)".
- Make sure the Date and Time of the server is synchronized with the NTP Server.
- To receive IM and IM notifications make sure the application is registered at Location 1. For more details, refer "[Configuring Matrix VARTA ADR100/AMP100 UC Clients](#)".

Let us see how the notifications will be sent by the server when MATRIX VARTA ADR100 application is registered with the server as a SIP Extension and it is in the background. There is an incoming call or message:

- You can check the status of the SIP Extension user. It will display Registered (as the device is in the background) and under the respective Contact 1, 2, 3, it will display the time remaining for the expiry of the VARTA Client Inactivity Timer. The default value of the VARTA Client Inactivity Timer is 10 days. To configure this timer, refer to "[System Timers and Counts](#)".
- The server will send a Push Notification to the MATRIX VARTA ADR100 application (client).
- The server will wait for 15 seconds after sending the Push Notification:
 - if the client registers with the server within this time, the call will be connected or the message will be delivered. The status of the SIP Extension will display Registered and under the respective Contact 1, 2, 3 it will display the SIP ID, IP Address and the Registration Expiry Timer.
 - if the client does not register with the server within this time, the call will be disconnected or the message will be rejected. The status of the SIP Extension will display Registered and under the

respective Contact 1, 2, 3 it will display the time remaining for the expiry of the VARTA Client Inactivity Timer.

- The server maintains a configurable timer, VARTA Client Inactivity Timer which is set as 10 days. Till the expiry of the timer the server will send Push Notifications to the application.
- If for this duration, the server does not receive any registration request from the application and the timer expires, the server will consider the application as unregistered and will stop all Push Notifications to the application. The status of the SIP Extension will display Not Registered and under the respective Contact 1, 2, 3 the details will be cleared. Calls and messages will be rejected.

The server will start sending notifications to the application in the background after the application is brought in the foreground once and a registration request is received by the server.

Feature Interactions when the Application is in the Background

Call Forward when not Registered:

If the application receives an incoming call from a QSIG caller, the Call Forward functionality will not be applicable.

To know more, see [“Call Forward-When Not Registered”](#).

Handover and Handoff:

VARTAADR100 users will be able to use Handover but Handoff will not be possible. To know more, see [“Handover and Handoff”](#)

System Restart

After System Restart the VARTA Client Inactivity Timer will be reset.

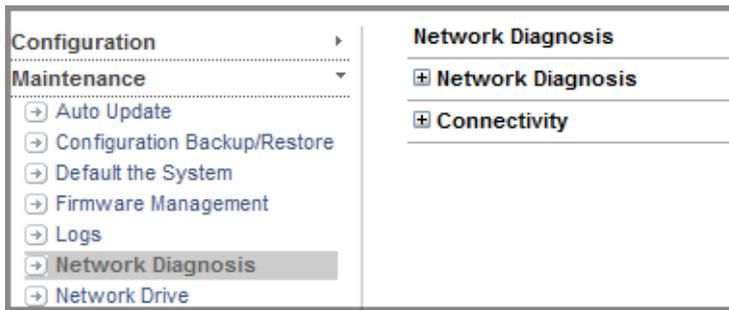

FCM Connectivity

A connectivity between the system and the FCM Server is required so that the Push notifications can be sent to the clients.

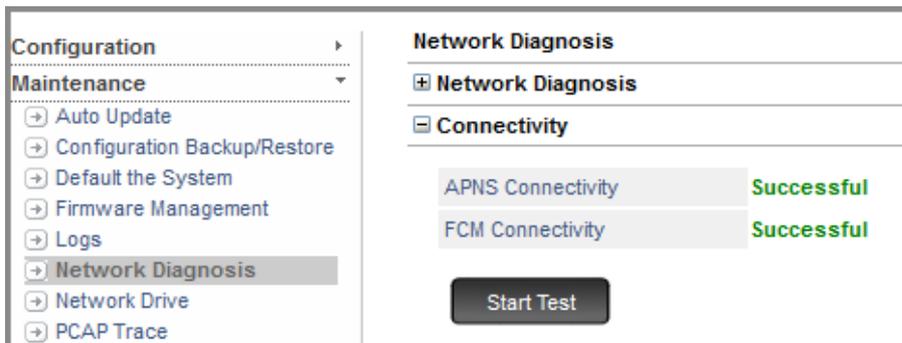

To check the FCM connectivity status,

- Log into Jeeves.
- Click the **Maintenance** link.

- Click the **Network Diagnosis** link

- Click **Connectivity** to expand.

- Click **Start Test**.
- In **Connectivity**, the status is displayed as:
 - Successful - if the connectivity between the system and the APNS/FCM Server is established
 - Timeout - if there is no connectivity.

*If the **Connectivity** Test of either of the servers (APNS or FCM) with SARVAM UCS is not successful, then Push Notifications will not be sent to the Mobile Clients — MATRIX VARTA ADR100 / AMP100 application.*

Flash Timer

What is Flash?

Pulse dialing is a type of signaling in which codes (digits) are dialed in pulses. A hook switch or a Flash key is generally used to dial this code. Technically, Flash is breaking the loop current for 200 milliseconds to 900 ms. Please note that since this code is not simulated in standard DTMF convention, one cannot dial it in DTMF mode.

Flash timer signifies the time period for which the loop current breaks. Flash timer is programmable. Flash timer ranges from 083 ms to 999 ms. *By default, Flash Timer is 600 ms.*

Where is it used?

Extensions dial flash to use few System features and also to use few PSTN features. Flash is used in following cases:

- While transferring a call from one extension to another.
- While making conference between few extensions.
- While toggling call between two extensions.
- While using call-waiting facility available from PSTN exchange.

Now a days, more number of basic service providers and different types of advanced electronic telephone exchanges are prevailing. It is possible that one service provider interprets breaking of loop current for 300 ms as flash, other service provider interprets breaking of loop current for 900 ms as flash and system interprets breaking of loop current for 600 ms as flash. Hence if the system engineer sets the flash timer to 600 ms then he might not be able to use features provided by the service provider interpreting 900 ms for flash. To take care of this situation, SARVAM UCS offers Flexibility to program different flash timers for both extensions and trunks.

How to configure

To set the timer to the desired value:

- for the SLT ports, refer "[SLT Hardware Template](#)".
- for CO Trunks, refer "[CO Hardware Template](#)".
- for E&M ports, refer "[E&M Feature Template](#)".

- *Many times it happens that while transferring the call, the call either gets disconnected or is not transferred.*

- *This happens due to mismatch of time for which the hook switch is pressed, if used for transferring the call hence it is advisable to use Flash Key of the telephone instrument, instead of hook switch.*
- *This problem may occur with Flash Key also, if the timer for the Flash Key on the telephone instrument and the flash timer of the system are not set properly.*
- *Few telephone instruments have flash timers set to 800 ms. In such case the call does not get transferred because the flash timer of all extensions is set at 600 ms by default. In such cases the flash timer of the extension where the phone is connected should be increased to 800 ms.*

Flashing on Trunks (Continued Dialing)

What's this?

Public exchanges support features like call waiting, call forward, etc. To be able to use these features, users need to dial certain codes during speech.

When a system is connected between the user and the central office, the codes for dialing the features of the central office may clash with the codes for accessing the features of the system, making it difficult for users to access the features of the central office while in speech.

To overcome this, SARVAM UCS supports Flashing on Trunks (Continued Dialing), which informs the system about the codes dialed for the features of the central office on trunks by extension users.

How to configure

To be able to use this feature, *Continued Dialing* must be allowed to the extension in its "[Class of Service \(COS\)](#)".

How to use

For EON and Extended IP Phone Users

While in speech on trunk,

- Press 'Transfer' Key, dial * and the Desired Service Provider Code.
Or
- Press DSS Key assigned to Flashing on Trunks (if programmed).
- Dial the Desired Service Provider Code.

For SLT Users

While in speech on trunk,

- Press 'Flash'.
- Dial *
- Dial the Desired Service Provider Code.

Example:

To use Call Waiting facility of service provider exchange from an SLT extension, follow the steps given below:

1	Dial Flash-* .	This informs the system to pass following code.
2	Dial Flash-1 .	Speech with second call.
3	Dial Flash-* .	This informs the system to pass following code.
4	Dial Flash-1 .	Speech with first call.
5	Dial Flash-* .	This informs the system to pass following code.
6	Dial Flash-1 .	Speech with second call.

Flexible Numbers

What's this?

SARVAM UCS offers Flexibility to assign a code of your choice to access an extension. This code is called Flexible number. For example, to access first SLT having software port 001, one has to dial 2001. It is possible to change this code to any other number of your choice.

SARVAM UCS offers the following types of extensions, namely SLT, DKP, Magneto, ISDN Terminals, SIP Extensions, Radio Extensions, Virtual Extensions and Department Groups. The system loads default access codes to all extensions on first power ON. Later on the extensions can be assigned default Flexible numbers using a command.

The Default Access Codes for the Extensions are given below:

Software Port	Default Access Codes (Flexible Numbers)
001 to 240	2001 to 2240 for SLT Extensions
01 to 96	3001 to 3096 for DKP Extensions
01 to 16	Blank for Magneto Ports
01 to 64	Blank for ISDN Terminals
001 to 999	Blank for SIP Extensions (This is the SIP ID)
01 to 16	Blank for Radio Extensions
01 to 64	Blank for Virtual Extensions
01 to 16 17 to 24	3901 to 3916 for Department Groups Blank

SARVAM UCS also allows you to assign a Flexible Number to each extension individually or to a range of extensions simultaneously.

Configuring Flexible Numbers (Access Codes)

Assigning Access Codes to Extensions

You can configure the Flexible Numbers using Jeeves as well as commands. For instructions, see [“Configuring SLT Extensions”](#), [“Configuring DKP Extensions”](#), [“Configuring ISDN Terminals”](#), [“Configuring SIP Extension Settings as per the Extended Phone Type”](#), [“Virtual Extension”](#), [“Configuring Radio Interface”](#), [“Configuring Magneto Interface”](#) and [“Department Call”](#).

- *It is possible to have maximum of 6 digit flexible numbers.*
- *It is possible to clear the flexible number of a extension, range of extension and all extensions.*
- *Flexible numbers are the codes dialed from dial phase to call another extension. These flexible numbers should be unique and should not match with either other SLT extensions or DKP extensions or any of the features available from the dial phase.*

- Flexible number having common digits can be assigned to another extension. Please refer “[Conflict Dialing](#)” for more details.
- Same flexible number cannot be assigned to two different extensions.
- Use flexible numbers for all the features used from User mode and SA mode. Software port numbers are to be used only from the SE mode.
- When the access code of a extension is cleared; its flexible number becomes null or void.
- If access code of a extension is cleared, one cannot call that extension. However the extension with NULL flexible number can make calls as usual.

Assigning Access Codes to a Range of Extensions

You can assign Access Codes to a range of Extensions using Jeeves only.

If you are assigning a range of Extension Numbers (Access Codes) to the desired ports, and a match is found for the same extension numbers, the system will clear these extension numbers from the existing database. The new extension numbers will be assigned according to the given range.

Assigning Extension Numbers through **Extn. Numbers Range** has a priority over Extension Numbers assigned on individual ports.

To assign a range of Extension Numbers,

- Login as System Engineer.
- Under **Configuration**, click **Access Codes**.
- Click **Extn Numbers in Range** to open the page.

Index	Extension Type	Start S/W Port Number	Start Extension Number
1	None		
2	None		
3	None		
4	None		
5	None		
6	None		
7	None		
8	None		
9	None		
10	None		
11	None		
12	None		
13	None		
14	None		
15	None		

- Against each Index configure the following:
 - **Extension Type:** Select the Extension Type. You can select SLT,DKP, SIP, ISDN Terminal, Magneto, Radio, Department Group or Virtual Extension.
 - **Start S/W Port Number:** Enter the Software Port Number from which you want the system to start assigning the desired extension numbers.
 - Define the range of Station Access Codes(Extension Number/Flexible Number/Access Code) that you wish to assign to the Extension Type you selected in **Start Extension Number** and **End Extension Number**.

For the given range of extension numbers, the system will assign extension numbers from the software port number specified in Start S/W Port Number for this particular entry. The range of extension numbers will be assigned in ascending order of the Software Port Number.

For example:

Extension Type you selected is SLT

Start Software Port Number is 1

Start Extension Number is 2001

End Extension Number is 2100

The system will assign Extension Number 2001 to Software Port Number 1, 2002 to Software Port Number 2 and so on. The system will assign the last Extension Number 2100 to Software Port Number 100.

If you want to assign access codes starting with # or * to a range of extensions, make sure both **Start** and **End extension numbers** begin with # or *.

- Click **Submit**.

To check the Extension Numbers (Access Codes) assigned by the system,

- Click the Extension Type, in this case, under **Configuration** click **SLT Configuration**.
- Click **SLT Parameters**.
- Similarly you can assign the Access Codes (Flexible Numbers) to DKP, SIP, ISDN Terminal, Magneto, Radio, Department Group or Virtual Extension.

Floor Service

What's this?

The Floor Service feature allows you to provide a common access code to extension users which they can dial to call floor service.

Essentially a hospitality feature, Floor Service is also useful in offices. Floor service can be any administration or service department in the building, such as a stationery room, back office, backroom, photocopy/ mail room, secretarial assistance, concierge/janitor, Storeroom.

Just as all extension users can reach the Operator by dialing the common access code '9', they can reach the floor service by dialing a common access code, '38'. This is the default Floor Service access code, for all geographical regions where SARVAM UCS is installed.

This feature can be used in:

- Multi-storied buildings, which have floor service (pantry, mail sorting, house keeping, janitor, coffee room, refreshment area) for each floor. The SARVAM UCS can be programmed to land calls made by extension users dialing the common access code '38' on the floor service extensions of their respective floors.
- Offices that have a centralized floor service, instead of one on each floor. The SARVAM UCS can be programmed to land calls made from all extension phones by dialing '38' on the common floor service extensions.

This feature requires a license. To use this feature you must purchase the license for Hospitality. Refer the topic "[License Management](#)" to know more.

How it works

For example, Midas Towers houses different departments on each floor. Each floor has Floor Service.

Extensions 2001 to 2010 are on the first floor, 2011 to 2020 on the second floor, and 3001 to 3010 on the third floor. The floor service extensions are numbered as 2012 on the first floor, 2022 on the second floor and 3012 on the third floor.

With the Floor Service programmed for each floor, when the extension user 2001 dials '38', the call will land on the service extension 2012, assigned to room service on the first floor. Similarly, when the extension user 3008 on the third floor dials '38', the call will land on the service extension 3012 on the third floor.

If Midas Towers had a single floor service extension 2012 for all floors, with Floor service programmed, calls made from all extensions by dialing '38' would land on extension 2012 only.

How to configure

Programming the Floor Service feature involves the following steps:

1. Creating a routing group for each floor. Include Floor service extensions of a floor in a routing group prepared for that floor.

2. Assigning a routing group (number) in the Floor Service feature in the Station Advanced Feature Template. Prepare a different Station Advance Feature Template for each floor.
3. Applying the Station Advanced Feature Template (with the Floor service group programmed) to the extension. This will assign the extensions to the routing group programmed in the Template.

If the Enterprise/Building has centralized floor service, you only need to create a single Routing Group with service extensions, as required. This routing group number can be programmed on a common Station Advanced Feature Template which will be applied to all extensions.

Floor Service parameters can be programmed using Jeeves and a Telephone.

Programming Floor Service using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **Routing Group**.
- Choose the Routing Group number (01-96) you want to use as floor service group.

01-08 09-16 17-24 25-32 33-40 41-48 49-56 57-64 65-72 73-80 81-88 89-96						
Routing Group						
Routing Group	Name	Rotation	Member 1			
			Member Type	Port Number	Ring Timer(sec)	
1		<input checked="" type="checkbox"/>	DKP	0001	015	
2		<input checked="" type="checkbox"/>	DKP	0001	015	
3		<input checked="" type="checkbox"/>	DKP	0001	015	
4		<input checked="" type="checkbox"/>	DKP	0001	015	
5		<input checked="" type="checkbox"/>	DKP	0001	015	
6		<input checked="" type="checkbox"/>	DKP	0001	015	
7		<input checked="" type="checkbox"/>	DKP	0001	015	
8		<input checked="" type="checkbox"/>	DKP	0001	015	

Submit Default Default One Clear

You can program different routing groups for different floors. In each routing group you can program maximum 32 service extensions as 'members'.

- For routing group to be used as floor service, program the following parameters:
 - **Rotation Flag:** With this flag, you can enable or disable the rotation of calls in the routing group which has multiple 'member' extensions. When enabled, each fresh call will land on the extension which is next to the one that received the last call. This ensures equal distribution of incoming calls to all the destinations within the routing group. The flag has no relevance if the routing group has only one member extension.
 - **When member rejects the call, place the call again:** If any SIP/DKP member extension rejects an incoming call and the system again checks the routing group sequence, you can allow or restrict placing the same call on this extension. Select the When member rejects the call, place the call again check box, if you want the system to place the call again on the extension.

If this check box is cleared (disabled) and you have selected the Continuous check box, the extension that rejects the call stops ringing while the system hunts for other extensions in the routing group to land the call.

- **Member Type:** Select the 'Member Type'. You can select SLT, DKP, SIP, Virtual Extensions, ISDN Terminal, OGTBG or the Voice Mail Auto Attendant.

Program only as many extensions as you want in the routing group and set the remaining Member Types to 'None'.

For example: if you want to program only one extension in the routing group, set the Member Type in the remaining columns (Member 02-Member 32) to 'None.'

- **Port Number:** Enter the software port number on which the SLT/DKP/SIP/Virtual Extension/ISDN Terminal is connected.

If you have selected OTBG then enter the OTBG number here.

- **Voice Mail Auto Attendant (VMAA) Menu:** if you have selected the *Voice Mail Auto Attendant* as the Port Type, select the VMAA Menu to assign to the respective routing group.

You may click the *Voice Mail Auto Attendant (VMAA) Menu* link to edit the parameters of desired VMAA Menu. For details, see ["Voice Mail Auto-Attendant Menu"](#).

- **Ring Timer(s):** This timer defines the time for which the extension, on which the call lands, should ring. By default, the ring timer is set to 015 seconds and can be changed.
- **Continuous Ring Flag:** With this flag, you can set an extension to ring continuously until the call is answered. The first extension will continue to ring even as the system hunts for other extensions in the routing group to land the call. If the call still remains unanswered, the system will return the call to the first extension once again. This flag is of no relevance, if there is only one member extension in a routing group.

- Repeat the above steps to include other floor service extensions in the routing group.
- Click **Submit** at the bottom of the page to save your settings.
- Click **Station Advanced Feature Template** to open the page.

All extensions are assigned the Advanced Feature Template 01, by default. If the enterprise requires separate floor-service group for each floor, program a separate Station Advanced Feature Template for the extensions of each floor.

- Select a Station Advance Feature Template number to be assigned to the user extensions of a floor. For example: Template number 02 for extensions 2001 to 2010 are on the first floor, Template number 03 for extensions, 2011 to 2020 on the second floor, and Template number 04 for extensions 3001 to 3010 on the third floor.

Template No.	Caller ID Presentation while Transfer	Call Forward No Reply Timer (sec)	Preset Call Forward (WH)		
			Forward Type	Destination	Port No.
1	Transferring Party	030	None	Voice Mail	0001
2	Transferring Party	030	None	Voice Mail	0001
3	Transferring Party	030	None	Voice Mail	0001
4	Transferring Party	030	None	Voice Mail	0001
5	Transferring Party	030	None	Voice Mail	0001
6	Transferring Party	030	None	Voice Mail	0001
7	Transferring Party	030	None	Voice Mail	0001
8	Transferring Party	030	None	Voice Mail	0001
9	Transferring Party	030	None	Voice Mail	0001
10	Transferring Party	030	None	Voice Mail	0001

- Scroll with the horizontal bar to reach the column **Floor Service** of the selected Templates. Enter the Routing Group number you want to use as floor service group for that particular Station Advance Feature Template.
- Click **Submit** at the bottom of the page to save your settings.
- Now, apply the Station Advanced Feature Templates (with floor service routing groups programmed) to the extensions of the respective floors. For example: Template number 02 on extensions 2001 to 2010 are on the first floor, Template number 03 on extensions, 2011 to 2020 on the second floor, and Template number 04 on extensions 3001 to 3010 on the third floor.

If extensions are SLT, assign the Template on the **SLT Parameters** page.

If extensions are DKP, assign the Template on the **DKP Parameters** page.

If extensions are ISDN Terminals, assign the Template on the **ISDN Parameters** page.

If extensions are Virtual Extensions, assign the Template on the **Virtual Extensions** page.

Refer the topic "[Station Advanced Feature Template](#)" for instructions.

Programming Floor Service using a Telephone

- Enter SE mode.

To program a routing group with member extensions, dial:

- **6502-1-Routing Group-Destination Index-Port Type-Port Number**

Where,

Routing Group is the number of the Routing Group 01 to 96.

Destination Index is from 01 to 32

Port Type is the 'Member type':

00 for None

01 for SLT

02 for DKP

28 for ISDN terminal

34 for SIP Extension

36 for Virtual Extension

Port Number is the Software port number³⁰⁵ on which the floor service member extension SLT, DKP, ISDN Terminal is attached.

Software port number of the SLT, from 001 to 512.

Software port number of the DKP, from 001 to 128.

Software port number of the ISDN Terminal, from 01 to 64.

Software port number of the SIP Extension, from 001 to 999.

Software port number of the Virtual Extension, from 01 to 64.

To program the Ring Timer for the routing group, dial:

- **6503-1-Routing Group-Destination Index-Ring Timer**

Where,

Routing Group is the number of the Routing Group 01 to 96

Destination Index is from 01 to 32

Ring Timer is from 000 to 255 seconds (default: 015 seconds).

To program the Continuous Ring Flag for the routing group, dial:

- **6504-1-Routing Group-Destination Index-Flag**

Where,

Routing Group is the number of the Routing Group 01 to 96.

Destination Index is from 01 to 32

Continuous Ring Flag is

0 for disable continuous ring (each member extension in the group will ring for the programmed 'Ring Timer' for the group)

1 for enable continuous ring (the first extension in the group will ring till the call is answered)

To program the routing group in a Station Advanced Feature Template, dial:

- **5602-1-Template Number-11-Routing Group**

Where,

Template Number is from 01 to 50

11 is the feature code for Floor Service

Routing Group is from 01 to 96³⁰⁶

To apply the Station Advanced Feature Template now programmed with the Routing Group to SLTs, DKPs, ISDN Terminals, SIP extensions, refer the topic "[Customizing Station Advanced Feature Template using a Telephone](#)".

- Exit SE mode.

305. Refer the topic 'Software Port and Hardware ID' .

306. Enter the number of the routing group you programmed as Floor Service group.

How to use

To be able to use floor service, extension users may dial the default Access Code defined for Floor Service: 38.

Check with your System Engineer if this access code has been changed and dial the new access code obtained from the System Engineer.

For EON and Extended IP Phone Users

- Go OFF-Hook.
- Press DSS Key assigned to Floor Service (if programmed)

OR

- Dial Access Code '38'
- Talk
- Go ON-Hook

For SLT Users

- Lift handset
- Dial, Access Code '38'
- Talk
- Replace Handset.

Follow Me

What's this?

Using this feature, extension users can make your calls follow you wherever you go. Extension users can receive their calls on another extension, whenever they want.

How it works

- A's extension number is 2001.
- B's extension number is 2003.
- A is currently at B's extension.
- A wants to receive calls from extension 2001 on extension 2003.
- A sets Call Follow Me on extension 2003.
- All calls landing on A's extension 2001 will be forwarded to extension 2003.
- When A returns to extension 2001, A cancels Call Follow Me.

- *The extensions dial tone changes to feature tone if its calls are forwarded.*
- *Multiple users can use 'Follow Me' from the same extension.*
- *Follow Me can be overwritten. Extension A sets Follow-Me on extension B. After a period of time; goes to extension C. A can receive calls on extension C by setting Follow Me on extension C. Follow Me set by A on extension B will be cancelled.*
- *Follow Me cannot be chained. If extension A sets Follow Me to extension B. And extension B sets Follow Me on extension C, Calls for A will land on B only and calls for B will land on C only.*
- *DND is given priority over Call Follow Me feature.*

Also see ["Call Forward"](#), ["Class of Service \(COS\)"](#) and ["Do Not Disturb \(DND\)"](#)

How to configure

To be able to use Follow Me, extension users must have Call Forward feature enabled in their Class of Service for the time zone. For instructions, see ["Class of Service \(COS\)"](#) and ["Station Basic Feature Template"](#).

How to use

For EON & Extended IP Phone Users

To set Follow Me from another extension,

- Press 'Forward' Key of the other extension.
OR
Dial 135.
- Enter your extension number.
- Enter your user password.

To cancel Follow me, from your extension,

- Press 'Forward' Key of your extension phone.
- Select 'Cancel'
OR
Dial 130.

For SLT Users

To set follow me from another extension,

- Lift the handset of the other extension.
- Dial 135
- Dial your extension number.
- Dial your user password.
- Replace handset.

To cancel Follow me,

- Lift the handset of your extension.
- Dial 130
- Replace handset.

Forced Answer

What's this?

Extension users can force other extension users to answer their calls when there is no response from the called extensions.

How it works

Forced Answer can be requested by the calling extension. The calling extension may be an SLT, a DKP or an Extended IP Phone. However, the called extension (being forced to answer) must be either a DKP or an Extended IP Phone.

- Extension user A (SLT) calls extension user B (DKP/Extended IP Phone).
- B's phone is ringing, but B does not answer.
- A dials Forced Answer feature code.
- The speaker of B's phone's is turned on (goes OFF-Hook).
- A may now talk to B.

Forced Answer can be used when the called extension idle or ringing.

How to configure

To be able to use Forced Answer, extension users must have this feature enabled in their Class of Service for the time zone. For instructions, see ["Class of Service \(COS\)"](#) and ["Station Basic Feature Template"](#).

How to use

For EON & Extended IP Phone Users

To use forced answer on an extension:

- Dial the desired extension number.
- Press the DSS Key assigned to Forced Answer on Ring Back tone.
OR
Dial **5** on Ring Back Tone.
- The Ring Back Tone stops.
- The called extension's speaker is turned on.
- You are in speech with the called extension.
- You may talk.

For SLT Users

To use forced answer on an extension:

- Dial the desired extension number.
- Dial **5** on Ring Back tone.
- The Ring Back Tone stops.
- The called extension phone's speaker is turned on.

- You are in speech with the called extension.
- You may talk.

You can also dial '5', the feature code for Forced Answer, immediately after dialing the desired extension number, instead of dialing it during the Ring Back Tone. This way, you can talk to the desired extension user without waiting for the called extension user to answer your call.

Forced Call Disconnection

What's this?

Forced Call Disconnection enables extension users to disconnect a busy extension or a trunk at will, and free the system resources (access to extension and trunk) for themselves.

How it works

Forced Call Disconnection of an Extension:

- A, B and C are extensions.
- A and B are in speech.
- C calls B and finds it busy.
- C uses Forced Call Disconnection by dialing the feature command.
- C gets confirmation tone, while A and B get error tone.

Forced Call Disconnection of a Trunk:

- A and B are extensions. C is the external party.
- A is in speech with C on Trunk 1.
- B grabs Trunk 1 using *Selective Port Access*, but gets busy tone.
- B uses Forced Call Disconnection by dialing the feature command.
- B gets confirmation tone. A gets disconnected and gets error tone.
- B must grab Trunk 1 again to get the dial tone of the network.

To be able to use Forced Call Disconnection, the extension user must have a higher **“Priority”** than the extension user whom he/she tries to forcibly disconnect.

To be able to use Forced Call Disconnection on a busy trunk, the extension user must have grabbed that trunk using **“Selective Port Access”**. If the extension user has grabbed the trunk using a Trunk Access Code, the feature code to dial Forced Call Disconnection will not work.

In PLCC applications, Forced Call Disconnection can be used in a chain to reach the last Exchange through many tandem exchanges in between.

Forced Call Disconnection is not supported on SIP Trunks, BRI and T1E1 lines.

You are advised to restrict access to this feature only to important extension users. Extension Users who are allowed this feature are advised to use it judiciously.

How to configure

To be able to use Forced Call Disconnection, the extension must have:

- **Forced Release** feature enabled in the Class of Service. For instructions see **“Class of Service (COS)”** and **“Station Basic Feature Template”**.
- As Forced Call Disconnection on a busy trunk is possible only if the extension user has grabbed that trunk using **Selective Port Access**, this feature must be enabled in the Class of Service of the extension. For instructions see **“Class of Service (COS)”** and **“Station Basic Feature Template”**.

- Higher **Priority** assigned than other extensions. See “[Priority](#)” for instructions.

How to use

For EON & Extended IP Phone Users

To forcibly disconnect a busy extension/trunk³⁰⁷:

- Press the DSS Key assigned to Forced Call Disconnection on Busy tone.

OR

Dial **#*** on Busy tone.

- You get confirmation tone.
- You may now dial the extension number/grab the trunk.

For SLT Users

To forcibly disconnect a busy extension/trunk:

- Dial **#*** on Busy tone.
- You get confirmation tone.
- You may now dial the extension number/grab the trunk.

³⁰⁷. Only if you have grabbed this trunk using Selective Port Access.

Gain Settings

What's this?

To avoid noise or echo during speech, you must set the speech volume levels on the ports. SARVAM UCS allows you to set the speech volume levels for the following port types—CO, Mobile, SIP and SLT.

The speech volume levels can be adjusted by increasing or decreasing the Gain Settings provided on each port type.

How it works

A call received on the CO port can be placed on any of the following ports—DKP, SLT, Mobile, T1E1, SIP, BRI, E&M. The speech volume levels differ according to the port type. Hence, on the CO port you must set the speech volume levels for each of these port types.

In this case, let us assume that the call on the CO Trunk is to be placed on the SLT Port.

Before placing the call on the SLT Port, the system applies the CO to SLT Gain Setting (Receive and Transmit Gain settings) configured on the CO Trunk to adjust the speech volume level.

When the call is placed on the SLT Port, the SLT to CO Gain Settings (Receive and Transmit Gain settings) on the SLT Port are applied to adjust the speech volume level.

Hence, you can set different speech volume levels for each port type and the system automatically detects and applies these gain settings for each port type.

How to configure

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **CO Configuration**.
- Click **CO Gain Settings** to open the page.

Template No.	CO-SYSTEM		CO-Voice Mail		CO-Voice Module		CO-Call Progress Tones	
	Tx-Gain	Rx-Gain	Tx-Gain	Rx-Gain	Tx-Gain	Rx-Gain	Tx-Gain	Rx-Gain
1	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB
2	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB
3	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB
4	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB	-0.6 dB	-0.3 dB

- Select the CO Gain Settings Template Number you want to assign in the CO Hardware Template and configure the following Transmit and Receive Gain Settings:

- **CO - System (Tx-Gain and Rx-Gain):** Configure the Gain Settings that you want the system to apply on the CO port with respect to the system (for example Call Conference). These will not be applicable for any other port type. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - Voice Mail (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the incoming calls on the CO port are being answered by the VMS. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - Voice Module (Tx-Gain and Rx-Gain):** Configure the Gain Settings that you want the system to apply on the CO port when incoming calls are answered using Auto Attendant or Trunk Auto Answer. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - Call Progress Tones (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port while playing Call Progress Tones. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - Radio (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the CO port is connected to any Radio Port of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - SLT (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the CO port is connected to any FXS Port of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - CO (Tx-Gain and Rx-Gain):** Configure the Gain setting that you want the system to apply on the CO port when the CO port is connected to another CO Port of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - DKP (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the CO port is connected to any DKP Port of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - SIP (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the CO port is connected to any SIP Trunk or SIP Extension of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - Mobile (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the CO port is connected to any Mobile Port of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - T1E1/BRI (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the CO port is connected to any T1E1/BRI Port of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- **CO - E&M (Tx-Gain and Rx-Gain):** Configure the Gain Setting that you want the system to apply on the CO port when the CO port is connected to any E&M Port of the system during an incoming or outgoing call. Valid Range for Tx gain: +10dB to -15dB and Rx Gain +10dB to -15dB.
- Click **Submit** to save the settings.
- Similarly, to configure the Gain settings for the Mobile Port, click **Mobile Gain Settings** under **Mobile Configuration**.

- For SIP Trunk / Extension, click **SIP Gain Settings** under **VoIP Configuration**.
- For SLT Port, click **SLT Gain Settings** under **SLT Configuration**.

Assigning the Gain Settings Templates

To apply the Gain Settings you configured for each port type, you must assign these templates on the respective ports

- Assign the CO Gain Settings Template you configured in the CO Hardware Template, see [“CO Hardware Template”](#).
- Assign the Mobile Gain Settings Template you configured in the Mobile Port Parameters, see [“Mobile Port Parameters”](#).
- Assign the SIP Gain Settings Template you configured in the SIP Hardware Template, see [“SIP Hardware Template”](#).
- Assign the SLT Gain Settings Template you configured in the SLT Hardware Template, see [“SLT Hardware Template”](#).

Gateway Application-Answer Signaling

What's this?

When SARVAM UCS acts as a Gateway, this feature is used to convey the call maturity information on source port, when call made using destination port gets matured. This information can be useful for billing equipment connected at calling party end.

When the system acts as a Gateway, the Source Port is the port on which call originates and the Destination Port is the port on which the call terminates.

How it works

- This feature of answer signaling is applicable only for DISA option selected as 'CLI Authentication-one call-Ans. Sig.' in the DISA-CLI Authentication Table. Refer chapter [“Direct Inward System Access \(DISA\)”](#).
- The SARVAM UCS works as gateway for routing the call to the destination.
- If the calling party's number is programmed in Table - 'DISA-CLI Authentication', the SARVAM UCS will consider the calling party as successfully logged in as station which is programmed as "Auto Login station". The call will get answered by the SARVAM UCS. The caller will get dial tone.
- Caller can dial the desired number.
- SARVAM UCS will route the call from the destination port.
- When called party answers the call (that is, call on destination port gets matured), the Answer Signaling will be done on source port, if enabled.
- Answer Signaling will be done in form of DTMF digit string as programmed on the source port.
- If Answer Signaling is disabled on the source port, the DTMF digit string will not be dialed out, even if it is programmed.
- On receiving these digits, Billing equipment/System with which the calling party is connected, can consider the call is matured and start billing.

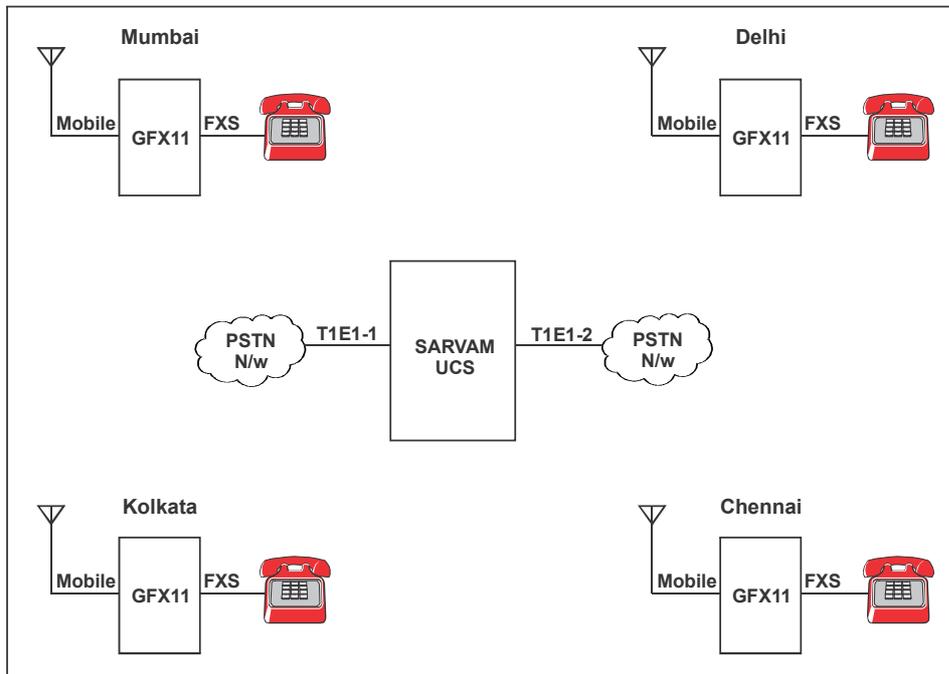

How to configure

To configure 'Gateway Application-Answer Signaling' flag and 'DTMF String' on desired trunk refer following chapters:

- For CO Trunk, Refer chapter [“CO Hardware Template”](#)
- For E&M Trunk, Refer chapter [“E&M Feature Template”](#)
- For Mobile Trunk, Refer chapter [“Configuring Mobile Trunks”](#)
- For T1E1 Trunk, Refer chapter [“Configuring PRI Trunks”](#)
- For BRI Trunk, Refer chapter [“Configuring BRI Trunks”](#)
- For SIP Trunk, Refer chapter [“Configuring SIP Trunks”](#)

By default, 'Gateway Application-Answer Signaling' is disabled for all ports. By default, DTMF Digit String' is programmed as 'CCC' on all ports.

Application:

- Multiple GFX11s are installed at different places for PCO Application.
- One SARVAM UCS is installed at central place.
- On FXS port of each GFX11, 'Pay Phone' is connected.
- On GSM port of each GFX11, SIM card is installed.
- GFX11s are configured for multi stage dialing, in which when ever caller dials the number using pay phone, GFX11 will store the number, it will first make a call to SARVAM UCS's T1E1 line on which DISA - 'CLI Auth- One Call - Ans. Sig.' is enabled.
- GFX11's SIM Numbers are programmed in 'DISA - CLI Auth.' table in SARVAM UCS.
- SARVAM UCS compares the Calling Number received on T1E1 Port with DISA-CLI Auth. Table.
- As the number is programmed in the table, SARVAM UCS answers the call and offers the trunk assigned in Station Basic Feature Template of the station used as 'Auto Login'.
- When SARVAM UCS answers the call, the GFX11 sends the stored called number (which is actually dialed by the caller) in DTMF digits.
- SARVAM UCS routes the call on this number using the offered trunk.
- When called party answers the call, SARVAM UCS will send 'DTMF Digit Strings' programmed on the T1E1 Port (Source Port, on which call originated) as a Gateway Answer Signaling'.

- The Pay Phone connected with FXS Port of the GFX11 is also configured to understand the same DTMF string as call maturity.
- Pay Phone will start billing only on receipt of the desired DTMF digits.

GPAX Application

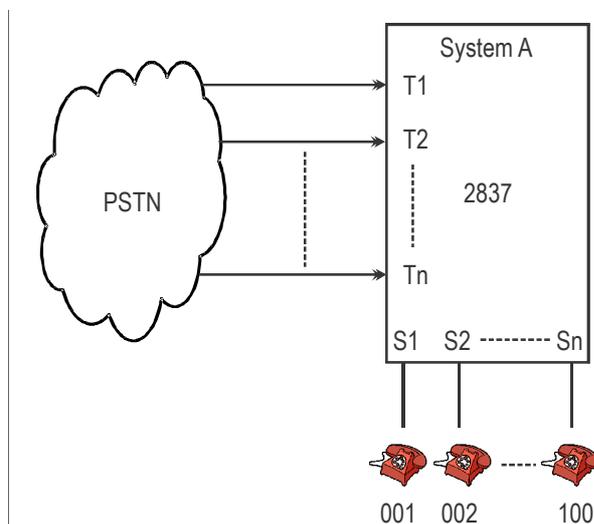

What's this?

GPAX application is one of the applications provided by SARVAM UCS and is used in commercial establishment/ Society/Organization, etc. Group Systems are installed, operated and maintained by organizations/agencies. The owner will be treated as the main hirer. The private exchange (PSTN)/service provider will provide junctions to the System and the owner will pay the rental of the junctions, and the call charges. The number of junctions provided to the System should be adequate to carry the traffic. The owner/agencies of the Systems will be responsible for the payment of all charges to the private exchange/service provider.

In this application say a System 'A' is connected to PSTN. System 'A' is given an exchange ID (say 2837). A number of stations (say 001-100) can be connected to System 'A'. When a station 015 dials 2837025, System 'A' interpret this number to be dialed for the same system. However, for dialing a station number belonging to same system, it is not necessary to prefix the station number with exchange ID. When a station 020 dials 2834537, System 'A' does not interpret this to be dialed for the same system and hence will dial the digits on the trunk.

When a station user picks up the handset and dials any digit except the one programmed in the routing table will be dialed on the trunk. If the user dials digit that is programmed in the routing table with Self-flag enabled, the system will not dial the digits on the trunk since it would interpret these to be dialed for the same system.

For dialing the digits on the trunk it is required to program the routing table carefully. Route code should be specified in route code column of routing table in association with Self Route Flag disable. This will make the call to be routed on trunk which is specified in OG Trunk Bundle Group. For details refer "[Closed User Group \(CUG\)](#)" and "[Closed User Group-With Exchange ID](#)".

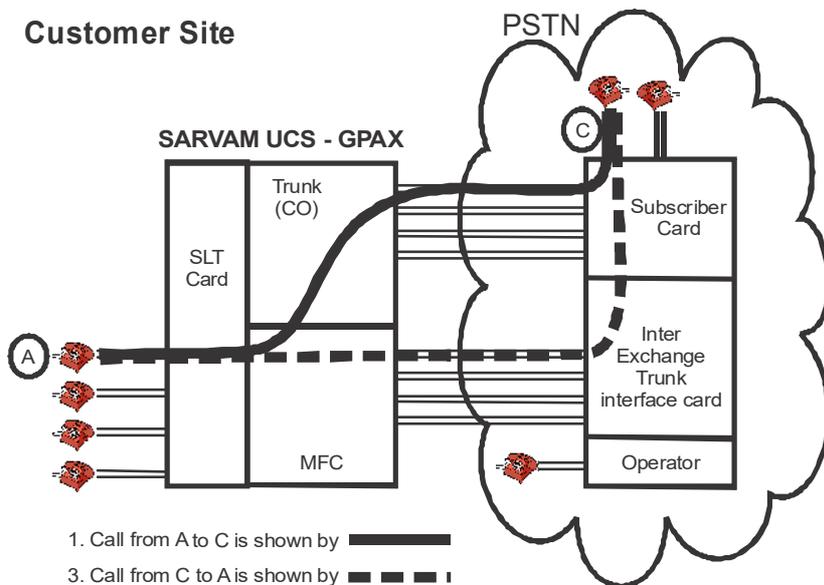

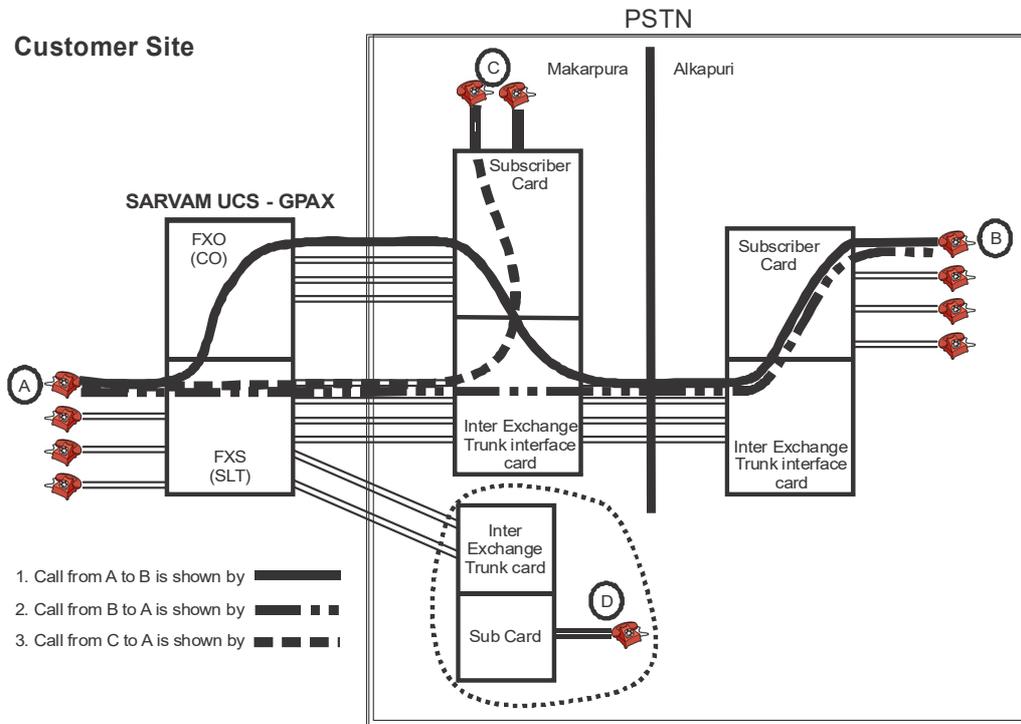

In order to make internal calls, user is advised to program Routing Table such that one of the entries in routing table should have route code as '#', Strip digit count as '1' and Self route flag as '1' (enable). Doing so, when user picks up handset and dials the required number with prefix '#', the system interpret this number as an activity for the internal users and waits for relevant access code.

Because of Strip digit count=1, the first digit dialed by the user (that is, # in this case) will be ignored and next digit will be processed which could be a feature code or a station number.

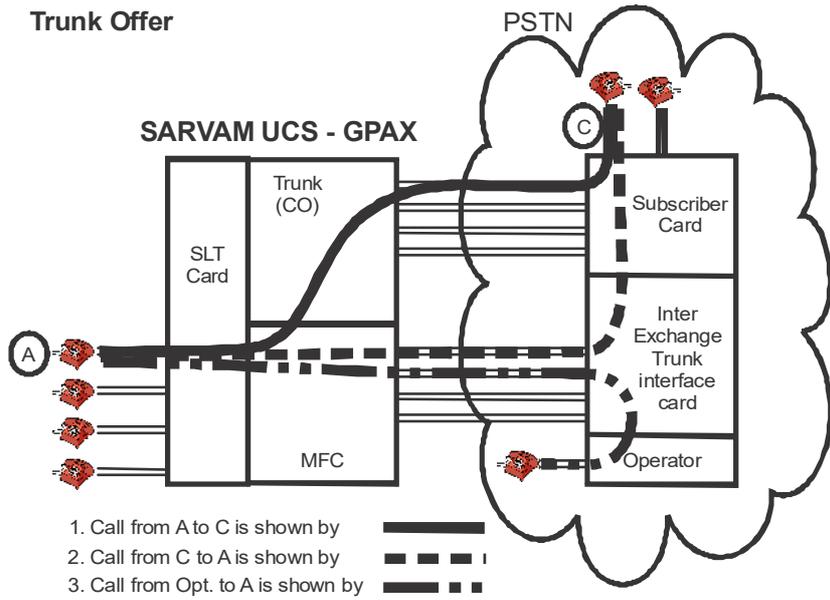

In order to use system features, the feature codes should be prefixed by '#'. Whenever the user dials '#' on picking the handset, the System assumes it to be an activity for the internal users and waits for relevant access code.

In GPAX application, Answer Signaling on SLT and Answer Supervision on trunk shall be programmed properly. Also the Disconnect Supervision parameter shall be programmed as appropriate for proper billing of calls.

Following figures shows how call is established between users using PSTN and SARVAM UCS-GPAX.

Trunk Offer

GPAX Billing

What's this?

In commercial establishments/large societies/organizations etc. staff make calls from their rooms. It is required that the cost of these calls is calculated so that amount of calls made by a staff member can be paid. GPAX provides a facility which if enabled can calculate cost of each call if programmed properly.

GPAX has a dedicated memory space (commonly called buffer) to store details of each call. These calls are retained in the buffer even during power failure. Once the buffer is 100% full, the new call overwrites the oldest one, that is First In First Out (FIFO) method.

You can also generate various reports and the same can be routed on the computer from this buffer. It is recommended that printing of various reports should be regularized on fixed dates. This should be done regardless of whether the buffer is full or not. This will prevent spilling and subsequent loss of data.

You can enable or disable call logging for individual trunk. This gives flexibility of monitoring only important (STD) trunks. This also prevents frequent spilling of the buffer, as new local calls will not be recorded.

How to configure

To calculate the total cost of a call, you must configure the relevant parameters in ["Call Cost Calculation \(CCC\)"](#), ["Call Duration Control \(CDC\)"](#), ["Call Budget on Extension"](#).

In order to bill internal calls between GPAX users, GPAX charge internal calls option must be enabled. For instructions see, ["Station Advanced Feature Template"](#). If GPAX charge internal calls option is enabled, this call will be recorded in the Station message detail recording-outgoing buffer. If GPAX charge internal calls option is disabled, the call made to an internal station will not be billed and will be recorded in the SMDR-Internal buffer as normal internal call.

Handover and Handoff

What is this?

Handover allows you to move an active VARTA Mobile UC Client call from the Wi-Fi network to the cellular number (in the cellular network). This is useful when you have an ongoing call and you leave the Wi-Fi network, or if there are voice quality issues over the Wi-Fi network.

Handoff is when you are back into the Wi-Fi network you can move the call from the cellular number to the VARTA Mobile UC Client. The call is moved without being disconnected and redialing the number.

SARVAM UCS will serve the Handover request only if:

- *the Cellular Number is configured in the Application Settings in the Mobile Client. Refer to the respective Mobile Client User Guide for details.*
- or*
- *the Mobile Number is configured in the system. See [“Configuring Matrix VARTA ADR100/AMP100 UC Clients”](#).*

When the VARTA ADR100/ VARTA AMP100 application is in the background, Handoff will not be possible. Refer VARTA ADR100 User Guide and VARTA AMP100 User Guide to know more.

How to configure

To use this feature, make sure the *Basic Features* are enabled in the Class of Service assigned to you. For instructions, see [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#).

Help Desk

What's this?

An organization may have a Centralized Information Office which provides information related to different departments such as HR, IT, or General information. For each department in the organization, an extension number can be defined as a Help Desk.

How it works

- Extension 2002 is defined as Help Desk for HR policies and general rules.
- Extension 2016 calls the Help Desk extension 2002.
- If the Help Desk extension is busy/not responding, an Auto Callback request is set automatically on the Help Desk extension.
- The system will serve the auto callback request as soon as the Help Desk extension is available.
- The Help Desk extension calls back extension 2016.

Also see ["Auto Call Back \(ACB\)"](#)

How to configure

You can define an extension as 'Help Desk' by enabling the 'Help Desk' flag in its ["Station Advanced Feature Template"](#).

Holiday Table

What's this?

The Holiday Table feature of SARVAM UCS enables you to configure incoming call management for holidays.

Using the Holiday Table feature of SARVAM UCS you can,

- define the landing destination for incoming calls on trunks on holidays.
- greet callers with customized holiday messages.
- determine the way extensions must work on the holidays.

You can configure a list of holidays in a single table.

How it works

In the Holiday Table, you need define the following:

- The Start and the End Dates and the Time to be considered as Holiday.
- The Time Zone to be considered for operating the time-zone based trunk and extension features³⁰⁸ during the Date and Time configured as Holiday. The Time Zone for Holiday can be defined as *Non-Working Hours*, *Working Hours*, or *As per Time Table*.

If you have Voice Mail System and are using the Voice Mail Auto Attendant as the landing destination for calls, on holidays, you can play customized greeting messages to callers. For each holiday, you can play a different message.

For example, A company, ABC Ltd., has the following requirements:

- December 23 to December 31, all the employees will be on a holiday. The callers must be greeted with a holiday message.
- January 1 to January 4, few employees will be attending the office.

In this case you must define the following in the Holiday Table:

At Index 1,

- In **Start**, enter the starting date and time of the holiday in DD-MMM-HH-MM format, that is 23 DEC, 00:00 and in **End** enter the last date and time of the holiday, that is 31 DEC, 23:59.
- In **Time Zone for Holiday**, select Non-working hours.
- In **Holiday Message** select the customized holiday message number. The system will greet the callers with this message.

308. *Trunk Landing Group, Auto-Attendant, DISA are time-zone based features of Trunks configured in the Trunk Feature Template assigned to trunks. Class of Service, Toll Control, and OG Trunk Bundle Group, are time-zone based features of extensions that are configured in the Station Basic Feature Template assigned to extensions.*

At Index 2,

- In **Start**, enter the starting date and time of the holiday in DD-MMM-HH-MM format, that is 31 DEC, 00:00 and in **End** enter the last date and time of the holiday, that is 4 JAN 23:59.
- In **Time Zone for Holiday**, select As per Time Table.
- In **Holiday Message** select **None**.

Index	Holiday								Name	Time Zone for Holiday	Holiday Message
	Start (DD-MMM-HH-MM)				End (DD-MMM-HH-MM)						
1	23	DEC	00	00	31	DEC	23	59	Christmas Holidays	Non-Working Hours	01
2	31	DEC	00	00	04	JAN	23	59	Christmas Holidays	As per Time Table	

After you have defined the above parameters, this is how the feature Holiday Table works,

- On the set date and time, when SARVAM UCS detects a day as a holiday, it checks the configured Time Zone for Holiday and whether Holiday Message is configured.
- When the Time Zone for Holiday is defined as Non-working hours,
 - the system checks for and routes the incoming call on the trunk as per the Trunk Landing Group and the Auto Attendant defined for the trunk for Non-Working hours in the Trunk Feature Template.
 - customized Holiday Message, if configured, is played to the caller. The Holiday message is played in place of the Welcome message for Non-Working hours.
 - Extensions work according to the Class of Service, Toll Control and Outgoing Trunk Bundle Group assigned to them for Non-working hours in the Station Basic Feature Template.

Similarly, if the Time Zone for Holiday is defined as Working Hours, the system will operate the time-zone based features of the trunks and extensions according to Working Hours.

- When Time Zone for Holiday is As per Timetable,
 - the system routes the call as per the Trunk Landing Group and Auto Attendant defined for the current time zone in the Trunk Feature Template.
 - customized Holiday message, if configured, is played to the caller in place of the Welcome message for the current time zone.
 - extensions work according to the Class of Service, Toll Control and Outgoing Trunk Bundle Group assigned to them for the current time zone in the Station Basic Feature Template.

Feature Interaction:

Day/Night Mode: You can set the system in Day/Night Mode, even when you have configured the Holiday Table. In that case, the mode you select, Day (Working Hours) or Night (Non-working Hours) will override the Time Zone you have selected for Holiday.

In order for the Time Zone for Holiday to come into effect, you must set the Day/Night Mode in System Parameters to **Operate System as per Timetable Assignment**.

See “Day Night Mode” and “System Parameters” to know more about this feature.

How to configure

You can configure the Holiday Table from the SE as well as the SA mode.

Configuring Holiday Table

- Log in as System Engineer.
- Under **Configuration**, click **Regional Settings**.
- Click **Holiday Table**.

Index	Holiday		Name	Time Zone for Holiday
	Start DD-MMM-HH-MM	End DD-MMM-HH-MM		
1	00:00	00:00		As per Time Table
2	00:00	00:00		As per Time Table
3	00:00	00:00		As per Time Table
4	00:00	00:00		As per Time Table
5	00:00	00:00		As per Time Table
6	00:00	00:00		As per Time Table
7	00:00	00:00		As per Time Table
8	00:00	00:00		As per Time Table
9	00:00	00:00		As per Time Table
10	00:00	00:00		As per Time Table

Note:
 1. On the Holiday, If Holiday Message is assigned, system shall play Holiday Message, in place of Welcome Message. Holiday Message shall be played when, In Trunk Feature Template assigned desired trunk, 'Voice Mail Auto Attendant' is selected as 'Auto Attendant'.
 2. On the Holidays, 'Time Zone for Holidays' shall be effective only when, 'Day-Night Mode' is set as 'As Per Time Table'.

Against each Index configure the following parameters:

- In **Holiday** configure the **Start** Date, Month and Time of the holiday and **End** Date, Month and Time of the holiday.
 Default, Start and End Date are Blank. Valid Range is from 01 to 31.
 Start and End Month are Blank. Valid Range is from January to December.
 Start and End Time is 00:00 (Hours:Minutes). Valid Range is from 00:00 to 23:59
- You can assign a **Name** to each time period you have defined as Holiday. For example, Christmas, Independence Day, Thanksgiving. Default: Blank
- As the **Time Zone for Holiday** select the time zone for the period you have defined as Holiday: Working Hours, Non-working Hours or As Per Time Table. Default: As Per Time Table.
- If the incoming calls are routed to the VMS Auto Attendant, select the **Holiday Message** number that you want the system to play to the callers. Default: 01.
- Click **Submit** to save changes.

You can also configure the Holiday Table from the SA mode also. To do this,

- Log in as System Administrator.
- Click **Holiday Table**.

Index	Holiday						Name	Time Zone for Holiday										
	Start DD-MMM-HH-MM			End DD-MMM-HH-MM														
1	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
2	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
3	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
4	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
5	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
6	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
7	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
8	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
9	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼
10	▼	-	▼	00	▼	:	▼	▼	▼	-	▼	00	▼	:	▼	▼		As per Time Table ▼

Note:
 1. On the Holiday, if Holiday Message is assigned, system shall play Holiday Message, in place of Welcome Message. Holiday Message shall be played when, in Trunk Feature Template assigned desired trunk, 'Voice Mail Auto Attendant' is selected as 'Auto Attendant'.
 2. On the Holidays, 'Time Zone for Holidays' shall be effective only when, 'Day-Night Mode' is set as 'As Per Time Table'.

Submit Default

- Follow the same steps as given above to configure the Holiday Table.
- Click **Submit** to save your settings.

Configuring Holiday Messages

To greet callers with customized holiday messages, you need to do the following configuration:

- Ensure that Voice Mail Auto Attendant is selected as the Auto Attendant in the Trunk Feature Template. For detailed information, see [“Trunk Feature Template”](#).
- You can either use the default Holiday messages or customize your messages by recording messages of your preference. To know more about the default Holiday Messages and how to record customized Holiday Messages, see [“Recording Voice Messages”](#).

Hot Desking

What's this?

Hot Desking enables extension users to use all the properties of their own extension from another extension.

Hot Desking is useful for people who are often away from their own desks and must work from another. Hot Desking allows them to use all the features and facilities of their own extension from another.

How it works

This feature is supported on DKP and SLT extensions only.

Hot Desking is possible only between extensions of the same type: SLT to SLT and DKP to DKP extensions.

The User Password of both extensions involved in Hot Desking must not be 1111.

Hot Desking can be performed only when both the extensions are idle.

To perform Hot Desking two extensions are required:

- The Host Extension - the extension whose user performs the Hot Desking.
- The Hot Desk Extension - the extension on which Hot Desking is performed.
- When Hot Desk is performed from the Hot Desking extension, all the properties of the Host Extension are copied to the Hot Desk Extension.
- On the Host Extension, the user cannot perform any activity except Cancel Hot Desking.
- You must cancel Hot Desk from both the Hot Desk Extension and the Host Extension.
- After cancelling Hot Desk, the Host Extension and the Hot Desk Extension acquire their original properties.

How to configure

For this feature to work, the feature 'Hot Desk' must be enabled in the Class of Service of the Host Extension and the Hot Desk Extension. See "[Class of Service \(COS\)](#)" and "[Station Basic Feature Template](#)" for instructions.

How to use

For EON users

To perform Hot Desk:

- Go to the EON extension (Hot Desk Extension) with which you want to swap your EON extension (Host Extension) properties.
 - Press DSS Key assigned to Hot Desk.
- OR

- Dial 1091
- Enter Host Extension number
- Enter Host Extension User Password
- Go ON-Hook.

The User password of both the extensions involved cannot be default password.

To cancel Hot Desk:

- On the Host Extension, press DSS Key assigned to Hot Desk.
OR
- Dial 1091
- Enter own extension number
- Enter own extension User Password
- Go ON-Hook.

- On the Hot Desk Extension, press DSS Key assigned to Hot Desk.
OR
- Dial 1091
- Enter own extension number
- Enter own extension User Password
- You get confirmation, Hot Desk cleared
- Go ON-Hook.

For SLT Users

To perform Hot Desk:

- Go to the SLT extension (Hot Desk Extension) with which you want to swap your SLT extension (Host Extension) properties.
- Lift the handset of the Hot Desk extension.
- Dial 1091
- Dial Host Extension number
- Dial Host Extension User Password
- Replace handset.

To cancel Hot Desk:

- On the Host Extension, dial 1091
- Dial own extension number
- Dial own extension User Password
- Go ON-Hook.

- On the Hot Desk Extension, dial 1091
- Dial own extension number
- Dial own extension User Password
- You get confirmation, Hot Desk cleared
- Go ON-Hook.

Hotline

What's this?

The Hotline feature connects the extension user immediately to a particular number or trunk, whenever the extension user goes OFF-Hook.

You can set Hotline to connect immediately to another extension, to a Department Group, to an external number or to an outgoing trunk.

Hotline set for external numbers and outgoing trunks is referred to as *Hot Outward Dialing*.

SARVAM UCS offers two types of Hotline/Hot Outward Dialing:

- **Immediate:** As soon as the extension user goes Off-Hook, the user gets connected to the desired hotline extension number, department group, external number, or outgoing trunk. For this the *Hotline Timer* must be set to '00' seconds (default: 3 seconds).
- **Delayed:** When the extension user goes OFF-Hook, the system plays Dial Tone to the extension user and waits for the *Hotline Timer* (default: 3 seconds). On the expiry of this timer, it connects the extension user to the desired hotline extension number, department group, external number or outgoing trunk.

How it works

- Hotline/Hot Outward Dialing can be set from an SLT, DKP or Extended IP Phone extension, if the extension has Hotline in its Class of Service.
- To be able to use Hotline/Hot Outward Dialing, extension users must do the following:
 - Select the type of Hotline they want to set on their extension; whether to an internal Extension Number, a Department Group, or an External Number or Outgoing Trunk.
 - Configure the *Hotline Timer*. For *Immediate Hotline*, extension users must set the Hotline Timer to '00' seconds. For *Delayed Hotline*, extension users can set the Timer as per their requirement.
- Here is an example of how Hotline works:

A frequently dials the number of B. So, A sets Hotline for B's number and also sets the Hotline Timer to 5 seconds (Delayed Hotline).

- A goes Off-Hook
- SARVAM UCS plays dial tone and waits for 5 seconds
- If A dials a number within the Hotline Timer, SARVAM UCS outdials the number dialed by A.
- If A *does not* dial any digit within this time, SARVAM UCS dials B's number.
- A gets connected to B.

If 'Dial Tone' timer of the system is less than Hotline Timer, the Hotline Timer will override the 'Dial Tone' timer. To know more about these timers, see "[System Timers and Counts](#)".

- If A had set the *Hotline Timer* to '00' seconds (Immediate Hotline), A would be connected to B as soon as A goes Off-Hook.

- If A sets delayed Hot Outward Dialing for a Trunk or an External Number, the system will play dial tone to A and wait for the duration of the Hotline Timer for A to dial digits. If A does not dial any digits within this timer, the system connects A to the Trunk/External Number.
- If A sets immediate Hot Outward Dialing (Hotline Timer set to '00' seconds), A will be connected to the Trunk/External number as soon as A goes Off-Hook.
- Delayed Hotline/Hot Outward Dialing allows extension users to dial out other numbers or grab another trunk, without having to cancel the Hotline/Hot Outward Dialing they have set for a particular number or trunk.

How to configure

To be able to use Hotline, extension users must have this feature enabled in their “[Class of Service \(COS\)](#)” for the time zone, as required.

How to use

Hotline can be set/canceled by users for their own extension, or for any other extension from the SA mode.

Hotline when set/canceled from the SA mode, will not depend on the assigned CoS.

Set/Cancel Hotline for Extension Users

The Operator or any extension user having access to System Administrator mode can set or cancel Hotline for other extension users.

Set Hotline using SA Jeeves

- Log in to Jeeves as System Administrator.
- Click **Extension**.

<p>Extension</p> <p>Department Group Properties</p> <p>Call Forward - All Extensions</p> <p>Trunk Properties ▶</p> <p>Status ▶</p>	<p>Search Extension</p> <p>Select Extension <input type="text"/></p> <p><input type="submit" value="Submit"/></p>
---	--

- In **Select Extension**, enter the Number or the Name of the extension on which you want to set this feature
- Click **Submit**.
- The searched extension users details appear on your screen.

- Click **Hotline** to expand.

The screenshot shows a configuration page for an extension. On the left is a navigation menu with items like 'Extension', 'Department Group Properties', 'Call Forward - All Extensions', 'Trunk Properties', 'Status', 'Voice Mail Memory Status', 'Day/Night Mode', 'Holiday Table', 'Authority Code', 'PIN Configuration', 'SMDR Management', 'SMS Server', 'Reports', 'Dial In Conference - Cancel', 'SA Password', 'SA Timer', 'System Activity Log', 'System Fault Log', and 'T1E1 Performance Report'. The main area is titled 'Search Extension' and contains several expandable sections: 'Phone Properties', 'Do Not Disturb', 'Call Forward', 'Call Forward - Scheduled', 'Wakeup Alarm', 'Reminder', and 'Hotline'. The 'Hotline' section is expanded, showing three radio button options: 'Hotline to Station or Department Group' (with an empty text box), 'Hot Outward Dialing to Group of Trunks using TAC' (with a dropdown menu showing '9'), and 'Hot Outward Dialing to External Number' (with an empty text box and a dropdown menu showing '9'). Below these options are two buttons: 'Set Hotline' (disabled) and 'Hotline is not set'. At the bottom of the section is a 'Set' button and a 'Hotline Timer' field with the value '3' and the unit 'Sec'. At the very bottom of the page are two more expandable sections: 'Cancel All Features' and 'Redirect VMS Messages'.

- Select the type of Hotline you want to set for the extension user from the following:
 - To set Hotline for an Extension or Department Group, select the radio button **Hotline to Station or Department Group**. Enter the Extension number or the Department Group Number in the corresponding box. Default: Blank.
 - To set Hotline for a group of trunks, select the radio button **Hot Outward Dialing to Group of Trunks using TAC** and select the Trunk Access Code from the corresponding drop down list.
- Each Trunk Access Code has a group of trunks for which Hotline will be set.
- To set Hotline for an external number, select the radio button **Hot Outward Dialing to External Number**. Enter the external number in the corresponding box and in **Using TAC** select a TAC from the drop down list. Using a free trunk from this TAC the external number will be dialled out by the system.

- Click the **Set Hotline** button to set Hotline.

The message "Hotline is set" appears.

- To set Delayed Hotline, in **Hotline Timer** enter the desired time in seconds.

On the expiry of this timer, it connects the extension user to the desired hotline extension number, department group, external number or outgoing trunk.

- Click the **Set** button to set Delayed Hotline.
- To cancel Hotline, click the **Cancel Hotline** button.

Set/Cancel Hotline by Extension Users

For EON & Extended IP Phone Users

To set Hotline on an Extension / Department Group,

- Press DSS key assigned to Hotline.
 - Scroll to select 'Set Hotline: Stn/ Dept', press enter key
 - Enter Extension / Department Group Number
- OR
- Dial 151 and enter Extension Number / Department Group Number

To set Hot Outward Dialing for Trunk,

- Press DSS key assigned to Hotline.
 - Scroll to select 'Set Hotline: OG Trunk', press enter key
 - Enter TAC
- OR
- Dial 152-TAC

To set Hot Outward Dialing to External Number,

- Press DSS key assigned to Hotline.
 - Scroll to select 'Set Hotline: Ext Num', press enter key
 - Enter TAC
 - Enter External Number #*
- OR
- Dial 153-TAC-External Number#*

You cannot set Hotline and Hot Outward Dialing on the same extension at the same time.

To set Hotline Timer,

- Press DSS key assigned to Hotline
 - Scroll to select 'Set Hotline Timer', press enter key
 - Enter Hotline Timer:000-255 seconds
- OR
- Dial 154-seconds (000-255)

The default value of Hot Line Timer is 3 seconds.

To Cancel Hotline / Hot Outward Dialing,

- Press DSS key assigned to Hotline
 - Scroll to select 'Cancel Hotline', press enter key.
- OR
- Dial 150

The cancellation code must be dialed from the dial tone. You have to be very quick in dialing the cancellation code, if the delay in the Hotline Timer is set to 1 or 2 seconds.

For SLT Users

To set Hotline on an Extension / Department Group,

- Dial 151-Extension Number / Department Group Number

To set Hot Outward Dialing for Trunk,

- Dial 152-TAC

To set Hot Outward Dialing for External Number,

- Dial 153-TAC-External Number#*

To set Hotline Timer,

- Dial 154-seconds (000-255)

To cancel Hotline / Hot Outward Dialing,

- Dial 150

When you set the Hotline Timer to '00' seconds (for immediate Hotline), you will not be able to dial any digits, not even the feature code to Cancel Hotline.

If you have set Immediate Hot Outward Dialing for a Trunk or External Number, you will not be allowed to dial any feature code, not even the feature code to cancel Hot Outward Dialing. However, if you need to cancel, you must follow the steps described below.

- Go OFF-Hook.
You get the CO network Dial Tone.
- Dial by Digit.
You will hear Pause/Silence.
- Wait for the duration of the Trunk Inter Digit Timer
You will hear Pause/Silence.
- Press Flash.
You will hear the Feature Tone.
- Dial the code to change the Hot Outward Dialing Timer (154) and change the duration of the timer
–or–
Dial the access code to cancel the Hot Outward Dialing (150).

You get Confirmation Tone.
- Go ON-hook.
You get the return ring of the trunk.
- Go OFF-Hook again.
You get connected to the held trunk.
- Go ON-Hook.

Incoming CLI Modification

What's this?

For System users in countries, where the Calling Line Identification (CLI) received must be suitably modified before it can be used to dial out the number, SARVAM UCS offers the feature 'Incoming CLI Modification'.

The Incoming CLI received with the Country or Area Code, or both. However, the dialing pattern of the public network may require the received CLI to be prefixed with additional digits, to dial out the same number. Or the dialing pattern of the public network may require the CLI to be stripped off the prefixed digits to dial out the same number.

With the feature 'Incoming CLI Modification' programmed, the SARVAM UCS detects whether the incoming CLI is a local number, a national, or an international number. It modifies the incoming CLI accordingly, by adding or stripping off the prefixed digits so that the number can be dialed out as per the dialing pattern supported by the public network.

The modified CLI is presented to the extension phones and is stored in the "Call Logs", and SMDR (see "Station Message Detail Recording (SMDR)"). Extension users can call a number in the Call Logs without having to modify the CLI manually.

How it works

- Incoming CLI Modification parameters must be programmed in the system considering the dialing pattern supported by the local public network.
- Accordingly, SARVAM UCS matches the CLI received with the programmed parameters.
- It detects whether it is an international, national or local number.
- It modifies the CLI according as per the Modification parameters programmed.
- It presents the modified CLI to the extension; stores the modified CLI in the SMDR and in the Call Logs of the extension, provided it is a digital key phone.
- When the received CLI is dialed out by the extension user from Call Log, SARVAM UCS dials out the same number.

How to configure

For this feature to work, the **Incoming CLI Modification** check box in 'System Parameters' and the **Allow Incoming CLI Modification** check box in the respective trunk must be enabled. This can be done from Jeeves or by dialing SE commands from a Telephone. To know more, refer to "Configuring BRI Trunks", "Configuring CO Trunks", "Configuring E&M Lines", "Configuring Mobile Trunks", "Configuring SIP Trunks", "Configuring T1 Trunks" and "Configuring E1 Trunks".

Programming Incoming CLI Modification using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **System Parameters** to open the page.
- Click **Incoming CLI Modification** to expand.

Now, program these parameters:

- **Enable Incoming CLI Modification:** Enable this flag if you want to use the Incoming CLI Modification feature. By default, this flag is disabled.

If you receive CLI in dialable format, there is no need to use this feature. In such case, keep the flag disabled. You do not need to program any of the CLI modification parameters.

- **Country Code:** Enter the Country Code of the country where SARVAM UCS is installed. The Country Code helps SARVAM UCS detect whether the Incoming CLI received is a national or an international number. Do not enter any prefix for the Country Code. For example, if your SARVAM UCS is installed in USA, enter only '1' as the Country Code. Do not enter '+' or '00' as prefix to the country code '1'. By default the Country Code is '91' (India).
- **Area Code:** Enter the Area Code of the place where the SARVAM UCS is installed. The Area Code helps SARVAM UCS detect whether the Incoming CLI received is a local number. Do not enter any prefix for the Area Code. For example, if you want to enter Area Code for Mumbai, enter only '22'. Do not enter the prefix '0' to the area code. By default, Area Code is '265' (Vadodara city).
- **International Prefix:** Enter the digits that are required as Prefix for dialing International Numbers. The prefix may be up to 5 digits, with numbers from 00000 to 99999. By default, '00' is set as the prefix for dialing International numbers.
- **National Prefix:** Enter the digits that are required as Prefix for dialing long distance, National (within the country) numbers. The prefix may be up to 5 digits, with numbers from 00000 to 99999. By default, '0' is set as prefix for dialing national numbers.
- **Area Code required to make local calls?:** Depending on the dialing pattern of your local public telephone network, you may choose from the following options:
 - **No (Area Code not required):** select this option if your public telephone network does not require the dialing of Area Code for local numbers.
 - **Yes (Area Code is required):** select this option if your public telephone network requires you to dial the Area Code for local numbers.

- **Yes (Area Code with Prefix required):** select this option if you public telephone network requires you to dial Area Code with a particular Prefix for local numbers. If you select this option, you must also program the Prefix digits for the Area Code.

By default, the option, 'No (Area Code not required)' is selected.

- **Prefix Area Code:** If you have enabled the 'Area Code required to make local calls' flag in the previous parameter, enter the prefix digits for the area code for local calls in this field.
- Click **Submit** at the bottom of the page to save changes.

Programming CLI Based Routing Table using a Telephone

- Enter SE mode from a DKP/SLT.

To enable/disable Incoming CLI Modification, dial:

- **5367-Flag**
Where,
Flag is
0 for Disable
1 for Enable
Default: Disabled

To program the Country Code, dial:

- **5368-Country Code**
Where,
Country Code is a number string up to 5 digits. The number string may consist of numbers from 00000 and 99999.
Default: 91 (India)

Program the Country Code without any prefix. For example, if you want to program USA as Country Code, enter '1' only (without the prefix '00' or '+')

To program the Area Code, dial:

- **5369-Area Code**
Where,
Area Code is a number string up to 5 digits. The number string may consist of numbers from 00000 and 99999.
Default: 265 (Vadodara)

Program the Area Code without any prefix. For example, if you want to program Mumbai as Area Code, enter '22' only (without the prefix '0')

To program International Call Prefix, dial:

- **5370-International Call Prefix**
Where,
International Call Prefix is a number string up to 5 digits. The number string may consist of numbers from 00000 and 99999.
Default: 00

To program National Call Prefix, dial:

- **5371-National Call Prefix**
Where,

National Call Prefix is a number string up to 5 digits. The number string may consist of numbers from 00000 and 99999.

Default: 0

To enable/disable 'Area Code required to make local calls?', dial:

- **5372-Code**

Where,

Code is

1 for No (Area Code is not required)

2 for Yes (Area Code is required)

3 for Yes (Area Code with Prefix required)

Default: 1

To program Prefix Digits to Area Code for Local Calls, dial:

- **5373-Prefix Digits**

Where,

Prefix Digits to Area Code is a number string up to 5 digits. The number string may consist of numbers from 00000 and 99999.

Default: Blank

- Exit SE mode.

Intercom

What is this?

The Intercom feature of SARVAM UCS enables extension users to connect quickly with any desired extension, without waiting for the called extension to answer.

- SARVAM UCS will serve an Intercom call made by an extension only if:
 - the called extension is a DKP or a SIP Extension (Matrix Extended IP Phone or Standard SIP Phone).
 - the called extension is in idle state.
 - the called extension is able to identify the incoming call as an intercom call (applicable in the case of Standard SIP Phones).
 - the calling extension has Intercom in its Class of Service.
 - the Priority of the calling extension is higher than that of the called extension.
- On SIP extensions, SARVAM UCS supports Intercom using Call-INFO / Alert-INFO Message. For a list of IP phones on which this feature has been tested, see [“SARVAM UCS Features tested on IP Phones of different Brands”](#) in the Appendix.

How it works

- A's extension number is 3001 with Priority Level '7' and 'Intercom' feature enabled in the Class of Service.
- B's extension number is 3003 with Priority Level '5'.
- A wants to quickly connect to B. A dials the Intercom feature code *5 followed by B's number, 3003.
- SARVAM UCS places the Intercom call on B.
- B's extension is idle at the time of the call, and the speaker of B's phone goes OFF-Hook, creating a speech path between A and B.
- A can now talk with B.

Feature Interactions

- **Do Not Disturb (DND):** If the called extension has set DND, SARVAM UCS will not place the intercom call on the called extension.
- **Privacy from DND Override:** If DND as well as Privacy from DND Override is enabled in the Class of Service of the called extension, SARVAM UCS will reject the Intercom call.
- **Call Forward-Unconditional:** If the called extension has set Call Forward-Unconditional, SARVAM UCS will forward the intercom call to the forwarded destination number. The call placed on the forwarded destination will not be an Intercom call.
- **Call Forward-No-Reply:** If the called extension has set Call Forward-No-Reply, SARVAM UCS will not forward the intercom call to the forwarded destination number on the expiry of the No-Reply Timer.

- **Call Forward-Busy:** If the called extension has set Call Forward-Busy, SARVAM UCS will place the call on the forwarded destination number. However, this call (placed on the forwarded destination) will not be an Intercom call.
- **User Absent/Present:** SARVAM UCS will place the Intercom call on the called extension only if the status of the called extension is 'Present'.
- **Auto Call Back:** When the Intercom call is generated and the called extension is busy, the calling extension can set Auto Call Back on the called extension. When the called extension is free, SARVAM UCS will serve the Auto Call Back request set by the calling extension. The ACB call placed on the called extension will be a normal call.
- **DISA:** An Intercom call can be generated also from DISA mode.
- **Priority:** The calling extension must have a higher Priority level than the called extension.

When the Intercom call is generated on SIP Extension having multiple call appearance and already a call is present on the SIP Extension then the SARVAM UCS will place the Intercom call as normal call on the SIP Extension.

How to configure

To provide this feature to extension users, you must enable this feature in their Class of Service. For instructions, see ["Class of Service \(COS\)"](#) and ["Station Basic Feature Template"](#).

How to use

For EON & Extended IP Phone Users

To use intercom to call an extension:

- Press the DSS Key assigned to Intercom.
OR
Dial *5
- Dial the desired extension number.
- The called extension's speaker goes OFF-Hook.
- You are in speech with the called extension.
- You may talk.

For SLT Users

To use intercom to call an extension:

- Dial *5 followed by the desired extension number.
- The called extension's speaker goes OFF-Hook.
- You are in speech with the called extension.
- You may talk.

Internal Call Restriction

What's this?

Using this feature, the operator will be able to allow/restrict internal calls. The operator has flexibility to allow calls during day time and restrict calls during night time.

In SARVAM UCS this feature is implemented in the following ways:

- Assigning 'Guest Group' to the station
- Enable/disable Internal Call Barring (Call Block)

Assigning 'Guest Group' to the station

- Privacy of the user is very important in Enterprises and hospitals. In general, most of the users need to communicate only with reception, operator, pantry and such other service stations. He is not required to dial other user numbers. For example, in hospitals the patients need to call the nurse and not the doctor or other patients.
- Sometimes, a group of users occupy multiple rooms in the Enterprise. In such cases members of the group would like to communicate only among themselves and service stations.

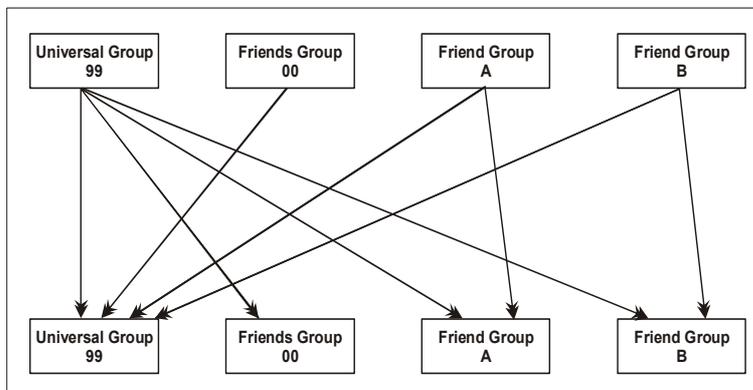

Essentially we need following logic:

- Certain service stations should be able to dial any other service station or any guest (for example Nurses, Operator).
- Certain stations should be able to dial only service stations (for example: patients, single user in the office).
- A group of station users need to dial amongst each other and the service stations (for example: doctors).

Above requirements are implemented as follows:

- Solo Group (for example patients, single user of the station). This is classified in group 00.
- Universal Group (Nurses and other services staff for example). This is classified in group 99.
- Friend's Group (for example, Group of visitors). Such a group of station users can be assigned to any group number from 01 to 98.

Following diagram depicts this logic:

How to use

From SA mode:

Dial, **1072-904-Flexible Number-Guest Group**

OR

Press DSS key for 'Guest Group'

Where,

Flexible Number is the code given to access a station.

Guest Group is from 00 to 99.

By default, the guest group assigned is 99.

- The user can call any body in his 'guest group' number '99'.
- The station users in one 'guest group', '99' can call each other within the group as well as the station users in other groups.
- The default Guest group of all the stations = 99.

Enable/Disable Internal Call Barring (Call Block)

SARVAM UCS supports a feature, to allow or bar the Internal Calls for the users of SARVAM UCS. This is called Call Blocking.

How to use

From SA mode:

Dial, **1072-045-Code**

OR

Press DSS key for 'Enable/Disable Internal Call Block'.

Where,

Code	Meaning
0	Disable Call Block, (that is, Internal Calls allowed)
1	Enable Call Block (that is, Internal Calls barred)

- When this feature is enabled, the LED on the DSS key assigned to 'Call Block' will glow Red and when disabled, the LED will be turned Off.
- When the operator issues "Call Block"- Enable command, all the station users will be assigned guest group = 00.
- When the operator issues "Call Block"- Disable command, all the station users will be assigned guest group = 99.

- *Even after issuing SA command for 'Call Block', the operator can use the SA command **1072-904** to change the guest group of any station user.*

- *Please refer the Hospitality Manual for more details.*

Interrupt Request (IR)

What's this?

Interrupt Request allows you to break into an on-going conversation after intimating the extension user about the interruption.

In case of an important or urgent trunk call the operator can put the call on hold, interrupt the busy extension user to inform about the urgent call and then transfer the urgent call.

How it works

- A, B and C are extension users.
- A and B are talking to each other.
- C calls A.
- C gets busy tone.
- C dials Interrupt Request feature code.
- C gets Ring Back tone (RBT) and A gets beeps indicating a new call.
- To answer C's call, A must dial **Flash** before the expiry of the Interrupt Request Timer. A will be in speech with C. B will be put on hold and will get music on hold.
- If A does not dial Flash before expiry of the Interrupt Request Timer, C's call will be disconnected.

Feature Interactions

- **Call States:**
 - Interrupt Request works only if the dialed extension is busy. The dialed extension may be busy with another extension or trunk (external number).
 - Interrupt Request works only if the user about to be interrupted is in a two-way normal speech with another user or external party. However, it will not work if the conversation is being recorded.
 - It will not work if the busy signal is due to the user being Off-hook, or in the middle of dialing, or accessing a feature of the SARVAM UCS.
- **“Call Toggle”**: Once A and C comes in speech with each other, A can toggle between B and C using Call Toggle feature.
- **Privacy against Interrupt Request**: If the feature 'Privacy against Interrupt Request' is enabled for an extension, it cannot be interrupted. See [“Privacy”](#).
- **“Priority”**: No Interaction with Interrupt Request. If 'A' has lower priority than 'B' but has Interrupt Request enabled; A can interrupt B.

- **“Call Taping”**: Interrupt Request will not work when the two-way conversation between the users is being taped.

How to configure

To be able to use Interrupt Request, extension users must have this feature enabled in their **“Class of Service (COS)”** in their **“Station Basic Feature Template”**.

For instructions on configuring the different extension port types:

- **“Configuring SLT Extensions”**
- **“Configuring DKP Extensions”**
- **“Configuring ISDN Terminals”**
- **“Configuring SIP Extensions”**

If required you may also change the default value of the *Interrupt Request Timer*. For instructions see **“System Timers and Counts”**.

How to use

For EON & Extended IP Phone Users

When dialed extension is busy,

- Press DSS Key assigned to Interrupt Request
OR
- Dial 3 on Busy Tone

For SLT Users

When dialed extension is busy,

- Dial 3 on Busy Tone.

Last Caller Recall

What's this?

SARVAM UCS offers a facility—Last Caller Recall— to trace the extension that last made the call to your extension.

How it works

- A's extension number is 2001.
- A wants to know who made the last call to extension 2001.
- A dials Last Caller Recall feature access code (Default:1092).
- The extension that last called 2001 rings.
- When the called extension answers, speech is established between A and the called extension user.

On SIP extensions, SARVAM UCS supports Last Caller Recall using text (lcr) as access code. For a list of IP phones on which this feature has been tested, see ["SARVAM UCS Features tested on IP Phones of different Brands"](#) in the Appendix.

How to use

For EON & Extended IP Phone Users

- Press DSS Key assigned to Last Caller Recall.
OR
- Go OFF-Hook
- Dial **1092**
The system dials out the extension number that last called your extension.

For SLT Users

- Lift the handset.
- Dial **1092**
The system dials out the extension number that last called your extension.

Last Number Redial

What's this?

The system redials the last number string (external/internal) dialed from an extension. By default the system stores only the external numbers in the Last Number Redial List. If you want the system to store internal calls in this list, make sure you enable the **Store Internal Calls in Redial Call Log** check box in the ["System Parameters"](#).

How it works

- Extension A dials the feature access code for 'Redial'.
- If Extension A is a SLT, the system dials the last number dialed from Extension A using the same trunk access code used for dialing that number. However, the system will not place the call, if the last number dialed is an internal number.
- If Extension A is a DKP or an Extended IP Phone, last 16 numbers dialed by Extension A are displayed on the phone's LCD.
- Extension A may select the number to be dialed out. The system will dial out this number using the same trunk access code used for dialing this number.

If Extension A has 'Dynamic Lock' set and uses Redial feature, the system will check for Toll Control as per the Lock Level set for Extension A before dialing out the number.

How to configure

No particular configuration is required for this feature to work. Redial is included in the Basic Features allowed to all extensions by default in their ["Class of Service \(COS\)"](#). So, all extensions can use the Redial feature.

How to use

For EON & Extended IP Phone Users

- Press Redial Key.
Or
- Dial 7
A List of last 16 numbers dialed will appear on your phone's display.
- Scroll to select the desired number.
- Press Enter key.
- The system dials out the number.

For SLT Users

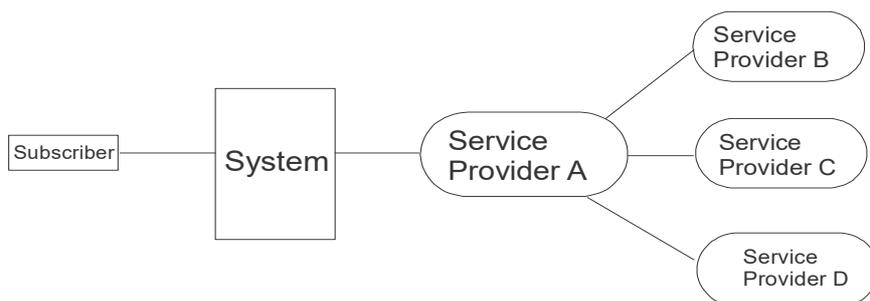

- Lift Handset
- Dial 7
- The system dials out the number last dialed from your extension.

Least Cost Routing-Carrier Pre-Selection

What's this?

This type of Least Cost Routing is used in countries where the same service provider offers local call and long distance calling services. These service providers allow subscribers to select the service provider or Carrier for long distance calling.

For example,

The subscriber of Service Provider A must grab trunk lines of Service Provider A to call other subscribers in the local area.

However, when the subscriber of Service Provider A wants to make a long distance call, the subscriber must dial a prefix to select the a carrier (trunk) of the desired long distance, Service Provider B, C and D. Thus, the subscriber accesses a secondary service provider by dialing a short code or prefix for long distance calling.

This feature works on the basis of [“Automatic Number Translation”](#). Using Automatic Number Translation, SARVAM UCS adds the code of the appropriate secondary Service Provider to the number string dialed by the extension user to route the call to the desired secondary Service Provider.

How to configure

To use this feature, you must do the following:

- Select an Automatic Number Translation Table Number from 1 to 8.
- Configure the Automatic Number Translation Table. In the Automatic Number Translation Table, in the Dialed Number String column, enter the long distance numbers that extension users will dial. In the Add Prefix column, enter the digits which are to be added as prefix to the Dialed Number string by the system before dialing it out and in the Strip Digits column enter the number of digit(s) to be stripped off by the system from the Dialed Number string before dialing it out. For example, the code ‘961’ for Service Provider B must be prefixed to the number ‘2630555’ dialed by extension users, you must enter ‘2630555’ in the Dialed Number String column, ‘961’ in the Add Prefix column and ‘0’ in the Strip Digits column.
- Enable [“Automatic Number Translation”](#) feature on the trunk (CO/Mobile/SIP/T1E1/BRI) of your Primary Service Provider in the [“Outgoing Trunk Bundle”](#) and apply the ANT Table number you configured to this OG Trunk Bundle.
- Create [“OG Trunk Bundle Group”](#) that includes the OG Trunk Bundle you created with Automatic Number Translation as member.

- Assign the OG Trunk Bundle Group (containing the OG Trunk Bundle with ANT) to the extensions for the Time Zones, that is, Working Hours, Non-Working Hours, Break Hours, in the “[Station Basic Feature Template](#)” of the extensions.

License Management

What's this?

The application SARVAM UCS and the features that it supports, require the purchase of licenses. When you buy the ETERNITY GENX Platform, you get a unique default license key for the platform.

SARVAM UCS Application License³⁰⁹

To use ETERNITY GENX as the Unified Communication Server, you need to purchase the **SARVAM UCS SME** Application software license.

To use ETERNITY LENX/MENX as the Unified Communication Server, you need to purchase the **SARVAM UCS ENT** Application software license.

To use ETERNITY PENX as the Unified Communication Server, you need to purchase the **SARVAM UCS SMB** Application software license.

If you do not have the license for the SARVAM UCS SME/ENT Application and you do not start the Demo Period, the system will disconnect all the connected calls³¹⁰ (internal or external, incoming or outgoing) from any port after 60 seconds³¹¹. For details, refer "[Demo Provision](#)".

Described below are the features of SARVAM UCS for which you require licenses. To know the name of the license you need to purchase, see "[Supported Licenses](#)".

IP Subscribers (For SIP Extensions)

SARVAM UCS supports upto 999 SIP Extensions. With a license, you can register SIP-enabled devices with the SARVAM UCS. Without a license you cannot register any SIP Extension.

MATRIX VARTA User Licenses

SARVAM UCS supports three types of user licenses for VARTA Users — VARTA Essential Users, VARTA Professional Users and VARTA Collaboration Users.

Following table lists the features which will be supported in MATRIX VARTA WIN200 / VARTA ADR100 / VARTA AMP100 when you activate the respective license.

Features	VARTA Essential Users			VARTA Professional Users			VARTA Collaboration Users		
	WIN 200	ADR 100	AMP 100	WIN 200	ADR 100	AMP 100	WIN 200	ADR 100	AMP 100
Making Calls	✓	✓	✓	✓	✓	✓	✓	✓	✓
Receiving Calls	✓	✓	✓	✓	✓	✓	✓	✓	✓

309. Refer "[Pre-activated Licenses](#)".

310. Connected calls means where speech is connected between calling party and called party even if the called party port is not matured.

311. Make sure the NX DBM VOCODER64 module is installed for SIP calls.

To know more about Matrix VARTA WIN200 refer to the *MATRIX VARTA WIN200* User Guide and for VARTA UC Clients for Mobile refer to the respective User Guide — *Matrix ADR100* User Guide and *Matrix AMP100* User Guide.

Expansion Slots³¹²

Expansion Slots License is required to expand the number of functional universal slots in the system. This license is applicable only for Firmware version V1R3 and later.

If you have upgraded the system firmware to V1R3 and later in the old ETERNITY LENX/MENX/GENX system, the Expansion Slots license will be applicable for the universal slots. No universal slots will be functional by default. You must purchase the license to activate the universal slots as required.

If you have purchased the new ETERNITY LENX/MENX/GENX system with the firmware V1R3 and later, the Expansion Slots license will be applicable for the universal slots.

- For ETERNITY LENX, the first eight universal slots after the power supply card in the first rack will be functional by default.
- For ETERNITY MENX, the first eight universal slots after the power supply card will be functional by default.
- For ETERNITY GENX, the first four universal slots after the power supply card will be functional by default.

If you require more functional universal slots, you must purchase the Expansion Slots License to activate the same.

Matrix provides two Expansion Slots licenses:

- SARVAM EXP4 SME for ETERNITY GENX system
- SARVAM EXP4 ENT for ETERNITY MENX and LENX system.

Each SARVAM EXP4 SME/ENT license will provide the activation for next four universal slots in the sequence.

VOCODER Channels

VOCODER Channels license is required for SIP calls. The maximum number of VOCODER channels that will be supported would be as per the license you purchase. SIP calls uses the VOCODER Channels, if you select RTP Mode for routing SIP calls. Refer "[RTP Mode](#)" for details of VOCODER Channels usage during SIP calls.

The system supports two³¹³ NX DBM VOCODER64 Modules. You must purchase the module separately. Each NX DBM VOCODER64 module supports a maximum of 64 VOCODER channels.

The system provides 4 pre-activated VOCODER channels by default. To use these channels make sure you have installed atleast one NX DBM VOCODER64 module. If you require more channels, you can purchase the channel licenses according to your requirement.

If you require more than 64 VOCODER channels, you must install another NX DBM VOCODER64 Module. During a SIP call, VOCODER channel is required and if no free channel is available, the system will reject the call.

³¹². This License is not applicable to ETERNITY PENX.

³¹³. ETERNITY PENX supports only one NX DBM VOCODER64 Module.

VMS Channels

VMS Channels license is required for allowing the VMS calls. The system allows simultaneous VMS calls as per the license only.

The NX DBM VMS64 Module is an optional module. If required, you may purchase it separately. The system supports a maximum of 64 channels out of which 4 channels are provided by default. If you require more channels, you can purchase the channel licenses according to your requirement.

If VMS call request is received and no free VMS channels are available, the system will reject the call.

CTI

CTI stands for Computer Telephony Integration. CTI is a technology that integrates a telephone and a computer. With the CTI license, the Matrix TAPI Service Provider (TSP) acts as a link to integrate the interactions between your telephones and your computers. The computer in which you install this application functions as a Client and SARVAM UCS functions as a Server. In an organization, it is possible that the data is stored in different computers. In this scenario, the Matrix TAPI Service Provider can be installed in three (maximum) different computers, if required.

Q-Sig

When SARVAM UCS is networked with another SARVAM UCS or with any other ISDN-System, Q-Sig or Q-Signaling is supported to facilitate feature transparency between the systems in the network. Q-Signaling will be activated when you buy the license for the same.

Hospitality Management System

This functional module contains a set of special telephone and guest/patient management features for hospitality and accommodation establishments like hotels and hospitals, which SARVAM UCS supports when it is deployed in a hotel or hospital. When you buy the license for this module, the following features will be activated:

- Room Shift
- Check-In, Check-Out
- Change Room Occupancy Status
- Floor Service
- Change Room Clean Status
- Front Desk User GUI (web interface)

Property Management System (PMS)

SARVAM UCS supports interface for PMS, the application software commonly used by hotels to manage their administrative functions. The PMS Interface supports proprietary PMS protocols of Matrix (Matrix PMS Type 1 and Type 2), Micros Opera and Softbrands Extended Starlight. To be able to select any of these PMS Protocols, you must buy a license.

License for the Hospitality module is a pre-requisite for PMS.

E911

SARVAM UCS supports the E911 license. You will be able to dial the Emergency number 911 from the system only if you buy this license.

This license is applicable in new systems dispatched with the Firmware V1R5.2 and later only.

Gateway

When SARVAM UCS is to be used with Gateway functionality, a license is required to activate this functionality.

PLCC³¹⁴

This functional module contains a set of special features supported by the SARVAM UCS when it is deployed in a Power Line Carrier Communication Network of electric utilities. When you buy the license for this module, the following features will be enabled:

- CCS Signaling when End Point and Transit.
- Express Signaling.
- Seizure Pulse and Release Pulse Signaling.

SMS Server

With the SMS Server license, you can:

- Send/ receive SMS to/from individuals or groups using the Mobile Port of SARVAM UCS.
- Forward SMS received on Mobile Port as Emails to users through the Email Client.
- Forward Email of the users as SMS to the Mobile users through the Mobile Port.

The SMS Server application works as an intermediary between the GSM Short Message Service and the SARVAM UCS. The Server supports multipart, 7 bit text messages as well as UNICODE messages.

The Server functions as an SMTP Client to send emails and as a POP3 Client to receive emails. SMS Server supports three types of Emails—Plain Text, HTML and MIME— from its mail clients.

SMS Gateway

With the SMS Gateway license, you can send/receive messages to/from individuals, selective groups or masses using the Mobile Port of SARVAM UCS.

SARVAM UCS allows you to register multiple SMPP Clients (Software Applications used for sending/receiving messages) with SARVAM UCS. SARVAM UCS functions as an SMPP Server. These Clients can send/receive messages using the Mobile port/s of SARVAM UCS.

Redundancy License

With Redundancy license, you can increase the system reliability by providing uninterrupted communication.

You must activate this license in case you want Hardware and Application redundancy in ETERNITY LENX/MENX. To know in detail about redundancy, refer to ["Redundancy"](#).

For redundancy, you must install two CPU cards in the system - CPU Card 1 and CPU Card 2.

This redundancy license allows the CPU Card 1 (Active) to share its licenses with the CPU Card 2 (Standby) during redundancy. In other words, if you activate redundancy license along with the required licenses in the CPU Card 1

³¹⁴. ETERNITY PENX does not support PLCC

(Active) and activate no licenses in CPU Card 2 (Standby), you will still be allowed to access all the licensed features activated in CPU Card 1, even when this CPU Card 1 fails. However, you can use these licenses for a limited period of time.

You can activate redundancy license either in CPU Card 1 or CPU Card 2 as per your requirement. However, it is recommended to activate this license in the CPU Card which has maximum number of licenses activated. This is important as during redundancy, the system will allow you to use the set of features and facilities as per the licenses activated in that CPU Card.

Supported Licenses

Refer to the table below to know the name of the respective licenses you need to activate for each feature.

License Name	Description
SARVAM UCS SME	Unified Communication Server License for Small-Medium Enterprise. This is a UC Server License for ETERNITY GENX.
SARVAM UCS ENT	Unified Communication Server License for an Enterprise. This is a common UC Server License for ETERNITY LENX and ETERNITY MENX.
SARVAM UCS SMB	Unified Communication Server License for an Enterprise. This is a UC Server License for ETERNITY PENX.
SARVAM EXP4 SME	License for SARVAM UCS SME to activate four Expansion Slots.
SARVAM EXP4 ENT	License for SARVAM UCS ENT to activate four Expansion Slots.
SARVAM IPSUB5	License for 5 IP Subscribers to create 5 SIP Users.
SARVAM IPSUB10	License for 10 IP Subscribers to create 10 SIP Users.
SARVAM IPSUB50	License for 50 IP Subscribers to create 50 SIP Users.
SARVAM IPSUB100	License for 100 IP Subscribers to create 100 SIP Users.
SARVAM IPSUB500	License for 500 IP Subscribers to create 500 SIP Users..
SARVAM VARTA USER5E	License for 5 VARTA UC Users with Essential features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER10E	License for 10 VARTA UC Users with Essential features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER50E	License for 50 VARTA UC Users with Essential features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER100E	License for 100 VARTA UC Users with Essential features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER500E	License for 500 VARTA UC Users with Essential features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER5P	License for 5 VARTA UC Users with Professional features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER10P	License for 10 VARTA UC Users with Professional features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER50P	License for 50 VARTA UC Users with Professional features. This license is required to register Android/iOS/Windows UC Clients.

License Name	Description
SARVAM VARTA USER100P	License for 100 VARTA UC Users with Professional features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER500P	License for 500 VARTA UC Users with Professional features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER5C	License for 5 VARTA UC Users with Collaboration features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER10C	License for 10 VARTA UC Users with Collaboration features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER50C	License for 50 VARTA UC Users with Collaboration features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER100C	License for 100 VARTA UC Users with Collaboration features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VARTA USER500C	License for 500 VARTA UC Users with Collaboration features. This license is required to register Android/iOS/Windows UC Clients.
SARVAM VOCODER CHNL4	License for activating 4 additional VOCODER Channels.
SARVAM VOCODER CHNL16	License for activating 16 additional VOCODER Channels.
SARVAM VMS CHNL4	License for activating 4 additional VMS Channels.
SARVAM VMS CHNL16	License for activating 16 additional VMS Channels.
SARVAM CTI SME	License for SARVAM UCS SME to enable CTI functionality to connect to third party CTI application.
SARVAM QSIG SME	License for QSIG interface for SARVAM UCS SME to contact with other Matrix or third party System for seamless calling and inter-working of certain System features.
SARVAM HOSPITALITY SME	License for Hospitality functions suite for SARVAM UCS SME to support hospitality functions and features used in Hotel-Motel.
SARVAM PMS SME	License for Property Management System interface for SARVAM UCS SME to contact with third party PMS used in Hotel-Motel.
SARVAM GATEWAY SME	License for SARVAM UCS SME to support Gateway functions in addition to UCS functions.
SARVAM SMS SERVER SME	License for SARVAM UCS SME to enable SMS Server functionality to connect to any Email Client and send/receive Email to SMS and vice versa over GSM SIM installed on GSM Interface Card.
SARVAM SMS GATEWAY SME	License for SARVAM UCS SME to enable SMS Gateway functionality to connect to third party SMS Gateway Clients and send/receive SMS over GSM SIM installed on GSM Interface Card.
SARVAM CTI ENT	License for SARVAM UCS ENT to enable CTI functionality to connect to third party CTI application.
SARVAM QSIG ENT	License for QSIG interface for SARVAM UCS ENT to contact with other Matrix or third party System for seamless calling and inter-working of certain System features.
SARVAM HOSPITALITY ENT	License for Hospitality functions suite for SARVAM UCS ENT to support hospitality functions and features used in Hotel-Motel.

License Name	Description
SARVAM PMS ENT	License for Property Management System interface for SARVAM UCS ENT to contact with third party PMS used in Hotel-Motel.
SARVAM GATEWAY ENT	License for SARVAM UCS ENT to support Gateway functions in addition to UCS functions.
SARVAM SMS SERVER ENT	License for SARVAM UCS ENT to enable SMS Server functionality to connect to any Email Client and send/receive Email to SMS and vice versa over GSM SIM installed on GSM Interface Card.
SARVAM SMS GATEWAY ENT	License for SARVAM UCS ENT to enable SMS Gateway functionality to connect to third party SMS Gateway Clients and send/receive SMS over GSM SIM installed on GSM Interface Card.
SARVAM HOSPITALITY E911 SME	License for SARVAM UCS SME to enable dialing of emergency number 911.
SARVAM HOSPITALITY E911 ENT	License for SARVAM UCS ENT to enable dialing of emergency number 911.
SARVAM REDUNDANCY ENT	License for SARVAM UCS ENT to support Hardware and Application Redundancy.
SARVAM CTI SMB	License for SARVAM UCS SMB to enable CTI functionality to connect to third party CTI application.
SARVAM QSIG SMB	License for QSIG interface for SARVAM UCS SMB to contact with other Matrix or third party System for seamless calling and inter-working of certain System features.
SARVAM HOSPITALITY SMB	License for Hospitality functions suite for SARVAM UCS SMB to support hospitality functions and features used in Hotel-Motel.
SARVAM PMS SMB	License for Property Management System interface for SARVAM UCS SMB to contact with third party PMS used in Hotel-Motel.
SARVAM GATEWAY SMB	License for SARVAM UCS SMB to support Gateway functions in addition to UCS functions.
SARVAM SMS SERVER SMB	License for SARVAM UCS SMB to enable SMS Server functionality to connect to any Email Client and send/receive Email to SMS and vice versa over GSM SIM installed on GSM Interface Card.
SARVAM SMS GATEWAY SMB	License for SARVAM UCS SMB to enable SMS Gateway functionality to connect to third party SMS Gateway Clients and send/receive SMS over GSM SIM installed on GSM Interface Card.
SARVAM HOSPITALITY E911 SMB	License for SARVAM UCS SMB to enable dialing of emergency number 911.

Pre-activated Licenses

Pre-activated Licenses	Systems purchased on January 1, 2021 and later	Systems purchased before January 1, 2021
SARVAM UCS SME	Yes	No
SARVAM UCS ENT	Yes	No
SARVAM UCS SMB	Yes	No

Pre-activated Licenses	Systems purchased on January 1, 2021 and later	Systems purchased before January 1, 2021
IP SUBSCRIBERS (SIP EXTENSIONS)	5 (SME,ENT & SMB)	5 (SME,ENT & SMB)
VOCODER CHANNELS	4 (SME,ENT & SMB)	4 (SME,ENT & SMB)
VMS CHANNELS	4 (SME,ENT & SMB)	4 (SME,ENT & SMB)
VARTA USERS	0 (SME,ENT & SMB)	0 (SME,ENT & SMB)
EXPANSION SLOT	4 - SME 8 - ENT NA - SMB	4 - SME 8 - ENT NA - SMB

Other feature licenses mentioned in “Supported Licenses” need to be purchased.

Demo Provision

Demo provision for licensed features is useful for the following scenarios:

- when the customer’s system having licensed features cannot be repaired on-site and a standby system needs to be installed.
- when end user demands to use all the licensed features on trial basis before actually purchasing the license.

Demo Provision enables you to use the SARVAM UCS Application as well as all the licensed features it supports, free of cost for a period of 60 days. In this case, the application starts even if you have not purchased the SARVAM UCS SME/ENT/SMB license.

All the Universal Slots will be functional during the Demo period irrespective of the number of activated SARVAM EXP4 SME/ENT licenses.

The Demo Provision lets you access and use all the licensed features and functionalities³¹⁵ supported by the application.

When Demo Mode is activated, VARTA Collaboration Users license is by default assigned to all SIP Extensions internally. You do not need to configure it manually.

To avail this facility,

- Open Jeeves.
- Log in as System Engineer.

³¹⁵ For VoIP and VMS, the number of channels that will be supported in demo period will be equal to the total number of channels available in the respective hardware module/s installed in the System.

Under **Configuration**, click **License Management**. The License Management page opens.

License Management

License Key: D02E-CD94-00FA-0000-0000-0000-00-0000 In use View Profile Enter License Key

Demo Period

Available: 60 Days, 00 Hours Start

- Under **Demo Period**, click the **Start** button. The demo period for using licensed feature in your system starts and the Start button will change to Pause. The demo period is of 60 days.
- Once the Demo period starts, you can click on **View Profile** button to view the list of all the features and functionalities supported.

You may Pause the Demo Period, if required. When you pause the demo period, all licensed features will work as per the license key installed in the system.

If you want to use licensed feature after the expiry of the demo period, you must purchase the license key and activate it in your system.

When you default the SARVAM UCS, the demo period will not be reset.

How to activate your License

For the functional modules and features described above, you would need to activate a valid License Key.

Instructions for Matrix Channel Partners

Your license voucher may be a paper or a PDF (protected) file.

You may activate your License Online. For this, keep the following items ready:

- The License Voucher containing the 16-digit PIN.
- A valid, unique User ID and Password from the Matrix License Support Centre.
- Access to Internet.
- Current License Key of the system.

To activate the License Key *online*,

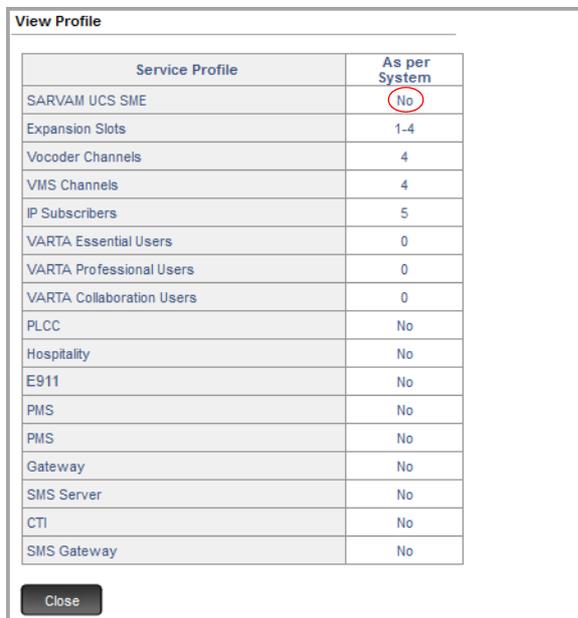

- Open Jeeves.
- Log in as System Engineer.
- Under **Configuration**, click **License Management**.

The License Management page opens.

- Note down or copy the current **License Key** on this page.

If you wish to view the features and functions currently available on your system, click the **View Profile** button.

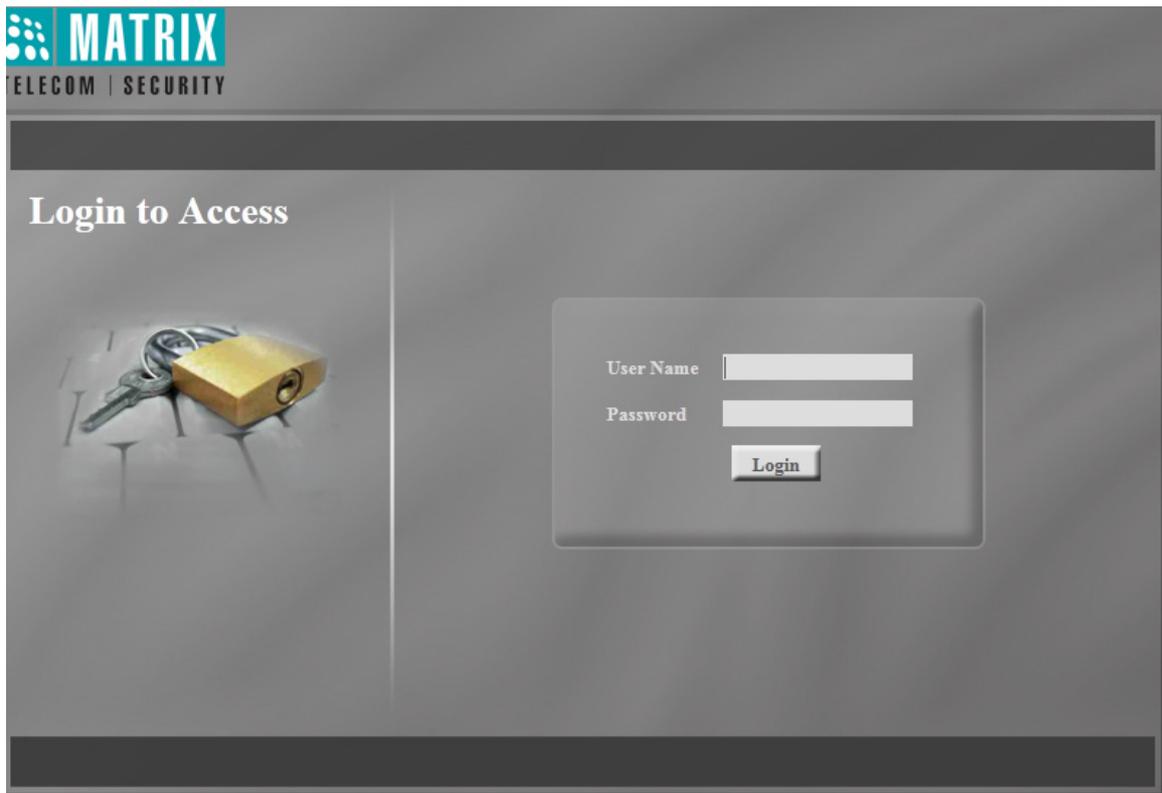

A new window opens which displays the features and functionalities that are currently available to you.

- Keep your Current License Key and the License Voucher (paper or PDF) ready.
- Open a new window on your browser.

Enter <http://www.matrixcomsec.com/support/license-activation/> in the address bar.

The Login to Access page will open.

In the **License PIN** field on this page, enter the 16-digit License PIN from the Voucher.

How to Activate the License:

Step 1: Ensure compatibility of this new license with Matrix product by checking the product name, variant and version.

Step 2: Open web interface of the product and go to the License Management page.

Step 3: Verify existing licenses active on the product and note down the existing license code.

Step 4: Ensure that this new license is meaningful on the product.

Step 5: Send existing license key and this PIN together to Matrix.

Step 6: Matrix will send you new license key.

Step 7: Enter new license key you received from Matrix on the License Management page of the product.

Step 8: The new license is activated on your Matrix product.

Step 9: The License Management page should now show all the licenses including the new license you just activated.

Lightweight Directory Access Protocol (LDAP)

What's this?

LDAP (Lightweight Directory Access Protocol) is an application protocol used by the system for accessing and maintaining information services for the distributed directory over an IP network.

The advantage for LDAP is that you can access the central LDAP directory of the organization using your system. Therefore, you do not have to maintain the local directory. The LDAP server differentiates the data in its entries based on specific attributes. SARVAM UCS functions as the LDAP client and once it synchronizes with the LDAP server, it saves the fetched LDAP entries to the Global directory. You can search and dial out the desired contact from the Global directory.

This feature is beneficial for organizations where multiple servers are deployed at various locations and all these servers need to maintain a centralized directory to facilitate ease of inter-department communication.

How it works

Pre-requisites

To be able to use this feature,

- Make sure that the third-party LDAP server supports LDAP Protocol Version 3.

The following LDAP servers have been tested successfully:

- Microsoft Active Directory
- Open LDAP Directory Server
- The required details of the contacts are stored in the LDAP server directory.
- Make sure the LDAP parameters have been properly configured. For details, refer to [“Configuring LDAP using Jeeves”](#).
- Manually synchronize your system with the LDAP server.

Once you have fulfilled the above pre-requisites, the sequence of the events that occur are as follows:

- When you manually synchronize, the system sends request to the LDAP server.
- The LDAP server asks for Authentication ID and Password depending upon the authentication settings in the server. Consult your SE for more details.
- After successful authentication, the LDAP server sends response to the system with the required contacts and their details as per the search criteria configured.
- The fetched results are stored in the Global Directory. The total number of search results stored depends upon the number of Global Directories synchronized with the LDAP server.
- Now, any extension user can easily dial out the desired contact from the Global Directory. To know more about making an outgoing call from the Global Directory, refer to [“Global Abbreviated Dialing”](#).

- Once the required contacts are synchronized with the LDAP server and loaded in the Global directory, these cannot be edited or deleted unless the LDAP option is disabled.
- Extension users can edit a number before making an outgoing call, but the changes will not be applied to the details stored in the LDAP directory and in the Global Directory which is synchronized with LDAP.

LDAP Attributes

LDAP database consists of various details — first name, last name, common name, multiple phone numbers etc. To distinguish it, each type of detail is assigned a specific attribute in LDAP database. Contact your LDAP server Administrator to know the detailed list of attributes maintained.

A few examples are listed below.

Abbreviation	Name	Description
gn	givenName	First name
cn	commonName	Full name
sn	surname	Last name or family name
dn	distinguishedName	Unique identifier for each entry
dc	dc	Domain component
-	company	Company or organization name
-	telephoneNumber	Office phone number.
mobile	mobilephoneNumber	Mobile or cellular phone number
mail	emailid	Email address

How to configure

Configuring LDAP using Jeeves

- Log in as System Engineer.
- Under **Configuration**, click **LDAP** to open the page.

LDAP

Enable LDAP	<input type="checkbox"/>
LDAP Protocol	Version 3
LDAP Server Address	<input type="text"/>
LDAP Server Port	<input type="text" value="00389"/>
Enable Authentication	<input type="checkbox"/>
Authentication ID	<input type="text"/>
Authentication Password	<input type="password"/>
Base Distinguished Name	<input type="text"/>
Name Attribute	<input type="text"/>
Number Attribute	<input type="text"/>
Email Attribute	<input type="text"/>
Search Filter	<input type="text"/>

Synchronization

Global Directory for LDAP	<input checked="" type="checkbox"/> Global Directory 1	<input type="checkbox"/> Global Directory 2	<input type="checkbox"/> Global Directory 3
Synchronize Status			
Last Synchronized on	Not Synced		

LDAP

Make sure you Contact your LDAP Server Directory Administrator for the LDAP Server configuration details.

- **Enable LDAP:** Enable this check box if you wish to synchronize contacts from the LDAP server. When this check box is enabled, SARVAM UCS behaves as the LDAP client. By default, it is disabled.
- **LDAP Protocol:** Displays the LDAP Protocol Version supported. By default, it is Version 3.
- **LDAP Server Address:** Configure the IP address or Domain name of the third-party LDAP server here.
- **LDAP Server Port:** Configure listening port of LDAP Server here. By default, the value is 00389.
- **Enable Authentication:** This parameter enables you to set permission for validating the credentials (Authentication ID and password) of the system by the LDAP server. By default, it is disabled.

- **Authentication ID:** Enter the ID for authentication. The Authentication ID entered here should match with the Authentication ID configured in the LDAP server. You cannot keep this field blank. The ID may be a string of maximum 40 characters. Default: Blank.
- **Authentication Password:** Enter the Password for authentication. The Authentication Password entered here should match with the Authentication Password configured in the LDAP server. You cannot keep this field blank. The Password may be a string of maximum 24 characters. Default: Blank.

*Authentication ID and Password can only be configured when **Enable Authentication** check box is enabled. Contact your SE for more details.*

- **Base Distinguished Name:** Enter location in the LDAP Server from where the search should begin. You can also specify the subtree as the base entry. You cannot keep this field blank. Default: Blank.
- **Name Attribute:** You can define the Name attribute to be fetched from the LDAP server directory here. You cannot keep this field blank. Default: Blank.
- **Number Attribute:** You can define the Number attribute to be fetched from the LDAP server directory here. You can define only one attribute and hence the system will fetch only one number per contact from the search results. You cannot keep this field blank. Default: Blank.
- **Email Attribute:** You can define the Email Attribute to be fetched from the LDAP server directory here. This needs to be configured only if you need the Email-id of the required contacts.
- **Search Filter:** You can use the Search filter when specific entries from a particular Distinguished Name are required. Enter the details after contacting you LDAP Server Administrator.

Synchronization

The Synchronization with the LDAP server will function only if the parameters mentioned under LDAP have been configured correctly.

You can now proceed further with configuring the Synchronization parameters:

- **Global Directory for LDAP:** Select the Global directory in which the search results obtained from the LDAP server should be stored. You can select either one or combination of — Global Directory 1, Global Directory 2, Global Directory 3. By default, Global Directory 1 is selected.
- **Synchronize Status:** Displays the synchronization status (In Progress, Fail or Pass) of the system with LDAP server.
- **Last Synchronized on:** Displays the date & time when the system last synchronized with LDAP server.
- Click on **Sync Now** button to manually synchronize the system with the LDAP Server.
- **Test:** You can test the parameters configured in the system for LDAP synchronization. To do so,
 - click the **Test** button. A new window for Test is displayed.
 - Select the desired attribute and enter the — Name, Number or Email-id.
 - Click the **Test** button.
 - If the connection has been successfully established then search results fetched from the LDAP server will be displayed.

- *Test button will be displayed only when the mandatory fields in LDAP have been configured.*
- *When configuration backup is restored then the synchronized LDAP contacts in the Global directory will not be restored. Hence, you must manually synchronize the Global directory contacts with LDAP server again (if LDAP contacts are required).*
- Click **Submit** to save your settings.

How to use

To make an outgoing call to an LDAP contact from the synchronized Global Directory, refer to [“Global Abbreviated Dialing”](#)

Live Call Screening

What's this?

Live Call Screening enables extension users to screen callers before attending their calls on their extensions.

How it works

To be able to use this feature,

- the VMS module must be present in the SARVAM UCS.
- the extension users who are to be provided this feature must have a Personal Mailbox assigned, and have this feature allowed to them in their Class of Service.
- the extension users who want to use this feature must set *Call Forward to Voice Mail System* on their extension.
- the extension on which this feature is used must be a DKP.

With the above pre-requisites fulfilled, this is how Live Call Screening will work:

- Extension A has activated Live Call Screening.
- B calls A, and is transferred to A's mailbox (as Call Forward to Voice Mail System is set).
- The VMS Auto Attendant offers B the option to leave a message in the mailbox of extension A.
- As B starts to record a message in A's mailbox, the speaker of the DKP of A gets turned ON for the duration of the *Live Call Screening Timer* (configurable; default: 10 seconds).
- A hears the message being recorded in the mailbox.
- If A wants to answer the call, A can go Off-Hook. A gets connected to the caller and the system stops recording the message in the mailbox.
- If A does not answer the call, the speaker is turned Off automatically on the expiry of the *Live Call Screening Timer*.
- Also, after listening to some part of the message, if A finds that the call is not important, A can ignore the caller by dialing any digit. When A dials any digit, the speaker of the DKP is turned OFF, but the message recording in the mailbox continues.

LCS works only if your extension is idle.

How it configure

To be able to use Live Call Screening, extension users must have:

- A mailbox assigned to them.
- Live Call Screening enabled in the “[Class of Service \(COS\)](#)” for the time zone in their “[Station Basic Feature Template](#)”, as required.

If required, you may also change the duration of the Live Call Screening Timer. See “[System Timers and Counts](#)” for instructions.

How to use

For EON Users only

To activate Live Call Screening,

- Press DSS key assigned to Live Call Screening.
OR
- Dial 1094-1

To answer a caller who is recording a message in your mailbox,

- Go Off-Hook by pressing the speaker key or lifting the handset.
- Speak to the caller.

To ignore the message of the caller,

- dial any digit.

To deactivate Live Call Screening,

- Press DSS key assigned to Live Call Screening, again.
OR
- Dial 1094-0

Live Call Supervision

What's this?

Using Live Call Supervision, any extension can know the last external number dialed by another extension, even when that extension is in speech with an external party.

This feature is useful for supervisors who want to know where their subordinates are calling.

This feature is supported on DKP and SIP extensions, and on SLT extension which have CLI phone.

How it works

- A is the supervisor of B.
- A wants to know where B is calling, A can use Live Call Supervision.
- When B dials an external number it is stored in the system's memory.
- When A requests Live Call Supervision for B's extension, the system retrieves the last external number dialed by B and presents it on the display of A's phone.
- If B has not dialed any external number, A will get error tone with the message 'No Calls to Supervise' displayed on the LCD.
- If the B has dialed internal as well as external numbers, the last external number dialed by B will be displayed on LCD of A's phone.

Live Call Supervision can be used also when the extension being supervised is in speech with an external party.

How to configure

To be able to use Live Call Supervision, extension users must have this feature enabled in their "[Class of Service \(COS\)](#)" in their "[Station Basic Feature Template](#)" for the required time zones.

How to use

For EON & Extended IP Phone Users

- Press DSS key assigned to Live Call Supervision
OR
- Dial 1098
- Enter the Extension number to be supervised

For SLT Users

- Dial 1098-Extension number to be supervised.

Logical Partition

What's this?

Logical Partitioning is used to restrict the flow of call traffic between PSTN and Private Networks, between PSTN and VoIP networks as well as VoIP to VoIP networks.

This feature may be used in countries where such restrictions are mandated by telecom regulations. For example, in certain countries, calls from VoIP to Public Networks (PSTN, Public Land Mobile Network) are not allowed.

Thus, local telecom regulations may either disallow termination of lines from both networks on the same equipment or may allow lines from both networks to be terminated on the same equipment, provided the equipment is designed to restrict flow of call traffic from these networks. For example, the Telecom Regulatory Authority of India allows termination of lines from the PSTN and VoIP Networks in the same equipment, only if these lines are logically partitioned. Termination of lines from both these networks in the same equipment without a logical partition constitutes an offence.

SARVAM UCS supports Logical Partitioning for this purpose.

How it works

Logical Partition is applied on the Trunk ports. Trunk ports are assigned to any of the following categories according to their installation scenario:

- **Category 1:** Trunk ports interfaced with PSTN /PLMN (Public Land Mobile Network) are assigned this category.
- **Category 2:** Leased lines terminated in the trunk ports are assigned this category.
- **Category 3:** Trunk ports used to interconnect two Systems are assigned this category. For example, QSIG used on T1E1 port or the CO of SARVAM UCS is interfaced with FXS of other System for expanding configuration.
- **Category 4:** SIP Trunks interfaced with ISP/ITSP are assigned this category.
- **SIP Extensions:** Internal calls using SIP are assigned this category.

- *These are default Categories. You have the flexibility to define each category according to suit your preference. For example, you may, if you so prefer, define Leased lines to Category 3 and Trunk ports connecting two Systems to Category 1.*
- *As calls from Category 4 (SIP trunks) to Public network trunks are always to be restricted.*

For each of the above categories, the System Engineer can program the calling permission, that is, whether to 'allow' or 'restrict' the calls across and within these categories. Similarly, the calling permission can also be programmed for the SIP Extensions.

You can change the settings as per the regulations in your country.

Depending on the calling permission programmed between the trunk categories, the system will allow or deny the calls on the trunks.

If within the office premises, you want to remove the logical partition for local SIP Extensions allowing the Internal Extension (SLT, DKP, Local SIP Extension and Remote Extension) calls and External (Trunk) calls, then you can configure the table defining the IP address range of those local SIP Extensions. These local SIP Extensions will be considered similar to the System extensions such as a DKP or SLT.

The SIP Extensions other than those configured in the table will be considered as External/Remote SIP Extensions. Though Remote SIP Extensions can make internal calls to the DKP/SLT/Local SIP Extensions, but Logical Partition will be applied for the external SIP extension calls and trunk calls.

Matrix recommends you to enable the logical partition in order to avoid any toll bypass wherever necessary. Matrix will not be responsible in case of any discrepancy related to this.

How to configure

To able to use this feature you must first assign the trunk port - CO, ISDN BRI, T1E1PRI, Mobile, VoIP to the appropriate Category and then define the calling permission - allow or restrict calls - in Category 1 to 4 and SIP Extension (as described above).

Configuring Logical Partition using Jeeves

- Log into Jeeves as System Engineer.
- Now, assign the categories to the different Trunk Type, by programming the parameter 'Category (Logical Partition)' in the Trunk Port Parameters of the respective trunk types: CO, BRI, T1E1, E&M and Mobile Port.
 - For CO trunks, assign Category in the [“CO Hardware Template”](#).
 - For E&M ports, assign Category in the [“E&M Feature Template”](#).
 - For Mobile ports, assign Category in the [“Mobile Port Parameters”](#).
 - For T1E1PRI ports, assign Category in the [“Configuring E1 Trunks”](#) and [“Configuring T1 Trunks”](#).
 - For BRI ports, assign Category in the [“Configuring BRI Trunks”](#).

- Open the desired Trunk Port Parameters page by clicking the link. For example, to assign a Category to CO ports, open the CO Hardware Template page.

The screenshot shows the 'CO Hardware Templates' configuration page. The left sidebar contains a navigation menu with the following items: Authority Code, Automatic Number Translation, BRI Configuration, Call Cost Calculation, Call Duration Control, Change SA P/w, Change SE P/w, CLI Based Routing, Class of Service, Closed User Groups, Communication Port, Configuration Upload, CO Configuration (selected), CO Parameters, CO Hardware Templates (selected), CO Gain Settings, AC Impedance Test, Status, COSEC Integration, CTI, Date & Time, DDI Routing, DDI Routing Table, Incoming Reference Table, and Outgoing Reference Table. The main content area is titled 'CO Hardware Templates' and features a table with the following columns: Template No., Trunk Type, Dial Type, Pulse Dial Ratio, and Rx CLI Type. The table contains 10 rows, each with a template number from 1 to 10. All 'Trunk Type' and 'Dial Type' fields are set to 'Normal' and 'Tone' respectively. The 'Pulse Dial Ratio' is set to '10PPS 1:2' for all. The 'Rx CLI Type' is set to 'Any FSK Bellcore format'. Below the table, there are three buttons: 'Submit', 'Default', and 'Default One'.

- Scroll with the horizontal bar to reach the column 'Category (Logical Partition)'.
- Select a Category number 1, 2, 3 or 4 to assign Category to CO ports.
- Click 'Submit' at the bottom of the page to save your settings.
- Repeat the same steps to assign Categories to other Trunk ports.

If you have completed assignment of Category to the Trunk Type,

- Under **Configuration**, click **Logical Partitioning** to open the page.

The screenshot shows the 'Logical Partitioning' configuration page. The left sidebar contains a navigation menu with the following items: Key Template, LDAP, Least Cost Routing (LCR), License Management, Logical Partitioning (selected), Macros, Magneto Configuration, Mobile Configuration, Network Parameters, Number List, Operators, OG Trunk Bundle, OG Trunk Bundle Groups, Page Zones, PCAP Trace, PIN Configuration, Radio Extension Parameters, Regional Settings, Response Mapping, Routing Group, Security Settings, SMS on No Reply, SLT Configuration, Station Advance Features, Templates, Station Basic Features, Templates, Station Message Detail, Recording, SMS Gateway, SMS Routing, SMS Server, SMTP Settings, and System Log. The main content area is titled 'Logical Partition' and features a table for 'Calls to' with the following columns: Calls from, Category-1, Category-2, Category-3, Category-4, and SIP Extension. The table contains 5 rows, each with a 'Calls from' category from Category-1 to SIP Extension. All 'Calls to' fields are set to 'Allow'. Below this table is an 'Apply Logical Partition Except' table with the following columns: Index, IP Address, and Subnet Mask. The table contains 12 rows, each with an index from 1 to 12. All 'IP Address' and 'Subnet Mask' fields are set to '000 . 000 . 000 . 000'. At the bottom of the page, there are two buttons: 'Submit' and 'Default'.

- Now, define the call permission for each category, that is, 'allow' or 'restrict' calls. For example, allow/restrict calls from Category 1 to Category 1, from Category 1 to Category 2, from Category 1 to Category 3 and so forth.
- In the table, configure the IP addresses and subnet masks of those SIP Extensions/SIP Trunks for which you want to allow the Internal Extension and External (Trunk) calls without checking the logical partition. You can change the settings as per the regulations in your country.. These local SIP Extensions will be considered similar to the System extensions such as a DKP or SLT. You can configure upto 25 entries in this table.
- Click **Submit** to save changes.
- Log out of Jeeves or continue with the configuration.

Configuring Logical Partition using a Telephone

- Enter SE mode from a DKP/SLT.
- First, program the parameter 'Category (Logical Partition)' in the Trunk Port Parameters of the respective trunk types. For SE Commands, refer the topics:
 - [“CO Hardware Template”](#)
 - [“E&M Feature Template”](#)
 - [“Mobile Port Parameters”](#)
 - [“Configuring E1 Trunks”](#) and [“Configuring T1 Trunks”](#)
 - BRI Parameters in [“Configuring BRI Trunks”](#)

To define call permission across and between categories:

- Dial **5317-Category-Category-Flag**
Where,
Category is
1 for Category 1 trunks
2 for Category 2 trunks
3 for Category 3 trunks
4 for Category 4 trunks

Flag is
0 for restrict calls
1 for allow calls
Default: 0 (that is, restrict calls) for Category 1 to 3 and 1 (allow calls) for Category 4.
- Exit SE mode.

- *If you select India as the Region, by default, calls are restricted for all categories, except within SIP Extensions.*
- *When call permission is restricted between two categories of trunks, following feature interactions will apply:*
 - **Call Transfer:** *Trunk to Trunk Transfer between restricted categories of trunk will not be allowed. If the user attempts trunk-to-trunk transfer between restricted trunks, Error Tone will be played.*

- **Raid:** *If a user using DISA attempts to Raid a conversation of an extension with a trunk to which call permission is restricted, the Raid attempt will fail and the user will get an Error Tone.*
- **Conference:** *An extension user will not be able to include restricted trunks in a 3 party or multi-party conference. An Error Tone will be played when s/he attempts it.*
- **Dial-In Conference:** *Participation in a Dial-In Conference from trunks with restricted call permission is not allowed.*
- **External Call Forward:** *In the case of Auto Attendant, DISA or when transferring a trunk call to an extension, if the extension has set call forward to an external number, the system will allow the call only if the call permission between the source and destination trunk is allowed. Otherwise, an Error Tone will be played to the user.*
- **Hotline:** *When a user has logged into DISA and the extension being used for the DISA login has the Hotline - Trunk or Hot outward dialing (HOD) feature enabled, the system will allow the call between the source trunk (from where the DISA login is made) and the destination trunk (which is used as Hotline Trunk) only if calling is permitted between them. Otherwise an Error Tone will be played to the DISA caller on the expiry of the Hotline Timer.*

Loop Back Tests

What's this?

SARVAM UCS supports following types of Loop Back Tests for T1 and E1 lines:

- Near End Loop Back: These are of two type viz.
 - Line Loop Back test
 - Payload Loop Back test
- Far End Loop Back Test: These are of two type viz.
 - Line Loop Back test
 - Payload Loop Back test

These tests are conducted when the T1E1 port is in NT mode and is connected to other System and wants to test the line between itself and the far end. In this mode, SARVAM UCS acts as a network.

Near End Loop Back

Line Loop Back

This can be implemented by shorting of signaling wires 'RTIP' and 'RRING' to 'TTIP' and 'TRING' respectively at the line side.

This is as good as shorting the **Rx pair to Tx pair**. In this case you do not need to sync the T1E1 port with the network.

Payload Loop Back

This is effectively a physical connection of **payload** channels (Timeslot) with **framing** generated by T1E1 port itself for the transmit signal. In this case you must sync the T1E1 port with the network.

When the other end connected with the T1E1 port of the SARVAM UCS wants to perform the Loop Back tests, the T1E1 port will form the Loop Back depending upon the type of test the other end wants to perform (that is, Line Loop Back or Payload Loop Back).

Loop Back Process

Method of forming loop back

Method of forming loop back at the T1E1 port side is different for the E1 and T1 carrier. These are explained in the following.

When line type is configured as ISDN_E1_PRI or ISDN_E1_CAS on the T1E1 port,

- The protocol doesn't support the facility that the remote end can close/open the loop at the T1E1 port side automatically.
- Hence when the remote end wants to perform the loop back test, the SE must be informed, to form the desired type of loop back (that is, Line Loop Back or Payload Loop Back) on the T1E1 port.

- When the SE forms the loop back at T1E1 port side (by issuing appropriate SE Command), the remote end can start the test.
- On completion of the testing, the remote end must inform the SE to release/open the loop back formed on the T1E1 port side.
- On receipt of the request from the remote end, the SE will issue SE command to open the loops on the T1E1 port.

When line type is configured as ISDN_T1_PRI or ISDN_T1_RBS on the T1E1 port,

- The protocol supports loop back Activation and deactivation message, whereby the remote end can send the loop activation code to the T1E1 port and the T1E1 port decodes the message and forms the loop back automatically.
- On completion of the testing, the remote end can send the loop deactivation code and the T1E1 port can open the already formed loop back.
- So in this case the SE's intervention is not required to form and release the loop back.
- In case the remote end doesn't support the facility to automatically form/release the loop back for the T1E1 port though the carrier is T1, the SE can use the commands (6141-1-T1E1-Type of Loop Back) on request of the remote end to form and release the loop backs.

Loop back Activation

When the system receives the SE command to form Line/Payload loop back (in case of E1):

- It will inform the SARVAM UCS Card T1E1 about the received command SARVAM UCS Card T1E1 will release all the calls supported by the T1E1 Port under test.
- The SARVAM UCS Card T1E1 will form the required type of loop back.
- System will put the T1E1 port in maintenance mode. It will release all active calls supported by T1E1 port and restrict the usage of T1E1 port for IC/OG calls.

When the loop back activation code is received from far end on the T1E1 port, (in case of T1 carrier):

- SARVAM UCS Card T1E1 will inform the system about the received information and the T1E1 port number.
- SARVAM UCS Card T1E1 will release all the calls supported by the T1E1 Port under test.
- System will put the T1E1 port in maintenance mode. It will release all active calls supported by T1E1 port and restrict the usage of T1E1 port for IC/OG calls.

Release Loop Back

On receiving the loop back release code or receiving the command to release the loop back (either Payload or Line), the system will take the T1E1 port out from the maintenance mode and now the T1E1 port will function normally.

Far End Loop Back Test

Far End Loop Back test gives facility to SARVAM UCS to check the health of the line towards the other end connected on its T1E1 port using loop back tests.

The types of the far end loop back test are:

- Line Loop Back
- Payload Loop Back

Line Loop Back

This can be implemented by shorting of signaling wires 'RTIP' and 'RRING' to 'TTIP' and 'TRING' respectively at the line side.

This is as good as shorting the **Rx pair to Tx pair**. In this case you do not need to sync the T1E1 port with the network.

Payload Loop Back

This is effectively a physical connection of **payload** channels (Timeslot) with **framing** generated by T1E1 port itself for the transmit signal. In this case you must sync the T1E1 port with the network.

When the other end connected with the T1E1 port of the SARVAM UCS wants to perform the loop back tests, the T1E1 port will form the loop back depending upon the type of test the other end wants to perform (that is, line loop back or payload loop back).

The option 'Release All Loop Backs' is required when the far end requires the universal loop back release code to release the Loop Back.

Loop Back Process

Method of forming loop back

Method of forming loop back at the T1E1 port side is different for the E1 and T1 carrier. These are explained below.

When line type is configured as ISDN_E1_PRI or ISDN_E1_CAS on the T1E1 port,

- The protocol doesn't support the facility that the SARVAM UCS can perform the loop back tests automatically.
- The SE of the SARVAM UCS will inform the far end connected with the T1E1 port, to form the loop back as required.
- Once the far end has formed the desired loop back the SE can issue command to start the Far end loop back test.

Start Loop Back Test:

- On receiving the command to start Far End loop back test (either the Line Loop Back or Payload Loop Back test) the system will put this T1E1 port in maintenance mode and informs the T1E1 Card about the test to being performed on the T1E1 port.
- All the calls supported by the T1E1 Port under test will be released.

- The T1E1 Card will start the PRBS generator and counter.
- The T1E1 Card will send the PRBS count every 1 second to the system.
- The T1E1 Card will increment PRBS Counter for every error encountered during the test every one second.
- The T1E1 Card will reset the PRBS counter to zero, after sending the PRBS Counter to the system, every second.
- The system will store the received PRBS count (received every second) in Performance Report, which can be captured from Serial port/Ethernet port.

End Loop Back Test/Release All Loop Backs

- When the SE wants to end the loop back test he will issue the command to end the Far End Loop Back Test, for the T1E1 port under the test.
- SE will inform the other end's person that loop back test is finished and now the remote end can open the loop formed.
- On receiving the command to end loop back test for the T1E1 port, the system will take the T1E1 port out of maintenance state and inform the T1E1 port about the received command.
- Normal functioning of the T1E1 port will resume.

When the line type is configured as "ISDN_T1_PRI" or "ISDN_T1_RBS" on the T1E1 port,

- Loop back activation/deactivation is automatic.
- The activation methods are different for the D4 and ESF framing.
 - D4 framing supports only Line loop back
 - ESF framing supports both Line loop back and Payload loop back.
- **When D4 is selected as Framing,**

Start Line Loop Back Test

- The test will start for the T1E1 port when SE issues the command to start the far end line loop back test. When SE command (6142-1-T1E1-1) is issued the system will inform the T1E1 Card about the command and this T1E1 port will be in maintenance mode.
- All the calls supported by the T1E1 Port under test will be released.
- The T1E1 Card will send the line loop back "Activation Code" and will start the PRBS generator and counter.
- The T1E1 Card will send the PRBS count every 1 second to CPU Card.
- The T1E1 Card will increment PRBS Counter for every error encountered during the test every one second.

- The T1E1 Card will reset the PRBS counter to zero, after sending the PRBS Counter to the system, every second.
- The system will store the received PRBS count (received every second) in Performance report, which can be captured from Serial port/Ethernet port.

Stop Loop Back Test

- When SE command (6142-T1E1-2) or (6142-T1E1-5) to end the Far end loop back test is issued the system will inform the T1E1 Card about the received command and will remove the T1E1 port from the maintenance mode.
- The T1E1 Card will send the inband "Deactivation Code".

- **When ESF is selected as Framing,**

Start Loop Back Test

- Depending upon the SE command issued to start the type of Loop Back (Line or Payload) test the system will put the T1E1 port under test in Maintenance mode and will inform the T1E1 Port about the received command.
- All the calls supported by the T1E1 Port under test will be released.
- The T1E1 Card will send the Loop back "Activation Message" for the line/payload loop back as informed by the system.
- The T1E1 Card will start the PRBS generator and counter.
- The T1E1 Card will send the PRBS count every 1 second to CPU Card.
- The T1E1 Card will increment PRBS Counter for every error encountered during the test every one second.
- The T1E1 Card will reset the PRBS counter to zero, after sending the PRBS Counter to Master, every second.
- The system will store the received PRBS count (received every second) in Performance report, which can be captured from Serial port/Ethernet port.

Stop Loop Back Test/Release All Loop Backs

- When SE issues command (6142-T1E1-2) or (6142-T1E1-4) or (6142-T1E1-5) to end the Far end loop back test the system will inform the T1E1 Card about the received command and will remove the T1E1 port from the maintenance mode.
- The T1E1 Card will send the "Deactivation Message" for the line/payload loop back test as required.

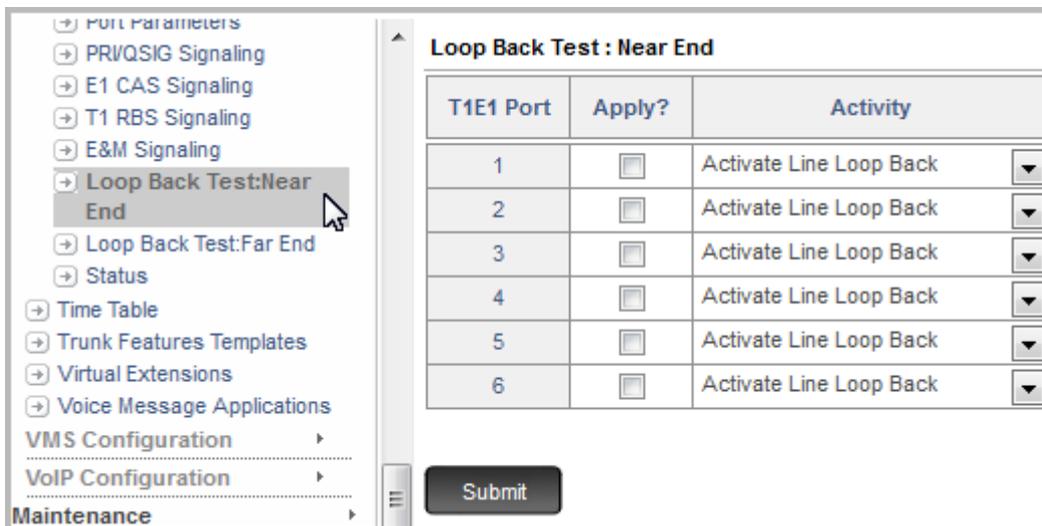

Performance Report

A Performance Report of the tests can be generated. It contains the log of all the errors. The Performance Reports stores upto 50 entries on FIFO basis.

Configuring Loop Back Test using Jeeves

To configure the Near End Loop Back Test parameters,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **T1E1 Configuration**.
- Click **Loop Back Test: Near End**.

T1E1 Port	Apply?	Activity
1	<input type="checkbox"/>	Activate Line Loop Back
2	<input type="checkbox"/>	Activate Line Loop Back
3	<input type="checkbox"/>	Activate Line Loop Back
4	<input type="checkbox"/>	Activate Line Loop Back
5	<input type="checkbox"/>	Activate Line Loop Back
6	<input type="checkbox"/>	Activate Line Loop Back

Submit

- For each T1E1 port,
 - Select the **Apply?** check box to enable loop back.
 - From the **Activity** list, you can select to Activate or Release the loop back test.
 - Click **Submit** to save the settings.

To configure the Far End Loop Back Test parameters,

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **T1E1 Configuration**.

- Click **Loop Back Test: Far End**.

- Select the Communication Port/Ethernet Port/ USB to COM to be assigned as destination port for **Online** and **Report** logs.
- If you select Ethernet Port as the destination, enter the **IP Address** of the Ethernet Port and the **Port** (Listening Port for the packets) for the **Online** and **Report** logs respectively. Both IPv4 and IPv6 addresses are supported. Valid port range: 1025 to 65535;514.
- For each T1E1 port,
 - Select the **Apply?** check box to enable loop back.
 - From the **Activity** list, you can select to Start, End or Release the loop back test.
 - Click **Submit** to save the settings.

Configuring Loop Back Test using Telephone

The commands explained below should be referred as:
• To program a single port: XXXX-1
• To program a range of ports: XXXX-2
• To program all the ports: XXXX-*

Near End Loop Back

Use the following command to activate/release Near End Loop Back for T1E1:

6141-1-T1E1-Loop back

Where,

T1E1 is from 01 to 08.

Loop back	Meaning
1	Activate Line Loop back

Loop back	Meaning
2	Activate Payload Loop back
3	Release Loop back

Far End Loop Back

Use the following command to start/stop far end loop back test for T1E1:

6142-1-T1E1-Code

Where,

T1E1 is from 01 to 08.

Code	Meaning
1	Start Line Loop Back Test
2	End Line Loop Back Test
3	Start Payload Loop Back Test
4	End Payload Loop Back Test
5	Release All Loop Backs

Performance Reports

Online Performance Report Printing

Use following command to assign the port for online Performance Report Printing:

6143-Port

Where,

Port	Meaning
0	None
1	COM Port
2	Ethernet Port
3	USB to COM Port

Default, None.

Offline Performance Report Printing

Use following command to assign the port for offline Performance Report Printing:

6144-Port

Where,

Port	Meaning
0	None
1	COM Port
2	Ethernet Port

Port	Meaning
3	USB to COM Port

Default: None.

Performance Reports From SA Mode

Online Performance Reports

Use the following command to start/abort online printing of T1E1 performance report:

1072-030-Flag

Where,

Flag	Meaning
0	Disable
1	Enable

By default, Flag is 0.

Offline Performance Reports

Use the following command to start/abort offline printing of T1E1 performance report:

1072-031-Flag

Where,

Flag	Meaning
0	Disable
1	Enable

By default, Flag is 0.

- *PRBS counter = 0 indicates the 'healthy' condition.*
- *During loop back test the PRBS counter may be greater than zero at initial stage of the loop back stage, but it will be zero afterwards consistently for the healthy condition.*
- *PRBS counter = greater than zero, indicates the 'faulty' condition for the loop back test.*

Macros

What's this?

Extension users often have to dial access codes for specific functions like dialing a feature code, making an internal call, making an external call, etc.

SARVAM UCS supports Macros, using which, you can abbreviate long number strings for regularly used functions in to macros and assign them to a DSS key on a DKP/Extended IP Phone extension.

You can also assign Macros on SLTs that have special keys.

How it works

- Extension 2001, frequently sets *Call Forward-All Calls* to an external number 26550333.
- To do this, each time, Extension 2001 must dial **131-Trunk Access Code-26550333-#***.
- Instead of having to dial this lengthy number string, a Macro can be created for *Call Forward-All Calls* to External number.
- If Extension 2001 is an Extended SIP Phone or a DKP, the Macro can be assigned to a DSS key on the phone.
- Instead of dialing this number string, the user of Extension 2001 can simply press the DSS key on which this Macro is assigned.
- Thus when the DSS key on which a Macro is assigned is pressed, the corresponding access code is executed.
- The system sets call forward to the external number automatically.

SARVAM UCS also supports Macros for SLT which have special keys. When each of these keys is pressed, a special number string, which you can program is dialed.

For example, an SLT instrument has 5 special purpose keys. When these keys are pressed, the strings *50, *51, *52, *53, *54 programmed on these keys are dialed out.

You can create Macros for the strings dialed out using the special keys, whereby the string dialed by each of these special keys is associated with a particular function. For example, the special key for dialing *50 is associated with *Call Forward -All Calls* to an external number. So, when the extension user presses *50, the system receives this string and takes appropriate action, that is, interprets it as call forward to the external number, and sets call forward.

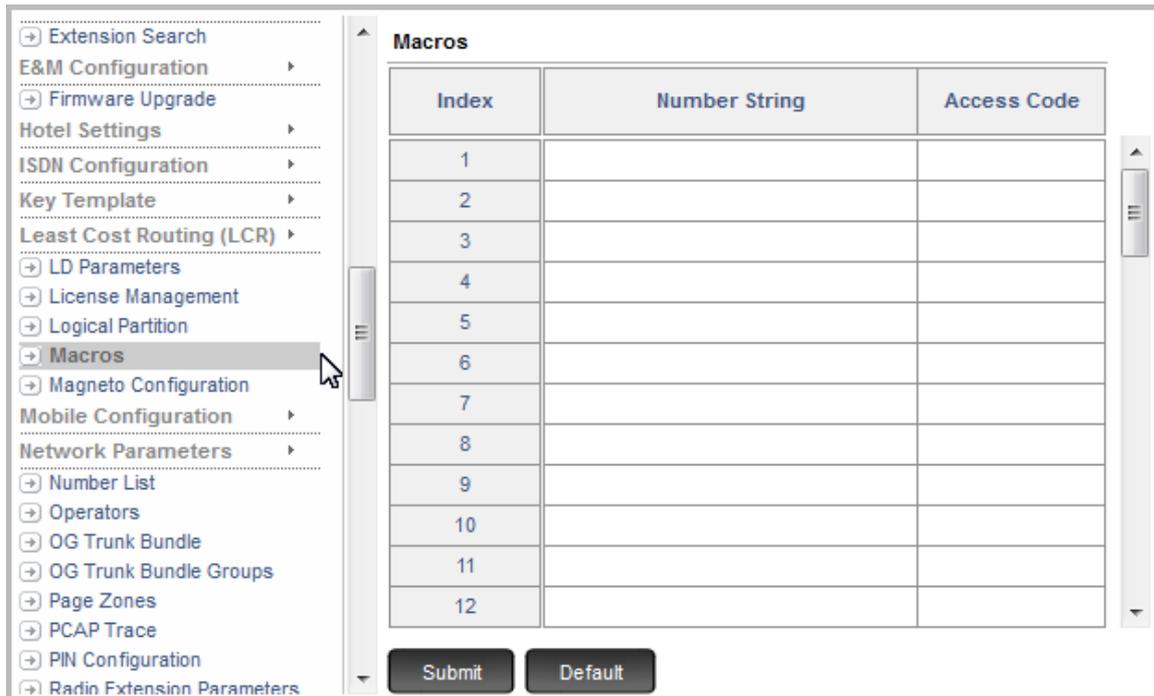

Thus, each time the extension user presses the special key *50, the system considers that the extension user has dialed **131-Trunk Access Code-26550333-#***.

How to configure

You can create as many as 50 Macros using Jeeves and by dialing system commands from a telephone connected to the SARVAM UCS.

Creating Macros using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **Macros**.

Index	Number String	Access Code
1		
2		
3		
4		
5		
6		
7		
8		
9		
10		
11		
12		

The Macros page opens. Each macro is stored against an index number. By default the Macros Number String and Access Code are blank when the system is operated in the **Enterprise Mode**.

- When creating a Macro for a **DKP/Extended IP Phone**,
 - In the **Number String** field, enter the strings the system should consider as command when the DSS Key on the DKP/Extended IP Phone.
 - Click **Submit** to save.

When SARVAM UCS is operated in the **Hotel Mode** (see **Customer Profile** under “[System Parameters](#)”), Number Strings and Access Codes are assigned for features such as Front Desk, Room Service, Voice Guided Alarm, Reservation Desk, Voice Mail System, Retrieve Message. These Macros will appear on this page. To know more, see the topic Customer Profile in the SARVAM UCS Hospitality System Manual.

- Now, assign this Macro to a DSS Key on the DKP/Extended IP Phone.
- When you assign a Macro to a DSS Key on a DKP or Extended IP Phone,
 - you must select **Macro** as **Function Type**

- As **Offset**, you must select the Macro Index number (1-50) at which the number string is stored. In this example, it would be Macro Index 1.

For detailed instructions on assigning a macro to a DSS key of a DKP, see [“DSS Keys Programming”](#).

For instructions on assigning a macro to a DSS key of the Extended IP Phone, see [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP330”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP248”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP310”](#) and [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP510”](#) for instructions.

- When creating a Macro for a special Key on an **SLT**,
 - In the **Number String** field, enter the strings the system should consider as command when the special key on the SLT is pressed.
 - In the **Access Codes** field, enter the strings sent by the SLT on pressing the special function key.

For example, if the SLT sends the string ‘*53’ to the SARVAM UCS when the function key for Alarms is pressed, enter the string **163** (the feature access code for Voice-guided Alarms) in the **Number String** field, and enter the string ***53** in the corresponding **Access code** field.

The Access Code that you assign here in Macros must not conflict with any other Access Codes in the Dial Phase. See [“Access Codes”](#).

- Click **Submit** to save.
- Log out of Jeeves.

Creating Macros using a Telephone

- Enter SE mode from an SLT/DKP.

To create a Macro, dial:

- **1810-Macro Index-Number String**

Where,

Macro Index is from 01 to 25.

Number String is a string of 24-digits.

If the length of the Number String is less than 24-digits terminate it with #*.

To clear a Macro, dial:

- **1810-Macro Index-#***

You can program a special digit for 'Pause' in the Key Board Macro Number string using the code #3.

To assign an Access Code for the Macro, dial:

- **3115-1-Macro Index-Access Code**

Where,

Macro Index is from 01 to 25.

Access Code is a string of 4-digits.

Access Code is maximum of 6 digits. If it is less than 6 digits, terminate it with #*.

To clear Access Code assigned to a Macro, dial:

- **3115-1-Macro Index**

Where,
Macro Index is from 01 to 25.

To default the access code for the Macro, dial:

- **3165-1-Macro Index**

Where,
Macro Index is from 01 to 25.

When SARVAM UCS is operated in **Enterprise** mode, the default Macros Number String and Access Codes are blank. So, when you dial this command, the values in the Macros will become blank.

When SARVAM UCS is operated in the **Hotel Mode**, the Number Strings and Access Codes assigned by default will be restored when you dial this command. See the topic Customer Profile in the SARVAM UCS Hospitality System Manual to know more.

- Exit SE mode.

Meet Me Paging

What's this?

While a Paging announcement is being made, any extension user of SARVAM UCS can get connected to the Paging extension, by dialing the Meet Me Paging feature code and the number of the Paging extension.

This feature is useful to Operators. Using this feature they can locate extension users who are away from their desks and get connected to them at their current location.

How it works

- A calls B's extension, but B is away from the desk.
- A uses Paging and makes an announcement asking B to call A's extension.
- To get connected to A's extension, B may use Meet Me Paging from any extension, while the announcement is being made.
- B dials Meet Me Paging code and A's number during the announcement.
- B gets connected to A.

- *Paging is an announcement made to a group of extensions within a Page zone. Extension users, (including those who are outside the Page zone) who want to use Meet Me Paging to answer the Paging call, will need to know the extension number they must call. Therefore, extension users who are paging are advised to announce their extension number.*
- *Meet Me Paging can be used only if the Paging call is active. Therefore, extension users who are paging must keep their call active, if they want their call to be answered using Meet Me Paging.*

How to configure

No configuration is required for Meet Me Paging. However, extension users who are using Paging to make their announcement, must have the feature "[Paging](#)" allowed in their Class of Service.

How to use

You can use Meet Me Paging to answer a Paging call from any extension, if you know the number of the Paging extension, and if the call is still active.

For EON & Extended IP Phone Users

To answer a Paging call from any extension other than the Paged extensions,

- While the announcement is being made,
- Press the DSS key assigned to Meet Me Paging.
OR
- Dial 1093
- Dial the number of the paging extension.
- You get connected to the Paging extension user.

To answer a Paging call from the same extension that is paged,

- While the announcement is being made,
- Go ON-Hook and then go OFF-Hook.
- Press the DSS key assigned to Meet Me Paging.
OR
- Dial 1093
- Dial the number of the paging extension.
- You get connected to the Paging extension user.

For SLT Users

To answer a Paging call from any extension other than the Paged extensions,

- While the announcement is being made,
- Lift the handset.
- Dial 1093-Paging Extension Number.
- You get connected to the Paging extension user.

To answer a Paging call from the same extension that is paged,

- While the announcement is being made,
- Go ON-Hook and then go OFF-Hook.
- Dial 1093-Paging Extension Number.
- You get connected to the Paging extension user.

Message Wait

What's this?

The Message Wait feature of SARVAM UCS enables extension users/Operator to set Message Wait on other extensions to deliver important messages.

If the extension user has a mailbox assigned, the Message Wait feature indicates to the extension user, the arrival of new messages in the user's mailbox.

Thus, Message Wait can be set by extension users as well as by the Voice Mail System.

You can set multiple Message Wait, but on different extension users. However, only one Message Wait can be set on one extension. A Maximum of 4 Message Wait can be set on an extension.

How it works

Message Wait set by Extensions/Operator

The Operator/any extension user can set Message Wait on another extension.

- The Operator calls Extension A.
- Extension A is not at the desk to attend the call.
- The Operator has an important message to communicate. So, the Operator sets Message Wait on Extension A, using the Message Wait key (if configured) or by dialing the feature access code.
- Extension B tries to reach Extension A, and sets Message Wait on Extension A, using the Message Wait key (if configured) or by dialing the feature access code.
- Message Wait will be indicated to Extension A according to the *Type of Message Wait Notification* set for Extension A. This may be in the form of a Stuttered Dial Tone, a Voice Message, Ring, or LED Lamp.
- If Extension A is a DKP or an Extended IP Phone and has DSS key assigned for Retrieve New Message, the LED of this key will glow to indicate new message wait.
- Now, Extension A can dial the feature access code to retrieve Message Wait, or press the Retrieve Message Wait Key, if assigned.
- The system will call the extension that first set Message Wait on Extension A. In this case, the Operator. If the Operator is busy, the system will place the call on Extension B. The system will try to call the extensions that set Message Wait until the call is answered.
- The extension that set Message Wait on A gets the CLI of A as Message Wait. A can now deliver the message.
- The LED of the Retrieve Message Wait key, if assigned, on Extension A will be turned off after all message wait set by other extensions on Extension A have been served.

Message Wait set by the Voice Mail System

The Voice Mail System (VMS) sets Message Wait on the extension, whenever a new message arrives in its personal Mailbox.

- Extension A is assigned a Personal Mailbox.
- There is a new message in A's Mailbox. The VMS indicates this to Extension A as per the Type of *Message Wait Indication* set for Extension A. This may be in the form of a Stuttered Dial Tone, a Voice Message, Ring or LED Lamp.
- If Extension A is a DKP or an Extended IP Phone, the Voice Mail key on the phone will also glow to indicate the arrival of a new message.
- If the Retrieve Message Wait key is assigned on the DKP/Extended IP Phone of Extension A, the LED of this key will also glow simultaneously to indicate arrival of the new voice mail.
- To listen to the new message, Extension A can
 - press the Voice Mail key
 - or
 - the Retrieve New Message key (if assigned)
 - or
 - dial the feature access code for Retrieve New Message.

The VMS answers the call. After Extension A has listened to the new messages, the LED of the Voice Mail key is turned off.

The LED of the Retrieve Message Wait key, if assigned, will also be turned off.

Types of Message Wait Indications

The system gives Message Wait indication to extensions according to the type of *Message Wait Indication* selected for the extension. The types of Message Wait Indications offered by SARVAM UCS are:

Stuttered Dial Tone/Voice Message

- When the extension user goes OFF-Hook, the user will hear a voice message, if a pre-recorded Voice Module has been assigned for Message Wait Notification. If no voice module is recorded and assigned, the extension user will hear a stuttered dial tone instead.
- If you want voice message to be played as message wait notification, record and assign a Voice Module. Refer "[Voice Message Applications](#)" for instructions.

SARVAM UCS can play only 9 Voice Modules simultaneously. The Voice Module for Message Wait Notification will not be played if there are already 9 being played simultaneously. In this case, Stuttered Dial Tone will be played for Message Wait Notification, when the extension user goes OFF-Hook.

LED Lamp

- When the extension user has an SLT with 'Message Wait' lamp, you can set this type of Message Wait Indication. When Message Wait is set, the lamp will blink continuously either using High Voltage or Polarity Reversal. The lamp will be turned off when the extension user has retrieved all the waiting messages.

Ring

- When a new Message Wait is set on the extension, the system will play *Message Wait Ring* (Short, Fast) on the extension. See [“Distinctive Rings”](#).
- The extension will ring for the duration of the Message Wait Ring Timer (configurable; default: 30 seconds). If the call is not answered within this timer, the system will ring on the extension again for as many times as the Message Wait Ring Count (configurable; default: 10 times), and at the interval set as the Message Wait Ring Timer Interval (configurable; default: 30 minutes).
- When the extension user answers the call, the user gets connected to the VMS or the extension that set Message Wait.

Message Wait Signal generated by SARVAM UCS

Particulars	Value
Peak Voltage	82-85 V
ON Time	100ms
OFF Time	150ms
Frequency	4Hz
DC Offset	48V

How to configure

To provide this feature to extensions, you must do the following configuration on the extensions:

- Enable the Message Wait feature in the [“Class of Service \(COS\)”](#) of the [“Station Basic Feature Template”](#) of the extensions. This allows the extensions to set and cancel Message Wait on other extensions. Only those extensions that have this feature in their COS can set or cancel Message Wait on other extensions. By default, this feature is enabled in the COS of all extension types for all the time zones.
- Select the desired **Message Wait Indication** in the [“Extension Voice Mail Settings”](#) of the SLT, DKP, ISDN Terminal, SIP extensions and Department Groups.
- If you selected **Voice Message** as Message Wait Indication Type for an extension, you must also record the desired Voice Message in a Voice Module and assign it to the Message Wait application. See [“Voice Message Applications”](#) for instructions.
- If you selected **Ring** as Voice mail/Message Wait Indication Type for an extension, you may configure the following Ring Parameters:
 - Message Wait Ring Timer (default: 30 seconds)
 - Message Wait Ring Count (default: 10 attempts)
 - Message Wait Ring Timer Interval (default: 30 minutes).

See [“System Timers and Counts”](#) for instructions.

- You may also assign DSS Keys to ‘Message Wait’ and ‘Retrieve Message Wait’ on DKP and Extended IP Phone extensions.

For instructions on assigning these features to DSS keys of a DKP, see [“DSS Keys Programming”](#).

For instructions on assigning these features to DSS keys of the Extended IP Phone, see [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP330”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP248”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP310”](#), [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP210”](#) and [“DSS Key Settings”](#) in [“Configuring Matrix SPARSH VP510”](#)

How to use

For EON & Extended IP Phones

To set Message Wait:

- Press DSS Key assigned to 'Message Wait'.
OR
- Dial 1076
- Dial the extension number on which you want to set Message Wait.
- Select the option 'Set Message Wait'
- Press Enter Key.

To cancel Message Wait:

- Press DSS Key assigned to 'Message Wait'.
OR
- Dial 1076
- Dial the extension number on which you want to cancel Message Wait.
- Select the option 'Cancel Message Wait'
- Press Enter Key.

To retrieve Message Wait:

- Press DSS Key assigned to 'Retrieve Message Wait' or the Voice mail Key when the LED glows.
OR
- Dial 1077

For SLT

To set Message Wait:

- Pick up the handset.
- Dial 1076
- Dial extension number on which you want to set Message Wait.
- Dial 1
- Replace the handset.

To cancel Message Wait:

- Pick up the handset.
- Dial 1076
- Dial extension number on which you want to cancel Message Wait.
- Dial 0
- Replace the handset.

To Retrieve Message Wait:

- Pick up the handset.
- Dial 1077

Mobility Extension

What's this?

SARVAM UCS offers mobility to its extension users whose nature of work keeps them away from their desks frequently and for longer durations.

Using mobility extensions, the extension users of SARVAM UCS can make and receive their calls from their current (remote) location, placing calls through the system, and can access the system just as any other normal extension of the SARVAM UCS.

SARVAM UCS offers mobility using:

- VARTA UC Clients — VARTA ADR100 or VARTA AMP100. For details refer to the respective User Guide.
- DISA. For details, refer to the explanation given below.

How it works

SARVAM UCS supports two types of users:

- **Station Users:** they are extension users of SARVAM UCS to whom a dedicated physical station is assigned on their desk.
- **Virtual Users:** they are extension users of SARVAM UCS who share a physical station, or may not have any physical station allotted to them.

The facility of Mobility Extension is provided to both virtual and normal extension users using the features [“Direct Inward System Access \(DISA\)”](#) and [“Call Forward”](#).

How to configure

To provide Mobility Extension to users, the follow the steps described below.

- List out the Station Users and Virtual Users and configure them first. The software ports of SLT, DKP and ISDN Terminals which are not assigned a physical slot - port, can be used as Virtual stations.
- Make sure that stations which are to be provided Mobility Extensions have the features Call Forward and DISA enabled in their [“Class of Service \(COS\)”](#)³¹⁷. Class of Service is to be programmed in the [“Station Basic Feature Template”](#) assigned to the Mobility Extensions.
- Make a list of External numbers to which the Mobility Station users will forward their calls. Program these numbers in the 'Allowed List' of Local, Regional, National and International Numbers, as appropriate.
- The Toll Control assigned to the station will be applied when a call is forwarded to an external number. Make sure that the stations which are to be provided Mobility Extension have the required [“Toll Control”](#) level for Call Forward to the External Numbers (the numbers you have programmed in the Allowed List).

³¹⁷. It is possible to map the virtual user's flexible number (extension number) to a physical station. With this mapping, whenever a virtual user's number is dialed, the call is placed to the assigned physical station. The physical station can be assigned by defining it as the 'Landing Destination for Virtual Users' in the Station Advanced Feature Template assigned to the virtual user.

Toll Control level is to be programmed in the [“Station Basic Feature Template”](#) assigned to the Mobility Extensions.

- Program the parameter 'External Call Forward for' in the [“Station Advanced Feature Template”](#) assigned to the Mobility Extensions. This parameter defines the types of call for which the External Call Forwarding is to be applied. Select any one of the options, Internal Calls Only, Trunk Calls Only, Internal + Trunk Calls as required.
- Program the parameter 'DISA' in the [“Trunk Feature Template”](#) of the trunk lines which Mobility Extension users are to be provided access to. Make sure you select the option 'CLI Auth. Multiple Calls' in the 'DISA' parameter of the 'Trunk Feature Template'.
- Make a list of numbers which the Mobility Extension users will use to access the SARVAM UCS from DISA mode. Program this list of numbers in the "DISA-CLI Authentication Table".

Program this list of numbers in the 'Calling Number' field of the Authentication Table. Program the 'Port Type' and 'Port Number' of the Station assigned to Mobility Extension Users in the 'Auto Login As' field for the respective 'Calling Number' field. Refer the topic [“Direct Inward System Access \(DISA\)”](#) to know more.

How to use

The Mobility Extension Users of SARVAM UCS can use the features of SARVAM UCS from a remote location as described below.

Receiving calls

To receive calls, the Mobility Extension User must set Call Forward on his station with an external number (mobile number, landline number, etc.) as the destination number.

To make calls ring on the station and the external number simultaneously, the Mobility Extension User must activate the Call Forward-Dual Ring feature on his station.

The Mobility Extension User can also choose where he wants to receive the calls during a particular time of the day. For example, he can receive calls during a particular time of the day, that is, Time Zone on his external number and have his calls received by his Voice mail or the Operator or any other number during another Time Zone. To do this, he must set **“Call Forward-Scheduled”** on his station. Dual Ring can also be set for Call Forward-Scheduled.

Making calls

The Mobility Extension User should make a call on the DISA enabled trunk of SARVAM UCS from the external number and the system will provide the dial tone to the user after authenticating the external number with the help of the DISA-CLI Authentication table.

On getting the dial tone, the Mobility Extension User can make internal as well as external calls as per the [“Toll Control”](#) and [“Class of Service \(COS\)”](#) assigned to his Station.

The Mobility Extension User can also dial codes of the Personal directory and Global directory numbers to use the feature Abbreviated Dialing.

Accessing Features

The Mobility Extension User can access the system features by dialing specific codes after making calls on the DISA enabled trunk of SARVAM UCS, or after answering the calls received on his external number.

These codes are listed below.

Activity	Code to be dialed
On-Hook	#0
Off-Hook	#1
Flash	#2
Pause	#3
Terminate the call	#9

Described below are instructions for Mobility Extension users on using different call management features.

Call Hold

To put a call on hold,

- When in speech with Party A, Mobility Extension User dials **#2**.
- The call with Party A is put on Hold.
- Press Flash (**#2**) to retrieve the held call and talk to Party A again.

Call Transfer

To conduct a screened Call Transfer,

- When in speech with Party A, Mobility Extension User dials **#2**.
- The Call of Party A is put on Hold.
- Mobility Extension User gets Feature Tone.
- Dial Trunk Access Code (TAC) followed by the number of Party B. [To make external call]

OR

- Dial Internal station number [to make call on a station]
- When in speech, dial **#0** to go on hook.
- Party A and Party B will get connected.

To perform Call Transfer-While Ringing,

- Mobility Extension User is in speech with Party A.
- During speech, Mobility Extension User dials **#2**.
- The Call of Party A is put on Hold.
- Mobility Extension User will get Feature Tone.
- Dial TAC - number of Party B. [To make external call]

OR

- Dial Internal station number [to make call on station]
- Dial **#0** on receiving Ring Back Tone (RBT).

To perform Call Transfer-On Busy Station,

- Mobility Extension User is in speech with Party A.
- During speech, Mobility Extension User dials **#2**.
- The Call of Party A is put on Hold.
- Mobility Extension User will get Feature Tone.
- Dial number of Station user.
- Dial **#0** on receiving Busy Tone.

To perform a Call Transfer-Trunk-to-Trunk,

- Mobility Extension User is in speech with Party A.
- During speech, Mobility Extension User dials **#2**.
- The Call of Party A is put on Hold.
- Mobility Extension User will get Feature Tone.
- Dial Trunk Access Code to grab the Trunk
- After receiving the Dial Tone of the trunk, dial number of Party B.
- After Party B answers the call, dial **#0**.
- Party A will get connected with Party B.

Making a Second Call

To make a second call by putting the current call on hold,

- Mobility Extension User is in speech with Party A.
- During speech, Mobility Extension User dials **#2**.
- The call of Party A is put on hold.
- Mobility Extension will get Feature Tone.
- To make an external call: dial TAC - number of Party B.

OR

- To make an internal call: dial extension number.

Call Toggle (Call Splitting)

To toggle between two calls,

- Mobility Extension User is in speech with Party A.
- During speech, Mobility Extension User dials **#2**.
- The call of Party A is put on hold.
- Mobility Extension will get Feature Tone.
- Dial number of Party B.
- Make speech with Party B.
- Dial **#2-1** to put Party B in hold and speech with Party A.
- Again dial **#2-1** to put Party A in hold and speech with Party B.

Call Pick Up

To pick up the call of same Call Pick Up-Group,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After receiving dial tone, dial **4**.

- The call ringing on the station of the same Call Pick up-Group will get connected with Mobility Extension User.

To pick up the selective call,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After receiving dial tone, dial **12-Station Number**.
- The call ringing on the dialed station of will get connected with Mobility Extension User.

3-Party Conference

To conduct a 3-Party Conference,

- Make the first call.
- Dial **#2**.
- Make the second call.
- Dial **#2-*3** to establish conference.

Multiparty Conference

To create a Multiparty Conference,

- Mobility Extension User has generated three-party conference with B and C.
- Dial **#2** from Mobility Extension user.
- Dial number of Party D.
- After speech, dial **#2-*3**.
- Mobility Extension User, B, C and D are in Multi-party Conference.
- Dial number of Party E.
- Dial **#2** from Mobility Extension user.
- After speech, dial **#2-*3**.
- Mobility Extension User, B, C, D and E are in Multi-party Conference.
- Dial **#2** from Mobility Extension user.
- Dial number of Party F.
- After speech, dial **#2-*3**.
- Mobility Extension User, B, C, D, E and F are in Multi-party Conference.
- All Parties will get connected with each other.

To terminate the Multiparty Conference,

- When in the middle of a Multiparty Conference,
- Dial **#2**.
- Dial **190** after getting feature tone.

To temporarily leave the Multiparty Conference,

- When in the middle of a Multiparty Conference,
- Dial **#2**.
- Dial **191** after getting feature tone.

To rejoin the Multiparty Conference,

- Dial **#1** to go Off Hook.
- Dial **191**.

To permanently leave the Multiparty Conference,

- While in multi-party conference, dial **#0** to go Off Hook.

When Dialed Station is busy

To make a call on an internal station which is busy,

- During busy tone
- Dial **3** for interrupt request.
- Dial **4** to Barge-In
- Dial **5** to Raid.

Call Forward-Unconditional

To set Call Forward-Unconditionally,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After getting Dial Tone, dial **131-Station/Department Group/VMS**.
- The system will give confirmation tone.

To set Call Forward-Unconditionally on external number,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After getting Dial Tone, dial **131-TAC-external number**.
- The system will give confirmation tone.

Call Forward-Busy

To set Call Forward-Busy,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After getting Dial Tone, dial **132-Station/Department Group/VMS**.
- The system will give confirmation tone.

To set Call Forward-Busy on external number,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After getting Dial Tone, dial **132-TAC-external number**.
- The system will give confirmation tone.

Call Forward-No Reply

To set Call Forward-No Reply,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After getting Dial Tone, dial **133-Station/Department Group/VMS**.
- The system will give confirmation tone.

To set Call Forward-No Reply on external number,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After getting Dial Tone, dial **133-TAC-external number**.
- The system will give confirmation tone.

Call Forward-Busy/No Reply

To set Call Forward-Busy/No Reply,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After the Dial Tone, dial **134-Station/Department Group/VMS**.
- The system will give confirmation tone.

To set Call Forward-Busy/No Reply on external number,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After the Dial Tone, dial **134-TAC-external number**.
- The system will give confirmation tone.

To cancel Call Forward,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After the Dial Tone, dial **130**.
- The system will give confirmation tone.

Call Forward-Dual Ring

To set Call Forward-Dual Ring,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After the Dial Tone, dial **136-1**.
- The system will give confirmation tone.

To cancel Call Forward-Dual Ring,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After the Dial Tone, dial **136-1**.
- The system will give confirmation tone.

Call Forward-Scheduled

To set/cancel Call Forward-Scheduled,

- Make a call on DISA enabled Trunk from Mobility Extension User.
- After the Dial Tone, dial **1175-Time Zone-Call Forward Type-Number**.
- The system will give confirmation tone.

- *Mobility Extension users can have Call Forward and Call Forward-Scheduled set on their extension by the Operator or by another extension user.*
- *Using “Call Forward-Remote” and by setting “Call Forward-Scheduled” from the SA mode (using SA commands or Jeeves), the extension user/Operator can set Call Forward and Call Forward-Scheduled for any Mobility extension user. Refer the respective topics to know more.*

Multi-Stage Dialing

What's this?

The Multi-Stage Dialing feature of SARVAM UCS is typically used in applications like Calling Card, where extension users are required to dial digits in stages when making a call using the calling card.

The Multi-Stage feature enables extension users to directly dial the number they want to call, and the system dials out the number at different stages of the call by suitably modifying the number.

How it works

A typical example of Multi-Stage Dialing is the use of prepaid Calling Cards. Here, the person using a calling card must dial a fixed number string before dialing the actual number. When using a calling card,

- Users must first dial the number of the Calling Card server, for example: 1602233 (7 digits).
- After the call is answered by the Calling Card server, users must dial the PIN provided by the calling card service provider, for example 1132121234.
- After dialing the PIN number, users can dial the number they want to call, for example 0014125126508.

Thus, when using a Calling Card, users must dial a very lengthy number string, each time they need to make a call using the Calling Card.

The use of Multi-Stage Dialing saves the time and effort of dialing out lengthy digits in stages.

The Multi-Stage Dialing makes use of the [“Automatic Number Translation”](#) table. This table must be configured on the trunk from which extension users will make calls using Calling Cards.

To take the above example further,

- Say, extension users are allowed to make international calls using Calling Card from the trunk CO1. [“Automatic Number Translation”](#) table must be configured on CO1 trunk.
- The Automatic Number Translation table consists of Dialed Number Strings, Strip Digit and Add Prefix Number strings.
- In Dialed Number, you must configure ‘00’, the prefix for international numbers.
- In Add Prefix you must configure the Calling Card server number and the PIN Number.
- Keep Strip Digits as 00.
- As the system must wait for the Calling Card server to answer before dialing the PIN, you must configure Wait for Answer between the Calling Card server number and the PIN number.

You must insert a delay by configuring the Pause Timer after the PIN number and the destination number.

- The Automatic Number Translation table would look like this:

Index	Dialed Number String	Strip Digits	Add Prefix
1	00	00	1602233W1132121234P
2			
3			
4			
5			
6			
:			
32			

- When the Automatic Number Translation table is configured, the Extension user can simply dial the Trunk Access code and the destination number: 0/5/61/62/63/64 - 0014125126508.
- The system matches the dialed number with the Dialed Number String of the ANT table, the number matches with the entry '00' stored in the table.
- The system dials the Add Prefix Number string 1602233 (number of the calling card server). It waits for the calling card server to answer the call.
- When the call is matured, i.e. the calling card server has answered the call, the system dials the PIN number 1132121234 and waits for the Pause Timer before dialing the destination.

Thus, the extension user directly dials the desired destination number and the system substitutes this number by adding the Calling Card server number and PIN number and dials these numbers in two stages.

How to configure

Configuring Multi-Stage Dialing using Jeeves

To be able to use Multi-Stage Dialing, you must configure the following:

- Automatic Number Translation table on the trunk you want to use this feature. For instructions on configuring ANT on different Trunk types, see [“Automatic Number Translation”](#) and to assign the ANT Table number see [“Outgoing Trunk Bundle”](#).
- Configure the **DTMF Out Dial** on the Trunk. Set the **DTMF ON Time** and the **DTMF Inter Digit Pause Timer** and **Pause Timer** to the required values.

For instructions on configuring DTMF Out Dial on different Trunk types, see [“Configuring CO Trunks”](#), [“Configuring E1 Trunks”](#), [“Configuring T1 Trunks”](#), [“Configuring BRI Trunks”](#), [“Configuring Mobile Trunks”](#), [“Configuring SIP Trunks”](#), [“Configuring E&M Lines”](#).

- If required you may configure the **Call Proceeding Tone for Multi-stage Dialing** as **Network tone**, **Pseudo Tone**, or **Silent**. For instructions, see [“System Parameters”](#).

Configuring Multi-Stage Dialing using a Telephone

Notes for programming Number String:

- It is recommended to SE, to not to program Pause character "P" before "W" character for the number string to be out dialed from Mobile port. Else, the GSM Module may get restart while out dialing the DTMF digits without call maturity signal.
- Use following Codes to program the special digits:

Special Digits	Code for Programming through Command
Flash (F)	#2
Pause (P)	#3
A	#4
B	#5
C	#6
D	#7
+	#8
. (dot)	#9
#	##
*	**
W	*1

Enable 'ANT' for the trunk port using command 6702. Refer chapter [“Outgoing Trunk Bundle”](#) for more details.

Assign the ANT Table to the trunk port using command 6702. Refer chapter [“Outgoing Trunk Bundle”](#) for more details.

Refer chapter [“CO Hardware Template”](#) for command **'5902'** to program Pause Timer on CO Trunk.
Refer chapter [“Configuring PRI Trunks”](#) for command **'6109'** to program Pause Timer on T1E1 Trunk.
Refer chapter [“Configuring BRI Trunks”](#) for command **'6209'** to program Pause Timer on BRI port.
Refer chapter [“Configuring Mobile Trunks”](#) for command **'8014'** to program Pause Timer on Mobile port.
Refer chapter [“E&M Feature Template”](#) for command **'6002'** to program feature Pause Timer on E&M trunk.

Refer chapter [“CO Hardware Template”](#) for command **'5902'** to program DTMF ON Time on CO Trunk
Refer chapter [“Configuring PRI Trunks”](#) for command **'6117'** to program DTMF ON Time on T1E1 Trunk.
Refer chapter [“Configuring BRI Trunks”](#) for command **'6210'** to program DTMF ON Time on BRI port.
Refer chapter [“Configuring Mobile Trunks”](#) for command **'8015'** to program DTMF ON Time on Mobile port.

Refer chapter [“CO Hardware Template”](#) for command **'5902'** to program Inter Digit Pause Time on CO Trunk
Refer chapter [“Configuring PRI Trunks”](#) for command **'6118'** to program Inter Digit Pause Timer on T1E1 Trunk.
Refer chapter [“Configuring BRI Trunks”](#) for command **'6211'** to program Inter Digit Pause Timer on BRI port.

Refer System Parameters for command **'5311'** for programming of Call Proceeding Tone.

Music on Hold (MOH)

What's this?

The music played to extension users and external callers who are put on hold is called Music on Hold (MoH).

How it works

SARVAM UCS supports Music on Hold from an Internal Music Source.

A Voice Module assigned the Music on Hold application serves as the source of music for this feature. By default, Voice Module 1 is assigned for Music on Hold.

When a caller is put on hold, SARVAM UCS plays the music recorded in Voice Module 1.

You can play a voice message of your choice instead of music to the callers. The message may contain any promotional information about your company or services provided by your organization, etc. For this, you must record a Voice Module with the custom message and assign the Voice Module to the Music on Hold application.

*If the option **Routing Group** is selected as the **Alarm Notification Type** for an extension, when the extension goes Off-hook to answer an alarm call, and the extensions in the Routing Group for Alarm Notification are busy, Music-on-Hold will also be played to the extension answering the alarm call.*

*If your DKP/SIP Extension supports multiple call appearance and you want the system to play MOH to internal callers, when your extension is busy, enable the **Play MOH to Queued Internal Calls on DKP/Extended IP Phone** check box in "[System Parameters](#)". As soon as your extension is free, Ring Back Tone will be played to the caller.*

How to configure

You can record a piece of music or a message of maximum 16 seconds duration and assign it to Voice Module 01, which is reserved for Music-on-Hold.

Refer the topic "[Voice Message Applications](#)" for instructions on recording and assigning voice modules.

Mute

What's this?

This feature helps the extension user to disconnect the speech transmission path in the middle of a conversation. The extension user can still listen to the opposite party because the receiving path remains connected. Mute is useful when you want to consult someone in the middle of a conversation, but do not want the opposite party to listen to your discussion. You can Mute a call before making a call or during speech.

How it works

- A is in speech with B.
- A wants to consult to C in the room, but does not want B to hear their conversation.
- A presses the Mute Key.
- The transmit speech path from A to B is disconnected. The receive path remains connected.
- So, A will be able to hear B, but B will not be able to hear the conversation between A and C.
- When A has finished consulting C, to resume speech with B, A presses the Mute key again.
- The transmit speech path from A to B is restored. A and B are in speech again.

How to use

For EON & Extended IP Phone Users

To mute a call before making the call:

- Press the 'Mute' Key
The LED of the key glows.
- Dial a number on confirmation tone.
OR
- Dial 1052
- Dial desired number.

To mute a call during speech:

- Press the 'Mute' Key to silence outgoing speech.
OR
- Press Transfer Key.
- Dial 1052

To resume outgoing speech:

- Press the 'Mute' Key.
The LED of the key is turned off.
OR
- Press Transfer Key.
- Dial 1052

For SLT Users

To mute a call before making the call:

- Dial 1052
- Dial desired number.

To mute a call during speech:

- Press Flash Key.
- Dial 1052

To resume outgoing speech:

- Press Flash Key.
- Dial 1052

Number Lists

What's this?

A 'Number List' is a group of number strings. SARVAM UCS uses Number Lists to support different features as Toll Control, Call Duration Control, Call Taping, Call Back on Trunk Ports, Station Message Detail Recording (SMDR).

SARVAM UCS supports 16 Number Lists. Each Number List can contain upto 999 number strings. Each number string consist of a maximum of 16 characters.

The number strings are stored against Location Index numbers in the Number List. The Location Index numbers start from 001 to 999.

The default values of the Number Lists in the system are shown below:

Default Number Lists

Location Index	List Number															
	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16
001		00	0	00	*	*	*	*	*	*	*	*	*	*		
002		0	*	*	#	#	#	#	#	#	#	#	#	#		
003		1	#	#	F	F	F	F	F	F	F	F	F	F		
004		2	F	F												
005		3														
006		4														
007		5														
008		6														
009		7														
010		8														
011		9														
012		*														
013		#														
014		F														
015		+														
016																
:	:	:	:	:	:	:	:	:	:	:	:	:	:	:	:	:
999																

Use of Number Lists in various Features of SARVAM UCS

Call Back on Trunk Ports

When Call Back on set on any of the Trunk port types (CO, Mobile, BRI, T1E1, SIP), you must program two lists:

- Call Back Incoming Number List: this list defines the numbers which are eligible for a call back.
- Call Back Outgoing Number List: this list define the number to which the call back is to be made.

By default, Number List 15 is assigned to Call Back Incoming Number List, and Number List 16 is assigned to Call Back Outgoing Number List.

Call Duration Control

To set Call Duration Control (CDC) feature on an extension, you must program the Call Duration Control Table, in which you must program the numbers on which CDC must be applied as well as the numbers on which CDC must not be applied.

This requires you to program and assign two Number Lists: the Apply CDC to Number List and the Do Not Apply CDC to Number List.

By default, Number List 02 (For CDC Table 1, for others it is 7) is assigned to Apply CDC Number List, and Number List 08 is assigned to Do Not Apply CDC Number List.

Refer [“Call Duration Control \(CDC\)”](#) to know more.

Call Taping

Call Taping allows you to record conversations of incoming and outgoing internal and external calls. When you set Call Taping on an extension for external calls, the SARVAM UCS uses two Lists: Number List - Incoming Calls: this list has the list of numbers of external callers whose conversation is to be recorded.

Number List - Outgoing Calls: this list has phone numbers of external called parties whose conversation is to be recorded. The system matches the incoming and outgoing numbers with the respective lists to apply Call Taping.

By default, Number List 09 is assigned to Incoming Calls Number List, and Number List 10 is assigned to Outgoing Calls Number List.

Refer the feature description [“Call Taping”](#) to know more.

Toll Control

The Toll Control Call Privilege Type “Limited Calls” allows and restricts dialing of telephone numbers starting with a particular digit or a particular area code or certain telephone numbers only. To apply Call Privilege type ‘Limited Calls’ you must program an Allowed Number List with numbers that are to be allowed, and a ‘Denied List’ with numbers that are to be restricted.

Refer the feature description for [“Toll Control”](#) to know more.

Station Message Detail Recording (SMDR)

SARVAM UCS supports 'Destination wise' storage of outgoing calls as an SMDR Filter, using which it is possible to store calls made from and received on selected destination numbers. To set Destination wise storage of calls in the SMDR Buffer, you must program and assign a Number List containing the phone numbers whose call details need to be tracked and stored. SMDR of an outgoing call will be tracked and stored only if it matches with an entry in the Number List assigned.

Similarly, SMDR Reports of Incoming and Outgoing Calls can be generated and printed for selected numbers by programming and assigning a Number List.

By default, Number List 02 is assigned to Destination Wise storage of SMDR and SMDR Report Printing.

Refer the topics "[Station Message Detail Recording \(SMDR\)](#)", "[Station Message Detail Recording-Storage](#)", "[Station Message Detail Recording-Report](#)".

SMS on No Reply

SMS on No Reply feature is used to send an SMS to the mobile user only, when an extension user calls the mobile user and the mobile user doesn't answer the call. The SMS that is sent to the mobile user contains the extension user's contact information and the message to be conveyed in brief, so that the mobile user can call back if necessary. You must enter only the first digit of the number string, or a part of the string, or the complete number string in the Number list for sending SMS. The system compares the dialed numbers with the numbers in this list to confirm if the outdialled numbers are mobile numbers. Only if a match is found the SMS is sent.

By default, Number List 16 is assigned for SMS on No Reply.

Refer the feature description for "[SMS on No Reply](#)" to know more.

How to configure

Take a pen and a paper. Decide which of the above-mentioned seven features are to be used. Number List according to the feature for which it is to be used.

Number Lists can be programmed from Jeeves or by dialing SE commands from a telephone.

Programming Number List using Jeeves

- Log into Jeeves as System Engineer.

- Under **Configuration**, click **Number List** to open the page.

Number List

Index	Number List 01	Number List 02
001		00
002		0
003		1
004		2
005		3
006		4
007		5
008		6
009		7
010		8

- Select the desired List Number. For example, Number List 03-04. Now click '001-250' of Number list 03-04. The location Index 001 to 250 will appear for both lists on the page.

Number List

Index	Number List 03	Number List 04
251		
252		
253		
254		
255		
256		
257		
258		
259		
260		
261		
262		

- Enter each number string against a Location Index (refer to the list you prepared).
- Click **Submit** at the bottom of the page to save your list.
- Assign the Number List you prepared to the relevant feature.
- Log out of Jeeves if you have no other configuration tasks.

Programming Number List using a Telephone

- Enter SE mode.

To program a number in a Number List, dial:

- **4302-Number List-Location Index-Number-#***

Where,

Where

List is from 01 to 16.

Location Index is from 001 to 999.

Number is a number string of maximum 16 digits. The digits allowed are: 0-9, #, *, A, B, C, D, F, P, +.

Refer the table below for codes for dialing the special digits. Terminate the number string with **#***

Special Digit	Code
Flash (F)	#2
Pause (P)	#3
A	#4
B	#5
C	#6
D	#7
+	#8
Dot (.)	#9
#	##
*	**

To clear the number programmed at a Location index in a Number list, dial:

- **4302-Number List-Location Index-#***

Where,

Number List is from 01 to 16.

Location Index is from 001 to 999.

To default Number Lists, dial:

- **4301-1-Number List** to default a single number list.
- **4301-2-Number List-Number List** to default a range of number lists.
- **4301-*** to default all number lists.

Where,

Number List is from 01 to 16.

- Exit SE mode.

OFF-Hook Alert

What's this?

When the handset of an extension is not placed correctly, it will not be possible for the Operator or any other extension to call the extension. Also, incoming calls will not reach the extension, Alarms and Reminders cannot be placed on that extension.

To avoid this inconvenience, the SARVAM UCS supports the feature 'OFF-Hook Alert', whereby the system detects and informs the Operator of the extension phone that remains OFF-Hook accidentally.

How it works

To give the Operator an OFF-Hook Alert,

- SARVAM UCS places a call on the Operator's phone.
- It displays a message on the Operator's phone "<extension number> Stand-By"
- When the Operator answers the call, s/he is played a confirmation tone, the text message "Hangup <extension number> Properly" is displayed.
- The Operator can send someone to inform the extension user to place the handset of the phone correctly.
- If the extension phone is an SLT, OFF-Hook Alert will be given to the Operator phone only. The Operator phone can be an EON or a SLT with CLI support.
- If the extension phone that is OFF-Hook is EON, the SARVAM UCS will activate 'OFF-Hook Alert' on the extension phone, by playing the Error Tone continuously, on speaker to draw the attention of the extension user.
- While the Error Tone for OFF-Hook Alert is being played on the extension phone, if the user presses the Speaker Key, the Error Tone will continue to be played on the handset until it is replaced correctly.

How to configure

For this feature to work,

- the 'OFF-Hook Alert to Operator' flag must be enabled by the System Engineer in the 'System General Parameters'.
- the Operator phone can be EON or SLT with CLI support, the extension phones may be EON or SLT.

Programming 'OFF-Hook Alert to Operator' using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **System Parameters** to open the page.

- Go to the parameter **Give Off-hook Alert to Operator**, select the check box to enable the flag.

The screenshot shows a web-based configuration interface for 'System Parameters'. On the left is a navigation menu with various categories like Security Settings, SLT Configuration, Station Advance Features, Station Basic Features, Station Message Detail, Recording, SMS Gateway, SMS Routing, SMS Server, System Log, System Parameters (highlighted), System Prerequisites, System Timers and Counts, T1E1 Configuration, Time Table, Trunk Features Templates, Virtual Extensions, Voice Message Applications, VMS Configuration, VoIP Configuration, Maintenance, and Status. The main area displays a list of system parameters with their current values and checkboxes. The 'Give Off-hook Alert to Operator' parameter is checked and highlighted with a red box. A mouse cursor is pointing at the checkbox. Other parameters include Customer Name, Customer Profile (Enterprise), Onsite configuration, Station Name Pattern (Name Only), Default Call Hold Type (Exclusive Hold), and several 'Store Internal Calls' options (all checked). MoH Source when Station kept on Hold and MoH Source when Trunk kept on Hold are both set to Internal (VM-01). Play MOH to Queued Internal Calls on DKP/SIP Extension is unchecked. Day/Night Mode is set to Operate System as per Timetabl. Emergency Dialing Reporting is checked. Replace '+' from CLI is unchecked. A 'Submit' button is at the bottom.

System Parameters	
Customer Name	
Customer Profile	Enterprise
Onsite configuration	<input type="checkbox"/>
Station Name Pattern	Name Only
Default Call Hold Type	Exclusive Hold
Store Internal Calls in Missed Call Log	<input checked="" type="checkbox"/>
Store Internal Calls in Dialed Call Log	<input checked="" type="checkbox"/>
Store Internal Calls in Answered Call Log	<input checked="" type="checkbox"/>
MoH Source when Station kept on Hold	Internal (VM-01)
MoH Source when Trunk kept on Hold	Internal (VM-01)
Play MOH to Queued Internal Calls on DKP/SIP Extension	<input type="checkbox"/>
Give Off-hook Alert to Operator	<input checked="" type="checkbox"/>
Day/Night Mode	Operate System as per Timetabl
Emergency Dialing Reporting	<input checked="" type="checkbox"/>
Replace '+' from CLI	<input type="checkbox"/>

- Click **Submit** to save the change.
- Log out of Jeeves or continue programming as required.

Programming 'OFF-Hook Alert to Operator' using a Telephone

- Enter SE mode from a DKP/SLT.
- Dial **5333-1** to enable the flag.
- To disable the flag, dial **5333-0**.
- Exit SE mode.

One Touch Transfer

What is this?

SARVAM supports the UC feature, One Touch Transfer. Using this you can transfer an ongoing call from one extension to another mobile/fixed extension without putting the call on hold or dialing the destination extension number.

SARVAM UCS will serve the One Touch Transfer request made by a DKP or a SIP Extension (Matrix Extended IP Phones or Mobile Clients) only. The fixed destination extension number can be a SLT, DKP, SIP Extension or an ISDN Terminal.

How it works

Consider the scenario, wherein you have the following registered as your extensions:

1. VARTA Mobile UC Client is registered as SIP Extension 1 at location 1
 2. Extended IP phone is registered as SIP Extension 1 at location 2.
- You are in speech with A using your Extended IP Phone and you want to move away from your desk.
 - In this case, you can transfer the ongoing call on your VARTA Mobile UC Client using One Touch Transfer.
 - Press the DSS key assigned to One Touch Transfer (make sure the extension number of SIP Extension 1 is pre-configured as destination number for One Touch Transfer).
 - You will receive the call on your VARTA Mobile UC Client.
 - Answer the call from the VARTA UC Client. Speech is established and the call on your Extended IP Phone disconnects.
 - You can now move away from your desk but your call can continue.

Similarly, you can transfer a call to another fixed extensions also.

You can access One Touch Transfer only during an ongoing 2-way speech. A held or a waiting call cannot be transferred using One Touch Transfer.

For using One Touch Transfer between Extended IP Phone/VARTA UC Clients registered on different locations of the same SIP Extension, make sure the Call Appearance of the SIP Extension is more than 1.

How to configure

To access this feature,

- Make sure the *Basic Features* are enabled in the Class of Service assigned to you. For instructions, see [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#).
- Make sure you have configured a DSS Key for One Touch Transfer. For instructions on configuring DSS Key, see the topic [“DSS Keys Programming”](#).

- Configure the destination extension number for One Touch Transfer. This number can be configured by extension users themselves from the Phone Menu or for any other extension from the SA mode.

Configuring One Touch Transfer using SA Jeeves

- Log in to Jeeves as System Administrator.
- Click **Extension**.

<ul style="list-style-type: none"> Extension Department Group Properties Call Forward - All Extensions Trunk Properties ▶ Status ▶ 	<p>Search Extension</p> <p>Select Extension <input type="text"/></p> <p><input type="button" value="Submit"/></p>
---	--

- In **Select Extension**, enter the Number or the Name of the extension on which you want to set this feature.
- Click **Submit**.
- The searched extension users details appear on your screen.
- Click **One Touch Transfer** to expand.

<ul style="list-style-type: none"> Extension Department Group Properties Extension Over Q-SIG Call Forward - All Extensions Trunk Properties ▶ Status ▶ Voice Mail Memory Status Day/Night Mode Holiday Table Authority Code PIN Configuration SMDR Management ▶ SMS Server ▶ Reports ▶ Dial In Conference - Cancel SA Password SA Timer System Activity Log System Fault Log T1E1 Performance Report 	<p>Search Extension</p> <ul style="list-style-type: none"> <input checked="" type="checkbox"/> Phone Properties <input checked="" type="checkbox"/> Language Setting <input checked="" type="checkbox"/> Do Not Disturb <input checked="" type="checkbox"/> Call Forward <input checked="" type="checkbox"/> Call Forward - Scheduled <input checked="" type="checkbox"/> Wakeup Alarm <input checked="" type="checkbox"/> Reminder <input checked="" type="checkbox"/> Hotline <input checked="" type="checkbox"/> Cancel All Features <input checked="" type="checkbox"/> Redirect VMS Messages <input type="checkbox"/> One Touch Transfer <p>Transfer to Extension Number <input type="text"/></p> <p><input type="button" value="Set"/></p>
---	---

- In **Transfer to Extension Number**, enter the destination extension number on which you want the call to be transferred, when the feature One Touch Transfer is accessed.

Configuring One Touch Transfer by Extension Users using Phone Menu

To configure the Destination Extension Number,

- Scroll down the Local Menu of the phone.
- Select **One Touch Transfer** by pressing the Enter Key.
- Select **Set Transfer Number** by pressing the Enter Key.
- Enter the destination extension number on which you want the call to be transferred.
- You hear Confirmation tone.

How to use

For EON & Extended IP Phone Users

To use One Touch Transfer:

- During an ongoing call, press the DSS Key assigned to One Touch Transfer.
- The destination extension number configured for One Touch Transfer starts ringing.
- Answer the ringing call.
- You will be in speech with the remote party.

Outgoing Trunk Bundle

What's this?

The Outgoing Trunk (OG) Trunk Bundle is set of parameters that completely define the grouping of similar channels. The word channel refers to a speech path. By this definition, a channel can be a CO trunk, an E&M trunk, a Mobile port. Each speech path of the T1/E1 line is a channel. Bundles of similar trunks are formed. These Bundles are used to form an OGTBG. The SARVAM UCS supports 128 OG Trunk Bundles.

With the default OGTB assigned in the OGTBG outgoing calls will not be possible. Refer to the instructions below to configure the same to ensure calls are routed. Also refer [“Outgoing Call Routing”](#).

Configuring using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **OG Trunk Bundle**.

Bundle No.	Trunk Port		Start Channel No.	Total Trunk Count	Rotation Type	Automatic Number Translation (ANT)	
	Type	Number				Apply	ANT Table No.
1	T1E1	0001	01	008	Ascending	<input type="checkbox"/>	1
2	Mobile	0001	01	032	Ascending	<input type="checkbox"/>	1
3	BRI	0001	01	002	Ascending	<input type="checkbox"/>	1
4	T1E1	0001	01	030	Ascending	<input type="checkbox"/>	1
5	SIP Trunk	0001	01	099	Ascending	<input type="checkbox"/>	1
6	None	0000	01	017	Cyclic	<input type="checkbox"/>	1
7	None	0000	01	017	Cyclic	<input type="checkbox"/>	1
8	None	0000	01	017	Cyclic	<input type="checkbox"/>	1
9	None	0000	01	017	Cyclic	<input type="checkbox"/>	1
10	None	0000	01	017	Cyclic	<input type="checkbox"/>	1

Buttons: Submit, Default, Default One

Configure the following parameters for each Bundle Number:

- **Trunk Type:** Specific trunk bundle consists of some of these ports. The different types of ports are CO, BRI, T1E1PRI, E&M, Mobile and SIP.
- **Trunk Number:** Once the type of port is identified in the bundle, it is required to identify the number of that port, because there can be more than one port for the given type.
- **Start Channel Number:** This is applicable to BRI and T1E1 Trunks.
- **Total Trunk Count:** This is the number of trunks to be kept in the same bundle. For CO and E&M this could be 128. This value for the BRI and T1E1 Trunks is counted from the start channel. For example, if the port type is CO, port number is 002 and channel count is 025, then CO channels 002 to 027 would be

grouped together. Consider a second example where channels 15 to 25 of T1E1PRI port are to be programmed in one channel group, then the port type will be T1E1PRI, port number would be 5, start channel number will be 15 and channel count will be 11.

- **Rotation Type:** This parameter shows which channel should be selected when the next call lands on that port. For example, if ascending order is selected, the system checks 001-128, for first free channel and if descending order is selected the system checks from 128-001.
 - Ascending Order:
 - 001 to 128 (for CO/E&M)
 - 01 to 30 (for T1E1PRI)
 - 01 to 02 (for BRI)
 - 01 to 32 (for SIP)
 - Descending Order:
 - 128-001 (for CO/E&M)
 - 30 to 01 (for T1E1PRI)
 - 02 to 01 (for BRI)
 - 32 to 01 (for SIP)
 - Cyclic:
 - Always the next channel is picked for a new OG call.
- **ANT Apply:** Select from enable/disable as required. To use ANT feature, it should be enabled for the trunk port from which the number is to be dialed out.
- **ANT Table No.:** This is a Table number in which you have configured the Dialed Numbers and their corresponding Strip Digits and/or Add Prefixes. This table number is assigned to the specific trunk port from which the number is to be dialed. Refer chapter [“Automatic Number Translation”](#) for more details.

Configuring using a Telephone

Use following command to program the feature in an OG Trunk Bundle Number:

6702-1-OG Trunk Bundle Number-Feature Number-Code

6702-2-OG Trunk Bundle Number-OG Trunk Bundle Number-Feature Number-Code

6702-*-Feature Number-Code

Where,

OG Trunk Bundle Number is from 001 to 128.

Feature Number is from 1 to 6.

Use following command to set default values for OG Trunk Bundle:

6701-1-OG Trunk Bundle Number

6701-2-OG Trunk Bundle Number-OG Trunk Bundle Number

6701-*

Where,

OG Trunk Bundle Number is from 001 to 128.

Default values of OG Trunk Bundle

Bundle No.	Feature Number						
	1		2	3	4	5	6
	Trunk Port		Start Channel No.	Total Trunk Count	Rotation Type	Alternate Number Translation (ANT)	
	Type	Number				Apply	ANT Table No.
001	None	000	01	008	Ascending	No	1
002	None	000	01	032	Ascending	No	1
003	None	000	01	002	Ascending	No	1
004	None	000	01	032	Ascending	No	1
005	None	000	01	032	Ascending	No	1
006	None	000	01	017	Cyclic	No	1
007	None	000	01	017	Cyclic	No	1
:	None	000	01	017	Cyclic	No	1
060	None	000	01	017	Cyclic	No	1
061	None	000	01	008	Ascending	No	1
062	None	000	01	002	Ascending	No	1
063	None	000	01	030	Ascending	No	1
064	None	000	01	032	Ascending	No	1
065	None	000	01	017	Cyclic	No	1
:	None	000	01	017	Cyclic	No	1
128	None	000	01	017	Cyclic	No	1

Parameter Values:

Code	Port Type							
0	None	None	000				No	
1	CO	03	001-128	01-30	001-128	Ascending	Yes	1-8
2	BRI	04	001-032			Descending		
3	T1E1	05	001-008			Cyclic		
4	E&M	06	001-128					
5	Mobile	25	001-064					
6	SIP Trunks	26	001-032					

OG Trunk Bundle Group

What's this?

OG Trunk Bundle Group provides efficient allocation of trunks to different stations.

All the trunks connected to the system can be bunched in different groups called OG Trunk Bundle Group. Maximum 8 Trunk Bundles can be put in one OG Trunk Bundle Group and 32 such OG Trunk Bundle Groups can be formed. These OG Trunk Bundle Groups can be allotted to each individual extension. An Extension can be allotted different OG Trunk Bundle Group during different timings of the day.

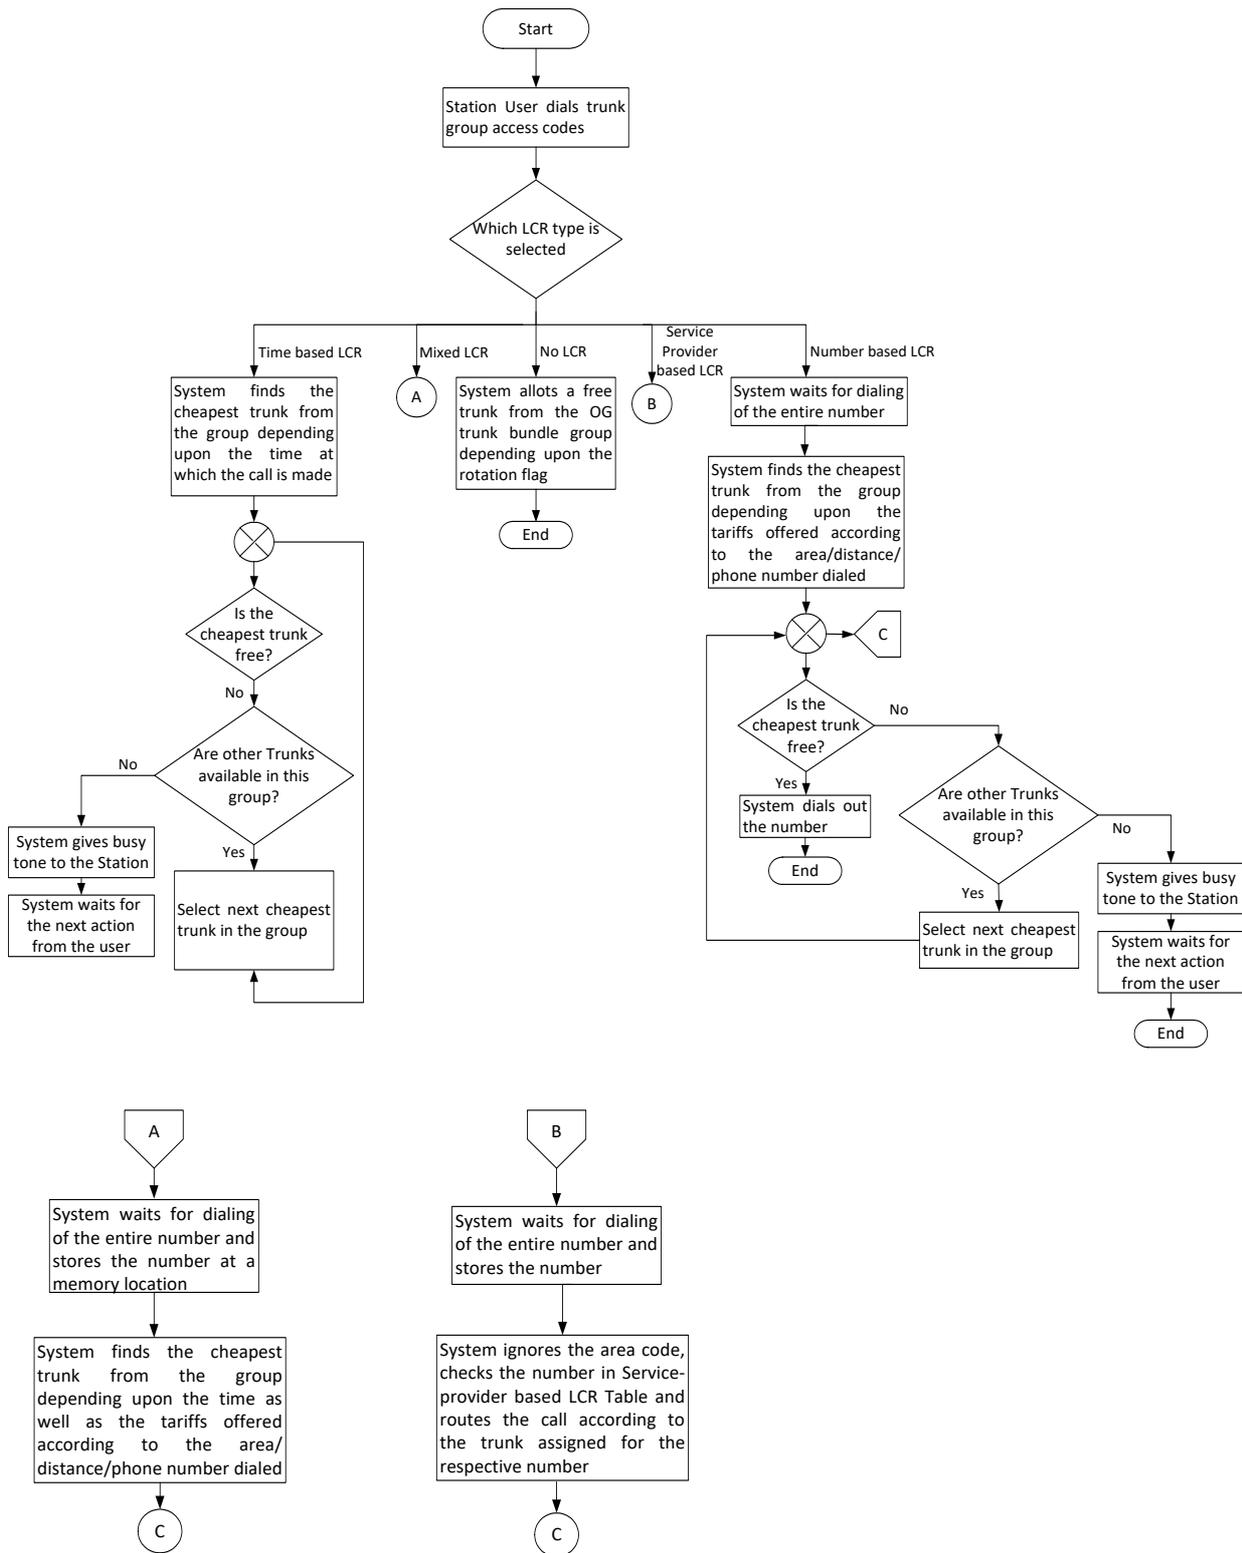

With the default OGTB assigned in the OGTBG outgoing calls will not be possible. Refer to the instructions below to configure the same to ensure calls are routed. Also refer "[Outgoing Call Routing](#)".

How it works

System uses two methods while selecting a trunk from the OG Trunk Bundle Group: 'Remember last trunk' and 'Don't Remember last trunk'.

In 'Remember last trunk' method, the system remembers the last trunk used and allots next trunk in the group to the extension. In 'Don't remember last trunk' method, the system searches for a first free trunk from the group.

Following flow chart depicts the chronology of events when an extension grabs a trunk.

Configuring using Jeeves

- Log into Jeeves as System Engineer.

- Under **Configuration**, click **OG Trunk Bundle Groups**.

Group No.	Rotation	LCR	OG Trunk Bundle Member 1	OG Trunk Bundle Member 2
1	<input checked="" type="checkbox"/>	None	001	001
2	<input checked="" type="checkbox"/>	None	001	000
3	<input checked="" type="checkbox"/>	None	001	000
4	<input checked="" type="checkbox"/>	None	001	000
5	<input checked="" type="checkbox"/>	None	001	000
6	<input checked="" type="checkbox"/>	None	001	000
7	<input checked="" type="checkbox"/>	None	001	000
8	<input checked="" type="checkbox"/>	None	001	000

Choose the OG Trunk Bundle Group number (01-08) you want to use. In each group you can program maximum 8 'members'.

- Now program the following parameters for the selected OG Trunk Bundle Group:
 - **Rotation:** Select the Rotation check box to enable rotation for routing outgoing calls in the group which has multiple 'member' trunks. When enabled, each outgoing call will be routed through the next member to the one that routed the previous call. This ensures equal distribution in routing outgoing calls. The flag has no relevance if the group has only one member. For detailed instructions, see [“Outgoing Trunk Bundle”](#)
 - **Least Cost Routing:** If required select the desired method — Time-based LCR, Number based LCR, Time and Number based LCR or Service Provider-based LCR — as per your requirement. For details, see [“Configuring LCR”](#).
 - **OG Trunk Bundle Member1 to 8:** Select the desired OG Trunk Bundle numbers you have already created. If you have not created the OG Trunk Bundles, for instructions see [“Outgoing Trunk Bundle”](#).

Configure only as many OG Trunk Bundles as members in the group as you want and set the remaining Members as '000'.

- Click **Submit** to save.
- Repeat the same steps to create another OG Trunk Bundle Group.

Configuring using Telephone

The commands explained below should be referred as:
To program a single port: XXXX-1
To program a range of ports: XXXX-2

To program all the ports: **XXXX-***

Step 1

Use following command to make default OG Trunk Bundle Group:

```
1401-1-OGTBG Number  
1401-2-OGTBG Number-OGTBG Number  
1401-*
```

Where,
OGTBG Number is from 01 to 32.

Step 2

Use following command to set OG Trunk Bundle:

```
1402-1-OGTBG Number-Destination Index-OG Trunk Bundle  
1402-2-OGTBG Number-OGTBG Number-Destination Index-OG Trunk Bundle  
1402-*-Destination Index-OG Trunk Bundle
```

Where,
OGTBG Number is from 01 to 32.
Destination Index is from 1 to 8.
OG Trunk Bundle is from 001 to 128.

For Defaults refer Table1.

Step 3

Use following command to set Rotation Flag. For explanation on how to use, refer important point at the end of chapter:

```
1403-1-OGTBG Number-Flag  
1403-2-OGTBG Number-OGTBG Number-Flag  
1403-*-Flag
```

Where,
OGTBG Number is from 01 to 32.

Flag	Meaning
0	Rotation OFF
1	Rotation ON

For Defaults refer Table1.

Step 4

For LCR Type-refer chapter [“Configuring LCR”](#).

Step 5

For CPS refer chapter [“Least Cost Routing-Carrier Pre-Selection”](#).

Step 6

Refer the topic [“Station Basic Feature Template”](#) for details on assigning OGTBG to extensions.

Step 7

How to assign an access code to OGTBG?

There are maximum 6 trunk access codes. These are Flexible access codes. Trunk access codes are common for all the users. They cannot be different for different extension.

A default trunk access codes table is given below:

OGTBG Index	Default Trunk Access Code
1	0
2	5
3	61
4	62
5	63
6	64

Use following command to program the desirable access code for a trunk access index (TAC):

3112-1-OGTBG Index-Access Code-#/Press <Hold>

3112-2-OGTBG Index-OGTBG Index-Access Code-#/Press <Hold>

3112-*-Access Code-#/Press <Hold>

Where,

OGTBG Index is from 1 to 6.

Access Code is maximum 6 digits (Generally access code for trunk is of two digits).

Use following command to clear the access code for a OGTBG index:

3112-1-OGTBG Index-#*

3112-2-OGTBG Index-OGTBG Index-#*

3112-*-#*

Use following command to assign default access code for a OGTBG index:

3162-1-OGTBG Index

3162-2-OGTBG Index-OGTBG Index

3162-*

How to use

1	Lift the handset.	Dial tone
2	Dial 0/5/61 to 64.	Dial tone of the trunk.
3	Dial desired external number.	

- To grab OG Trunk Bundle Group 3, the user should dial '61'.
- To grab OG Trunk Bundle Group 1, the user should dial '0'.

How the Rotation flags work?

- Eight OG Trunk Bundles can be programmed as members of each OGTBG.
- OGTBG has "Rotation" flag, and each OG trunk bundle has Rotation type "Cyclic/Descending/Ascending".
- These two flags don't have any relation with each other, and so, will work in isolation.

If Rotation is ON in the OGTBG:

- The first call will get routed using the “OG Trunk bundle Member1”. The trunk port from the OG Trunk Bundle member 1 will get selected using the rotation type programmed for the OG trunk bundle programmed as member 1.
- When there is a second call, it will get routed using the “OG trunk bundle Member 2”, and the trunk port from the OG trunk bundle member 2 will get selected according to the rotation type programmed in the OG Trunk Bundle programmed as member2.
- Accordingly, the member of the OGTBG will be accessible to the station user accessing the OGTBG in sequence.

If the Rotation is OFF in the OGTBG:

- The calls will always get routed from the “OG trunk Bundle member 1” if any trunk/channel in it is free. If all the trunks/channels of the “OG trunk bundle member 1” are busy, then the call will get routed using the “OG trunk bundle member 2”.
- Now the trunk/channel to route the call will get selected as per the rotation type programmed for the OG trunk bundle used as member 2. When the trunk ports of OG trunk bundle programmed in member 1 and member 2 all are busy, the OG trunk bundle member 3 will be used to route the call.
- Thus the Rotation flag of OGTBG will be used to select the OG trunk bundle member1 to member 8 as per call basis while the rotation type flag associated with the OG trunk bundle will decide the rotation mechanism to select the trunk port from the particular OG trunk bundle.

Default OG Trunk Bundle Group Table (Table-1):

Group No.	Rotation	LCR	OGTB Member 1	OGTB Member 2	OGTB Member 3	OGTB Member 4	OGTB Member 5	OGTB Member 6	OGTB Member 7	OGTB Member 8
01	√	None	00	00	00	00	00	00	00	00
02	√	None	00	00	00	00	00	00	00	00
03	√	None	00	00	00	00	00	00	00	00
04	√	None	00	00	00	00	00	00	00	00
05	√	None	00	00	00	00	00	00	00	00
::	√	None	00	00	00	00	00	00	00	00
21	√	None	00	00	00	00	00	00	00	00
22	√	None	00	00	00	00	00	00	00	00
23	√	None	00	00	00	00	00	00	00	00
24	√	None	00	00	00	00	00	00	00	00
25	√	None	00	00	00	00	00	00	00	00
26	√	None	00	00	00	00	00	00	00	00
27	√	None	00	00	00	00	00	00	00	00
28	√	None	00	00	00	00	00	00	00	00

29	√	None	00	00	00	00	00	00	00	00
30		None	00	00	00	00	00	00	00	00
31		None	00	00	00	00	00	00	00	00
32		None	00	00	00	00	00	00	00	00

Paging

What's this?

Paging allows you to make announcements to groups of extension users and to make public announcements over a public address system. You can deliver a message to a mass of people at once by just lifting the handset of your phone and dialing a code.

This feature is useful when you want to call several people at once; for example, to inform them about a meeting you have scheduled. If the persons you want to call have Digital Key Phones (DKP) or the Matrix Extended IP Phones, Radio devices or Standard SIP Phones as their extensions, you can use paging instead of calling them up one by one.

SARVAM UCS supports paging where announcements are made on DKP/SIP extensions /Radio Ports.

The extensions which are to be paged must be included in 'Page Zones'.

- You can start paging **from** an SLT, a DKP or any SIP Extension. However, the paged extensions must be DKPs, Extended IP Phones, Radio device or Standard SIP Phones. The Standard SIP Phones on which you are paging must support Call-Info or Alert-Info header for Paging.
- When the Paging call is generated in SIP Extension having multiple call appearance and already a call is present on the SIP Extension then the SARVAM UCS will place the Paging call as normal call on the SIP Extension (as headers required in INVITE for paging call and intercom call are same).
- Paging is a one-way communication. As the mic of the paged extensions is muted during Paging, the users of the paged extensions cannot speak to the paging extension.

How it works

The Pre-requisites

- Page Zones must be created. Each Page Zone accommodates up to 32 DKP/SIP extensions/Radio devices. You can create 12 different Page Zones of 32 DKP/SIP extensions/Radio devices.
- Paging must be enabled in the Class of Service allowed to the DKP/SIP/SLT/Radio extension from which this feature is to be used.

The Process

- A user of a DKP/SLT/SIP Extension having Paging in its Class of Service, dials the Access code for Paging and the Number of the Page Zone to which the user wants to make the announcement.
- The system activates the speakers of the DKP/SIP Extensions programmed in the Page Zone number. The system activates the speakers only of those DKP/SIP/Radio extensions in the Page Zone that are free.
- The calling DKP/SLT/SIP Extension user makes the announcement.

- All DKPs/SIP/Radio Extensions in the Page Zone can hear the announcement. But as the mic of their phones is muted, their speech will not be heard by the calling DKP/SLT/SIP extension user.
- To answer the Paging call the desired extension user must use Meet Me Paging while the Paging call is active. For details refer, "[Meet Me Paging](#)".
- If no reply is received via Meet Me Paging, the calling DKP/SLT/SIP extension goes ON-Hook after the announcement.
- The system deactivates the speakers of the DKP/SIP/Radio Extensions.

How to configure

For this feature to work, you must create Page Zones and enable this feature in the Class of Service of the extensions which are to be allowed this feature.

Allowing Paging in Class of Service

In the default factory settings, Station Basic Feature Template Number 01 is assigned to all the stations of SARVAM UCS. Template 01 is assigned CoS group 01 which has Paging enabled. So, all stations of SARVAM UCS can page.

If you want to allow Paging to all stations, retain CoS group 01 in Template 01.

However, if Paging is to be disallowed to some stations then follow these steps:

- Define a CoS group with Paging disallowed.
- Prepare a Station Basic Feature Template with this CoS group applicable in all the "[Time Zones](#)".
- Assign this new Template to the stations to which Paging is to be disallowed.

Refer the topics "[Class of Service \(COS\)](#)" and "[Station Basic Feature Template](#)" for detailed instructions and programming.

Creating Page Zones

Decide how many Page Zones you want to create. You can create as many as 12 different Page Zones. You can include upto 32 DKP/SIP/Radio extensions.

For each Page Zone number, decide and assign the DKP/SIP/Radio extensions.

On a sheet of paper create a three-column table for each page zone, as shown below. Enter the Type of extension, whether DKP, SIP or Radio, and the Software Port number of the extensions you want to include in the page zone.

Page Zone 1

Member Number	Type of Extension	DKP/SIP Extension Port Number
1	DKP	002

Member Number	Type of Extension	DKP/SIP Extension Port Number
2	DKP	003
3	DKP	008
4	SIP	009
:		
:		
32		

Page Zone 2

Member Number	Type of Extension	DKP/SIP Extension Port Number
1	SIP	007
2	SIP	010
3	SIP	012
4	DKP	013
:		
:		
32		

Now, program Page Zones using Jeeves or by dialing SE commands from a Telephone.

Programming Page Zones using Jeeves

- Login as System Engineer.
- Under **Configuration**, click **Page Zones** to open the page.
- The first three page zones appear on this page.
- Refer to the Page Zones you created on paper and program the following parameters in each Page Zone:
 - **Name of Page Zone:** Enter the name you want to assign to the Page Zone.
 - **Member Type:** Select the type of extension you want to include in the Page Zone: DKP, Radio or SIP extension.

- **Port Number:** Enter the number of the Software Port of the extension you selected in the Port Type.

The screenshot shows the Jeeves configuration interface. On the left is a navigation menu with 'Page Zones' highlighted. The main content area is split into two sections: 'Page Zone 1' and 'Page Zone 2'. Each section contains a table with the following structure:

Name of Page Zone			
Page on following Extensions			
Member	Member Type		Port Number
1	None	▼	0000
2	None	▼	0000
3	None	▼	0000
4	None	▼	0000
5	None	▼	0000
6	None	▼	0000
7	None	▼	0000
8	None	▼	0000
9	None	▼	0000
10	None	▼	0000

At the bottom of the page are three buttons: 'Submit', 'Default', and 'Default One'.

- Click **Submit** at the bottom of the page to save your Page Zone settings.
- To go to other Page Zones, you may click the hyperlinked page zone numbers on the top of the Jeeves screen.
- If you have completed programming Page Zones, you may log out of Jeeves.

Programming Page Zones using a Telephone

- Enter SE mode from a DKP/SLT.

To program a DKP/SIP Extension in a Page Zone, dial:

- **2302-1-Page Zone-Member Index- Port Type-Port Number** to program a DKP/SIP extension in a single Page Zone.
- **2302-2-Page Zone-Member Index- Port Type-Port Number** to program the same DKP/SIP Extension in a range of Page Zones.
- **2302-*-Member Index- Port Type-Port Number** to program the same DKP/SIP Extension in all Page Zones.

Where,

Page Zone is from 01 to 12.

Member Index is from 01 to 32.

Port Type is 02 for DKP, 34 for SIP Extension, 40 for Radio Extension.

Port Number is the software port number of the extension to be included in the Page Zone. Port Number is

001 to 128 for DKP.

001 to 999 for SIP Extensions.

01 to 16 for Radio Extensions

To include/exclude a member DKP, SIP or Radio Extension in/from a Page Zone, dial:

- **2303-1-Page Zone-Member Index-Flag** to include/exclude an extension in/from a single Page Zone.
- **2303-2-Page Zone-Page Zone-Member Index-Flag** to include/exclude the same extension in/from a range of Page Zones.
- **2303-*Member Index-Flag** to include/exclude the same Extension in/from all Page Zones.

Where,

Page Zone is from 01 to 12.

Member Index is from 01 to 32.

Flag is

0 for Exclude member extension from Page Zone.

1 for Include member extension in Page Zone.

- Exit SE mode.

How to use

It is possible to page from a DKP, a SIP Phone and an SLT.

For EON and Extended IP Phone Users

- Press DSS Key assigned to Paging.
OR
- Dial 1074
- Enter Page Zone Number on the prompt on your phone's display.
- You get the prompt on your phone's display: Start Paging <Page Zone Number>.
- Make your announcement.
- Go ON-Hook at the end of your announcement.

For SLT Users

- Lift the handset.
- You get dial tone.
- Dial 1074-Page Zone Number.
- Start your announcement.
- Replace the handset after completing your announcement.

Peer-to-Peer Calling

What's this?

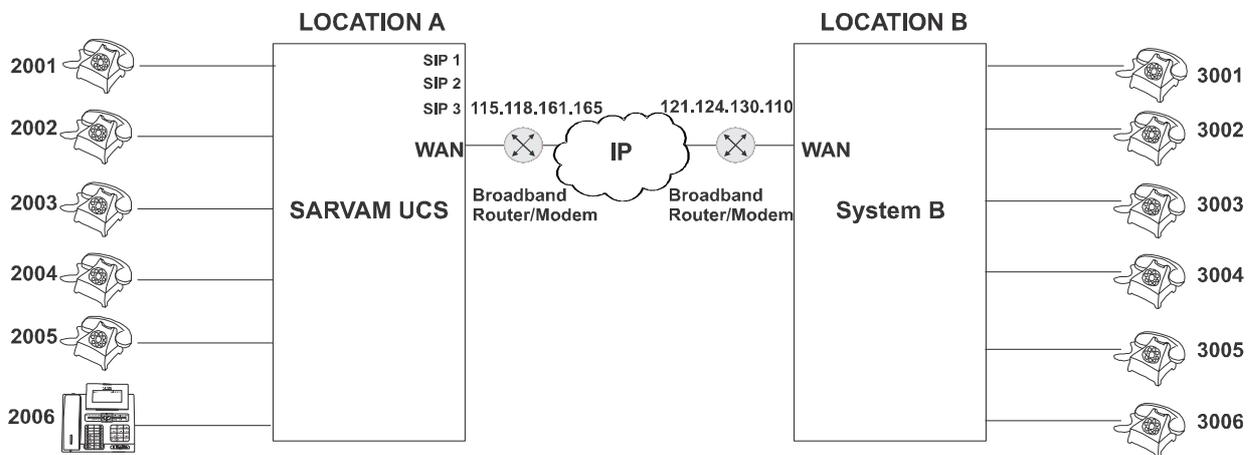

Making an IP call without the intervention of a proxy server is called Peer-to-Peer Calling. As Peer-to-Peer calling does not require a proxy server, voice communication using this application can be done virtually free of cost. The major cost savings offered by this application makes it a very attractive mode of inter-branch or intra-office voice communication.

For dialing a number use '*' in-place of '.'

How it works

Let us understand how to use Peer-to-Peer Calling with the following illustration:

- Two offices are directly connected over the IP network.
- SARVAM UCS is installed at Location A.
- The System at Location B may also be SARVAM UCS.
- Peer-to-Peer calls can be made between the two locations with suitable configuration of SARVAM UCS and the System.
- **At Location A**, you need to do the following configuration in the SARVAM UCS:
 - Select a SIP Trunk to be used for this application and enable it. For example, SIP1.
 - Set the **SIP Trunk Mode** of this trunk to **Peer-to-Peer**.
 - Keep the **SIP ID** field of the SIP trunk blank.
 - Set the **Treat Incoming call as** option on the SIP trunk to **Station**.

For detailed instruction, see ["Configuring SIP Trunks"](#).

In the Router, you must configure the same SIP and RTP Ports as configured in the SARVAM UCS. In other words, you must configure Port Forwarding for SIP and RTP on the Router.

- You must also configure the **Trusted IP Address/es** table for this SIP Trunk to receive incoming calls. If you do not configure this table, all incoming calls on this SIP Trunk will be rejected. For instructions, see “[Configuring SIP Trunks](#)”.
- Set the **Send CLI Option** on the SIP trunk as **Calling Party Wise**. See “[Configuring SIP Trunks](#)” for instructions.
- You may also configure the **Closed User Group (CUG) Table** to avoid dialing the Trunk Access Code for the outgoing calls made from this SIP Trunk, i.e. SIP 1.

At Location A, you may configure the CUG table as follows:

Index	Route Code	OG Trunk Bundle Group	Strip Digit Count	Self Route	Dialed Digit Count	Apply Toll Control	Apply Call Cost
1	3	01	0	<input type="checkbox"/>	4	<input checked="" type="checkbox"/>	<input type="checkbox"/>
2		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
3		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
4		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
5		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
7		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
8		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
9		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
10		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
11		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>
12		01	0	<input type="checkbox"/>	99	<input checked="" type="checkbox"/>	<input type="checkbox"/>

- In **Route Code**, enter the extension numbers of the System at Location B. Instead of entire number strings, you can configure a single digit, the starting digit of the extension numbers as Route Code. In this case, you may configure Route Code as ‘3’, as all extensions at Location B start with ‘3’.
- Keep the **Strip Digit Count** as ‘0’.
- Keep the **Self Route** check box disabled.
- In **Dialed Digit Count**, enter the digit length of the extension numbers at Location B. In this case, ‘4’.
- In **OG Trunk Bundle Group**, select 01. Configure SIP Trunk1 as the only member in this group. The calls will be routed through this SIP Trunk only.
- When Self Route check box is disabled, system will check **Apply Toll Control** parameter. By default, it is enabled. The system will apply toll control to all the outgoing calls.

Disable this check box, if you do not want to apply toll control to the CUG numbers dialed by you.
- By default, **Apply Call Cost** check box is enabled. Select this check box for Peer to Peer calls if you require the call cost calculation.

For detailed instructions, see “[Closed User Group \(CUG\)](#)”.

If the System's at both the offices have the same extension numbers, the users need to dial the Exchange ID of the System along with the extension numbers. For detailed instructions, see “[Closed User Group- With Exchange ID](#)”.

- Now, configure the **Peer-to-Peer Table**.

The Peer-to-Peer table stores up to 500 entries. Each entry consists of the parameters Number, Domain Address, Name and Default Transport for Outgoing Message.

At location A, you would have to configure the Peer-to-Peer table as follows:

Index	Number	Domain Address	Name	Default Transport for Outgoing Message
1	No Match Found			UDP
2	3	192.168.105.61	PBX-B	UDP
3				UDP
4				UDP
5				UDP
6				UDP
7				UDP
8				UDP
9				UDP
10				UDP

Note: While programming IPv6 Address as target address use '[' square bracket.

Submit Default Default One

- In **Number**, enter the digit you configured as **Route Code** in the CUG Table for calling the extension numbers of the System at Location B. In this case '3'.
- In **Domain Address**, enter the **IP Address** of the WAN Port of the Router at Location B.
- In **Name**, enter 'Location B' for identification.
- Keep **Default Transport for Outgoing Message** as 'UDP'.
- At Location B, you may do a suitable configuration of the System.
- When an extension user 2001 of SARVAM UCS at Location A dials 3001, an extension number of System B, it checks the CUG table to match the dialed digits with the Route Code and the Dialed Digit Count. As a match is found, it selects the SIP trunk defined for routing the Route Code, i.e. SIP 1.
- As SIP 1 is set to Peer-to-Peer mode, the system checks the Peer-to-Peer Table configured. It finds a match for the digit '3' and will route the call to the IP Address configured for this number. In this case, to the IP Address of the Router at Location B (121.124.130.110).
- Further, the Router will forward the call to System B. With suitable configuration done in System B, the call will be routed to the desired destination i.e. extension 3001.

Configuring the Peer-to-Peer table using Jeeves

Peer to Peer Table is used, for deciding the destination IP Address for routing calls using non-proxy SIP trunks (Registrar server address shall be programmed as blank for these trunks). The Peer-to-Peer table stores upto 500 entries. Both IPv4 and IPv6 addresses are supported. This table is common for all the SIP trunks.

For instructions on configuring the SIP Trunk for the Peer-to-Peer application—SIP Trunk Mode, SIP ID, Treat incoming calls as Station, Trusted IP Address/es table—see “[Configuring SIP Trunks](#)”.

For instructions on configuring the CUG Table, see “[Closed User Group \(CUG\)](#)”.

To configure the Peer-to-Peer table using Jeeves,

- Log in as System Engineer.
- Under **VoIP Configuration**, click **Peer-to-Peer Table**. The Peer-to-Peer table opens.

Index	Number	Domain Address	Name	Default Transport for Outgoing Message
1	No Match Found			UDP
2				UDP
3				UDP
4				UDP
5				UDP
6				UDP
7				UDP
8				UDP
9				UDP
10				UDP
11				UDP
12				UDP

Note: While programming IPv6 Address as target address use '[' square bracket.

Submit Default Default One

The first entry is reserved for No Match Found.

- In **Number**, enter the peer-to-peer number string—prefix or entire number—that will be dialed. The number string must not exceed 8 digits. Default: Blank.
- In **Domain Address**, enter the domain name or IP Address to where the call is to be placed. Both IPv4 and IPv6 addresses are supported. The Domain Address may consist of up to 48 characters (maximum). Default: Blank.

The Destination Address can also be in the form of Address: Port number.

- In **Name**, enter a name to identify the number string you configured. It may be the name of your contact or any name you wish to assign to the number string. The name may consist of 24 characters (maximum). Default: Blank.
The name you configure here will not be used in SIP signaling.
- In the **Default for Outgoing Message** field, select the option for transporting outgoing SIP messages. You can select UDP, TCP or TLS.

The parameter Default for Outgoing Message can be configured through Jeeves only.

- Click **Submit** to save your entries.

Configure using Telephone

Enter the SE mode.

For programming parameters using SLT/DKP use '#9' in-place of '.'

For dialing a number use '' in-place of '.'*

To configure a Number, dial:

- **7801-1-Index-Number String-#*** to configure the number for a single index.
- **7801-2-Index-Index-Number String-#*** to configure the numbers for a range of indexes.
- **7801-*-Number String-#*** to configure the numbers for all the indexes.

Where,

Index is from 001-500.

Number String can be a complete telephone number, truncated telephone number or an area code.

Number string is of maximum 8 digits with (0-9, #, *).

By default, Blank for all indices.

To clear a Number, dial:

- **7801-1-Index-#*** to clear the number for a single index.
- **7801-2-Index-Index-#*** to clear the numbers for a range of indexes.
- **7801-*-#*** to clear the numbers for all the indexes.

To configure the Destination Address, dial:

- **7802-1-Index-Destination Address-#*** to configure the Destination Address for a single index.
- **7802-2-Index-Index-Destination Address-#*** to configure the Destination Address for a range of indexes.
- **7802-*-Destination Address-#*** to configure the Destination Address for all the indexes.

Where,

Index is from 001-500.

Destination Address is of maximum 40 char. with ASCII.

By default, Blank for all indices.

IPv6 address can be configured using Jeeves only.

To clear the destination address, dial:

- **7802-1-Index-#*** to clear the Destination Address for a single index.
- **7802-2-Index-Index-#*** to clear the Destination Address for a range of indexes.
- **7802-*-#*** to clear the Destination Address for all the indexes.

To configure the Name, dial:

- **7803-1-Index-Name-#*** to configure the Name for a single index.
- **7803-2-Index-Index-Name-#*** to configure the Name for a range of indexes.
- **7803-*-Name-#*** to configure the Name for all the indexes.

Where,

Index is from 001-500.

Name is a string of alphanumeric characters of maximum 24 characters.

Use first 25 keys and the redial key to enter the name. Terminate with #*.

By default, Blank for all indices.

Display Name field is not sent in the SIP message. It is just a tag for the entry.

To clear the Name, dial:

- **7803-1-Index-#*** to clear the Name for a single index.
- **7803-2-Index-Index-#*** to clear the Name for a range of indexes.
- **7803-*-#*** to clear the Name for all the indexes.

PIN Dialing

PIN is a unique four digit code with an associated Class of Service and Toll Control, which can be assigned to the extension user.

PIN Dialing allows an extension user to make outgoing calls from any extension according to the toll control assigned to his/her PIN. PIN Dialing must be enabled in the Class of Service of the extension from where the outgoing call using PIN is to be made. SARVAM UCS supports maximum 500 PINs for each type of toll control.

Calls made using PIN can be logged in the SARVAM UCS and you can print the report online or later as and when required.

How it works

Let us understand how this feature works with the help of an example.

User A is denied dialing of International Numbers from his/her extension but has PIN Dialing enabled in his/her CoS. A is assigned a PIN 1234 with toll control level as international call. Now, User A can make international calls in two ways:

1. User A must dial the feature access code to access PIN Dialing i.e. *2 (programmable, see [“Access Codes”](#)) followed by his/her PIN. As soon as SARVAM UCS detects a valid feature access code and PIN, it gives trunk dial tone to A. Now user A can dial the desired international number and talk.
2. User A can directly dial an international number from any extension that is assigned a [“Station Basic Feature Template”](#) with PIN Dialing enabled in the Class of Service and LCR enabled in the OGTB group.

SARVAM UCS will prompt A to dial his/her PIN either by playing feature tone or a voice message. Voice message will be played, if recorded. See [“Voice Message Applications”](#) for more details. As soon as s/he dials a valid PIN, SARVAM UCS will dial out the number and connect A to the called party.

This method of calling is useful while making calls through Standard SIP Phones, as it prevents the PIN from being stored in the call logs of the phone.

- *You cannot Redial or set Auto Redial for the numbers dialed out using PIN.*
- *While dialing the Access Code and PIN from the desired extension, the **Extension - Inter Digit Wait Timer (sec)** will be applicable. See [“System Timers and Counts”](#) for more details.*

How to configure

To be able to use this feature,

- Make sure, PIN Dialing is enabled in the [“Class of Service \(COS\)”](#) of the Extensions from where you want to make outgoing calls using PIN.
- Enable the parameter *Store Outgoing Calls* in the [“Station Basic Feature Template”](#) assigned to the extensions from where you want to make outgoing calls using PIN.
- Assign LCR enabled OGTB Group in the [“Station Basic Feature Template”](#) of the Extensions from where you want to make outgoing calls using PIN.

- Configure the PIN table for each type of Toll Control level from the SA Mode. See “[Configuring PIN Table](#)”.
- Select the OGTB Group and type of LCR for making outgoing calls using PINs, for each Toll Control Level from the SE Mode. See “[Configuring OGTB Group and LCR](#)”.

Configuring PIN Table

- Make a list of users to whom you want to assign PINs.
- Log in as **System Administrator**.
- Click **PIN Configuration**.

The screenshot shows the 'PIN Configuration' interface for 'Local Calls'. The sidebar on the left contains various system configuration options, with 'PIN Configuration' highlighted. The main content area features a table titled 'PIN assigned for Local Calls' with 10 columns labeled 'Index' and 'PIN'. The table contains 60 rows, with indices ranging from 1 to 60 and corresponding PIN fields. Below the table are 'Submit' and 'Clear' buttons.

- Select the desired Toll Control level. Each Toll Control level includes the Allowed and Denied numbers as configured by SE. See “[Toll Control](#)” for more details.
- Configure the PINs at a desired index’s. The PIN must be of 4 digits. Valid digits are 0 to 9.

- *Each PIN must be unique. You cannot assign same PIN to two different index within the same Toll Control level.*
- *If you re-assign the same PIN to a different Toll Control Level, it will not be valid for the previously assigned Toll Control Level.*
- *To avoid unauthorized access, we recommend you to change the PIN regularly. Make sure it is strong and is kept confidential.*

Configuring OGTB Group and LCR

- Log in as **System Engineer**.
- Under Configuration, click **PIN Configuration**.

OG Trunk Groups for PIN Dialling	OGTB Group
OGTB Group for PINs defined for Local Calls	01
OGTB Group for PINs defined for Regional Calls	01
OGTB Group for PINs defined for National Calls	01
OGTB Group for PINs defined for International Calls	01
OGTB Group for PINs defined for All Calls	01
OGTB Group for PINs defined for Limited Calls 1	01
OGTB Group for PINs defined for Limited Calls 2	01
OGTB Group for PINs defined for Limited Calls 3	01

Note: PINs assignment for all the toll control levels will be done through SA mode only.

Submit Default

- In **OG Trunk Groups for PIN Dialling**, enter the desired **OGTB Group** number for each Toll Control level.
- To select the desired trunks in the OGTB Group and the type of LCR, see [“OG Trunk Bundle Group”](#) for instructions.
- To configure the LCR Table, see [“Configuring LCR”](#) for instructions.

How to use

For EON Users and Extended IP Phone Users

To use PIN Dialling from any extension:

- Go OFF-Hook.
 - Press DSS Key assigned to 'PIN Dialling'.
- OR**
- Dial *2
 - Dial the PIN.
 - You will hear the trunk dial tone.
 - Dial the desired number.

OR

- Go OFF-Hook.
- Dial TAC.
- Dial the desired number.
- You get Feature tone/ Voice message.

- Dial the PIN.
- Speech with the Called Party.

For SLT Users

- Go OFF-Hook.
- Dial *2
- Dial the PIN.
- You will hear the trunk dial tone.
- Dial the desired number.

OR

- Go OFF-Hook.
- Dial TAC.
- Dial the desired number.
- You get Feature tone/ Voice message.
- Dial the PIN.
- Speech with the Called Party.

Printing Reports of Outgoing Calls made using PIN

You can print call details of users who made outgoing calls using the PIN. For this, you will need to:

- enable **Store Outgoing Calls** in the Station Basic Feature Template of the extension from where you want to make outgoing calls using PIN.
- enable **Print Calls made using PIN** and set the PIN range in **Calls made using PIN** under Calls filter in Outgoing Call Report.
- configure the **destination port** for SMDR-Outgoing Call Report.

Refer "[Station Message Detail Recording-Report](#)", for detailed instructions on printing reports using filters.

You may also print online report of calls made using PIN, when the SARVAM UCS is interfaced with a third party Call Accounting Software (CAS). For this, you must set the parameter PIN in SMDR - Posting. See "[Station Message Detail Recording-Posting](#)" for more details.

PLCC-An Introduction

What's this?

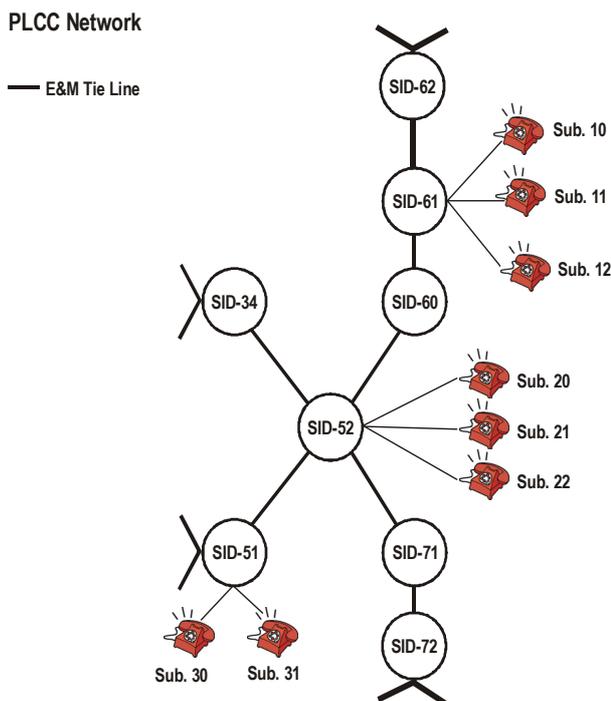

SARVAM UCS-PLCC Server is a digital System. It uses a digital switch and hence is a 100% non-blocking system. In PLCC network, number of PLCC Servers need to be connected.

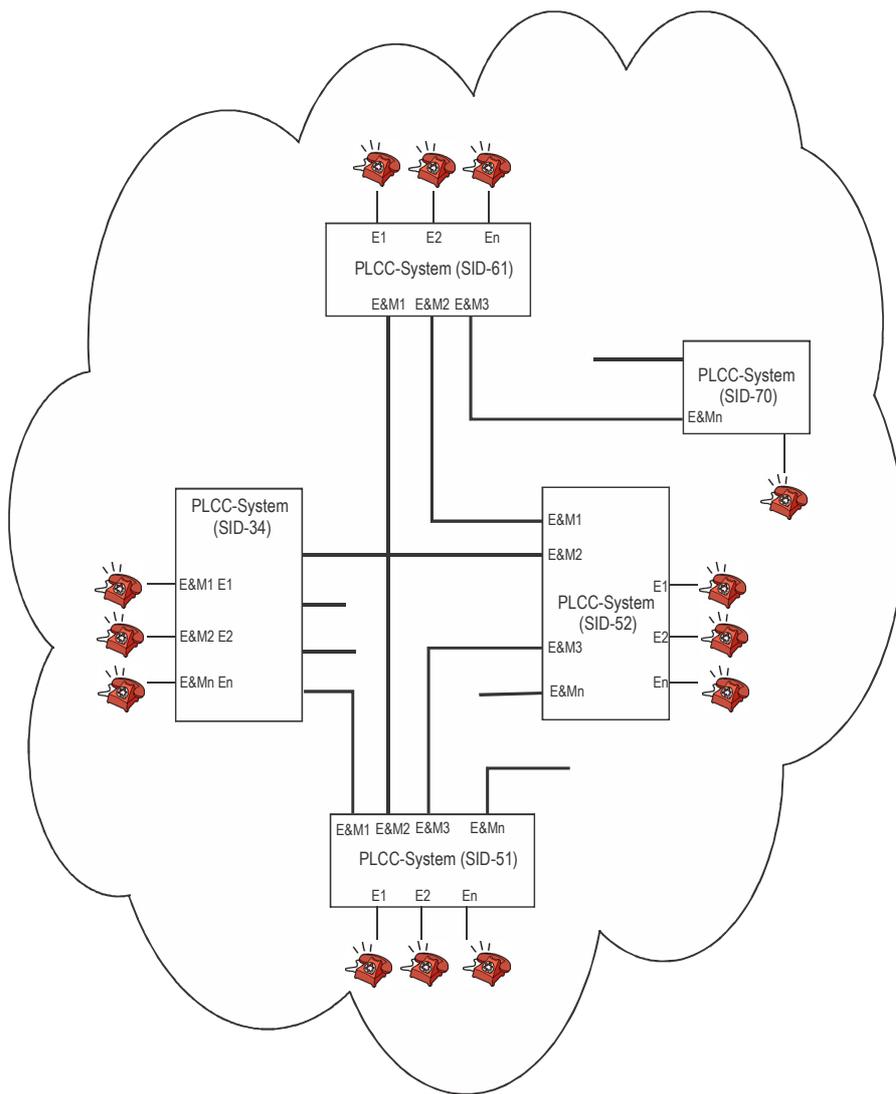

Refer to diagram showing cluster of exchanges in a PLCC network. Each exchange in PLCC network is assigned with Exchange Identity (SID) in order to get identified by other exchanges in the network. Thus each exchange is identified by Exchange Identity (SID). As shown, an exchange is connected to the other exchange through an E&M tie line. Also, it is possible that an exchange may not be directly connected to all other exchanges in a PLCC network through E&M tie lines.

For example, SID-52 exchange is connected to SID-51, SID-34, SID-71 and SID-60 exchanges through direct E&M tie lines. However, SID-52 exchange is not directly connected to SID-61, SID-62 and SID-72 exchanges through E&M tie lines.

Following example shows how a call is established.

- Consider, an example where subscriber 20 of SID-52 needs to call subscriber 30 of SID-51. After dialing trunk access code, dial 51 (SID number of the exchange) and then dial 30 (subscriber number of SID-51). This is how a call is completed, as both exchanges; SID-51 and 52 are connected through a direct E&M tie line.
- However, consider another example, where subscriber 20 of SID-52 needs to call subscriber 10 of SID-61. Even though, here both exchanges are not connected through direct E&M tie line, it is possible by dialing trunk access code with SID number of the exchange (here 61) followed by subscriber number (here 10). However, the call will proceed through SID-60 and then reach SID-61. This is called Transit Call. Here, the subscriber will not be able to know that call has proceeded to the required exchange through transit facility.

PLCC-Priority

All callers do not have same hierarchical position in an organization. 'Priority' can be assigned to each caller to make sure precedence is given to certain extensions over others in being answered.

The SARVAM UCS supports flexible priority assignment for different users. Each port can be assigned a priority level between "1" to "9". Higher the priority level, more important the caller is. Accordingly 1 has the least priority and 9 has the highest priority.

Using this feature the users can free the system resources (Trunk/Extension).

The PLCC functional module requires a license. You must purchase a license to activate CCS Signaling when End Point and Transit, Express Signaling, and Seizure Pulse and Release Pulse Signaling. Refer the topic "[License Management](#)".

How it works

Using Priority on a Station:

- Station A and Station B are talking to each other.
- Station C calls Station B and finds it to be busy. If s/he uses Priority, s/he gets connected to Station B.
- Station A gets disconnected and gets error tone. However, for this to happen the priority of Station C should be higher than that of Station B and Station A.

Using Priority on a Trunk:

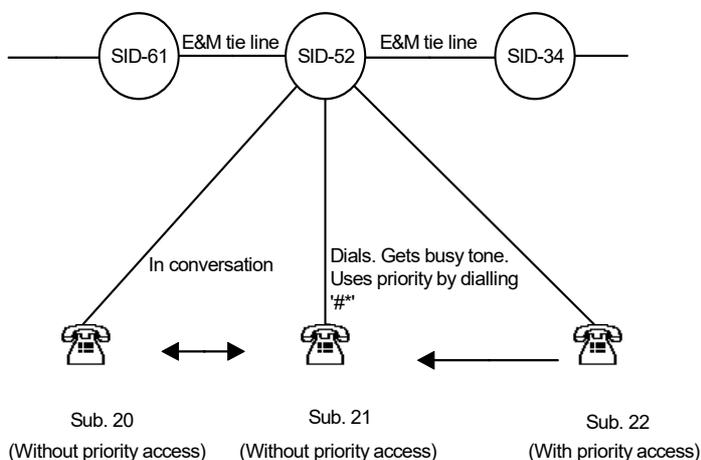

- Station A is talking to an external party through trunk 1.
- Station B tries to grab trunk 1. As the trunk is busy, s/he uses Priority. Doing so, s/he gets connected to trunk 1 and gets PSNT dial tone.
- Station A gets disconnected and gets error tone. However, for this to happen priority of Station B should be higher than Station A. In this case, priority of the trunk is not considered.
- Similarly, if station A is talking to an external party through trunk 1. Station B calls station A and finds it busy. S/he uses Priority. Doing so, station B gets dial tone whereas, the trunk 1 gets disconnected.

How to use

- Lift the handset. You hear the Dial tone.
- Dial Station/Trunk Access Code. You get Busy tone.
- Dial **#***. The called station/trunk gets disconnected. You get dial tone after the confirmation tone.
- Dial **Station/External Number**. You get Ring Back tone.

Priority-Within the Exchange

Under this facility any subscriber having priority access can enter in to conversation with two conversing subscribers within the exchange.

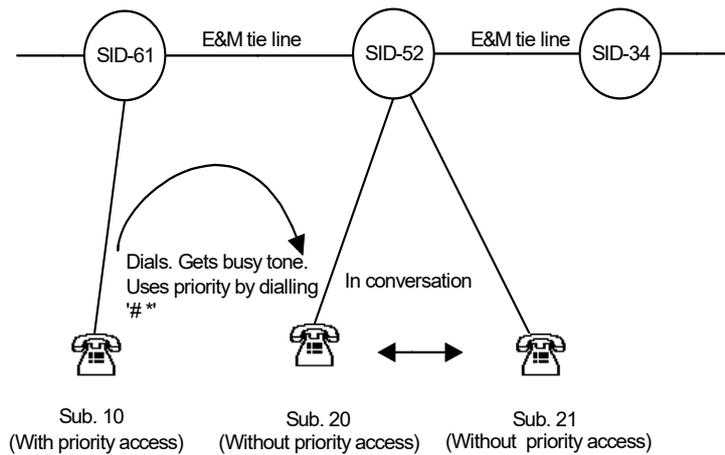

How to use

Please refer above diagram. If any two subscribers, say 20 and 21 of an exchange with SID-52 (without priority access) are in conversation and a third subscriber, say 22 (of same exchange) has priority access and wants to talk with subscriber 21. But, when subscriber 22 dials for subscriber 21, it gets busy tone. Subscriber 22 can use its priority by dialing code '#' in such case and can come in conference with subscribers 20 and 21.

Priority-In Other Exchange

Under this facility any subscriber having priority access can enter in to conversation with two conversing subscribers in two different exchange.

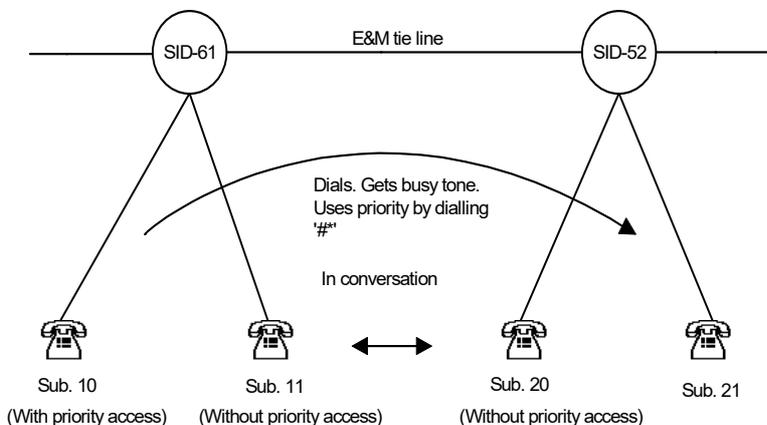

How to use

Please refer above diagram. If any two subscribers, say 20 and 21 of an exchange with SID-52 are in conversation and a subscriber, say 10 of an exchange with SID-61 (from the same network with priority access) want to talk with subscriber 20 of SID-52. After dialing the required subscriber 20 of SID-52, he gets busy tone. Subscriber 10 of SID-61 can now press '#' and can enter into conference with both subscriber 20 and 21 of SID-52.

Priority-Over Busy E&M Tie Line

Under this facility any subscriber having priority access can use priority to free a busy E&M tie line.

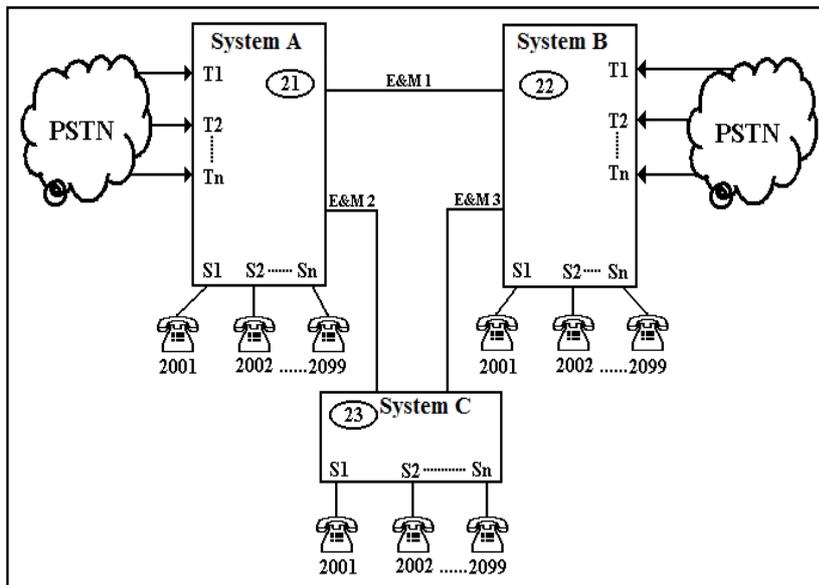

How to use

Please refer diagram, if two subscribers, say 20 of SID-52 (without priority access) and 11 of SID-61 (without priority access) are in conversation on an E&M tie line. Both the exchanges SID-52 and SID-61 are connected with each other through a single E&M tie line. Now, if subscriber, say 10 (with priority access) of SID-61 wants to talk with subscriber 21 of SID-52, then he will get busy tone. Subscriber 10 of SID-61 can now use its priority by pressing ‘##’ on his telephone and can get into conference with both subscriber 11 of SID-61 and subscriber 20 of SID-52. After termination of the call by subscribers 11 and 20, subscriber 10 gets dial tone and can make a call using the E&M tie line to subscriber 21 of SID-52.

PLCC-Routing Table

In PLCC network, number of PLCC-Servers need to be connected. The entire network should behave as a single unit or one group. It is not feasible to have unique station numbers throughout the network. In such cases, an Exchange ID is assigned to the Servers and a routing table is programmed in the exchange. In case of newly added exchange in the network, the routing tables of other exchanges need to be modified.

In the above figure, 3 systems are connected through E&M connectivity.

- T1 to Tn are trunk lines from the local central office (CO).
- S1 to Sn are stations.
- E&M1 to E&M3 are E&M lines between the three Servers.

How it works

In this application, it is possible to have same station number in two or more Servers of the network. Few new words have been used to explain PLCC routing table, each of these words have been explained below:

OG Call with Trunk Access Code:

In PLCC applications, SLT numbers are duplicated. Internal and External dialing is differentiated. Internal dialing happens by dialing SLT numbers directly. External dialing starts with dialing the trunk access code (usually '0') followed by SID and remote SLT number. Suppose the exchange ID of System-A is 21 and that of System-B is 22. Both Systems have same station numbers, say 2001,2002, etc. Suppose a station of System-A wants to call 2001

of System-B. He has two options. He can dial 222001 or 0222001 i.e one with route code 22 and other with route code 022. Hence we need to program two entries in the routing table, one with route code 22 and other with route code 022.

The SARVAM UCS has only one routing table. The same table is used for Closed User Group and Closed User Group-With Exchange ID. Hence the table has to be programmed keeping the application in mind.

- **Routing Table:** This table has following parameters viz. Route Index, Route Code, OG Trunk Bundle Group, Strip Digit Count, Self Route check box, Apply Toll Control check box and Apply Call Cost check box. The Closed User Group-With Exchange ID programming works according to this table.

Index	Route Code	OGTBG	Strip Digit Count	Self Route	Dialed Digit Count	Apply Toll Control	Apply Call Cost
001							
:							
250							

- **Index:** Maximum 250 different routes (001-250) can be programmed.
- **Route Code:** Route code could be of maximum sixteen digits. Valid Digits: 0 to 9, * # A B C D F P, where P is Pause, F is Flash, A to D is DTMF Digits. Generally, route code will be a unique number. The route code should not clash with any of the extension numbers of same System. For example in the figure given above, route code for System-A can be defined as '21', route code for System-B can be defined as '22' and that for System-C can be defined as '23'. This means that no extension in System-A can start with '22' or '23'. Similarly, no extension in System-B can start with '21' or '23' and no extension in System-C start with '21' and '22'.
- **OG Trunk Bundle Group:** An OG Trunk Bundle Group (OGTBG) is assigned to each route code. Whenever a call is to be made on that route, a free trunk from the OGTBG is selected and the extension number is dialed on it. The same logic of rotation On/Off for trunk selection from the OGTBG is used. If rotation is OFF then always the first trunk in the OGTBG is selected. If it is busy then the next trunk in the group is selected. This helps to select an alternate route. Whereas if rotation is ON then the trunks in the OGTBG are selected in round robin fashion.
- **Strip Digit Count:** This count signifies the number of digits to be stripped off while dialing/decoding a number. To elaborate: Consider figure 1. The requirement is that if extension 2001 of System-B dials 212002 and if E&M 1 is busy then the call should reach extension 2002 of System-A through alternate route. In this case the strip digit count of System-A should be programmed as 2 and that of System-B and System-C should be programmed as 0. Doing so, when extension 2001 of System-B dials 212002 and if E&M1 is busy then the call is routed through System-C. In this case, System-B dials 212002 on E&M3, System-C receive this code and dials out the same code, that is, 212002 on E&M2 without striping of any digit. On receiving 212002, System-A strips of two digits as per the programming and routes the call to extension 2002.
- **Self-Route:** This flag signifies that the digits being dialed are for the same System and are not to be dialed on the E&M trunk.
- **Dialed Digit Count:** When digits are dialed on the trunk, the system waits for inter digit timer after the last digit is dialed. In order to avoid this timer and number of digits dialed to be routed without further delay, count for the number of digits to be programmed in this field. If the number of digits received are equal to the parameters programmed then the number is dialed out immediately without waiting for the inter digit

timer. If the number of digits dialed by the user are not equal to the digits programmed, the number is dialed after inter digit timer.

- **Apply Toll Control:** This parameter is not relevant as Self Route flag is enabled. This parameter is relevant when you are configuring [“Closed User Group \(CUG\)”](#).
- **Apply Call Cost:** By default, this check box is enabled and the system will calculate the cost of each call.

For certain calls (internal calls) you do not require the call cost calculation, clear the check box corresponding to these entries. You can also set the filter **Calls with units more than** to generate a report according to the Call Cost. For details, see [“Station Message Detail Recording-Report”](#).

How to configure

For more details on above steps, please refer topic [“Closed User Group \(CUG\)”](#) and [“Closed User Group-With Exchange ID”](#).

PLCC-Express Line Network

SARVAM UCS-PLCC Express Line Communication Server is a digital system. It uses a digital switch and hence is a 100% non-blocking system. Refer to diagram in ‘Introduction to PLCC Network’ topic showing cluster of substations in a PLCC network. A substation in a PLCC network is connected to any other substation through a dedicated PLCC express line (that is, 4/6 wire E&M tie line) as shown in the diagram.

How to configure

PLCC Express Line Communication Server is one of the applications of the SARVAM UCS. We recommend the user to read relevant topics before programming it for PLCC Express Line application.

Step 1

Refer chapter [“E&M Feature Template”](#) to program the feature in an E&M Feature Template.

Step 2

Refer chapter [“E&M Feature Template”](#) to assign default values to an E&M Feature Template.

Step 3

Refer chapter [“E&M Feature Template”](#) to assign an E&M Feature Template to an E&M.

Step 4

Refer chapter [“Configuring DKP Extensions”](#) to program a name for E&M trunk.

Step 5

Hardware ID is an attribute of a software port. Hardware ID of a software port decides where the port is physically located. To derive hardware ID of a software port, we need slot number and port number of the card. Hence, all the programming is done for the software port and not for the hardware ID. Accordingly, the software port number is used for all the programming. Please refer [“Software Port and Hardware ID”](#) for more details, to assign hardware ID to an E&M software port:

Step 6

Refer chapter [“Station Advanced Feature Template”](#) to assign a Station Advanced Feature Template to an E&M.

Step 7

Refer chapter "[Station Advanced Feature Template](#)" to assign a Station Basic Feature Template to an E&M.

Step 8

Please refer "[Time Tables](#)" chapter to program the time zone of a trunk.

Step 9

To program a feature in a Trunk Feature Template, please refer "[Trunk Feature Template](#)" for more details.

Step 10

To assign a Trunk Feature Template to an E&M, please refer "[Configuring the E&M using Jeeves](#)" topic.

Step 11

Refer chapter "[DSS Keys Programming](#)" to assign a function to a key of DSS-64 assigned to a DKP. In this commands function type and function number can be programmed as explained below.

Function:

A function should be assigned to these Keys, which they should perform. There are 2 different types of functions, which can be assigned to a key for PLCC express line application. Each function that can be assigned to a key is given unique number. Following table list the function types available:

Function Type	Meaning	Function Number/Port
00	Null	--
06	Access a trunk	001 to 128

Step 12

Refer chapter "[DSS Keys Programming](#)" to assign a function to a DKP key. In this command refer above explanation to program 'Function Type'.

Step 13

Define dialing property of E&M port. The dialing properties are based on the applications. If the dialing type for a E&M is programmed as pulse type then Pulse-Dialing ratio should be defined. The E&M support six different Pulse Dialing Ratio's.

Value	Meaning/Ratio
1	10PPS, 1:2
2	10PPS, 2:3
3	10PPS, 1:1
4	20PPS, 1:2
5	20PPS, 2:3
6	20PPS, 1:1

For assigning Dial Type and Pulse Dial Ratio, please refer "[E&M Feature Template](#)" topic.

Presence

What's this?

Presence is an important UC feature as it helps you to know the availability status of other users. Depending on the status of users you can decide whether to initiate a conversation or find an alternative way to contact the desired user.

For example, an extension user may want to leave his desk for an indefinite period, but does not want to use Call Forward or set Do Not Disturb. He wants to indicate to callers about his absence. Similarly, extension users who are present at their desk may want to hide their presence from other users; or they may want to show their current activity to the other extension users like they are Busy, or are away from their desks, or on the phone with someone on another call, etc.

With the Presence feature of SARVAM UCS, extension users, including the Operator, can 'publish' their presence to callers from other extensions. By doing so, they can indicate to the other extensions about their availability.

In the same way, the Presence feature allows extension users to view the 'Presence' status (availability) of the extensions that they want to call, before making the call or when their call is not answered.

How it works

Publishing Presence

Any SLT, DKP, ISDN Terminal, and SIP Extension User can 'publish' their presence by setting any of the messages listed in the following on their phone, by dialing the access code for this feature.

SIP Extension users who want to publish their presence have two options:

- *Using the PUBLISH feature supported by the SIP Client.*
- *Using the feature access code for Publish Presence supported by SARVAM UCS.*

The first option requires the parameter 'PUBLISH' to be enabled in the SIP Extension Settings. Refer ["Configuring SIP Extensions"](#). By default, this parameter is disabled.

Publishing Presence Messages

1. **Absent:** When an extension user sets 'Absent' as the message, all incoming internal as well as external calls will be blocked from landing on his/her extension.

When any other DKP/SIP extension user calls this extension, the text message 'User Absent' will appear on the caller's phone display.

If the extension phone that has set 'Absent' is a DKP/SIP, the letter 'A' appears on the phone's display to indicate absence.

The letter 'A' disappears when the extension user sets a presence message other than 'Absent'.

- When an SLT extension user calls the extension which has set 'Absent', an error tone will be played. However, it is possible for the SLT extension user to find out the presence status of the called extension. Refer "[Viewing Presence](#)" later in this topic.
- External callers who call the extension, on which 'Absent' is set, will get an error tone only.
- Outgoing calls can be made from the extension which has set 'Absent'. Only incoming calls are restricted.
- If more than one extension is configured as "Operator" (routing group), incoming calls will be blocked only on the Operator extension which has set User Absent.

2. Present:

When an extension user sets 'Present', all incoming calls will be received as normal on this extension.

If previously set as 'Absent', when a DKP/SIP extension user sets 'Present' the letter 'A' will disappear from the phone's display.

When any other DKP/SIP extension user calls this extension, the name of the extension user will be displayed on the caller's phone display, when the called extension is ringing.

3. **Auto Detect:** When an extension user sets 'Auto Detect', the system will detect the state of the phone; depending on the call state, it will publish the presence message to the other extensions. Three types Publish Presence messages are possible, with Auto Detect:
 - a. **Idle:** When the system detects the extension phone to be ON-Hook, it indicates the status of the phone to other extensions 'idle'.
 - b. **On the Phone:** When the system detects the phone to be OFF-Hook, or in speech with another party or if it detects an incoming call placed on the phone, it will indicate to the other extensions that this extension user is 'On the Phone' with another party.
 - c. **DND Text message:** When the system detects that the extension phone has Do Not Disturb (DND) set on it with a DND Text message, it will display to the calling extension, the DND message set by the called party (this may be the default DND message or the DND Text message set by the called extension).
3. **Away:** When an extension user sets 'Away', the system will display this message to the other extensions.
4. **On the Phone:** When an extension user sets 'On the Phone', the system will display this message to the other extensions.
5. **Do Not Disturb:** The extension user can set this message to be published to other extensions, if s/he wants to work uninterrupted.

Unlike the DND Feature, the extension user who has set this message will continue to receive calls both internal as well as external calls, as the system considers this extension as 'present'.
6. **I am Mobile:** The extension user can set this message to be displayed to other extensions, when s/he is not at the desk.

7. **In Meeting:** The extension user can set this message to be displayed to the callers, if s/he is busy in a discussion or meeting.
8. **Out for Meal:** The extension user can set this message to be displayed to other extensions when going on a lunch break.
9. **Out of Office:** The extension user can set this message to be displayed to the callers when s/he leaves the office temporarily.

When an extension user sets any Publish Presence message other than 'Absent', the system will consider the user as 'Present'. All incoming and outgoing calls will be allowed on this extension.

It is possible to program another message in place of Publish Presence messages listed from 6 to 9: I am Mobile, In a Meeting, Out for Meal, Out of Office.

Publish Presence messages can be set or changed for any extension from the System Administrator (SA) mode.

Viewing Presence

- Extension users can know the status of another extension user before calling or when the extension user does not answer the call.
- Generally, when DKP extension users call another extension, the name of the called extension is displayed on the calling DKP extension. Now, if the flag 'Display User Status during Call' is enabled in the System Parameters, when DKP extension users call another extension, the calling DKP extensions will be displayed the 'presence' status message published by the called extension³¹⁸.
- SLT extension users, whose phone is equipped with a CLI display, can see the status of another extension by dialing a feature access code, then going ON-Hook. The system will ring back the SLT and send the Presence status of the desired extension as CLI.
- SIP extension users can use the Presence feature of SARVAM UCS to view the presence status of other extensions. For this, they must dial the feature access code and the number of the desired extension.
- SIP extension users who want to view the status of other extensions using the feature supported by their SIP Client, must have 'Presence Subscription' enabled in their SIP Extension Settings. Refer [“Configuring SIP Extensions”](#).

How to configure

This feature involves the programming of the following parameters:

- **'Display User Status during Call' flag:** DKP extension users will be able to view the presence status for the called extension only if this flag is enabled in the System Parameters.
- **PUBLISH:** SIP extension users who want to publish their presence using the feature supported by their SIP client will be able to publish their presence status only if this feature is enabled in their SIP Extension Settings. This parameter is not necessary, if they want to publish presence using the feature of SARVAM UCS.

318. DKP users can also dial a feature access code and the number of the extension to see the status of that extension on their DKP. But this would not be required, if the 'Display User Status during Call' flag is enabled in the System Parameters.

- **Presence Subscription:** SIP extension users who want to view the presence of other extensions using the feature supported by their SIP client must have this feature enabled in their SIP Extension Settings. This parameter is not necessary, if they want to view presence using the feature of SARVAM UCS.
- **Publish Messages:** It is possible to customize the Publish Messages listed above from 6 to 9 viz.: 'I am Mobile', 'In Meeting', 'Out for Meal', 'Out of Office'.

The above parameters, with the exception of 'Publish Messages', can be programmed using both Jeeves and a Telephone. You can program 'Publish Messages' using Jeeves only.

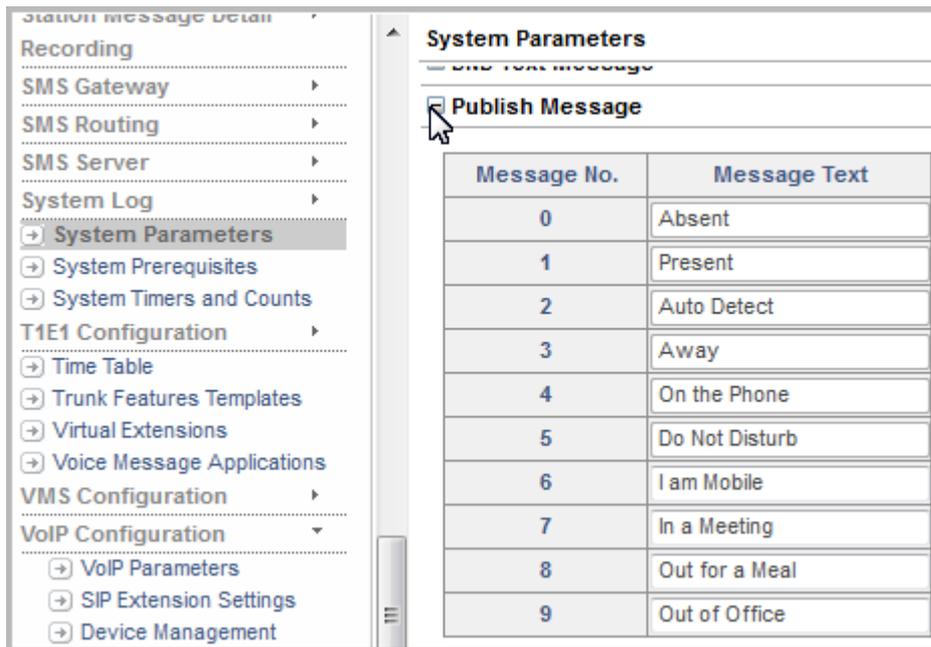

Programming Presence using Jeeves

- Log into Jeeves as System Engineer.
- Under **Configuration**, click **System Parameters** to open the page.
- Go to **Display Presence Status during Call on DKP**. Click to enable the flag.

System Parameters	
Call Proceeding Tone for Multi-stage Dialing	Network Tone
Companding Algorithm	A-Law
Language of SE, SA and Front Desk User Web Interface	English
Form Feed in Report Printing	<input checked="" type="checkbox"/>
Minimum No. of digits received in CLI to consider the call is from Public N/w	08
Display Presence status during call on DKP/Extended IP Phone	<input checked="" type="checkbox"/>
Enable Programming through Comm. Port	<input type="checkbox"/>
Communication Port for Programming	None
Enable Watch Dog	<input type="checkbox"/>
Master Buzzer - On Timer (ms)	0001
Master Buzzer - Off Timer (ms)	0300
Apply RCOC only if the caller calls back on the same trunk from which the call was made	<input type="checkbox"/>
Stuttered Dial tone when DND is set	<input type="checkbox"/>
Detect Possible toll bypass attempt by Extn. during IC Call from CO Line & Drop the Call	<input type="checkbox"/>
Magneto	
<input type="button" value="Submit"/>	

- Click **Submit** at the bottom of the page.

- Click **Publish Message** to expand.

- You can change message number 6 to 9 as desired. The string may consist of a maximum of 16 characters. All ASCII characters except < > and " (double quote) are allowed.
- Click **Submit** at the bottom of the page to save your settings.
- Under **Configuration**, click **VoIP Configuration**.
- Click **SIP Extension Settings** to open the page.
- Now, go to the desired SIP Extension number for which you want to enable the features PUBLISH and Presence Subscription. By default both features are disabled. Click the respective check boxes to enable the features.
- Click **Submit** at the bottom of the page to save your settings.
- Log out of Jeeves or continue, as desired.

Programming Presence using a Telephone

- Enter SE mode from a DKP/SLT.

To enable/disable 'Display Presence Status during Call on DKP', dial:

- **5320-Flag**

Where,

Flag is

0 for Disable

1 for Enable

By default, flag is disabled.

- Exit SE mode.

How to use

This feature requires you to dial your User Password. The default User Password 1111 is not accepted. Please change the User Password first.

Publish Presence can be set for an extension also from the System Administrator mode.

For EON and Extended IP Phone Users

Publishing Presence by Extension User

- Press DSS Key assigned to PUBLISH presence.

OR

- Dial **104**
- Enter User Password on the prompt.
- Scroll to the desired Publish message from the menu:
 - Absent
 - Present
 - Auto Detect
 - Away
 - On the Phone
 - Do Not Disturb
 - I am Mobile
 - In Meeting
 - Out for Meal
 - Out of Office
- Press Enter key to select message.
- You get the confirmatory tone.

Publishing Presence from SA Mode

- Press DSS Key assigned to PUBLISH presence.

OR

- Dial **1072-014**
- Enter Destination Number, that is, the number of the extension Publish Presence is to be set.
- Scroll to the desired Publish message from the menu:
 - Absent
 - Present
 - Auto Detect
 - Away
 - On the Phone
 - Do Not Disturb
 - I am Mobile
 - In Meeting
 - Out for Meal
 - Out of Office
- Press Enter key to select message.
- You get the confirmatory tone.

To view Presence Status

- Press DSS Key assigned to Display Presence Status.

OR

- Dial **1097**.
- Enter Extension number
- The status of the extension number you dialed will be displayed on your phone's LCD.
- Go ON-Hook.

For SLT Users

Publishing Presence by Extension User

- Lift the handset.
- Dial **104-Password-Index Number**

Index No.	Meaning
0	Absent
1	Present
2	Auto Detect
3	Away
4	On the Phone
5	Do Not Disturb
6	I am Mobile
7	In Meeting
8	Out for Meal
9	Out of Office

- Replace handset.

Publishing Presence from SA Mode

- Lift the handset.
- Dial **1072-014-Extension Number-Index Number**

Index No.	Meaning
0	Absent
1	Present
2	Auto Detect
3	Away
4	On the Phone
5	Do Not Disturb
6	I am Mobile

Index No.	Meaning
7	In Meeting
8	Out for Meal
9	Out of Office

- Replace handset.

To view Presence Status

You can view Presence Status of another extension only if your SLT has a CLI display.

- Lift handset.
- Dial **1097-Extension Number**.
- You get confirmation tone.
- Go ON-Hook during confirmation tone.
- Your phone will ring and the status of the extension number you dialed will be displayed on your phone as CLI.

Preset Call Forward

What's this?

SARVAM UCS supports the Preset Call Forward. This feature is useful when Call Forward is not set by users, as their calls will automatically be forwarded to the selected destination. This feature is independent of the Class of Service assigned to the extension users.

Preset Call Forward options can be configured for each time zone by the SE only. The calls will be forwarded to the selected destination— Voicemail, Extension (SLT, DKP, SIP) or Department Group as per the Preset Call Forward type selected.

If users set Call Forward from their extensions, it will have a priority over Preset Call Forward. When the users cancel Call Forward from their extensions, the Preset Call Forward option will be applicable automatically.

The Preset Call Forward feature of SARVAM UCS offers the following forwarding options:

- **When Busy** - calls are forwarded to the destination phone number only when the called party's phone is busy.
- **When No Reply** - calls are forwarded to the destination phone number only when the called party does not answer the phone. The default time is 30 seconds for all extensions and can be changed by programming the Call Forward No-Reply Timer.
- **When Busy or No Reply** - calls are forwarded to the destination phone number when the called party's phone is either busy or does not reply.

How it works

A has set Preset Call Forward When No Reply to the Voicemail.

- The system waits for the Call Forward No-Reply Timer to expire and forwards all incoming calls to A's Voicemail.

A has set Preset Call Forward When Busy to B's extension.

- The system forwards the call for A to B on detecting Busy signal from A.

B has set Preset Call Forward-No Reply on A and A belongs to a Department Group.

- If the Call Forward-No ReplyTimer set is less than the Ringer Timer of the Department Group, the Preset Call Forward request will be served and the call will land on A.
- If the Call Forward-No Reply Timer set is greater than the Ringer Timer of the Department Group, the Preset Call Forward request will not be served.

If the Ignore call forward set by member extension, when call is routed on Routing/Dept. Group option is enabled in System Parameters, then Preset Call Forward request will not be served. See ["System Parameters"](#) for more information.

A has set Preset Call Forward to Department Group.

- The system forwards the call for A to the Department Group. The free member in the group answers the call.

A has set Preset Call Forward When Busy or No Reply to the Voicemail.

- Whenever there is a call for A, if the system does not detect a busy signal from A, it waits for the Call Forward No-Reply timer to expire.
- The system forwards the call to the Voice Mail System.

If A wants to change the Call Forward destination temporarily, then A must set Call Forward from his/her extension. For detailed instructions, see [“Call Forward”](#). In this case, the Preset option will not be applicable. But as soon as A cancels Call Forward from his/her extension, the Preset option will be applicable.

- *Preset Call Forward cannot be cancelled by the users.*
- *The system supports only single-point Preset Call Forward, which means, if the destination extension has also forwarded its calls, the call will not follow the forwarding path. For example: Calls for extension A are forwarded to extension B. Preset Call Forward is also set on extension B with C as the destination number. In this case, Calls for A will land on B and calls for B will land on C. Calls for A will not land on C.*
- *Only one Preset Call Forward Type can be set for each Time Zone. Every new Preset Call Forward Type set overrides the previous one.*

How to configure

The functioning of this feature is controlled by the following parameters: Preset Call Forward configured in the 'Station Advanced Feature Template' assigned to the extension user and 'Call Forward No-Reply Timer'.

When Preset Call Forward No-Reply is set, if required the Call Forward No-Reply Timer needs to be programmed.

Configuring Preset Call Forward in the Station Advanced Feature Template

The default Station Advanced Feature Template 01 is assigned to all extension users of the SARVAM UCS. In this template Preset Call Forward is disabled.

Decide which extensions are to be allowed 'Preset Call Forward'. If you want to allow Preset Call Forward to all extensions, retain the default Station Advanced Feature Template 01 and configure the Preset parameters. However, if you want to allow Preset Call Forward only to selected extensions, select another Station Advanced Feature Template and configure the Preset parameters in that template.

Now, to assign the template to selected extensions, follow these steps:

1. Prepare a Station Advanced Feature Template with Preset Call Forward configured for each time zone.
2. Assign this newly prepared template to the desired extensions.

Refer the topics [“Station Advanced Feature Template”](#) for detailed programming instructions on how to customize a Station Advanced Feature Template, configure the Preset Call Forward parameters and how to apply this template on extensions.

Call Forward No Reply Timer

When using Call Forward -No Reply, each extension can set a different Time after which the incoming call on the extension should get forwarded when there is no reply from the extension. For this, the Call Forward No-Reply Timer must be programmed. By default, this timer is set to 30 seconds.

The Call Forward No-Reply Timer is to be programmed in the [“Station Advanced Feature Template”](#) applied on the extensions which are allowed Call Forward in their COS.

If you want to set this timer to the same duration for all extensions, simply set the Call Forward No-Reply Timer in the default Station Advanced Feature Template 01 which is assigned to all extensions.

If you want to set different Timer duration for different extensions, then prepare separate Station Advanced Feature Templates with the desired Timer durations and assign different Templates (with different Timer durations) to the extensions as desired.

Refer the topic [“Station Advanced Feature Template”](#) for instructions on customizing the template and applying the template to extensions.

Priority Calls in E&M MFCR2 Signaling

What's this?

In a network of Systems connected over E&M trunks, callers may be unable to reach the desired station, as the called station may be busy with another station.

The problem becomes more acute when important decision makers and persons involved in critical tasks in an organization are unable to get through to the desired extension of the networked System, because it is busy.

SARVAM UCS supports Priority Call in E&M MFCR2 Signaling to overcome this. This feature makes it possible to land a call on a busy extension and establish speech with the desired extension user. If required, you can also disconnect the remote party in speech with the called extension.

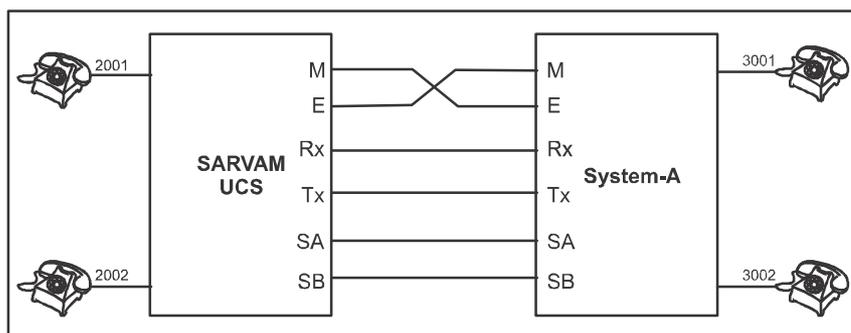

E&M MFCR2 Signaling is currently supported on ETERNITY GE E&M Card only. This feature is currently available on ETERNITY GENX only.

How it works

- The extensions which are to be allowed Priority Call feature must be defined as 'Priority Subscriber' in their Station Advanced Feature Templates.
- The extensions on which Priority Calls should be allowed to land must be 'Non-Priority Subscribers' (that is, defined as 'Ordinary Subscriber' in the Station Advanced Feature Template).
- In the following illustration, SARVAM UCS is networked with System-A over E&M Lines with MFCR2 Signaling.

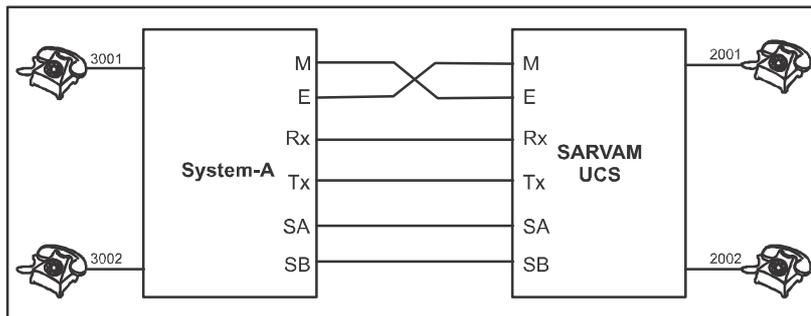

Priority Call from SARVAM UCS to Networked System

- SARVAM UCS is the Originating System and System-A is the Terminating System.
- Extension 2001 of SARVAM UCS is a 'Priority Subscriber'. Extension 2002 is an 'Ordinary Subscriber' (Non-Priority).
- Extension 3001 of System-A is a 'Non-Priority Subscriber'. Extension 3002 of System-A is also a 'Non-Priority Subscriber'.
- When Extension 2001 calls Extension 3001, depending upon its implementation, System-A understands it as a priority call.

- If Extension 3001 is busy with another extension, 3002, and since both are non-priority subscribers, System-A will automatically intrude the conversation between 3001 and 3002 and establish 3-way speech between Extensions 2001, 3001 and 3002.
- Now, if Extension 2001 (the Priority caller) does not want Extension 3002 to be part of the conversation, s/he can ask 3002 to go idle OR s/he can use the feature Forced Release Order to disconnect 3002 from the conversation. 2001 can use Forced Release Order only if it is allowed to it in its “Class of Service (COS)”.
- When Extension 2001 dials the Feature Access Code for Forced Release Order, Extension 3002 will be disconnected and two-way speech will be established between 2001 and 3001.

Priority Call from Networked System to SARVAM UCS

- System-A is the Originating System and SARVAM UCS is the Terminating System.
- Extension 3002 of System-A is a Priority Subscriber. Extension 3001 of System-A is Non-Priority Subscriber.
- Extension 2001 and 2002 of SARVAM UCS are Non-Priority Subscribers
- Extension 3002, a Priority Subscriber, calls Extension 2002 of SARVAM UCS.
- SARVAM UCS treats the call as priority call.
- Extension 2002 is busy with Extension 2001. SARVAM UCS checks the priority of both extensions. Since both are non-priority subscribers, SARVAM UCS gives priority to Extension 3002 and plays beeps to 2002 and 2001 before establishing 3-way speech.
- SARVAM UCS will not treat a call as priority in the following cases:
 - If the busy call is itself a priority call, that is, at least one of the two parties in the busy call is a priority subscriber.
 - If any party involved in a matured call is Priority Extension or Trunk, the call will be considered as priority call and hence no incoming priority call will be allowed to intrude this priority call.
 - If the call is routed to data equipment, for example, fax machine.
- SARVAM UCS allows non-priority subscribers to intrude on a busy call using the feature Manual Priority Intrusion. For this, the intruding extension must have the feature 'Manual Priority Intrusion' in its Class of Service.

- When a non-priority extension requests Manual Priority Intrusion, SARVAM UCS receives an 80msec pulse signal on the E wire of the E&M port, on detecting this signal SARVAM UCS will treat it as a Priority Call and check whether the called extension that is busy can be intruded or not.
- If intrusion is possible SARVAM UCS creates a conference call, after playing beeps to notify both parties of the 3-way conference call. This beep will be played only if Conference beeps are enabled.

How to configure

For this feature to work, the extensions of the networked Systems which are to be allowed Priority Call feature must be defined as 'Priority Subscribers'.

Extensions on which Priority Calls must be allowed to land may be defined as 'Non-Priority Subscribers'.

If non-priority subscribers are to be allowed to Priority Calls when necessary, Manual Priority Intrusion feature must be enabled in their Class of Service.

If the Priority Subscriber extension users are to be allowed to disconnect the second party (other than the desired party) from the conversation during a Priority Call, the feature Forced Release Order must be enabled in their Class of Service.

For Stations on which data terminals are connected (like Fax machine), it is recommended that the 'Caller Category' of these stations be programmed as 'Data Transmission' (in their Station Advanced Feature Template).

Programming Extensions as Priority Subscribers

To define extensions of SARVAM UCS as 'Priority Subscribers' or 'Non-Priority Subscribers', you must set the parameter "Caller Category" in the Station Advanced Feature Template assigned to these extensions.

In the default Station Advanced Feature Template 01 assigned to all extensions of the SARVAM UCS, the Caller Category is set to 'Ordinary Subscriber', which means all extensions are by default, 'Non-Priority Subscribers'.

Since all extensions cannot be defined as 'Priority Subscribers', prepare a new Station Advanced Feature Template, select the option 'Priority Subscriber' as Caller Category in this template and apply it on the selected extension that are to be defined as Priority Subscribers.

Refer the topic ["Station Advanced Feature Template"](#) for detailed instructions.

Programming Manual Priority Intrusion and Forced Release Order in Class of Service

In the default the default CoS group 01 in Station Basic Feature Template Number 01 assigned by default to all extensions of SARVAM UCS, 'Manual Priority Intrusion' and 'Forced Release Order' are disabled.

If you want to allow all extensions these features, simply enable them in the default CoS group 01.

However, if either or both these features are to be allowed only to select extensions, follow these steps:

1. Define a CoS group with Manual Priority Intrusion/Forced Release Order enabled.
2. Prepare a Station Basic Feature Template with this CoS group applicable in all the ["Time Zones"](#).

3. Assign this new Template to the extensions to which Manual Priority Intrusion/Forced Release Order is to be allowed.

Refer the topics [“Class of Service \(COS\)”](#) and [“Station Basic Feature Template”](#) for detailed instructions.

How to use

Manual Priority Intrusion

For EON and Extended IP Phone Users

- Dial the desired extension number.
- When you get the Busy Tone,
- Press DSS Key assigned to Manual Priority Intrusion (if programmed)
OR
- Press Transfer Key and dial ***37**.
- You are in 3-way speech.

For SLT Users

- Dial the desired extension number.
- On Busy Tone, press Flash to put call on Consultation Hold.
- Dial ***37**.
- You are in 3-way speech.

Forced Release Order

For EON and Extended IP Phone Users

- Dial the desired extension number.
- When you are in 3-way speech,
- Press DSS Key assigned to Forced Release Order (if programmed)
OR
- Press Transfer Key and dial ***38**.
- You are connected to the desired party. The second party is disconnected.

For SLT Users

- Dial the desired extension number.
- When you are in 3-way speech,
- Press Flash and dial ***38**.
- You are connected to the desired party. The second party is disconnected.

Priority

What's this?

'Priority' is the precedence given to certain trunks and extensions over others in being answered by the destination extension.

When 'Priority' is assigned to trunks, whenever there are incoming calls on multiple trunks at the same time, the call on the trunk with highest priority will be answered by the landing destination extension/Operator first.

When Priority is assigned to Extensions, calls from extensions with highest priority will have precedence in landing on the destination extension.

You can set priority levels from 1 to 9 as given in the table below.

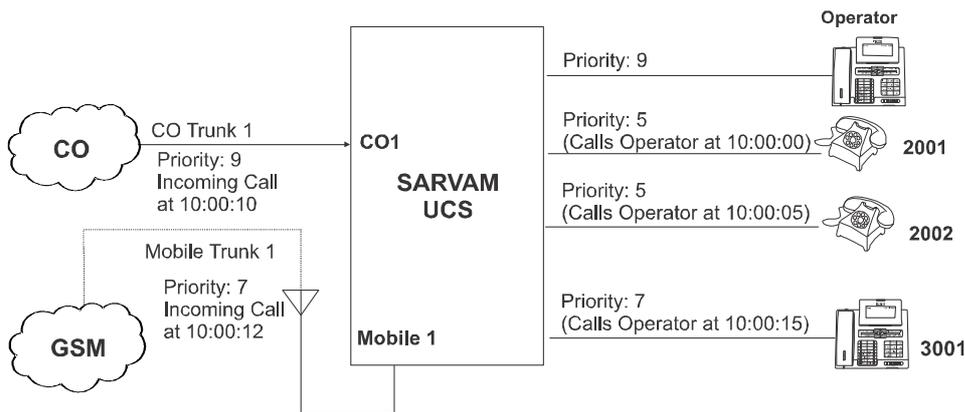

Priority Level	Meaning
1	None
2	Lowest
3	Lower
4	Low
5	Normal
6	Medium
7	High
8	Higher
9	Highest

Highest Priority can be assigned to Extensions of important or higher ranking persons in an organization; for example, calls from senior managers or top executives in an organization can be allowed to be answered first by the destination extension.

Highest Priority can be assigned to particular Trunks, such as special or private trunk lines, trunk lines dedicated as help lines or emergency trunks, or trunks designated as hotlines, so that when there are incoming calls on different trunks at the same time, the call on these trunks gets answered first by the destination extension.

Priority can be assigned to all Trunk types (CO, Mobile, SIP, T1E1PRI, BRI) and Extension types (SLT, DKP, ISDN terminal, SIP, E&M as Station, Radio, Magneto port).

To understand how this feature works, consider this illustration:

Here,

- There are two incoming calls, one on the Analog Trunk, CO 1 and the Mobile Trunk 1 at the same time.
- CO Trunk 1 has priority, '9', the Mobile Trunk 1 is assigned priority '7'.
- Three extensions, 2001, 2002 and 3001 are calling the Operator. Extension 3001 has priority '7', while extensions 2001 and 2002 have the same priority, '5'.
- Now, on the Operator extension, which is the landing destination, the incoming calls from the trunks and the extensions will land in the following chronological order:

Caller	Time of the Call	Priority
SLT 2001	10:00:00	5
SLT 2002	10:00:05	5
CO Trunk 1	10:00:10	9
Mobile Trunk 1	10:00:12	7
DKP 3001	10:00:15	7

- These incoming calls, however, will appear on the Display of Operator's phone (DKP or Extended IP Phone) in the order of priority:
 - CO 1
 - Mobile Trunk 1
 - DKP 3001
 - SLT 2001
 - SLT 2002
- Now, when the Operator goes Off-hook (pressing speaker key or picking up the handset), the call on CO 1 will be answered first, as CO Trunk 1 has the highest priority.
- The Operator goes On-hook and then Off-hook, the call on Mobile Trunk 1 will be answered. Though Mobile Trunk 1 and DKP 3001 have the same priority, '7', Mobile Trunk 1 will be answered first, following the chronological order.
- When the Operator goes On-hook after answering the call on Mobile Trunk 1, the call from DKP 3001 will be placed on the Operator phone with a *Priority Ring* (configurable; default: Triple Ring).

- When the Operator goes Off-hook, the call from DKP 3001 is answered.
- When the Operator goes On-hook and then Off-hook after answering the call from DKP 3001, the call from SLT 2001 will get answered first, though both 2001 and 2002 have the same priority, '5'. In this case, *Priority Ring* will not be played.
- Thus, calls from trunks and extensions are answered by the landing destination in the order of priority. Where priority is the same, calls are answered in chronological order. Calls from extensions with higher priority are indicated by a *Priority Ring* on the landing destination.

Priority is relevant only when there is more than one call on the destination.

You can assign Priority to SLT extensions. However, Priority is not relevant when the SLT is a landing destination, because there cannot be more than one call ringing on an SLT extension at a time.

An “[Intercom](#)” call will be placed at the destination only if the caller has a higher priority.

How to configure

To assign Priority to Trunks, you must set the priority in their “[Trunk Feature Template](#)”. See “[Configuring Trunks](#)”.

To assign Priority to Extensions, see instructions for configuring the respective Extension port type:

- “[Configuring SLT Extensions](#)”
